Supra

Extraordinary design that
breaks away from the conventional

Just when we believe that we have seen it all in design, something new always comes along to surprise us. In most cases, it's not just one detail, but the combination of many. The use of straight and curved lines, highlighting the camera's chromed ring, yet without extravagance. Easily identifiable mechanical buttons, double or single, with blue-toned nametag holders, all generously sized. There is also a harmonious blend of materials, from stainless steel to Zamak alloy, with the option of metallic grey or satin black.

The striking appearance of the Supra panel will leave no one indifferent.

The best modular panel, *without any doubt*

Supra is the third generation of modular panels from Golmar. It is the result of over 20 years of experience with previous versions, combined with input from professionals and end users.

A limited number of references—an essential feature of any modular panel—but able to be adapted to any project within the minimum possible space. Up to 38 push buttons in one single column, over 50% more than other modular panels of similar dimensions, and with larger button surfaces.

Supra is available in four different heights and an unlimited number of horizontally mounted modules.

Accessories such as rain shields, surface-mount boxes, and replacement frames for other panels cover all types of installation requirements.

Replacement frame

Angular surface box

Easy assembly
with excellent result

The Supra panel consists of a die-cast aluminium frame which solves any irregularities in the wall or incorrect embedding box mounting. A hinge located at the bottom of the frame allows the panel to be folded down, facilitating the assembly of the modules.

Lateral tabs attach the modules to the frame quickly and securely, which are connected to each other by means of ribbon cables with connectors, without the need of any tools. The removable installation terminals make the connection of the installation more convenient.

The module fronts are attached by lightly pressing them into place, while the outer frame is fastened to the panel with two hidden screws.

Fixing tabs

Maximum strength
that makes the difference

The goal was ambitious: to design a modular panel with high weather and impact resistance ratings. It has paid off.

Supra is the only modular panel with an IP65 rating developed by a Spanish manufacturer, guaranteeing resistance to the entry of dust and low-pressure water jets projected from any direction, without damaging the panel. Its IK08 resistance index provides excellent protection against moderate impacts.

To guarantee high resistance to corrosion, the main module grille is made of AISI 316 stainless steel and the plastic parts are UV protected against degradation by sunlight.

The safer and durable choice.

Accessibility for all
in any entrance

Nobody has been left out in the design and development of the Supra panel. We could say that it is a 'friendly' panel, inclusive, easy to use by everyone. As it is a modular panel, it is possible to detach the pushbutton modules from the rest of the panel, or even duplicate them. In this way, children or people with reduced mobility can call the apartment without any problem. The built-in prompt messages, in multiple languages, inform the visitor of the different status of the panel, and are specially helpful to people with impaired vision.

Indicator lights, located on the acrylic crossbar, help people with hearing impairments to know when to start to speak or to know when they can push the door. To enhance the experience for users with hearing aids, Supra has a inductive loop amplifier (ILA).

We are at the forefront
of technology and innovation

Supra features technological advances that make programming the system easier, such as the automatic codification of the calling address of the pushbuttons by simply connecting the modules.

Two programming modes: basic, with the help of the pushbuttons and the indicators lights, and advanced, which thanks to the integrated Wi-Fi module, allows you to manage all the parameters of the panel from a smartphone, tablet or computer.

The 2Mpx HD camera with 150º optics that incorporated in the module has a digital zoom of ten quadrants. If during the installation of the panel, the full-screen image captured by the camera shows non desired areas, it will be possible to select and fix the image in any of the available sections.
