Deputy Chief Minister 1 Penang

DATUK DR. MOHAMAD BIN ABDUL HAMID

Assalamu'alaikum Warahmatullahi Wabarakatuh and warm greetings,

All praise be to Allah SWT for granting us the opportunity to gather today for iRiseCon 2026 – a program that serves as an important platform for the exchange of knowledge, experiences, and innovations in the fields of science, technology, education, and entrepreneurship.

Guided by the theme "Inspiring Innovation, Connecting Continents," iRiseCon 2026 serves as a distinguished platform for academics, researchers, and practitioners worldwide to exchange knowledge, present groundbreaking work, and explore collaborative pathways that advance global progress in research, innovation, sustainability, and education.

I would like to express my deepest appreciation to all parties who have worked tirelessly to ensure the success of this program, including the organizing committee, sponsors, speakers, and all participants present.

This program has been carefully designed with a variety of interactive and informative sessions including providing opportunities for the exchange of ideas and continuous learning. I hope that all participants will make the most of this platform to expand their knowledge, forge new connections, and draw inspiration for their professional journeys.

In conclusion, I warmly welcome all participants and sincerely hope that iRiseCon 2026 will be a highly rewarding and meaningful experience for everyone. May the program run smoothly and achieve its intended goals.

Thank you.

Datuk Dr. Mohamad bin Abdul Hamid
Deputy Chief Minister 1
Penang

FOREWORD
Rector of Universitas Syiah Kuala

PROF. MIRZA TABRANI, S.E., M.B.A., D.B.A.

Assalamualaikum warahmatullahi wabarakatuh, and warm greetings to all,

All praise be to Allah SWT for His blessings, which have allowed us to gather here today at iRiseCon 2026. It is truly a pleasure to welcome all of you to this forum. This conference is not only about sharing research or academic ideas, but also about coming together, learning from one another, and building connections that go beyond disciplines. We hope this space brings inspiration, fresh perspectives, and meaningful exchanges across science, technology, education, and entrepreneurship.

With the theme "Inspiring Innovation, Connecting Continents," iRiseCon 2026 brings together scholars, researchers, practitioners, and students from diverse backgrounds. It is this diversity that makes our discussions richer and more relevant, especially as we strive to address today's global challenges in research, sustainability, education, and technological development.

More than anything, we hope this conference becomes a platform where conversations flow openly, ideas flourish, and collaborations begin. While the presentations and discussions are important, it is the relationships we build and the perspectives we gain that often leave the most lasting impact.

I would like to express my sincere appreciation to the organizing committee, our partners and sponsors, our keynote speakers, presenters, and all participants. Your support and dedication are what made this event possible, and we are truly grateful to have you here.

Throughout the conference, you will take part in keynote sessions, presentations, panel discussions, and workshops. We encourage you to actively engage, ask questions, share your thoughts, and make the most of this opportunity - not only to learn, but also to connect and grow together.

As we begin iRiseCon 2026, I warmly welcome you all and hope that your experience here will be both enjoyable and enriching. May this conference leave you with new ideas, meaningful connections, and lasting inspiration.

Thank you.

Wassalamualaikum warahmatullahi wabarakatuh.

DR. SHAHIZA BINTI AHMAD ZAINUDDIN

Assalamualaikum warahmatullahi wabarakatuh and warm greetings,

It is with great pleasure and gratitude that I welcome you to iRiseCon 2026. We are truly thankful to Allah SWT for granting us this valuable opportunity to come together in the spirit of knowledge sharing, collaboration, and innovation.

This conference reflects our aspiration to create meaningful connections across disciplines, industries, and nations. iRiseCon 2026 gathers distinguished scholars, researchers, practitioners, and students from diverse backgrounds to exchange ideas, showcase research findings, and explore transformative solutions that address global challenges in research, sustainability, education, and technological advancement.

We are honored that Politeknik Seberang Perai serves as the host institution for this international gathering in Penang, Malaysia. As a forward-looking TVET institution committed to academic excellence and industry engagement, Politeknik Seberang Perai continuously strives to cultivate innovation-driven learning environments and impactful research collaborations. We believe this conference will further strengthen our role as a catalyst for regional and global academic networking.

I would like to record my sincere appreciation to the organizing committee, strategic partners, sponsors, keynote speakers, presenters, and all participants whose dedication and support have been instrumental in bringing this event to fruition. Your presence signifies a shared commitment to advancing knowledge and fostering sustainable professional growth.

The program has been thoughtfully structured to include keynote sessions, research presentations, panel discussions, and interactive workshops. These platforms are designed not only to disseminate knowledge but also to encourage dialogue, inspire fresh perspectives, and initiate long-term collaborations. I encourage all participants to actively engage, exchange insights, and seize the opportunity to expand both intellectual horizons and professional networks.

May iRiseCon 2026 serve as a meaningful milestone in your academic and professional journey. I wish you a productive conference filled with fruitful discussions and lasting connections.

Dr. Shahiza binti Ahmad Zainuddin
Director
Centre of Research and Innovation
Department of Polytechnic and Community College Education
Ministry of Higher Education

Acknowledgement

The iRiseCon 2026 Organising Committee would like to extend our deepest appreciation and heartfelt gratitude to all parties who have contributed and been involved in **iRiseCon 2026 International Conference on Research, Innovation, Sustainability & Education**.

iRiseCon 2026 | International Conference on Research, Innovation, Sustainability & Education

Our deepest appreciation and sincere gratitude are extended to the **Department of Polytechnic and Community College Education (JPPKK), Universitas Syiah Kuala, Universitas Muhammadiyah Aceh, Politeknik Negeri Lhokseumawe, Sekolah Tinggi Iskandar Thani and Karamanoğlu Mehmetbey University** for their continuous collaboration, unwavering support, and significant contributions towards the successful implementation of this program.

Your invaluable contributions, support, and cooperation will be deeply appreciated and fondly remembered. May the Almighty bless and reward your generosity and goodwill. Thank you.

ABOUT iRiseCon 2026

International Conference on Research, Innovation, Sustainability & Education (iRiseCon) 2026

Date : 18–19 April 2026
Venue : Politeknik Seberang Perai, Malaysia
Theme : Inspiring Innovation, Connecting Continents

iRiseCon 2026 is an international conference strategically organized in collaboration with institutions from Malaysia, Indonesia, and Türkiye, welcoming participants from all over the world. The conference provides a platform for **research, innovation, sustainability, and education, while fostering knowledge exchange and global collaboration**. With its **hybrid format**, iRiseCon 2026 allows participants to join physically or virtually, ensuring inclusive engagement and wide accessibility.

This conference is organized in collaboration with the following institutions:

- Indonesia (Banda Aceh): **Universitas Syiah Kuala, Universitas Muhammadiyah Aceh, Politeknik Negeri Lhokseumawe, Sekolah Tinggi Iskandar Thani**
- Malaysia: **Politeknik Seberang Perai, Politeknik Balik Pulau**
- Türkiye: **Karamanoğlu Mehmetbey University**

Accepted papers will be published through selected publication channels, including **Atlantis Press (Springer Nature)**, **Scopus-indexed publications**, **Scientific.net (Trans Tech Publications)**, **Politeknik & Kolej Komuniti Journal of Engineering and Technology (PMJET)**, **Politeknik & Kolej Komuniti Journal of Social Sciences and Humanities (PMJSSH)**, **Politeknik & Kolej Komuniti Journal of Life Long Learning (PKKJLLL)**, and the **iRiseCon e-Proceeding**, subject to the respective publication requirements and review processes.

iRiseCon 2026 offers participants a unique opportunity to connect with leading experts, share innovative ideas, and foster international collaborations. Whether you are a seasoned researcher or an emerging scholar, this conference provides a global stage to showcase your work, gain recognition, and make a lasting impact.

Curriculum Implementation and Learning Support Resources in Kolej Komuniti Paya Besar: An Empirical Analysis of Course Outcomes, Pedagogy and Assessment Practices

Rospi Mat Husin[1, a*], Azli Bin Omar[1, b], Mohd Johanas Rahim[1, c] [1]Kolej Komuniti Paya Besar, Kuantan, Pahang Malaysia

[a*]rospi@kkpbe.edu.my, [b]azli@kkpbe.edu.my, [c]mohdjohanas@gmail.com

Abstract. Effective curriculum implementation depends on clear outcome communication, coherent pedagogy, transparent assessment, and adequate learning support. Although these dimensions are widely discussed in higher education research, evidence from Malaysian community colleges remains limited, particularly in studies that examine them together within a Technical and Vocational Education and Training (TVET) setting. This study investigates students' perceptions of curriculum implementation and learning support resources at Kolej Komuniti Paya Besar (KKPB), with emphasis on course learning outcomes, course structure, teaching delivery, assessment practices, Student Learning Time (SLT), and access to learning resources. A quantitative cross-sectional survey was administered to 155 Semester 3 students and students undergoing industrial training using a voluntary-response convenience sampling approach. Descriptive statistics were used to establish an institutional baseline, while Cronbach's alpha, Pearson correlation, independent-samples t-tests, and one-way ANOVA were employed as supplementary analyses to strengthen methodological rigor. The instrument demonstrated excellent internal consistency (overall $\alpha = 0.985$; construct $\alpha = 0.931–0.957$). The findings indicate very positive perceptions of curriculum clarity, lecturer competency, syllabus completion, assessment transparency and SLT adequacy. All major constructs were positively and significantly correlated ($p < .001$), indicating a coherent curriculum experience. At the same time, learning resources were comparatively less positive than other domains ($M = 1.72$, $SD = 0.60$), with Wi-Fi access emerging as the least favorable item ($M = 1.81$). The study contributes context-specific evidence from an underrepresented Malaysian community college environment and extends TVET quality assurance discussions by combining descriptive perception data with reliability and inferential evidence. These findings can support curriculum review, digital resource planning, and evidence-based improvement initiatives in community college education.

Keywords: curriculum implementation, TVET, Malaysian community college, constructive alignment, student perception, quality assurance

Introduction. Curriculum implementation is the operational mechanism through which educational intentions are translated into actual teaching practice and student learning experiences. Within higher education institutions, curriculum design establishes intended learning outcomes, while implementation determines whether those outcomes are effectively achieved through instructional delivery, assessment practices, and institutional support systems. Effective curriculum implementation has been consistently associated with improved student learning performance and institutional quality enhancement [1].

In community colleges, curriculum implementation carries additional significance due to the applied and vocational orientation of programmes. These institutions aim to equip students with both theoretical knowledge and practical competencies aligned with workforce demands. Research indicates that structured curriculum delivery and coherent outcome alignment are essential in vocational education contexts to ensure employability and skill acquisition. Misalignment between intended outcomes, instructional strategies, and assessment tasks may lead to fragmented learning and reduced academic engagement [2].

Malaysian higher education institutions operate within an Outcome Based Education (OBE) framework that emphasises measurable Course Learning Outcomes (CLO), transparent course planning, and continuous quality improvement mechanisms. The principle of constructive alignment asserts that successful learning transpires when planned objectives, instructional activities, and assessment tasks are consistently coordinated [3]. Empirical studies demonstrate that students who perceive alignment between learning objectives and assessment methods report higher satisfaction and stronger academic motivation [4].

Furthermore, student perception has emerged as a critical indicator of curriculum effectiveness in higher education research. Perception-based evaluations provide insight into instructional clarity, fairness of assessment practices, and adequacy of learning support systems [5]. Although perception data do not directly measure learning outcomes, they are strongly correlated with student engagement and retention rates.

The rapid digital transformation of higher education has further expanded the dimensions of curriculum implementation. Institutions are increasingly required to integrate digital learning ecosystems, blended instructional strategies, and online resource accessibility to support flexible and independent learning [6] Research suggests that effective digital integration enhances self-regulated learning and academic adaptability, particularly in post-pandemic educational environments [7].

Despite national policy emphasis on quality assurance and curriculum coherence, empirical investigations examining students' perceptions of curriculum implementation within Malaysian community colleges remain limited. Most existing studies focus on universities rather than vocationally oriented institutions, creating a research gap in community college contexts. Addressing this gap is essential to ensure that curriculum reforms translate effectively into student learning experiences.

Therefore, this study aims to examine students' perceptions of curriculum implementation and learning support resources within a Malaysian community college. Specifically, the research seeks to:

1. Analyse students' perceptions of CLO clarity and course structure.
2. Evaluate teaching and learning implementation effectiveness.
3. Assess the transparency and alignment of assessment practices.
4. Examine the adequacy of learning support resources and Student Learning Time (SLT) allocation.

By providing empirical evidence grounded in student perceptions, this study contributes to curriculum quality assurance discourse and supports evidence-based improvement initiatives in community college education.

Literature Review. Constructive alignment theory explains that effective learning occurs when intended learning outcomes, teaching activities, and assessment tasks are intentionally aligned. When that alignment is visible to students, they are more likely to understand expectations, engage more deeply in learning tasks, and report stronger academic confidence. In TVET and community college contexts, this principle is especially important because programmes are expected to produce both conceptual understanding and practical competence. As a result, curriculum implementation cannot be evaluated only by policy documents; it must also be examined through students lived academic experience.

Clear articulation of Course Learning Outcomes (CLO) and transparent course outlines help students understand what they are expected to learn, how learning will be assessed, and how coursework is sequenced across the semester. Prior studies show that clarity in outcomes, rubrics, and course structure improves self-regulated learning, confidence, and perceived fairness. In outcome-based systems, such clarity also functions as a quality assurance mechanism because it reduces ambiguity between curriculum intent and classroom practice [8].

Teaching effectiveness remains central to curriculum implementation. Active learning, supportive lecturer-student interaction, and timely feedback can improve motivation, participation, and persistence, particularly in applied learning environments. In community colleges, these factors are not peripheral. They are part of the delivery system through which students connect theory with practice. Positive perceptions of teaching therefore provide useful evidence about whether curriculum intentions are being translated into meaningful learning experiences [9].

Assessment transparency is equally significant. When students understand grading criteria, task expectations, and the relationship between assessment and learning outcomes, they are more likely to perceive evaluation as fair and credible. In TVET, the balance between psychomotor, cognitive, and affective domains must also be made explicit because students need to recognize why practical competence carries substantial weight in their overall achievement. Assessment design is therefore both a measurement issue and a communication issue [10].

Learning support resources, including library materials, online platforms, and digital tools, shape how effectively students can sustain learning beyond face-to-face instruction. Recent studies indicate that digital ecosystems support flexibility, self-regulation, and academic continuity when they are meaningfully integrated into pedagogy. This is particularly relevant in post-pandemic higher education, where students increasingly expect learning support to remain accessible across physical and virtual environments [11].

Student Learning Time (SLT) provides an additional lens for evaluating curriculum implementation because it reflects the realism of workload planning. When SLT is clearly communicated and balanced with course requirements, students are better able to manage time and complete assessment tasks without unnecessary stress. For this reason, the present study does not treat curriculum clarity, teaching, assessment, support resources, and SLT as isolated variables. Instead, it considers them as interconnected dimensions of implementation quality within a single community college setting [12].

Group-based comparisons provided several additional insights. Independent samples t-tests showed that Semester 3 students reported significantly more favorable perceptions than students undergoing industrial training for Curriculum Clarity ($M = 1.39$ versus 1.63, $p = 0.031$) and Course Outline ($M = 1.41$ versus 1.68, $p = 0.027$). One-way ANOVA also indicated significant programme-based differences in Student Learning Time, $F = 4.16$, $p = 0.017$, and Learning Resources, $F = 3.14$, $p = 0.046$. In practical terms, students from the Creative Multimedia programme expressed more favorable views on SLT and learning resources than students from Information Technology, which may reflect differences in resource use patterns or expectations across programmes. No statistically significant differences were observed by gender across the six constructs.

a) Curriculum Clarity (CLO and CO)
b) Teaching Effectiveness (PdP)
c) Assessment Transparency
d) Learning Support Resources
e) Student Learning Time (SLT)

The originality of this study lies in its context-specific and integrated focus. While perception-based studies are common in higher education, fewer studies examine curriculum clarity, teaching practices, assessment transparency, learning support resources, and SLT together within a Malaysian community college operating under the OBE framework. The study therefore contributes empirical evidence to an underrepresented TVET context and provides a practical baseline for institutional quality assurance and curriculum improvement [13].

Methodology. This study adopted a quantitative cross-sectional survey design to capture students' perceptions of curriculum implementation at a single point in time. The design was appropriate because the study sought to provide a broad institutional snapshot across several curriculum dimensions rather than examine change over time. The respondents comprised 155 students from Semester 3 and industrial training cohorts at Kolej Komuniti Paya Besar. A voluntary-response convenience sampling technique was used because participation depended on students' willingness and ability to complete the Google Forms questionnaire during the data collection period. Although this approach limits generalizability beyond the institution, it is suitable for exploratory institutional evaluation and for establishing an empirical baseline for curriculum quality improvement.

The structured questionnaire comprised seven sections. Section A collected demographic information, while Sections B to G examined the main curriculum dimensions investigated in this study:

a) Section B: Course Learning Outcomes (CLO)
b) Section C: Course Outline (CO)
c) Section D: Continuous Assessment and Final Examination
d) Section E: Teaching and Learning Implementation (PdP)
e) Section F: Student Learning Time (SLT)
f) Section G: Reference Books / Website

Each section contained items measured on a five-point Likert scale ranging from Strongly Agree to Strongly Disagree. Table 1 presents the scale structure used to interpret responses. Because the objective of this conference paper was exploratory rather than predictive, the analysis focused on descriptive statistics. Frequencies and percentages were used to summarise the response distribution for each item, while means and standard deviations were used to indicate the overall tendency and consistency of students' perceptions. This approach was considered suitable for establishing a baseline institutional picture before more advanced scale validation and inferential modelling are undertaken in a future expanded study.

Table 1: Five-point Likert scale structure

Scale	Category	Description
1	Strongly Agree	Reflects a very strong level of agreement.
2	Agree	Indicates agreement with the statement.
3	Satisfactory	Represents a neutral or moderately acceptable position.
4	Disagree	Indicates disagreement with the statement.
5	Strongly Disagree	Reflects a very strong level of disagreement.

Data were gathered through Google Forms. Participation was voluntary, and respondents were not required to disclose personal identifiers, thereby preserving anonymity. The data were analysed using IBM SPSS Statistics. Descriptive statistics, namely frequencies, percentages, means, and standard deviations, were used as the primary analytical technique because the main objective of the study was to map the pattern and level of student perceptions across curriculum dimensions. To strengthen methodological rigor, additional analyses were conducted. Internal consistency reliability was examined using Cronbach's alpha for each construct and for the full instrument. Pearson correlation analysis was used to examine the relationships among Curriculum Clarity, Course Outline, Assessment, Teaching Practices, Student Learning Time, and Learning Resources. Independent-samples t-tests were performed to compare perceptions by academic status, while one-way ANOVA was used to examine selected differences across programmes. These supplementary analyses were intended to support interpretation of the descriptive findings rather than replace the baseline evaluative purpose of the study.

Table 2 presents the interpretation framework for mean scores derived from the five-point Likert scale. Mean values between 1.00 and 1.80 indicate a Very High level of agreement, whereas values between 4.21 and 5.00 indicate a Very Low level of agreement. This classification facilitates consistent interpretation of the descriptive findings by converting numerical means into meaningful categories that can be used in curriculum quality evaluation.[14]

Table 2: Average score interpretation (five points).

Mean Score Range	Interpretation
1.00 – 1.80	Very High
1.81 – 2.60	High
2.61 – 3.40	Moderate
3.41 – 4.20	Low
4.21 – 5.00	Very Low

To represent the technical and multidisciplinary environment of the community college, respondents were drawn from several academic programmes at KKPB. As illustrated in Figure 1, the sample included students from Engineering (SKE), Information Technology (STM), and Creative Multimedia (SMP). This distribution allowed the study to capture perceptions across programmes with different technical emphases while remaining within the same institutional curriculum system.

a) Engineering (SKE) - focuses on technical competencies through laboratory work, practical training, and applied engineering tasks.
b) Information Technology (STM) - emphasises computational knowledge, digital systems, and analytical problem-solving in technological contexts.
c) Creative Multimedia (SMP) - combines technical applications with digital creativity, multimedia development, and design-based learning.

The involvement of students from SKE, STM, and SMP strengthened the descriptive coverage of the study by allowing curriculum implementation to be viewed across different TVET-oriented learning environments. Although the sample was limited to one institution, the inclusion of multiple programmes improved the internal breadth of the analysis.

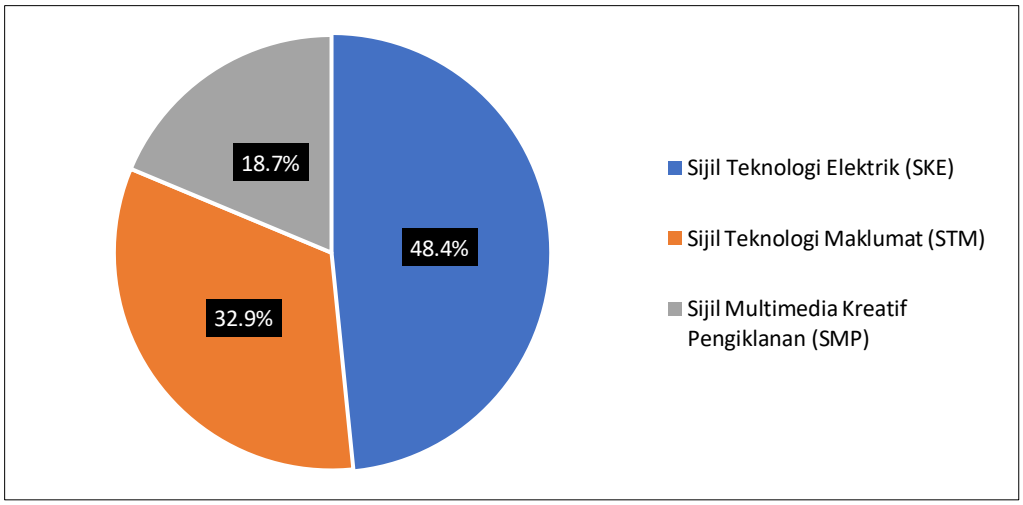

Figure 1: Respondents by academic programme.

Figure 2 presents the distribution of respondents based on their current academic status. Among the 155 participants, 80% were students undergoing industrial training, while 20% were current Semester 3 students. The inclusion of both groups offered perspectives from students who were still engaged in formal coursework and those who were already applying programme learning in workplace settings. This strengthened the practical relevance of the findings for TVET curriculum review.

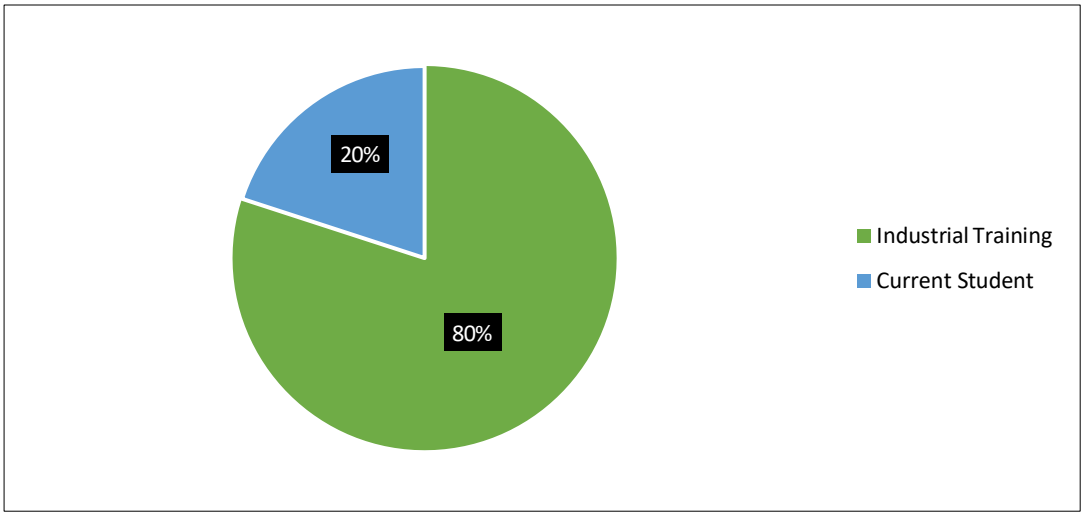

Figure 2: Distribution of respondents by current academic status

Results and Discussion. This section presents the descriptive findings on students' perceptions of curriculum implementation at Kolej Komuniti Paya Besar. The discussion moves beyond simple description by relating the findings to prior literature and by incorporating supplementary reliability and inferential evidence derived from the raw dataset. Together, these analyses provide a more rigorous interpretation of how students experience curriculum clarity, teaching practices, assessment transparency, Student Learning Time, and learning support resources within the community college setting.

Before examining individual items, the psychometric quality of the instrument was assessed. The 30 perception items demonstrated excellent internal consistency, with an overall Cronbach's alpha of 0.985. At the construct level, alpha coefficients ranged from 0.931 to 0.957, indicating that all domains were measured with high internal reliability. These results strengthen confidence that the questionnaire captured coherent dimensions of curriculum implementation and learning support.

Table 6: Construct reliability and descriptive summary statistics

Construct	Number of items	Mean ± SD	Cronbach's alpha
Curriculum Clarity (CLO)	5	1.58 ± 0.57	0.931
Course Outline (CO)	5	1.63 ± 0.56	0.943
Assessment Transparency	5	1.62 ± 0.56	0.945
Teaching Practices (PdP)	5	1.56 ± 0.55	0.957
Student Learning Time (SLT)	5	1.62 ± 0.55	0.944
Learning Resources	5	1.72 ± 0.60	0.931

Supplementary inferential analysis also revealed strong positive relationships among the major constructs. For example, Curriculum Clarity was strongly associated with Course Outline, $r = 0.851$, $p < .001$, while Course Outline was strongly associated with Assessment Transparency, $r = 0.925$, $p < .001$. Teaching Practices was also strongly related to Student Learning Time, $r = 0.899$, $p < .001$, and Student Learning Time was positively related to Learning Resources, $r = 0.874$, $p < .001$. These results suggest that students do not interpret curriculum elements in isolation; rather, clearer course structures and stronger teaching practices appear to coincide with more positive perceptions of assessment and learning support.

Students' Perceptions of Curriculum Clarity. Figure 3 shows students' perceptions of their ability to master the competencies stated in the Course Learning Outcomes (CLO) by the end of the teaching and learning process. A large majority expressed positive views, with 49.0% strongly agreeing and 43.9% agreeing that they were able to achieve the CLO competencies. Another 7.1% selected Satisfactory, while no respondents reported disagreement. This pattern suggests that students generally recognised a clear relationship between curriculum delivery and the competencies expected of them. The finding is consistent with prior work showing that visible alignment between outcomes, teaching, and assessment improves students' sense of direction and academic confidence [9].

At the same time, the presence of a satisfactory group should not be overlooked. Although numerically small, this segment indicates that a minority of students may still require clearer reinforcement of CLO meaning, examples of expected performance, or stronger linkage between classroom activities and stated outcomes. In a TVET setting, where students are expected to demonstrate applied competencies, even a modest level of uncertainty can affect motivation and performance. The result therefore supports the view that curriculum clarity at KKPB is strong overall, but it also points to the value of repeating CLO explanations at key stages of the semester rather than only at course commencement.

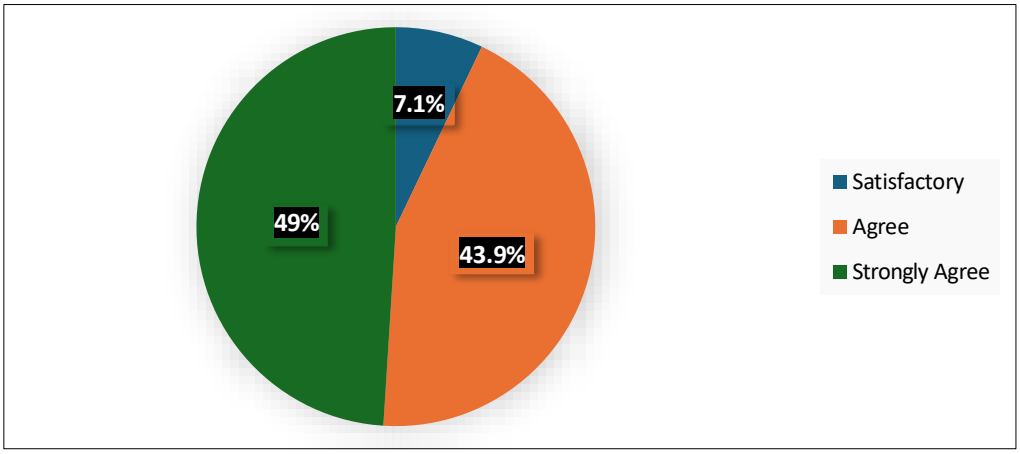

Figure 3: Students perceived mastery of CLO competencies

Table 3 presents students' perceptions of whether the curriculum prepares them for future employment. Most respondents responded positively, with 52.3% (n = 81) selecting Strongly Agree and 41.3% (n = 64) selecting Agree. Only 6.4% (n = 10) selected Satisfactory, and no respondents selected Disagree or Strongly Disagree. The mean score of 1.54 (SD = 0.62) indicates a Very High level of agreement. This finding is meaningful in a community college context because employability relevance is a core expectation of TVET curricula. Students appear to perceive the programme not only as academically organised but also as practically oriented toward workplace readiness.

This result also strengthens the originality claim of the study. Rather than merely showing that students are satisfied with teaching, the paper demonstrates that curriculum alignment is perceived as employment-relevant within a Malaysian community college. That point adds value to the TVET literature, which often emphasises skills alignment but less frequently documents students' institutional perceptions at the sub-degree college level. Still, the satisfactory responses suggest room for improvement in making career pathways, industry relevance, and skill transfer more explicit across courses.

Table 3: Students' perceptions of curriculum preparedness for employment

Score	Category	Percentage [%]	Frequency	Mean	SD
1	Strongly Agree	52.3	81		
2	Agree	41.3	64		
3	Satisfactory	6.4	10		
4	Disagree	0	0		
5	Strongly Disagree	0	0		
	Total	100	155	1.54	0.62

Assessment Transparency. Figure 4 shows students' perceptions of the assessment structure, in which 70% emphasises psychomotor skills and 30% covers cognitive and affective domains during teaching and learning. Most respondents viewed this distribution positively, with 48.4% selecting Agree and 43.9% selecting Strongly Agree, while 7.7% selected Satisfactory. No respondents expressed disagreement. The result suggests that students generally accept the weighting as appropriate for technical programmes, where practical competence is central to learning and employability.

The finding is consistent with the literature on constructive alignment and transparent assessment, which emphasises that students respond more positively when assessment design reflects the actual competencies expected in the programme [12]. The satisfactory responses, however, indicate that some students may still need clearer explanation of why psychomotor assessment carries greater weight and how cognitive and affective dimensions are embedded within practical tasks. This implies that assessment transparency should involve not only grading disclosure, but also explicit communication of the pedagogical rationale behind the assessment structure.

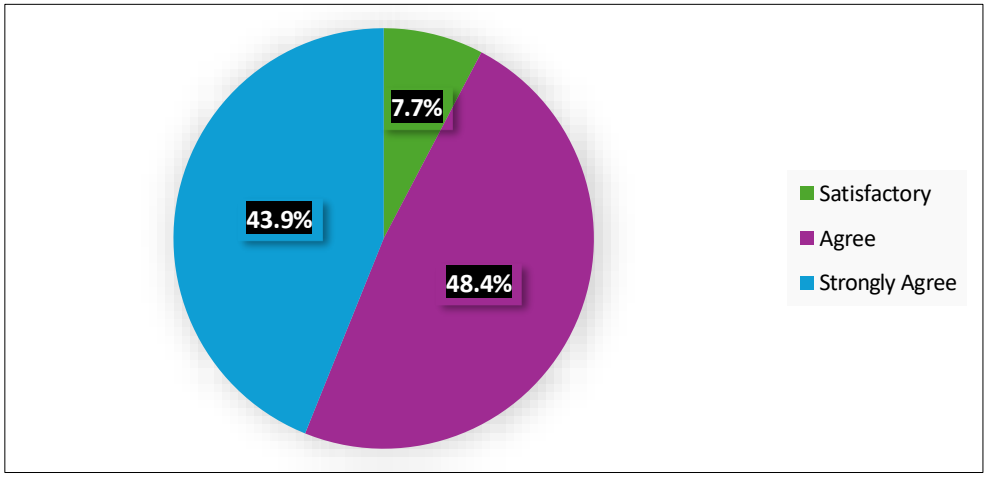

Figure 4: Students' perceptions of the psychomotor based assessment ratio

Teaching Practices. Figure 5 presents students' perceptions of lecturers' competency and knowledge throughout the 14-week teaching and learning process. Most respondents reported favorable views, with 47.1% selecting Agree and 46.5% selecting Strongly Agree. Another 6.4% selected Satisfactory, and none selected disagreement categories. These findings suggest that lecturers are generally perceived as knowledgeable and capable of supporting effective learning. This pattern aligns with previous studies showing that lecturer competency, active engagement, and feedback practice are important drivers of student confidence and academic participation [11].

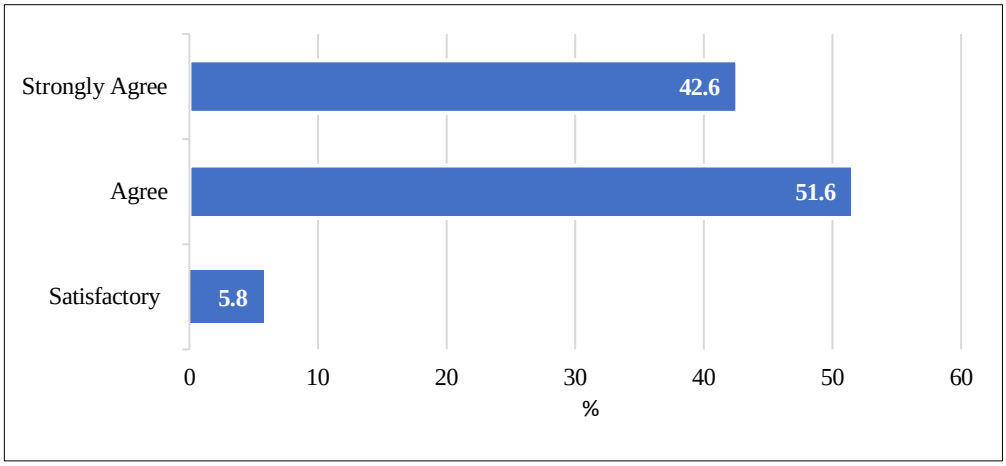

Figure 5: Students' perceptions of lecturers' competency in teaching

Table 4 presents students' perceptions of lecturers' ability to complete the syllabus within the allocated teaching time. Most respondents expressed positive agreement, with 51.0% (n = 79) selecting Strongly Agree and 43.9% (n = 68) selecting Agree. Only 5.1% (n = 8) selected Satisfactory, while none selected negative responses. The mean score of 1.54 (SD = 0.59) again indicates a Very High level of agreement. This suggests that students perceive time management in teaching as effective and that the planned syllabus is generally achievable within the academic schedule.

Taken together, the results in Figure 5 and Table 4 indicate that teaching effectiveness at KKPB is not limited to lecturer knowledge alone. Students also appear to perceive that lecturers can organise content delivery efficiently within a fixed semester structure. This is important because curriculum quality depends not only on what is taught, but also on whether the curriculum can be delivered in a manageable and coherent sequence. The small satisfactory group nevertheless signals that monitoring pacing across different courses remains worthwhile, especially in programmes with dense practical content.

Table 4: Students' perceptions of syllabus completion within the allocated time

Score	Category	Percentage [%]	Frequency	Mean	SD
1	Strongly Agree	51.0	79		
2	Agree	43.9	68		
3	Satisfactory	5.1	8		
4	Disagree	0	0		
5	Strongly Disagree	0	0		
	Total	100	155	1.54	0.59

Student Learning Time (SLT). Students' perceptions of the adequacy of time allocated for independent learning under the Student Learning Time (SLT) framework were generally positive. Most respondents expressed positive agreement, with 51.6% selecting Agree and 42.6% selecting Strongly Agree. A smaller proportion, 5.8%, selected Satisfactory, while none selected disagreement. This suggests that students generally perceive the planned SLT as sufficient to support mastery of the course syllabus. The finding is in line with previous studies indicating that realistic workload allocation contributes to academic satisfaction and time management [14].

Table 5 shows students' perceptions of lecturers' explanations of Continuous Assessment (PB) requirements and the associated SLT expectations. The results are strongly positive, with 48.4% (n = 75) selecting Strongly Agree and 46.5% (n = 72) selecting Agree. A further 5.1% (n = 8) selected Satisfactory, while no respondents selected negative categories. The overall mean score of 1.57 (SD = 0.59) indicates a Very High level of agreement. This suggests that lecturers generally communicate assessment expectations clearly, which is essential for trust, fairness, and effective workload planning.

Even so, this section also highlights the main improvement area emerging from the study. Positive perceptions of SLT and assessment explanation do not necessarily mean that all aspects of independent learning support are equally strong. The learning resources construct recorded the least favorable overall mean among the six domains (M = 1.72, SD = 0.60), although the interpretation level remained high. At the item level, Wi-Fi efficiency and access recorded the highest mean score in the instrument (M = 1.81), followed by the availability of reference books and scholarly materials in the library (M = 1.74). These comparatively weaker responses are important because they point to a subtle but meaningful gap between pedagogical quality and the infrastructure required to sustain self-directed learning. In other words, students generally trust the curriculum and the lecturers, but digital and resource support may not yet be equally strong for all learners. This finding aligns with recent discussions on digital learning ecosystems, which emphasizes that curriculum quality in contemporary TVET settings depends not only on aligned teaching and assessment, but also on reliable access to digital and physical learning resources.

Table 5: Students' perceptions of PB and SLT explanation

Score	Category	Percentage [%]	Frequency	Mean	SD
1	Strongly Agree	48.4	75		
2	Agree	46.5	72		
3	Satisfactory	5.1	8		
4	Disagree	0	0		
5	Strongly Disagree	0	0		
	Total	100	155	1.57	0.59

Conclusion and Future Research. This study examined students' perceptions of curriculum implementation and learning support resources at Kolej Komuniti Paya Besar within the Outcome-Based Education framework. The findings indicate very positive perceptions across curriculum clarity, teaching effectiveness, assessment transparency, Student Learning Time, and learning resources. Course Learning Outcomes and course structures were generally understood, teaching practices were viewed as supportive and well managed, and assessment procedures were perceived as transparent and aligned with programme expectations. The supplementary analyses strengthened these conclusions by showing excellent instrument reliability (overall α = 0.985) and significant positive correlations across the major curriculum constructs. Taken together, these results support the view that students experience curriculum implementation at KKPB as a coherent and mutually reinforcing educational system rather than as separate administrative components.

The paper also identifies several implications and limitations. A small proportion of satisfactory responses across multiple items suggest that some students may still need clearer reinforcement of CLO expectations, assessment rationale, and independent learning guidance. The comparatively less positive ratings for learning resources, especially Wi-Fi access and reference availability, indicate that institutional support for flexible learning can still be improved. From an analytical perspective, the present study was conducted at a single community college and relied primarily on self-reported perceptions, which limits broader generalization. Future research should involve multiple community colleges, consider longitudinal or mixed-method designs, and expand the analytical model to include confirmatory factor analysis or regression-based examination of how curriculum constructs jointly predict student satisfaction, engagement, or readiness for employment.

Abstract: The integration of Artificial Intelligence (AI) into Technical and Vocational Education and Training (TVET) has introduced innovative approaches to teaching and learning. Emerging AI systems now function as virtual mentors, providing guidance, feedback and personalized learning paths for students. While AI mentoring promises efficiency and individualized support, understanding students' perceptions is critical to evaluating its effectiveness, engagement and impact on skill development. This study explores how polytechnic students perceive learning from AI mentors, focusing on their experiences, challenges and perceived benefits. A mixed-method approach was employed, combining surveys and semi-structured interviews across multiple polytechnic institutions. Preliminary findings indicate that students appreciate the personalized feedback, instant guidance and adaptive learning paths offered by AI mentors. However, concerns were raised about the lack of human interaction, limited emotional support and potential over-reliance on AI, which may affect critical thinking, collaboration, and problem-solving skills. The study highlights the need for balanced pedagogical strategies, combining AI mentoring with human-led instruction to ensure comprehensive skill development. Insights from students provide guidance for educators and institutional leaders to integrate AI systems effectively while maintaining interpersonal, cognitive and social aspects of learning. In conclusion, exploring the role of AI as a mentor in TVET education offers a valuable understanding of how technological innovation can enhance learning while preserving the human-centered competencies essential for workforce readiness.

Keywords: Artificial intelligence (AI) Mentors, AI-Assisted Learning, Polytechnic Students, TVET Education, Personalized Learning

Introduction

The Paradigm Shift in TVET Pedagogy

The contemporary educational environment is now drifting in the stormy waters of the Fourth Industrial Revolution (IR 4.0) when the introduction of Artificial Intelligence (AI) is not a far-off possibility but an essential package. In the context of the Technical and Vocational Education and Training (TVET) industry, AI Mentor is a new creation that has emerged as a result of this technological infiltration. Conventionally, TVET has been characterized by the Master-Apprentice relationship, a high-touch and socio-cultural interaction in which skills are shared by means of observation, imitation and direct feedback [1]. Nevertheless, due to the growing populations of students enrolled in colleges and universities, as well as with the growing complexity of technical classroom programs, the traditional model of apprenticeship becomes fundamentally

challenged by the emergence of AI mentors, which can be ascribed to the Large Language Models (LLMs), Generative AI and Intelligent Tutoring Systems (ITS). These systems are also structured to offer cognitive scaffolding which is an element to Vygotsky's developmental theory that enables students to undertake activities that are just within their own reach. Moreover, the AI mentor would be a 24/7 digital mentor that would diagnose mistakes in the code live, simulate mechanical failures to practice diagnostic skills, or provide reference to architectural designs [2].

The AI Apprentice model, in turn, deals with democratizing personal learning. A traditional classroom learning experience is such that a single lecturer will have a hard time attempting to offer individualized, granular attention to thirty or forty students at once. AI alleviates it by providing Adaptive Learning Paths, in which the challenge and speed with which the content is delivered adjusts according to the personal metrics of performance in the learner [3]. This paper aims to investigate the meeting point of this "high-tech" intervention and needs of vocational mastery that are high touch. Using the case of the perceptions of polytechnic students, we would like to reveal whether the efficiency of the algorithmic guidance is capable of capturing the nature of the professional mentorship or it is simply a sophisticated version of automated lessons.

Problem Statement

The Crisis of Human-Centric Mastery

Although the implementation of AI in TVET is likely to bring unprecedented efficiency and data-driven accuracy, it brings about an existent ontological crisis of the concept of mentorship. The main issue is that it may result in the loss of the Human Element in vocational training. TVET is not only the learning of technical facts but also the development of Phronesis (practical wisdom) and professional identity. AI, which is controlled by mathematical probability and pattern recognition suffers from the Affective Domain, the capacity to give empathy, moral support and moral subtleties. Failure in a student at a complex technical task attracts context-aware motivation by a human mentor which considers the psychological conditions of the student; an AI, in turn, offers a cold optimization path [4].

Another major issue is Cognitive Atrophy and over-reliance. In case students view AI mentors as oracles of ultimate truth, they will be in danger of stopping applying critical thinking on their own. It is in technical areas where deep learning takes place in the struggle to find a solution to a problem. When an AI mentor solves the problem too easily, the student will not internalize the process but produce the output. The Socio-Collaborative Deficit threatens workforce readiness because it results in a vicious circle of Dependency [5].

Additionally, the Socio-Collaborative Deficit is a risk to workforce preparedness. Teamwork, conflict resolution and social intelligence have always been on the list of essential competencies of TVET graduates, as per the industry leaders. The nature of the "AI Apprentice" model is one that promotes a human to machine interaction which is solitary. Finally, the concept of digital mentor as a central force in providing guidance can lead to the erosion of traditional social constructions of peer-to-peer and student-to-teacher relationships, which is the basis of professional socialization [6].

Lastly, the issue of Black Box Problem in AI feedback creates problems with pedagogical transparency. Students can end up obeying AI recommendations without comprehension of the logic behind them and thus become superficially mastered in a way that does not work when the parameters of a task shift in a minor way [7]. Thus, the given study responds to the acute necessity to assess these perceptions prior to the AI mentorship transforming into a standardized but possibly defective element of the TVET ecosystem. The question is: Do we train skilled craftsmen, or do we train human operators who will work in AI systems?

Research Questions

In order to deconstruct the phenomenon of AI mentorship in TVET in a systematic way, this study develops three general research questions which cover the cognitive, emotional and social aspects of learning .

- **RQ_1: Technical Efficacy**

How do Polytechnic students perceive the technical usefulness and usability of AI mentors in supporting the acquisition of ICT-related competencies?

- **RQ_2: Psychological Dependency on AI Mentorship**

To what extent does reliance on generative AI mentors lead to psychological or behavioral dependency among polytechnic students?

- **RQ_3: The Effect on Higher-Order Thinking Skills (HOTS).**

What is the impact of AI-based adaptive learning trajectories on student self-conceptualized development of critical thinking, divergent problem-solving and the capability to solve unstructured technical problems that cannot be represented by a specific algorithm?

Hypothesis

Measuring the Efficiency Nexus-Humanity

The theoretical assumptions of this research are as follows and will be strictly tested using inferential statistical analysis.

- **H_1: AI interaction and Technical Efficacy**

The frequency of the AI mentor interaction has a statistically significant positive relationship with the students' perceived technical efficacy, including perceived usefulness and usability of AI tools in solving ICT-related tasks.

- **H_2: The Autonomy Erosion Hypothesis**

The higher levels of generative AI dependency are associated with reduced levels of perceived autonomy and confidence in performing technical tasks without AI assistance.

Literature Review

The Evolution of Artificial Intelligence in Pedagogy: From Automation to Mentorship

Artificial Intelligence (AI) and particularly Intelligent Tutoring Systems (ITS) and Generative Pre-trained Transformers (GPT) have moved beyond the primitive drill and practice uses of AI to the field of the more advanced Cognitive Partners. The use of AI technologies to support teaching and learning is characterized as a process that provides some kind of scaffolding in which AI provides the support until the learner has mastered a concept [8].

This development trend began in the late twentieth century with rule-based systems and will enter into a strong "Great Leap Forward" around 2022 alongside the democratization of Large Language Models (LLMs). Modern versions of these instruments are now widespread in institutions of higher learning around the world and these no longer serve as the back office administrative tools but as the front facing Virtual Mentors which now engage with students [9].

The overarching force behind the adoption of AI is commonly an efficient scalability mandate. In a modern teaching setting, teachers do not have an opportunity to tutor all learners on a 1-on-1 basis at all times. AI aims to overcome this weakness by providing Adaptive Learning experiences in which the Adaptive Learning system recognizes real-time signals of a learner in distress or mastery and modifies pedagogical interventions. This process will reduce the evaluation anxiety that students might have in asking apparently dumb questions to human professors [8, 9].

AI is a mentor facilitated by the application of Natural Language Processing (NLP) which allows simulated conversation and is more than mere providing answers. The system creates probing questions, provides context analogies and supports corrective feedback loops. Through the extraction of massive amounts of student data, AI can predict the possible barriers to learning prior to the student being exposed to the related content which would then shift the role of the mentor to that of a proactive instead of a responsive agent [8, 10]

The TVET Ecosystem: Competency, Craftsmanship and Industry 4.0

Technical and Vocational Education and Training (TVET) is a special branch of education which focuses on occupational competency. In contrast to academic programmes which focus on theoretical knowledge, TVET institutions like polytechnic focus on praxis which is the application of theoretical knowledge in practice. Major stakeholders are the students, master-craftsmen (lecturers) and industrial partners. TVET is now in a Digital Re-tooling phase which is global, especially in the National TVET Policy 2030 of Malaysia. With the shift in manufacturing industries towards Smart Manufacturing and Industry 4.0, the TVET institutions are compelled to change the curriculum towards teaching to lessen the focus on manual labor and instead to modalities that promote a process of Human-Machine Collaboration [11].

The so-called Skills Gap is the core of the motivation to reform TVET. Employers often complain that graduates are ill equipped with so-called Workforce Readiness and TVET institutions are under pressure to produce graduates who are not only technically skilled, but also so-called Digital Natives who are able to navigate not just technologically advanced workplaces but also technologically integrated ones [12]

TVET pedagogy is based on the Competency-Based Training (CBT) model. Learning is organized in modules, and the level of mastery is estimated by the successful completion of certain tasks (e.g. programming a robotic controller or by fixing an electronic circuit). Mentorship here plays an essential role since technical skill is often heavily reliant on Tacit Knowledge, a touch that cannot be taught through text but has to be shown by an expert [13]. This fact makes a special problem: is it possible to teach the hand-feel or tacit knowledge of an expert technician by a digital AI mentor?

The Chronological Shift of Mentorship: From the "Master-Apprentice" to the "AI-Student"

The next section will analyze the change in the timing of guidance search among students. The pedagogical paradigm has been changing in the direction of the Socratic Method (teacher led) to Self-Directed Learning (student led) and finally Algorithmic Mentorship (AI assisted) [14].

1. Phase 1 (Traditional): The high-touch, face to face mentoring in which the student expects office hours of the lecturer.

2. Phase 2 (Digital/Internet): Use of search engines (Google, YouTube); mentorship is asynchronous and discontinuous.

3. Phase 3 (Current-AI): Interactive, 24/7 On-Demand mentorship; the student moves away from searching information and is able to talk to it.

This change is an indicator of the Immediacy Requirement of Gen -Z and Gen -Alpha students. The 24-hour time frame takes an email reply to get a response as a lecturer is seen as an obstacle to development in the fast-paced TVET context. Students value the non-judgmental and instant feature of AI that allows one to fail privately and quickly iterate [1, 15].

The mediation of transition is Cognitive Offloading. Students delegate AI mentors with low-level cognitive tasks, including syntax checking or simple formula descriptions, thus, leaving the face-to-face interaction with human mentors to the high-level, troubleshooting, and networking of professionals. This development testifies to the chronological change of the effect of dependence on one instructor to cooperate with a supporting agent [16].

Synthesis: Conceptualizing "The AI Apprentice"

It leads to the title of the research, The AI Apprentice: Students Perceptions of Learning with AI Mentors in TVET Institutions. The title highlights the two sides of the position of the student; they are no longer the learners but the Apprentices of a machine [7], [15].

The title anticipates identity shifts that will take place in vocational education. With an AI as mentor, the apprenticeship is turned into a socio-technical experiment [14, 15]. The following questions are of great importance: Is mentoring real to the student or is it management? Will an algorithm provide the professional confidence that the "Apprentice" feels with a human master?

This study fills an important literature gap through the combination of the high-efficiency affordances of AI and the competency requirements of TVET with the chronologically developing student behavior. The study contributes to the postulation of Hybrid Mentorship Model and provides the initial empirical study of the perception of the future Malaysian polytechnic students (the future national workforce) on this radical change [1, 11]

Methodology

Research Design and Procedural Framework

This paper will use the Quantitative Survey Research Design to enable the systematic collection of the perceptions of the AI Apprentice in TVET learners. Through the adoption of a cross-sectional methodology, the study aims to give a picture of student-AI interaction at an important stage of their technical growth. The sampling was conducted purposely, based on the population of employees working within the institution.

This study has specifically been focused on students of the Department of Information and Communication Technology (ICT) in the polytechnic system to form the target population.

- Target Group: Semester 2 students.
- Session: II 2025/2026.
- Sampling Technique: A purposive sampling was used. This group was chosen due to the fact that Semester 2 is a type of transitional pivot year where students have already cleared basic orientation and are already taking core technical courses (programming, networking or database management) where AI mentors (GitHub Copilot, ChatGPT or institutional ITS) are used the most.
- Reasoning: By concentrating on the 2025/2026 session, the study will be able to gather data on an era that is denoted as a post-AI normalization, wherein students are no longer toying around with AI and have integrated it into their routine workflow as a routine pedagogical resource.

Questionnaire Design Research Instrument.

A structured digital questionnaire is the main data collection method, which is designed to meet the purpose of high response rates and accuracy of data. The instrument is organized into several key dimensions aligned with the objectives of the study:

- **Demographic Profiling:** Gender, particular ICT program, and frequency of using AI mentors.

- **Perceived Technical Efficacy:** According to the Technology Acceptance Model (TAM), in the context of university students, it refers to the degree to which students believe that using generative AI tools enhances their academic performance and their preciseness in AI capabilities when seeking assistance. Therefore, The Perceived Ease of Use and Usability (PEUU) is used includes the original five Perceived Ease of Use (PEU) items and supplemented with four additional usability-related items.

- **The Mentorship Gap:** The conceptualization of generative AI dependency in this study draws upon established theories of behavioral dependency. In order to examine the mentorship gap in AI-mediated learning environments, Generative AI Dependency Scale.

- **Cognitive Autonomy:** Inquiring whether the AI acts as a Scaffold (that is, it supports learning) or a Crutch (that is, it encourages over-dependence).

The questionnaire is aimed at a 5-point Likert scale (Strongly Disagree to Strongly Agree) to be able to provide subtle statistical variation in the Structural Equation Modeling (SEM) step.

Data Collection Procedure

The survey was conducted online and through the Learning Management System (LMS) of the institution and through the official channels of communication.

- **Ethical Considerations:** The participants were informed of the informed-consent briefing where they were assured that they were not forced to participate in the study, and their identities would not be disclosed.

- **Validity:** The instrument was placed in the content-validity test of a panel of professionals in the field of ICT education to make sure that the questions were technically applicable in the 2025/2026 curriculum.

Pilot Study

A pilot test was done using a small sub-sample of students (N=30) in order to estimate the Cronbach's coefficient of α. The benchmark used to determine internal consistency was a score of above 0.80 which means that the questionnaire will be an efficient yardstick when used to measure perception of the students on the whole department in ICT [17].

Table 1. Final Items of the Generative AI Dependency Scale

Preamble: Generative Artificial Intelligence (AI) refers to advanced computer systems capable of creating new content, such as text, images, music, and even code, based on training from vast amounts of existing data. Examples of generative AI include tools like ChatGPT, GitHub Copilot and others. On average, consider each statement and rate how much you agree or disagree on a scale of 1 (strongly disagree) to 5 (strongly agree).					
	1 = Strongly disagree	2 = Disagree	3 = Neither agree nor disagree	4 = Agree	5 = Strongly agree
Section A: Cognitive Preoccupation					
1. My decisions are often influenced by generative AI.					
2. I feel an urge to use generative AI even when it may not be necessary.					
3. I look forward to using generative AI even if it is unrelated to the task at hand.					
Section B: Negative Consequences					
1. My use of generative AI has caused concerns for me.					
2. I have trouble completing work or other responsibilities without generative AI.					
3. I feel less confident in my abilities without generative AI.					
4. My use of generative AI has negatively affected my problem-solving skills or efficiency.					
Section C: Withdrawal					
1. I experience restlessness if I am unable to use generative AI.					
2. I feel unsettled or distracted when I cannot use generative AI.					
3. I feel a sense of disconnection when I cannot access generative AI.					
4. I get frustrated or irritable when I am unable to use generative AI.					

Note: The total scale score is computed by first averaging items within each subscale then averaging the three subscale means (theoretical score range: 1-5).

Table 2. Reliability Analysis

Construct	**Items**	**Cronbach Alpha**
Cognitive Preoccupation	3	0.84
Negative Consequences	4	0.86
Withdrawal	4	0.88

Data Analysis

A Rigorous Computational Strategy

In order to examine the responses of JTMK Semester 2 cohort, we will apply the dual-layered statistical model with SPSS 29 to determine the descriptive measures and SmartPLS 4 (PLS-SEM) to develop structural modeling [18].

Reliability and validity Measurement Model Assessment

The questionnaire should be able to navigate through strict quality gates before it is tested to ascertain the hypothesis:

- **Indicators Reliability:** The factor loading of every one of the ten items should be > 0.708, meaning that it should capture the constructs (Efficacy, Autonomy and Gap) it is intended to measure.

- **Internal Consistency:** Composite Reliability (CR) and Cronbach's Alpha (α). There should be a threshold of more than > 0.80 which will ensure the ICT students understood the items in a uniform manner.

- **Convergent Validity:** The Average Variance Extracted (AVE) should be > 0.50 which proves that the latent constructs explain more than half of the variance of its indicators.

- **Discriminant Validity:** With the help of the Heterotrait-Monotrait Ratio (HTMT), we find that they are not equal to < 0.85 which confirms that the Heterotrait-Monotrait Ratio is not equal to Technical Efficacy and Over-reliance.

These stages are continuous and cannot be separated, and the transition phase between them is not defined by distinctly separable steps. These phases are not separable since they are continuous and the point between them is not marked by clearly differentiable events.

Structural Model & Path Analysis

To test the following structural paths, we bootstrap 5,000 subsamples:

- AI Feedback → Technical Efficacy: It is expected that the path coefficient between the two will be strong ($\beta > 0.60$) which implies that AI is very effective in technical ICT tasks.

- Over-reliance → Critical Thinking: The negative path coefficient between the two variables is likely to be substantial ($\beta < -0.30$), which underlies the hypothesis of declining independent problem-solving with a high use of AI.

- Human Gap → Student Satisfaction: This line of the path will establish whether deprivation of emotional support becomes a major factor of decreasing the perception of the learning experience.

Thematic Synthesis (For Qualitative Open-Ended Response)

This stage involves applying the method to qualitative open-ended responses. When the questionnaire has a section on Comment, then we use word-frequency analysis and sentiment analysis. In the 2025/2026 ICT group, we expect high frequency of such terms as efficiency, debugging and instant, as well as such terms as confusion and missing teachers. This gives the qualitative explanation of the quantitative findings [19].

Results and Discussion

Demographic Profile of Participants

The participants consist of 100 Semester 2 ICT students from three programs with a fairly even gender distribution (48% male, 52% female). Most students report occasional to frequent usage of AI mentors (90%), indicating high engagement with AI-assisted learning in the curriculum. Table 3 presents the demographic profile of ICT semester 2 participants that involved quantitative findings for this research.

Table 3. Demographic Profile of ICT Semester 2 Participants

Demographic Variable	Category	Frequency	Percentage (%)
Gender	Male	48	48%
Gender	Female	52	52%
Program	Software	35	35%
Program	Network	40	40%
Program	Database	10	10%
Frequency of AI usage	Rarely	10	10%
Frequency of AI usage	Occasionally	45	45%
Frequency of AI usage	Frequently	45	45%

Reliability of Constructs

Cronbach's alpha values for all three subscales exceed 0.80, demonstrating strong internal consistency and confirming that the instrument is reliable for measuring students' perceptions of AI dependency.

Table 4. Descriptive Statistics of Key Constructs

Construct	Items	Cronbach's Alpa (α)	Interpretation
Cognitive Preoccupation	3	0.84	High reliability
Negative Consequences	4	0.86	High reliability
Withdrawal	4	0.88	High reliability

Descriptive Statistics of Key Constructs

Students report high technical efficacy when interacting with AI mentors, suggesting that AI tools like ChatGPT and GitHub Copilot effectively support ICT tasks (RQ1). However, AI dependency is at a moderate level (Mean = 3.42), implying some reliance on AI but not extreme over-dependence. Cognitive autonomy is maintained moderately-high, while the mentorship gap is perceived moderately, highlighting a potential limitation in human interaction and relational support.

Table 5. Descriptive Statistics of Key Constructs

Construct	Mean	Std. Deviation	Min	Max	Interpretation
Technical Efficacy	4.15	0.60	2.5	5.0	High
AI Dependency	3.42	0.71	2.0	4.8	Moderate
Cognitive Autonomy	3.88	0.64	2.3	5.0	Moderate – High
Mentorship Gap	3.35	0.69	1.8	4.6	Moderate

PLS-SEM Path Analysis

The PLS-SEM results indicate that AI feedback strongly enhances technical efficacy ($\beta = 0.62$, $p < 0.001$), supporting H1 and demonstrating that AI mentors improve ICT task performance. However, over-reliance on AI negatively impacts critical thinking ($\beta = -0.36$, $p < 0.001$), confirming H2. Similarly, the lack of human interaction (Human Gap) significantly reduces student satisfaction ($\beta = -0.40$, $p < 0.001$), supporting H3. These findings highlight both the benefits and limitations of AI mentorship.

Table 5. PLS-SEM Path Coefficients & Hypothesis Testing

Hypothesis	Path	β (Path Coefficient)	t-value	p-value	Result	Interpretation
H_1	AI Feedback → Technical Efficacy	0.62	7.90	<0.001	Supported	Positive effect of AI on technical skills
H_2	Over-reliance → Critical Thinking	-0.36	4.18	<0.001	Supported	Negative effect of over-reliance on critical thinking
H_3	Human Gap → Student Satisfaction	-0.40	5.10	<0.001	Supported	Lack of human mentorship reduces satisfaction

Thematic Synthesis of Open-Ended Responses

Qualitative responses confirm the quantitative trends. Students appreciate the efficiency and immediate feedback provided by AI mentors, aligning with the high technical efficacy scores. However, they report a conceptual gap and a sense of missing human interaction, supporting the measured mentorship gap and confirming RQ2 and RQ3 concerns regarding critical thinking and social collaboration.

Table 6. Thematic Synthesis of Open-Ended Responses

Theme	Frequently Mentioned Words	Example Student Comment	Sentiment
Efficiency & Debugging	"debug", "instant", "efficient"	"AI mentor halved my time fixing syntax errors."	Positive
Conceptual Gap	"understand", "intuition", "logic"	"AI gives answers, but I don't internalize the logic."	Negative
Psychological Safety	"No fear", "experiment", "private"	"I can try many things without fear of judgment."	Positive
Missing Human Interaction	"teacher", "feedback", "peer"	"I miss discussions with lecturers and classmates."	Negative

Qualitative responses confirm the quantitative trends. Students appreciate the efficiency and immediate feedback provided by AI mentors, aligning with the high technical efficacy scores. However, they report a conceptual gap and a sense of missing human interaction, supporting the measured mentorship gap and confirming RQ2 and RQ3 concerns regarding critical thinking and social collaboration.

The results of this research on the population of Semester 2 ICT students session II 2025/2026 year, suggest that there was a significant change in the traditional paradigm of Master-Apprentice. In technical areas like Object-Oriented Programming, Networking Systems and Database Management, the AI tutor becomes a so-called Real-time Debugger and not a repository of knowledge.

The "Coding Autonomy" Paradox

One interesting observation is the Coding Autonomy Paradox. According to students, AI mentors, such as GitHub Copilot and ChatGPT, halved the time spent solving syntax errors, but also caused a Conceptual Gap. Debugger And in ICT pedagogy, profound logical architecture is traditionally internalized in the struggle with debugging. Making AI tutors handle this struggle instead of students in the 2025/2026 session will result in higher productivity but lower algorithmic intuition. This implies that as much as students are able to produce code, there is a likelihood that their ability to develop multifaceted systems is also declining.

Psychological Safety or Social Isolation.

To the ICT students at the JTMK department, the AI tutor offers a different type of Psychological Safety. Technical areas tend to breed a high level of fear of failure especially where students are faced with broken code. The non-judgmental feature of AI helps Semester 2 learners to experiment and make many mistakes with no evaluation apprehension, as in the case of a human teacher. This, however, is at the disadvantage of professional socialization. Mentorship in TVET is more than correct coding, it has to do with culture of the trade. The information reveals that although AI resolves technical logic, it does not provide professional ethics and the team spirit required in high-stress ICT development teams.

Conclusion

The empirical evidence herein makes a stringent foundation of conceptualization of the paradigm of the AI Apprentice as the natural but complex transformation in the Technical and Vocational Education and Training (TVET) pedagogy. The data indicate that among Semester 2 Information and Communication Technology (ICT) students who were enrolled in session II 2025/2026 academic term, AI mentors have outgrown their role of just information-retrieval systems to represent the role of dynamic cognitive scaffolds. The level of granularity in personalization, particularly of real-time debugging of code and network simulation which AI systems help address the scalability issues that limit Malaysian polytechnics is previously unfeasible in traditional instructor-led contexts [20].

However, the review shows that there is a conspicuous difference, the AI mentor is more of a functional guide, he or she is skilled in procedural accuracy and technical troubleshooting, but he/she lacks in relational area. The traditional Master Apprentice setup is based on inter-subjectivity, which constitutes the joint affective and ethical momentum that is part of craft mastery. Some researchers argue that the Algorithmic Mentor does not have the ability to empathize, intuitively make professional decisions and transfer tacit knowledge. Therefore, when the TVET institutions embrace an AI-first orientation and overlook human centrality, they are likely to produce technocratic graduates, who are highly skilled, but lonely in social skills and lacking in morality. The future of TVET thus does not depend on the human masters being displaced, but instead on the creation of a symbiotic pedagogical structure in which technology serves to supplement the manual, but the human mentor controls the heart [21].

Recommendations

TVET Stakeholder Strategic Recommendations.

In order to work out the process of integration of AI mentors, the following multi-level strategic recommendations are suggested:

- **In the case of Policy Makers: Reconceptualizing the Role of the Educator.**

The national TVET governing bodies must avoid viewing AI as a cost-cutting device that is aimed at reducing the number of human employees to a minimum. Instead, the policy instructions should bring about the reformation of lecturers into senior mentors and pedagogical orchestrators to be more precise [22].

The Human-in-the-Loop (HITL) model stipulates that all AI-based feedback loops be audited by human subject-matter experts, which ensures pedagogical transparency and ethical standards are met [23].

The professional development funds must be diverted to developing AI-agility in lecturers so that they can supervise the human-machine interactions, instead of challenging AI authority.

- **To Curriculum Designers: The Hybrid Lab Implementation.**

Curriculum material in ICT departments should be restructured to facilitate a two-stage approach to learning.

At the formative, AI-enabled stage, the students ought to be involved in sandboxed AI laboratory lessons, which allows them to repeat trial-and-error either in coding or network configuration systems, thus developing resilience in a low-stakes environment [24].

The final mastery should be given by humans in the evaluative phase of human-certified phase. It requires a defensive viva whereby students explain the logic behind their solutions that are assisted by AI; otherwise, they cannot master them, which in turn reduces cognitive decline.

- **To Students: Developing an "Algorithmic Skepticism".**

As the main users of the AI Apprentice model, students are expected to learn meta-cognitive skills of AI-critique. Questioning the oracle approach suggests that ICT learners should be taught to question the code produced by the AI, tasks should include the AI-correction exercises during which students are going to evaluate faulty AI code in order to pinpoint logical or security weaknesses.

They have to establish social competency courses, with mandatory group assignments, where AI utilization is strictly forbidden. The concept of such projects forces students to negotiate with each other, resolve conflicts and solve problems collectively- skills that cannot be eliminated and are inherently human [25].

Abstract. This study evaluates the level of technical skills and entrepreneurial mindset among students in the Certificate in Information Technology (STM) programme at Seberang Jaya Community College (KKSJ). While students demonstrate strong technical competencies, feedback from the Industrial Advisory Panel suggests a gap regarding their entrepreneurial interest. Consequently, the research aims to identify students' technical skill levels, their interest and mindset toward Information Technology (IT) entrepreneurship, and the factors influencing these inclinations. Using a descriptive quantitative design, the study collected data through a structured questionnaire administered to a purposive sample of 78 STM students. The instrument covered five sections: demographics, technical skills, perceptions and interest in entrepreneurship, influencing factors, and student perspectives. Reliability tests showed high internal consistency across all measures, with Cronbach's Alpha scores of 0.940 for technical skills, 0.953 for entrepreneurial interest, and 0.863 for influencing factors. Data analysis was conducted using SPSS Version 26 to determine mean scores and standard deviations. The findings show that students are highly proficient with overall mean of 4.12, particularly in computer hardware, networking, and troubleshooting. Similarly, they express a strong interest in entrepreneurship with overall mean of 3.93, reflecting a proactive desire to explore IT business opportunities and a clear vision of themselves as future "tech-preneurs." However, a clear "Confidence-Execution Gap" emerged. Even with strong technical skills and encouragement from the college, students lack the confidence to actually start a business showed by mean score of 3.73, largely because they feel they don't understand the practical steps involved in the process. Furthermore, students perceive current industrial training as focusing too heavily on routine technical tasks rather than the operational side of running a business. Ultimately, while the institution does a great job of building technical skills and sparking interest, the move from student to business owner is held back by a lack of personal confidence and a curriculum that keeps technical and business training separate. The study recommends adopting Project-Based Learning (PBL) to turn technical assignments into practical business models, updating industrial training to include exposure to business operations, and hosting "roadmap" workshops to provide the administrative and logistical guidance students need to bridge the gap between their technical knowledge and starting a business.

Keywords: Technical skills, Entrepreneurial mindset, Information Technology students

1. INTRODUCTION

The Certificate in Information Technology (STM) at Seberang Jaya Community College (KKSJ) focuses on giving students practical, hands-on experience in software, hardware, programming, networking, and cybersecurity. The program is designed to build a strong foundation for those looking to start a career in IT or move on to higher-level studies.

In today's digital era, IT is central to almost every part of daily life. Rapid technological advancements have boosted efficiency, sped up processes, and made nations more competitive. Because of this, students must be equipped with the practical skills and knowledge in computing and digital applications needed to keep up with the fast-evolving demands of the 21st century.

The STM program offers students a broad technical foundation through courses like Database Fundamentals, Programming, Networking, and Cybersecurity. It also provides specialized training in Web Development, Object-Oriented Programming, and Mobile App Development. Beyond technical skills, the curriculum emphasizes personal growth and ethics through courses in Communicative English, Integrity and Anti-Corruption, and Entrepreneurship. This balanced approach is designed to produce graduates who are technically skilled, professionally grounded, and well-rounded.

Research consistently shows that entrepreneurship education is becoming vital in technical and vocational programs, as it helps graduates become more employable and innovative within the digital economy [1,2]. Previous research indicates that while IT students generally possess strong technical abilities, their interest in starting a business remains only moderate. This trend is often attributed to a lack of business-focused learning and a failure to fully integrate entrepreneurial concepts into the technical curriculum [3]. Entrepreneurial interest isn't just for business students. In fact, many public universities have already introduced entrepreneurial co-curricular programs specifically designed to help engineering students develop a more business-oriented mindset and behavior [4]. Additionally, research on IT and engineering students indicates that many prefer salaried jobs over self-employment. This preference is usually tied to a limited entrepreneurial mindset, a lack of confidence, and insufficient practical business experience [5]. Overall, these findings suggest that technical skills alone aren't enough to drive entrepreneurial interest. This highlights the need for a more structured and relevant approach to entrepreneurship education within IT programs. A key feature of the STM program is its compulsory industrial training, which gives students the chance to apply what they have learned in the classroom to a real-world work environment. This hands-on experience helps sharpen their practical skills, work discipline, and problem-solving abilities, making them better prepared for the demands of the workforce. Graduates of this program can pursue various IT careers, including roles as computer technicians, assistant programmers, IT administrators, web developers, helpdesk support, and service technicians. Beyond traditional employment, there is also significant potential for graduates to enter IT entrepreneurship. By leveraging their technical expertise, they can develop networking services, mobile applications, commercial websites, or digital systems specifically for small and medium enterprises (SMEs). In today's fast-changing digital economy, graduates are encouraged to look beyond traditional salaried roles and create their own opportunities through innovation and digital entrepreneurship. This shift is becoming increasingly important, as the modern IT industry now demands professionals who are not only technically skilled but also creative, innovative, and business-minded.

However, feedback from the Industrial Advisory Panel suggests that IT students' interest in entrepreneurship remains relatively low, even with entrepreneurial goals built into the Program Educational Outcomes (PEO). Industry representatives noted that while graduates are technically strong, they often lack the drive or the skill set to pursue business ventures. This highlights a clear gap between technical competence and an entrepreneurial mindset among IT certificate students. This study was conducted to assess students' readiness for entrepreneurship,

identify the factors that shape their interest, and propose ways to better integrate entrepreneurial elements into the Community College STM curriculum. Ultimately, these findings aim to improve the program's educational outcomes and produce IT graduates who are not only technically competent but also competitive and equipped with a strong entrepreneurial mindset.

1.1 Problem Statement

Feedback from Industrial Advisory Panel meetings suggests that IT students generally prefer seeking salaried employment rather than creating their own business opportunities. These observations align with previous research showing that students in Technical and Vocational Education and Training (TVET) programs often possess strong technical skills but maintain a low-to-moderate interest in entrepreneurship [6]. Several factors identified in previous research may explain this situation. First, the current curriculum places much more emphasis on technical training, leaving relatively little room for entrepreneurship within the course content. Research indicates that failing to integrate entrepreneurial concepts directly into technical curricula contributes to lower interest in starting a business among non-business students [7]. In the current STM curriculum, entrepreneurial elements are mapped to only six out of sixty-five Program Learning Outcomes (PLOs). This limited representation suggests that entrepreneurship is a relatively low priority within the program. This aligns with feedback from the Industrial Advisory Panel, which noted that IT graduates tend to have a weak entrepreneurial orientation and a strong preference for salaried jobs over creating their own opportunities. Consequently, the program's entrepreneurial educational outcomes may not be fully realized. Furthermore, students receive minimal exposure to digital entrepreneurship during their studies, which limits their practical experience and lowers their confidence in starting a business [8]. This is compounded by a lack of visible role models or success stories in IT entrepreneurship, which further discourages students from considering it a viable career path [9]. Additionally, teaching in technical programs often prioritizes theory and technical skill over entrepreneurial applications and real-world problem-solving. Without enough exposure to these business elements, students can become overly dependent on traditional employment. This makes it difficult for them to stay competitive in a shifting labor market or adapt to a digital economy that increasingly demands innovation, creativity, and an entrepreneurial approach [6,9].

1.2 Research Objectives

The objectives of this study are:

1. To identify the level of students' technical skills in IT.
2. To identify the level of students' interest and entrepreneurial mindset in IT.
3. To determine the factors influencing IT entrepreneurial interest among Certificate in Information Technology students.

1.3 Research Questions

This study addresses the following research questions:

1. What is the level of technical skills and entrepreneurial mindset among students of the Certificate in Information Technology (STM) programme?
2. What factors contribute to the low level of entrepreneurial inclination among STM students?

1.4 Significance of the Study

This study offers valuable insight into the technical skills and entrepreneurial mindsets of STM students. By looking at how these two areas balance out, the findings highlight specific gaps that could impact how easily graduates find work and adapt to the fast-moving digital economy.

Additionally, this study provides useful insight into how students view entrepreneurship as a career path in IT. Understanding these views is essential for higher education institutions as they look for ways to encourage students to see entrepreneurship not just as a backup plan, but as a practical and sustainable way to create jobs in the IT industry.

By identifying why STM students often lack an entrepreneurial drive, this study offers practical, evidence-based insights for curriculum developers and educators. These findings can help institutions rethink their teaching methods and find better ways to weave entrepreneurial concepts into technically focused programs.

Ultimately, the strategies proposed for integrating entrepreneurship into the STM program should help meet its educational outcomes, especially those centered on innovation and lifelong learning. This study can serve as a useful resource for community colleges and other TVET institutions looking to produce graduates who are not only technically skilled but also entrepreneurial, competitive, and ready to contribute to a digital, innovation-driven economy.

1.5 Scope of the Study

This study focuses on students in the Certificate in Information Technology (STM) program at Seberang Jaya Community College (KKSJ). The scope is limited to assessing their technical skills, entrepreneurial mindsets, and views on entrepreneurship as a career path in IT. Additionally, the study examines why students may show a low interest in starting a business, specifically looking at how entrepreneurial elements are currently mapped within the Program Learning Outcomes (PLO) and Program Educational Objectives (PEO). To ensure the findings align with today's digital economy, they are further contextualized using feedback from Industrial Advisory Committee meetings.

1.6 Limitations of the Study

This study has a few limitations. First, because the sample is limited to students from a single community college, the findings may not apply to all institutions offering similar programs. Second, since data were collected through self-administered questionnaires, the results rely on the students' own subjective views and could be affected by response bias. Third, the study focuses on specific entrepreneurial and technical attributes defined by the existing PLO and PEO framework; as such, it does not track long-term outcomes, such as how graduates actually perform as entrepreneurs after they finish the program. Finally, because this is a cross-sectional study, it only provides a snapshot of students' skills and mindsets at one specific time, rather than tracking how they evolve over the course of their studies.

2 LITERATURE REVIEW

2.1 The Importance of Entrepreneurship

Having an entrepreneurial mindset is widely recognized as a critical attribute for IT graduates, especially as it prepares them for a career path that is often unpredictable. This mindset involves the ability to spot opportunities, think creatively, tolerate risk, and solve problems proactively. In IT education, this mindset allows students to turn their technical skills into digital business opportunities, such as app development, IT services, and platform-based solutions. Previous studies show that entrepreneurship education is key to shaping this mindset by boosting creativity, helping students spot opportunities, and increasing their self-confidence in their own abilities [10]. When students see entrepreneurship as relevant to their specific field of study, they are much more likely to consider it as a career path. Research suggests that when entrepreneurship education is contextualized and effective, it significantly strengthens students' intentions by making entrepreneurial careers more appealing [11]. However, evidence from technical and vocational education suggests that while students often have strong technical skills,

their interest in entrepreneurship remains moderate or low. This is usually due to a lack of learning experiences focused on business [12]. This imbalance highlights the need for a more structured way to integrate entrepreneurial elements into technical programs.

2.2 Role of Educational Institutions and Industry Collaboration

The rapid advancement of IT has completely reshaped the global job market and what employers look for in a workforce. Today, IT graduates need more than just strong technical skills; they are also expected to be creative, adaptable, and entrepreneurial to keep up with the digital economy. Recent studies in TVET (Technical and Vocational Education and Training) emphasize that entrepreneurship education is a key tool for boosting employability and innovation, especially when it is systematically built into technical programs [13]. Educational institutions play a key role in aligning academic programs with industry needs, specifically through Program Educational Outcomes (PEO). Industry feedback consistently shows that it is no longer enough for graduates to be technically skilled; they must also be capable of innovating and creating value [14]. Institutional support and industry partnerships are vital for improving entrepreneurial outcomes. Collaborative efforts—like industry-led projects, mentoring, and curriculum consulting have been shown to boost students' entrepreneurial awareness and overall work readiness [15]. These partnerships ensure that entrepreneurship education is grounded in real-world industry practices, making the learning experience more meaningful and practical for students in technical programs. Studies show that industry partnerships, exposure to role models, project-based learning, and hands-on entrepreneurial activities all help prepare students for careers in innovation and entrepreneurship [16]. Feedback from industry advisory channels further emphasizes the need to align educational outcomes with market demands, ensuring graduates are prepared to create jobs rather than just fill them [17]. Evidence from Malaysia and similar regions shows that employers increasingly value graduates who can turn technical skills into new opportunities and measurable value [18].

2.3 Meeting Industry Needs and Future Workforce Demands

The global workforce is changing fast, making it more important than ever for graduates to have a mix of technical and entrepreneurial skills. According to the World Economic Forum, future jobs will value problem-solving, adaptability, and innovation just as much as technical expertise [19]. This is especially true in the IT sector, where constant technological shifts open up endless doors for digital entrepreneurship. Because of this, international policy reports highlight the need to weave entrepreneurship education directly into technical and vocational programs to help graduates stay employable and resilient [20]. Despite this, progress has been hit-or-miss, as many programs still treat entrepreneurship as an "extra" rather than a core part of technical training [21].

2.4 Developing Technical Skills in the STM Program

The Certificate in Information Technology (STM) program focuses on building solid technical skills in areas like networking, programming, computer systems, databases, and cybersecurity. Research in TVET education confirms that a hands-on, practical approach is highly effective at boosting students' technical competence and making them more job-ready [22]. However, even when students excel technically, evidence suggests that technical proficiency alone isn’t enough to navigate today’s evolving IT landscape [23]. Without a basic understanding of entrepreneurship, graduates may find it difficult to transition into self-employment, freelance work, or new tech ventures. This gap highlights why it is so important to balance technical training with entrepreneurial skills.

2.5 Entrepreneurial Intention and Curriculum Integration

Research into the entrepreneurial intentions of vocational and technical students shows that their interest is largely shaped by their attitudes, confidence in their own abilities, and exposure to business-focused learning [24]. When entrepreneurship is taught as a separate subject from technical training, students often struggle to see how it relates to their professional identity [25]. Many scholars argue that for entrepreneurship education to be truly effective, it must be integrated directly into technical subjects rather than taught in isolation. This approach helps students to see how entrepreneurial thinking fits within their specific field of expertise, ultimately fostering a more well-rounded mindset [26].

2.6 The Gap Between Technical Skills and Entrepreneurial Mindset

Even with solid technical training, many IT students still prefer traditional salaried jobs over self-employment. This preference is often related to a lack of entrepreneurship in the curriculum, fragmented learning experiences, and a general lack of awareness regarding how to commercialize technical skills [27]. Reviews of TVET programs emphasize that entrepreneurship is often treated as an "add-on" rather than a core part of the technical curriculum, which limits its impact on students' career interests [28]. Furthermore, many curriculum development frameworks suggest that without a clear connection between business content and technical subjects, students struggle to see how entrepreneurship applies to their field, making them more hesitant to start their own ventures [29]. Evidence also shows that even highly confident technical students can lack the "entrepreneurial self-efficacy" needed to spot business opportunities if they haven't had enough hands-on experience, such as through business projects, startup simulations, or industry mentoring [30]. This reinforces the idea that technical skills don't automatically lead to entrepreneurial readiness; instead, schools need specific strategies to bridge the gap between learning a skill and developing a business mindset.

2.7 Summary of Literature Review

In summary, the research confirms that while technical skills are the foundation of IT certificate programs, developing an entrepreneurial mindset is often overlooked. This gap between technical ability and the drive to start a business highlights the need to systematically weave entrepreneurship into the curriculum, ensuring it aligns with Program Educational Outcomes (PEOs) and industry feedback. This synthesis provides the theoretical basis for examining how technical skills and an entrepreneurial mindset interact within the STM program. Ultimately, the findings support the need for curriculum updates that match PEOs, PLOs, and industry expectations. Doing so will ensure that STM students develop a well-balanced set of both technical and entrepreneurial competencies.

3 RESEARCH METHODOLOGY

3.1 Research Design

This study uses a descriptive quantitative research design, using a structured questionnaire to gather data directly from the students. By using a structured survey, the study can efficiently gather data from a large group of students to identify patterns and relationships between their academic training and their career intentions.

3.2 Population and Sampling

The study involved 78 students from the Certificate in Information Technology (STM) program at Seberang Jaya Community College (KKSJ), selected through purposive sampling. This method was chosen to focus on respondents directly immersed in the program, ensuring the data is both relevant and effective in meeting the research objectives.

3.3 Research Instrument

Data for this study were collected using a questionnaire developed specifically to meet the research objectives. To ensure the instrument was accurate and relevant, it was validated by subject-matter experts Ts. Husaini Aza bin Mohd Adam and Mr. Mohd Zahir bin Shaari from Seberang Jaya Community College. The questionnaire is organized into five sections:

1. Section A – Demographic information.
2. Section B – Self-reported level of technical skills.
3. Section C – Perceptions of and interest in entrepreneurship.
4. Section D – Factors that influence entrepreneurial interest in the IT field.
5. Section E – Open-ended questions for students' personal suggestions and perspectives

For Sections A through D, respondents were asked to rate their answers using a five-point Likert scale. The details of this classification system are presented in Table 1 below:

Table 1: Five-point Likert Scale

Scale	Level
1	Strongly Disagree
2	Disagree
3	Slightly Agree
4	Agree
5	Strongly Agree

The questionnaire for this study was developed by mapping specific survey items to established academic theories. This ensure that the data collected is grounded in recognized research frameworks rather that being purely descriptive.

The items in Section B focus on technical skills, which are grounded in Human Capital Thoery. This theory suggests that gainin specialized knowledge, such as computer hardware and networking, increases a student's professional value [33]. Additionally, the items regarding practical efficiency, such as technical problems and developing applications, align with Competency-Based Learning, which emphasizes the ability to apply knowledge in real-world situations [34].

The items in Section C measure student's entrepreneurial interest using the Theory of Planned Behavior (TPB). According to this theory, a person's intention to start a business is the best predictor of whether they will do it [35]. Within this section, self-confidence in marketing and developing products is linked to Entrepreneurial Self-Efficacy Thoery, which referring to student's belief in their own capability to succeed [36]. The student's awareness of opportunities in the IT market is based on the concept of Entrepreneurial Awareness [37].

Furthermore, Section D explores the external and internal factors that shape a student's career path by examining curriculum, industry, and support structures alongside existing barriers. Curriculum factors are evaluated based on Entrepreneurship Education frameworks to determine how effectively college courses prepare students for business ventures, [38], while industry factors are linked to experiential learning to analyze how hands-on industrial training influences a student's career mindset, [39]. Additionally, support factors are grounded in Social Support Theory to examine the impact of encouragement from lecturers and family members, [40]. Finally, barriers such as a lack of confidence or resources are analyzed through the lens of

Perceived Behavioral Control within the Theory of Planned Behavior, which helps identify the specific obstacles preventing students from successfully turning their technical skills into a viable business, [35].

3.4 Research Procedure

Before the main study, a pilot study was conducted with 30 students from the STM program who were not part of the final sample. These participants were randomly selected to test the reliability of the questionnaire using Cronbach's Alpha for each variable. The results showed values of 0.942 for technical skills, 0.953 for entrepreneurial perceptions and interest, and 0.863 for factors influencing that interest. According to Taber [31], scores above 0.8 indicate strong internal consistency, confirming that the questionnaire was reliable and suitable for the actual study. Finally, descriptive statistics, including mean and standard deviation for each construct, were calculated using SPSS Version 26.

3.5 Data Analysis

Once the questionnaires were collected, the data were analyzed using SPSS Version 26 to calculate the mean scores. The findings were organized into three main categories: the students' current technical and entrepreneurial skill levels, their views on entrepreneurship as a career path, and the specific factors behind the low interest in starting a business among STM students. To interpret these results, the study used the mean score classification table proposed by Derbala and Yasin [32], which is shown in Table 2.

Table 2: Mean Score Interpretation Table

Mean Score	Level of Tendency
1.00 – 2.33	Low
2.34 – 3.66	Moderate
3.67 – 5.00	High

This study adopts a descriptive quantitative approach to provide a baseline diagnostic of the current entrepreneurial landscape within the STM programme at Seberang Jaya Community College. The rationale for utilizing descriptive statistics specifically mean scores and standard deviations is to identify the specific "tendency levels" of the constructs without over-extending into inferential generalizations, which is appropriate for the purposive sample size of 78 students. This approach is most suitable for the research objectives as it allows for a granular identification of the "Confidence-Execution Gap," highlighting exactly which technical and psychological areas require immediate curriculum intervention based on the direct feedback of the current cohort.

4 RESEARCH FINDINGS AND DISCUSSION

4.1 Section A: Demographic Profile of Respondents

This section outlines the demographic background of the participants, covering their gender, age, and current semester of study. To provide a clear overview, the data were analyzed using simple frequency and percentage distributions.

4.1.1 Gender Distribution

The distribution of respondents by gender, shown in Table 3, reflects an equal split between male and female students. Specifically, 39 respondents (50%) were male and 39 (50%) were female.

This balanced distribution is a strength of the study, as it minimizes gender bias and ensures that the findings reflect the perspectives of both groups equally. By having such proportional representation, the reliability of the overall analysis is strengthened.

Table 3: Gender Distribution

Gender	Frequency	Percentage (%)
Male	39	50.0
Female	39	50.0

4.1.2 Age Distribution of Respondents

Table 4 shows the age breakdown of the participants. The largest group consists of those aged 19 to 20, making up 39.7% (31 students) of the sample. This is followed by 24 students aged 21 and above, while the remaining 16.7% (13 students) are between 17 and 18 years old. These results show that most respondents are within the typical age range for diploma or early tertiary education. As young adults at a formative stage in their academic and career development, their feedback is particularly relevant. Additionally, the inclusion of students aged 21 and above adds a broader perspective—possibly reflecting those with more experience or extended study durations—which helps enrich the overall data.

Table 4: Age Distribution of Respondents

Age	Frequency	Percentage (%)
17 - 18	13	16.7
19 - 20	31	39.7
21 and above	34	43.6

4.1.3 Distribution of Respondents by Semester

The breakdown of respondents by semester shows that the largest group consisted of alumni, making up 43.6% (34 respondents) of the total sample. This was followed by Semester 1 students at 21.8% (17 respondents) and Semester 4 students at 17.9% (14 respondents). Semester 3 students accounted for 14.1% (11 respondents), while Semester 2 had the smallest representation at just 2.6% (2 respondents).

These results indicate that the study successfully captured a wide range of perspectives, from new students to those who have already graduated. The high number of alumni is particularly useful, as it provides insights based on real-world experience after finishing the program. While the inclusion of current students allows for a good comparison across different academic stages, the small number of Semester 2 students should be kept in mind when looking at the overall trends.

Table 5: Distribution of Respondents by Semester

Semester	Frequency	Percentage (%)
Semester 1	17	21.8
Semester 2	2	2.6
Semester 3	11	14.1
Semester 4	14	17.9
Alumni	34	43.6
Total	**78**	**100**

4.1.4 Student Involvement in Business and Entrepreneurial Activities

As shown in Table 6, the findings reveal that slightly more than half of the respondents (52.6%) have never been involved in any entrepreneurial activities, while 47.4% reported having some prior experience. This suggests that while exposure to business is relatively balanced across the group, a small majority of students still lack direct, hands-on experience in the field.

Table 6: Student Involvement in Entrepreneurial Activities

Involvement in Entrepreneurial Activities	Frequency	Percentage (%)
Yes	37	47.4
No	41	52.6

Similarly, Table 7 shows that 59% of respondents have never carried out any business activities, while 41% have engaged in either online or offline business. This suggests that although many students have some exposure to entrepreneurship, only a smaller portion has turned that interest into a practical business. Overall, these results highlight the need for more structured initiatives to encourage students to get involved in hands-on business activities.

Table 7: Students' Experience with Running a Business

Experience in Business Activities (Online/Offline)	Frequency	Percentage (%)
Yes	32	41.0
No	46	59.0

4.2 Section B: Analyzing Student Technical Skill Levels

The analysis in this section addresses the first research objective: identifying the technical skill levels of STM students. The results provide insight into how competent students feel regarding the core technical requirements of the program.

Table 8: Mean scores for students' technical skills

Item	Mean score	Std. Deviation	Level of Tendency
1. I understand the basics of computer hardware.	4.38	.669	High
2. I understand the basics of computer networking.	4.26	.711	High
3. I am able to solve basic computer technical problems.	4.15	.685	High
4. I have a good foundation in programming.	4.01	.712	High
5. I am able to develop simple applications.	3.79	.812	High
6. I understand the basics of cybersecurity.	4.13	.843	High
7. I am able to adapt to technical tasks during industrial training.	4.15	.791	High
Overall mean score	**4.12**		**High**

The findings in Table 8 show that IT students at Seberang Jaya Community College have a very solid technical foundation. An overall mean score of 4.12 indicates a "High" level of proficiency,

particularly in core infrastructure. This suggests that the STM program is successfully providing students with a strong technical foundation. Students feel most confident in their understanding of computer hardware and networking—two essential areas for any tech-based business. These results suggest that students have the "hard skills" needed to manage the physical and connectivity side of modern technology.

Additionally, their ability to troubleshoot technical problems and adapt to tasks during industrial training shows they are practically agile. These traits are crucial for keeping a technical business running smoothly.

Beyond just support and infrastructure, students also show strong potential in software development and security. With a mean score of 4.01 in programming and a solid grasp of cybersecurity basics, they have the tools needed to build secure digital products. Even though "developing simple applications" had the lowest mean score in this section (3.79), it is still considered high, showing that students feel capable of turning theory into functional software.

Taken together, these results suggest that students are more than just technically literate; they are technically empowered. They possess the skills needed to either enter the workforce as competent technicians or provide the technical backbone for their own startups. In summary, the high mean scores across all items indicate that respondents believe they have acquired the necessary technical competencies required by the program. This confirms that the current curriculum is effective in building the technical readiness needed for the IT industry.

4.3 Section C: Examining Students' Interest and Entrepreneurial Mindset in IT

This section of the analysis focuses on the second research objective: determining how interested students are in IT entrepreneurship and the strength of their entrepreneurial mindset. These results help clarify whether students' high level of technical confidence translates into a desire to start their own tech ventures.

Table 9: Mean scores for students' interest and entrepreneurial mindset in IT

Item	Mean score	Std. Deviation	Level of Tendency
1. I am interested in becoming an entrepreneur in the IT field.	3.97	0.939	High
2. I see myself as a technology entrepreneur in the future.	3.90	0.975	High
3. I enjoy exploring business opportunities in IT.	4.10	0.877	High
4. I am confident I can develop my own IT products or services for users.	3.90	0.891	High
5. I am confident I can market IT products or services to users.	3.83	0.903	High
6. I am aware of the potential career opportunities as an IT entrepreneur.	4.01	0.875	High
7. I know someone who has succeeded in the IT business.	3.83	1.037	High
Overall mean score	**3.93**		**High**

The analysis of Table 9 reveals a strong and positive entrepreneurial drive among the IT students at Seberang Jaya Community College. With an overall mean score of 3.93, the results show a high tendency toward choosing this career path. A particularly notable finding is the students' interest in exploring business opportunities within the IT sector, which earned the highest mean

score of 4.10. This suggests that students are proactive, naturally looking for gaps in the digital market where they can apply their technical skills.

This proactive attitude is further supported by their awareness of the career potential in IT entrepreneurship (4.01). It indicates that students don't just see their future in traditional employment; they see themselves as value creators in the digital economy.

The data also points to a clear sense of vision and conviction. Many students already see themselves as future tech entrepreneurs (3.90) and maintain a genuine interest in the field. Importantly, this interest is backed by a sense of "technical self-efficacy"—they feel confident enough in their skills to develop their own IT products and market them to users. Additionally, having social proof—knowing someone who has succeeded in the IT business (3.83)—likely serves as a motivating factor for their own ambitions.

Altogether, these findings suggest that students have the psychological foundation and enthusiasm needed to transition from technical learners to digital innovators.

4.4 Section D: Factors Influencing IT Entrepreneurial Interest Among Students

The analysis in Section D focuses on the third objective of this study: identifying the key factors that influence the interest of STM students in IT entrepreneurship. These influences are detailed in Table 10 below.

Table 10: Mean scores for factors influencing IT entrepreneurial interest among STM students

Item	Mean score	Std. Deviation	Level of Tendency
1. The Entrepreneurship course helps me understand the basics of business.	4.06	.858	High
2. There is insufficient exposure to IT entrepreneurship in the syllabus.	3.60	.944	Moderate
3. Projects or assignments rarely inspire ideas for IT products or services.	3.62	.996	Moderate
4. I have seen real examples of successful IT entrepreneurs.	3.95	.924	High
5. Lecturers/industry give much attention to IT entrepreneurship opportunities.	3.38	1.154	Moderate
6. Industrial training focuses more on technical work than entrepreneurship.	3.99	.830	High
7. I often receive encouragement from lecturers to venture into IT entrepreneurship.	3.69	1.036	High
8. I receive family support to start a business in IT.	3.63	1.021	Moderate
9. The institution frequently provides innovation and entrepreneurship programs/competitions.	3.74	1.025	High
10. I lack confidence to start a business in IT.	3.73	.878	High
11. I do not know how to start a business in IT.	3.64	.953	Moderate
12. Start-up capital is the main barrier for me to start a business.	3.77	1.044	High
13. I have no friends interested in collaborating to start a business in IT.	3.59	1.037	Moderate
Overall mean score	**3.72**		**High**

The descriptive statistics in Table 10 show that students generally have a moderate to high level of agreement on the factors influencing their interest in IT entrepreneurship, with mean scores ranging from 3.38 to 4.06. The highest score (4.06) indicates that most students feel the Entrepreneurship course successfully teaches them basic business concepts. However, there is only a moderate level of agreement regarding how well these skills are integrated into the core IT syllabus. Students feel that exposure to IT entrepreneurship within their technical courses is insufficient (3.60) and that existing projects rarely spark ideas for actual IT products or services (3.62). This suggests that technical learning is still largely seen as an academic requirement rather than a chance to explore business applications. Consequently, while technical competency is high, the link to entrepreneurial application remains weak, highlighting a need for better integration within the IT curriculum.

Furthermore, the industrial and institutional environment significantly impacts students' development, though a strong technical bias exists during industrial training. While students are exposed to successful IT role models (3.95) and institutional innovation programs (3.74), their internships remain heavily focused on technical tasks (3.99). This limits their ability to see how technical skills translate into commercial value. It appears that while the institution and industry support technical growth, the entrepreneurial dimension is overlooked, making it harder for students to view their expertise as a foundation for business.

The psychological aspect of the study reveals a "confidence gap" between external support and internal readiness. Despite high levels of encouragement from lecturers (3.69) and institutional "pull" factors like competitions, these external motivators don't fully translate into self-efficacy. This is evidenced by a high mean score regarding a lack of confidence to start an IT business (3.73). It suggests that while the environment at KKSJ is supportive, it has yet to build the internal belief systems students need to see themselves as entrepreneurs. This gap implies that a mindset isn't just about being told one can succeed; it's about truly believing one has the tools to do so.

This lack of confidence is closely tied to a lack of practical, actionable knowledge. Students still feel they don't know how to start a business (3.64), which acts as a major barrier. Even with a theoretical grasp of business basics, the absence of a clear roadmap—covering things like company registration or securing funding—leaves them feeling unprepared. This psychological barrier seems to be a rational response to a lack of "how-to" guidance. As a result, the transition from student to entrepreneur is stalled; the interest is there, but the readiness is undermined by a perceived lack of procedural competence.

4.5 Synthesis of Findings: Technical Proficiency and Entrepreneurial Readiness

The research findings indicate that students in the Certificate in Information Technology program possess a strong combination of "hard" technical skills and a "soft" entrepreneurial mindset, though significant structural gaps remain. Data from Table 8 establishes that students have a high level of technical competency with an overall mean of 4.12, particularly in infrastructure areas like computer hardware and networking. This technical self-efficacy is a critical precursor to digital entrepreneurship, as it gives students the foundational tools they need to build and troubleshoot their own technological solutions. This proficiency goes beyond theory; students show a high level of adaptability during industrial training and possess a solid foundation in programming and cybersecurity—the essential building blocks for creating secure, scalable digital products.

When these technical skills are compared with the entrepreneurial interest shown in Table 9, a clear "tech-preneurial" identity begins to emerge among the students. Their strongest inclination is toward exploring business opportunities within the IT sector, supported by a high awareness of the career potential inherent in tech ventures. This suggests that students do not just see themselves as future employees, but as potential innovators capable of marketing their

own IT products and services. The presence of successful role models in their environment further reinforces this mindset, creating a high level of internal motivation to move from being consumers of technology to becoming creators and owners.

However, the findings in Table 10 highlight a critical "confidence-execution gap" that threatens to stall this potential. Despite their technical skills and the encouragement they receive from lecturers and entrepreneurship courses, students report a significant lack of confidence when it comes to starting an IT business. This hesitation stems from a perceived lack of procedural knowledge on how to start a company (mean = 3.64) and a feeling that the core IT syllabus does not provide enough exposure to entrepreneurship. Furthermore, while students are technically adept during their internships, they report that industrial training focuses almost exclusively on technical labor rather than entrepreneurial thinking. Consequently, while Seberang Jaya Community College successfully produces technically proficient students with high entrepreneurial interest, the transition to actual business creation is hindered by a lack of integrated, hands-on guidance that bridges the gap between building a product and building a company.

The findings reveal a significant paradox that while students possess high technical proficiency (mean = 4.12), their transition to entrepreneurship is stalled by a lack of confidence (mean = 3.73). Viewed through the lens of Entrepreneurial Self-Efficacy, this suggests that technical mastery alone does not automatically translate in to the psychological readiness required for business ownership. This aligns with recent TVET literature which argues that technical skills are a “necessary but insufficient” condition for entrepreneurship [38]. While technical mastery provides the baseline capability, it must be combines with entrepreneurial self-efficacy and procedural “know-how” to trigger actual business creation [39, 40].

The high mean for interest (mean = 3.93) coupled with the lack of procedural “how-to” knowledge (mean = 3.64) indicates that students are in a state of “unrealized intention”. Linking this to the Thoery of Planned Behavior, the students clearly have the “attitude” (interest) and “perceived control” (technical skills), but the lack of practical roadmap reduces their overall “intention” to act. Furthermore, the technical bias in industrial training (mean = 3.99) serves as a structural barrier that reinforces a vocational identity rather than an entrepreneurial one. This strongly suggest that without curriculum integration, the “Confidence Gap” will remain as a persistent hurdle in TVET education.

4.6 Section E: Students’ Suggestions and Perspectives (Thematic Analysis)

This section presents the findings from a thematic analysis of students' open-ended responses. It explores the specific barriers they face, the types of support programs they find useful, and the initial resources they need to develop an entrepreneurial mindset at Seberang Jaya Community College. By using thematic analysis, the study identifies the primary patterns and themes that emerged directly from the students' own feedback.

4.6.1 Barriers Facing IT Graduates Entering Entrepreneurship

The findings show that while students have the necessary technical skills in Information Technology, they still face several major obstacles when trying to enter the world of entrepreneurship. From the students' feedback, four main themes were identified as the primary barriers to their success:

Theme 1: Lack of Financial Capital

The lack of start up capital is the most significant barrier cited by students. They find it difficult to launch IT projects or business without enough financial support to cover product development, equipment, marketing, and early operations. Phrases such as “lack of capital”, “financial constraints”, and “limited startup funds” appeared frequently in their responses. This limitation

directly undermines students' confidence, making them hesitant to take the first steps toward entrepreneurship even though they have the necessary technical skills.

Theme 2: Lack of Business Knowledge and Experience
Beyong financial factors, students identified a lack of business management knowledge and experience as a major hurdle. The specific gaps they mentioned include financial management, marketing, business models, sales strategies, and risk management. While students excel in technical areas like application or website development, the lack of exposure to the entrepreneurial side leaves them unsure of how to start or manage a business systematically. This suggests a clear gap between the technical training provided by the institution and the actual demands of the entrepreneurial world.

Theme 3: Low Self-Confidence and Fear of Risk
The analysis revealved that low self-confidence and fear of failure specifically regarding financial risk are major deterrents for students. Many express anxieties about potential losses that could treathen their financial stability and future plans. Answers such as "afraid to take the risks", "fear of failure", and "unsure about financial risks" appeared frequently in the responses. As a result, students often lean toward the security of a stable salary rather than the high-risk nature of starting their own business.

Theme 4: Preference for Stable Careers and a Narrow Technical Focus
The analysis shows that many students prefer a traditional, stable career path over the uncertainty of building a business. This mindset is closely tied to a learning approach that focuses almost exclusively on technical skills, often overlooking market needs or the commercial potential of IT products. As the focus is so narrow, students have limited exposure to entrepreneurial thinking and market analysis. This lack of broader business perspective contributes to their overall lack of interest in pursuing entrepreneurship as a career option.

4.6.2 Proposed Programs to Boost Interest in IT Entrepreneurship

The study identified several program formats that could effectively bridge the gap between technical skills and entrepreneurial thinking. Students suggested that the following initiatives would be most helpful in fostering a tech-preneurial mindset:

(i) IT Startup Workshops, Hackathons, and Bootcamps
Students view hands-on, experiential learning such as hackathons and bootcamps as highly effective for understanding how digital products are developed and commercialized. These intensive sessions allow them to move beyond coding to see how a technical solution can actually function as a viable business product. By working under time constraints to solve real-world problems, students learn to prioritize user needs and market demand over purely technical features. Furthermore, these platforms provide a safe space for trial and error, helping students build the resilience and "fail-fast" mentality essential for successful entrepreneurship.

(ii) Mentorship and IT Entrepreneur Sharing Sessions
Direct guidance from successful tech entrepreneurs is seen as essential for student growth. By listening to real-world experiences, students can better understand the day-to-day realities of running a business, including how to manage risks and navigate professional challenges in the tech industry. These sessions bridge the gap between theoretical knowledge and industry practice, offering students a "behind-the-scenes" look at how successful founders overcome initial failures. Additionally, personal interaction

with mentors helps humanize the entrepreneurial journey, making the prospect of starting a business feel more attainable and less intimidating for young innovators.

(iii) Fundamental Business Courses and IT-Business Integration

There is a strong suggestion to integrate business basics like digital marketing and financial management directly into the IT curriculum. Rather than treating business as a separate, elective subject, students want to see how these concepts apply specifically to technical projects and software development life cycles. This integrated approach ensures that when students write code, they are also considering cost-benefit analyses and potential revenue models. By embedding these "soft skills" into the core technical training, the institution can produce graduates who are not only proficient programmers but also commercially-aware solution providers.

(iv) Innovation Competitions and Project-Based Learning (PBL)

These activities provide a safe environment for students to practice business decision-making and teamwork. By competing or working on long-term projects, they learn how to refine their ideas based on market needs rather than just technical specifications. These competitions also serve as a vital training ground for public speaking and pitching, teaching students how to effectively communicate the value of their technology to non-technical stakeholders or potential investors. Furthermore, the collaborative nature of project-based learning mimics real-world startup teams, helping students develop the leadership and conflict-resolution skills necessary for business success.

(v) Institutional Support and Incubators

Access to startup incubators and early funding opportunities is seen as a key factor in building an entrepreneurial culture. Having a dedicated space and resources on campus would help students feel more supported when trying to turn their technical projects into actual startups. Beyond physical space, an incubator acts as a professional hub where students can access legal advice, administrative support, and networking events that are often out of reach for independent beginners. This level of institutional commitment signals to the students that their creative ventures are valued, providing the formal backing needed to transition from a student project to a registered business entity.

4.6.3 Support Required to Launch IT Projects or Businesses

In order to help students shift toward an entrepreneurial mindset, students highlighted several critical forms of early-stage support they need to start a project or business in the IT field:

Theme 1: Startup Capital and Initial Funding

Securing initial financial support is the top priority for those looking to start a business. Students require early-stage funding to move their ideas from a concept or a classroom project into a functional business model.

Theme 2: Mentor Guidance and Industry Expertise

Aside from financial aid, students feel that professional advice is just as important as funding. Connecting with mentors who know the tech landscape allows them to learn from others' experiences and navigate the complexities of starting a business. This also serves as a starting point to bridge the gap between technical knowledge and the "real-world" skills needed to run a company.

Theme 3: Access to Infrastructure and Technological Facilities

Students require more than just basic equipment. They need access to a proper infrastructure including professional-grade tools, stable testing environment, and dedicated workspaces where they can develop and test their digital products in order to successfully transform their ideas into functional products.

Theme 4: Marketing Support and Industry Networking
Many students feel capable of building a product but they often struggle with the sales aspect. They find it challenging to reach their first customers without guidance on brand identity and access to networking opportunities that connect them with the right people to support their market entry and to help launch their ventures.

Theme 5: Social and Institutional Support
Establishing a supportive culture at the institutional level is vital for fostering entrepreneurial ambition among the students. When both the college and a student's peers actively value entrepreneurship, it builds the collective confidence necessary for students to take the risks associated with starting a business.

Overall, the findings demonstrate that technical skills alone are insufficient to cultivate an entrepreneurial mindset among IT students. Developing this mindset requires a holistic ecosystem comprising entrepreneurial education, experiential programs, mentorship, and institutional support. Integrating these elements will enhance student readiness to enter the entrepreneurial field with greater confidence and competitiveness.

5 CONCLUSION AND RECOMMENDATIONS

5.1 Conclusion

The findings of this study show that Certificate in Information Technology students possess a powerful, yet largely untapped, potential for "Tech-Preneurship". Their primary strength lies in their high technical competency, reflected by an overall mean score of 4.12. This mastery of "hard skills" particularly in computer hardware and networking provides a vital foundation for technical self-efficacy. Such technical maturity allows students to not only understand the infrastructure of the digital economy but also to solve complex problems and adapt quickly to industrial environments. When this proficiency is paired with their entrepreneurial mindset, a clear aspirational identity emerges; students are highly motivated to explore IT business opportunities and see themselves as future tech entrepreneurs. With an overall entrepreneurial interest mean of 3.93, these students demonstrate that they do not just want to be employees; they aim to be value-creators who can develop and market their own digital products.

However, the transition from a skilled student to a confident entrepreneur is currently blocked by a significant "Confidence-Execution Gap". While the college successfully teaches business basics through dedicated courses and creates a supportive atmosphere through lecturer encouragement and innovation programs, these "pull factors" are countered by systemic barriers. The data highlights a high level of personal doubt, with students reporting a lack of confidence to start an IT business primarily because they feel they lack the specific, practical knowledge needed to initiate a startup (mean = 3.64). This hesitation is made worse by an industrial training model that prioritizes routine technical tasks over entrepreneurial exposure (mean = 3.99) and a core IT syllabus that students feel lacks sufficient integration of business concepts (mean = 3.60).

In conclusion, while the technical training and motivational environment at Seberang Jaya Community College are highly effective, there is an urgent need to bridge the gap between "knowing" and "doing". The high mean scores for technical skills and interest suggest that the "raw materials" for successful IT entrepreneurs are already present. To turn this potential into

reality, the institution should consider moving beyond separate entrepreneurship modules and instead embed business-creation tasks directly into technical assignments. By transforming technical projects into "monetizable products" and shifting the focus of industrial training to include business operations, the college can help students overcome their lack of confidence and provide the practical roadmap necessary for them to successfully navigate the journey from certificate holder to IT entrepreneur.

5.2 Recommendations

To address the study's findings, several strategic recommendations are proposed to enhance the entrepreneurial ecosystem for Certificate in IT students:

(i) Integrated Project-Based Learning

The college should move beyond treating entrepreneurship as a standalone subject and instead embed business modeling into core IT technical modules. For example, programming assignments should not only be graded on code functionality but also on a "Product-Market Fit" presentation, encouraging students to view their technical output as a monetizable asset.

(ii) Entrepreneurial Industrial Training

The institution should collaborate with industry partners to redesign internship logs. This would ensure that students spend a portion of their training observing business operations, client acquisition, and project management, rather than focusing purely on routine technical maintenance.

(iii) Startup "Roadmap" Workshops

To bridge the gap in procedural knowledge, the college should conduct practical workshops focusing on the "nuts and bolts" of Malaysian business ownership. These should cover essential administrative tasks, such as SSM (Companies Commission of Malaysia) registration, basic bookkeeping for freelancers, and digital marketing strategies tailored for small IT startups.

(iv) Mentorship Circles

While students recognize successful role models, they need direct access to them. Establishing a mentorship program that pairs final-year students with alumni who have successfully started their own tech businesses would provide the "vicarious experience" and psychological support needed to overcome the confidence barrier.

Based on student perspectives, the findings show that technical proficiency alone is insufficient to foster an entrepreneurial mindset at Seberang Jaya Community College. Despite having strong "hard skills," students are held back by four main hurdles: financial constraints, a lack of management knowledge, a fear of risk, and a preference for the security of a monthly salary.

To address these issues, the college should close the gap between technical training and the business world by integrating fundamental business subjects such as financial management and digital marketing directly into the IT curriculum. Emphasizing "learning by doing" through startup workshops, hackathons, and bootcamps will allow students to test the commercial viability of their projects in the real world. Furthermore, a formal mentoring system and a stronger support network including incubators and early funding opportunities are essential to building student confidence and shifting their mindset from "employee" to "entrepreneur".

In addition to these structural changes, cultivating a sustainable entrepreneurial ecosystem requires a shift in the institution's cultural values and long-term support strategies. This involves moving beyond one-off events and instead creating a continuous pipeline where student projects are nurtured from the classroom to the marketplace. By providing consistent access to professional networking and industry-standard resources, the college can help students normalize the idea of business ownership, reducing the psychological barrier of risk. Ultimately, when students see their technical skills as a tool for independent value creation rather than just a qualification for employment, they become more resilient and adaptable in the face of a rapidly changing digital economy.

Development of Intelligent Automatic Fan with Temperature and Movement Monitoring Using ESP32

Mardiyana binti Mahmood[1,a], Nur Anis Hanani binti Muniff Affandee[1,b]

[1]Politeknik Kota Bharu, Kelantan.

[a)]mardiyana@pkb.edu.my, [b)]anishnani05@gmail.com

Abstract. This study presents the development of an intelligent automatic fan system using the ESP32 microcontroller as the primary control unit, responsible for processing sensor data and managing system operations. The system is designed to enhance energy-efficient airflow in enclosed environments, particularly in areas with fluctuating temperatures. By integrating a DHT11 temperature sensor and a PIR motion sensor, the system can monitor environmental conditions continuously while detecting the presence of users. The ESP32 processes the collected data to control the activation and deactivation of the DC motor driving the fan, while an LCD module provides real-time feedback on the system's status. This control approach ensures the fan operates only, when necessary, specifically when the temperature exceeds predefined thresholds and motion is detected, thereby minimizing energy consumption and maintaining user comfort. Performance evaluation under different environmental scenarios indicates that the system delivers fast, precise, and reliable responses. The findings demonstrate that ESP32 is a suitable platform for cost-effective smart automation applications, offering direct sensor data processing, stable connectivity, and support for IoT functionalities. This system is applicable in a wide range of settings, including smart buildings, offices, and public facilities, and has potential for future enhancements such as remote monitoring and air quality-based control. Overall, the development highlights the effectiveness of integrating temperature and motion sensors to create a practical, efficient, and user-friendly automated fan control system.

Keywords: ESP32, smart fan system, DHT11 sensor, PIR sensor, energy-efficient control, automated system, IoT-based automation

INTRODUCTION

The development of digital technology and the increasing awareness of sustainable energy consumption have prompted many modern buildings to adopt the concept of intelligent automation. Among the systems that are getting more attention is automatic airflow control, which aims to improve occupant comfort while minimizing energy consumption. Compared to manual control that often leads to wasted energy, intelligent automatic fan systems offer the ability to dynamically adjust ventilation according to the current conditions in the space.

In a closed environment, temperature and air quality regulation plays an important role in human comfort, health, and productivity. The fan is a key component that helps stabilize the temperature, reduce humidity, and support the performance of the air conditioner. However, manual use of the fan often causes it to operate without any real need. This happens when the fan is left rotating even though the temperature has stabilized or when no occupants are in the space.

Along with the development of smart building technology, smart automatic fan systems are becoming an option due to their ability to activate devices only when needed. Such a system can turn on the fan when the temperature rises past the comfort level or when detecting the user's movements. This approach not only continuously improves comfort but also reduces energy wastage.

In this study, the ESP32 microcontroller was chosen as the core of the control because of its ability to process data quickly, Wi-Fi connection, and compatibility with various sensors. The system also incorporates a DHT11 temperature sensor to monitor temperature changes and a PIR sensor to detect human presence. The data obtained is used to control the DC motor as a fan drive, while the LCD display works to show the status of the system to the user.

The aim of this study is to design and develop an intelligent automatic fan system that can monitor temperature and human presence directly, and control fan operation according to environmental conditions. With the integration of sensors and automatic controls, the system is targeted to be a more efficient, flexible and suitable solution for use in indoor spaces.

LITERATURE REVIEW

There have been many studies that have focused on the development of IoT-based automation systems, specifically involving fan control, temperature monitoring, and energy management using microcontroller platforms such as ESP32. These studies provide an important foundation that supports the need for the development of intelligent automatic fan systems in the context of modern buildings.

A study by Nor Suwadah Mohamed, Nor Farahwahida Mohd Noor & Arasu Puventharan (2025) *"Blynkintegrated ESP32 Based IoT System for Smart Home Light and Fan Control"* where this study developed a smart home automation system using ESP32 and Blynk application to control lights and fans. The system uses a relay module for fan and light control, as well as motor control (L298N) to set the direction and speed of the fan if necessary. Additionally through Blynk, users can remotely control this appliance (smartphone), set schedules, and check energy consumption. The study states that the system is able to provide seamless control and increase energy savings in daily use, thus proving ESP32's ability as a cost-effective automation platform in the residential sector

This is followed by a study by Mohd Hamim Sanusi & Khairul Anam Khair (2025) *"Greenhouse Environmental Control System"* where this study developed an environmental control system for greenhouses in Malaysia, with the use of sensors along with actuators such as fans to stabilize the air temperature and humidity in green structures. The system uses automation for ventilation control (fan) and irrigation system to ensure that crops are in good condition. The results of the study show that this system works to detect environmental changes and turn on ventilation fans when needed, having a positive impact on energy efficiency and crop yields.

Rifky Irfani, Achmad Aziz Rahmanto & Muhammad Edgar Gazazanata (2024) *"Design and Build an Automatic Exhaust Fan System Based on DHT11 Sensor and ESP32 Microcontroller"*. This study developed an automatic exhaust fan system using ESP32 and DHT11 sensors to improve air quality in smoking areas. The system is activated when the temperature exceeds 27°C or the humidity exceeds 60%, then the exhaust fan is turned on to drain the polluted air. The results showed a ~20% reduction in energy consumption compared to manual operation, as well as an accuracy of temperature readings of ±0.5 °C and ±2% humidity. This study is relevant because it shows how ESP32 and DHT11 can be used in fan control for environmental management especially in air quality and energy saving.

Zhamira Azreen Shazali and Jais Lias (2025) "IoT-Based Smart Home Automation System" developed an IoT-based smart home system with the aim of improving safety, energy efficiency and convenience to consumers. This study combined the use of ESP32, Arduino Mega and ESP32-CAM microcontrollers to control several home devices such as lights, fans and smart door systems. The DHT11 sensor is used for temperature control, while the PIR sensor allows the lamp to be activated based on motion detection. RFID modules are used to provide safer door access. All data in this

system is updated instantly through Firebase, allowing users to see the status of the device and control it through the mobile app more easily and quickly. EEPROM components are also used to ensure that the system is able to reconnect the Wi-Fi network after a power outage, thus improving the reliability of the system. The ESP32-CAM camera is also integrated to capture images when the doorbell is pressed, which adds value to the security aspect of the home. The results show that the system can function effectively, including temperature-based fan control, movement detection by PIR sensors up to a distance of 7 meters, as well as good operation of the door using RFID. Overall, the study proves that the combination of IoT technology, sensors, and synchronous databases is capable of producing a smart-home system that is responsive, energy-efficient, and accessible. The resulting model demonstrates the great potential of IoT in improving the functionality of modern homes through smart control, remote monitoring, and more efficient energy management.

Rohaidzam and Aziz (2025) "Smart Fan Temperature and Motion Detection" developed a smart fan system that combines DHT11 temperature sensor and two PIR motion sensors to automatically control fan operation based on ambient temperature and human presence. The system uses Arduino Uno as the main controller to process temperature and motion data before determining the appropriate fan speed level through PWM techniques using L298N motor drives. This approach aims to improve user comfort, reduce reliance on manual controls, as well as avoid wasting energy due to the fan being left to operate in the absence of the user.

Through room entry and exit detection, the system ensures that the fan only operates when there are users in the space, thus increasing accuracy compared to systems that rely solely on motion detection. The results obtained showed a consistent relationship between temperature readings and fan speed, i.e. 30% speed when the temperature exceeded 20°C, 60% when the temperature exceeded 25°C, and 100% when it exceeded 30°C. These results indicate the effectiveness of the use of PWM in controlling the output of the system fan against temperature changes in stages. Overall, this study proves that the integration of temperature sensors and motion detection can result in a flexible, responsive, and energy-friendly fan control system. With the use of Arduino microcontrollers and attendance calculation algorithms, the system supports the development of a more efficient smart home environment and is suitable for use in more modern applications.

Beki, C., Sahari, N., & Ismail, N. (2020) "Internet of Things Based Smart Home System Using ESP32 Microcontroller". This study presents the development of a smart home system using ESP32 microcontrollers and IoT platforms. Its main goal is to reduce the waste of electricity when consumers forget to turn off electrical appliances such as lights and to help individuals with disabilities so that they can control the equipment remotely. The system was developed using Ubidots STEM as an MQTT (broker) server, where the ESP32 sends the status of the equipment (ON/OFF) and receives control comments from the mobile application or computer. Users can turn electrical appliances on or off through the app or web interface, and the status of the appliances will be

updated and displayed on the Ubidots control panel. The system has proven to be useful in helping users manage equipment remotely, saving time and improving quality of life, especially for those with limited capabilities.

PROBLEM STATEMENT

Although automation technology exists, the use of manual fans is still widespread. The main problems identified are:

1. User discomfort – the fan often does not turn on or off according to changes in temperature or human presence.
2. Energy wastage – continuous uncontrolled use of the fan causes electricity consumption to increase.
3. Absence of real-time information – users cannot know the temperature or status of the room environment directly.

Therefore, the development of an automatic fan system with accurate sensors is essential to overcome the problem and improve energy consumption efficiency and user comfort.

OBJECTIVE

The study was conducted with the following objectives:

1. Developed an automatic fan system using the ESP32 microcontroller capable of detecting temperature, humidity, and human movement.
2. Ensure that the system can automatically control the fan based on accurate and consistent sensor readings.
3. Provides real-time display of temperature, humidity, and system status information using LCD.

METHODOLOGY

This chapter discusses the methodology used to conduct the study including project planning, project flow charts, and design flows used in these projects. The project methodology and measures used during the project are depicted in the flowchart in Figure 1,

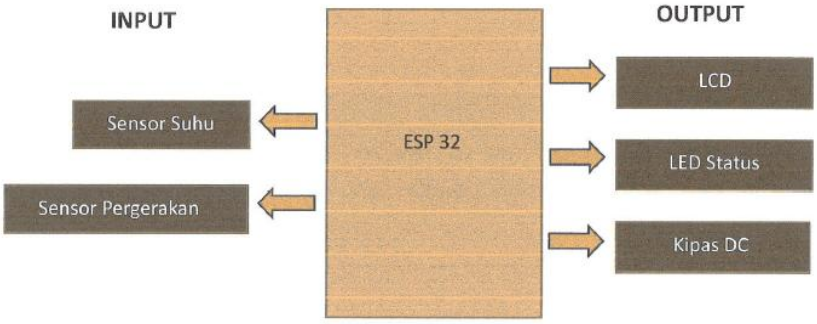

Figure 1: Project block diagram

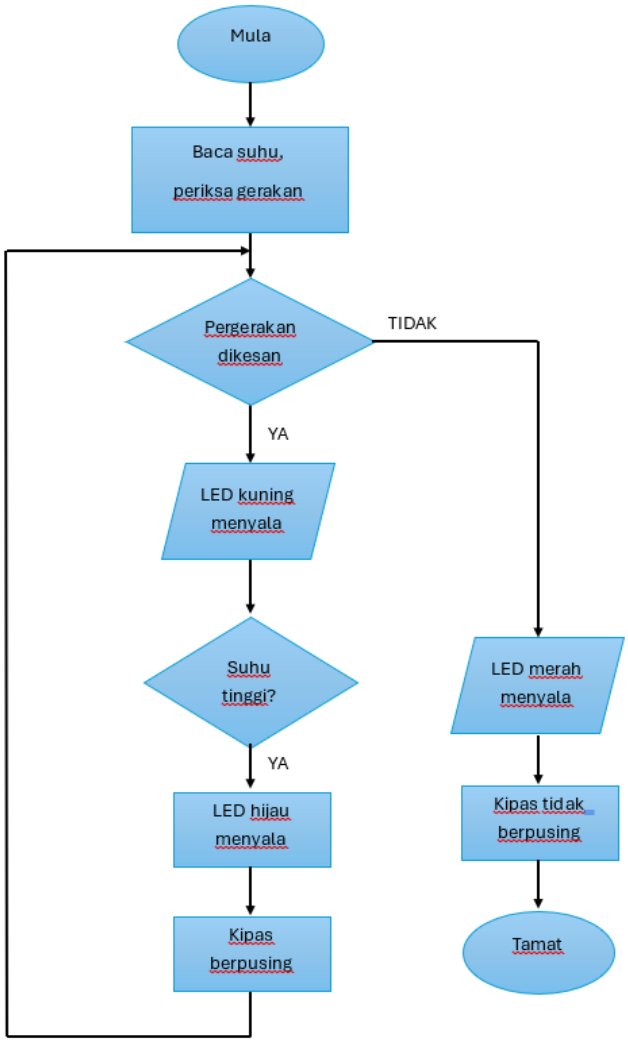

Figure 2: Project implementation flowchart

This study used an experimental design to develop and evaluate an automated fan system that operates based on the detection of human movement and ambient temperature. The methodology includes several main phases: system requirements analysis, hardware selection, circuit design, software development, system integration as well as performance evaluation.

A. System Requirements Analysis

The initial phase involves the process of identifying the functional requirements of the system. The fan must be able to be activated automatically when the sensor detects the presence of humans or when the ambient temperature exceeds a predetermined value. Figure 2 gives a brief overview of the proposed fan design as well as the installation of the sensors that will be used in the project prototype where the fan only works when there is a human presence and the temperature exceeds a certain value.

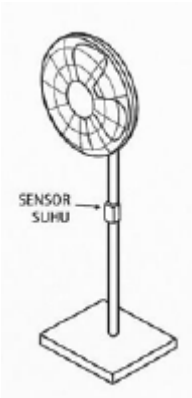

Figure 2: Prototype of the fan design proposal

In addition, the system also needs to save energy by turning off the fan when no movement is detected and the temperature returns to normal. These requirements form the basis for the selection of components as well as the overall design of the system and are shown in Table 1.

Table 1 : Truth table of project

INPUT		OUTPUT				
Temperature Sensor (DHT11)	Motion Sensor (PIR)	Red LED	LED Yellow	Green LED	DC Fan	Status LCD
Low	None	0	0	0	0	Standby (Suhu rendah)
Moderate	Yes	0	1	0	1	Aktif (Kipas perlahan)
High	Yes	0	1	1	1	Aktif (Kipas laju)

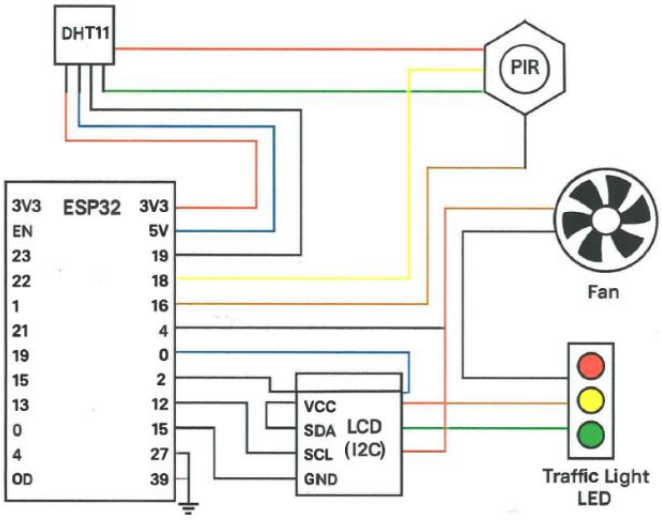
B. Selection of Hardware Components

The main components used are:

1. **Microcontrollers (Arduino/ESP32):** Acts as the main processor for data collection and operational control.
2. **PIR sensor:** Detects human movement
3. **Temperature Sensor (DHT11):** Measures ambient temperature
1. **Relay Module:** Performs a switch function to turn the DC fan on or off.
2. **Electric Fan:** The main device is controlled by the system.
3. **Power Supply:** Supplies a stable voltage to the entire circuit.

C. Circuit Design and System Configuration

The circuit design involves connecting all the sensors and components used to the ESP 32 microcontroller using PROTEUS. The PIR sensor and temperature sensor are connected to the microcontroller's input pin, while the relay module is connected to the output pin to control the fan as shown in Figure 3. Aspects of electrical safety and circuit isolation are given priority.



Rajah 3: Project circuit connection

D. Software Development

A control algorithm is built and uploaded to the microcontroller using a program programming approach using the Arduino Integrated Development Environment (IDE) software. The algorithm performs the following functions:

1. Take temperature readings regularly.
2. Detect any movement using the PIR sensor.
3. Activates the fan when movement is detected.
4. Turning on the fan when the temperature exceeds the set value
5. Turn off the fan when there is no movement and the temperature is at a normal level.

E. System Integration and Function Testing

Once the hardware and software development process is complete, all components are combined into a single prototype as shown in Figure 4. The system then undergoes the following tests:

1. Motion Detection Test: Assesses the sensitivity and stability of the PIR sensor.
2. Temperature Accuracy Test: Ensures accurate temperature readings in a variety of conditions.
3. Fan Activation Test: Evaluates the relay response and system reaction time.
4. Real Environment Test: The system is tested in real space to assess the response to movement and temperature variations.

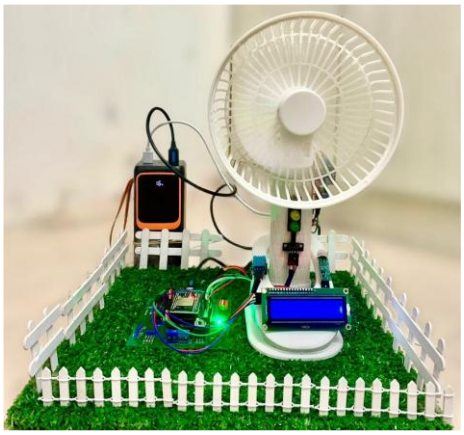


Figure 4: Prototype of the Project model

F. Performance Evaluation and Optimization

The final phase involves evaluating the system's performance in terms of tracking accuracy, fan control efficiency, energy saving and operational stability. Any weaknesses such as slow response or instability of temperature readings are analyzed and corrected through adjustment of the set values, tuning of the sensitivity of the sensor and optimization of the control logic.

ANALYSIS AND RESULTS

Table 2 shows the results of tests conducted on the system prototype. The test aims to assess how the system responds to temperature changes and the detection of human presence. Components tested include DHT11 temperature sensor, PIR motion sensor, LED, LCD display, and DC fan motor.

Jadual 2 : Hasil Ujian Berdasarkan sensor suhu dan pergerakan

Status	Temperature readings (^oC)	Human presence	Status LED	Fan Status	LCD Display
1	<28 ^oC	Tiada	RED(OFF)	Inactive	Low Temperature (Standby)
2	28 ^oC -31 ^oC	Ada	YELLOW (ON)	Slow Fan	Moderate Temperature (Kipas Aktif)
3	>31	Ada	GREEN (ON)	Speed Fan	High Temperature (Active Fan)
4	>31	Tiada	RED (ON)	Inactive	Fan OFF

The results obtained are as follows:

1. The DHT11 sensor shows stable performance in temperature detection, with a reading variation of around ±1°C.
2. The PIR sensor successfully detects human movements in the range of 3–5 meters with a response time of between 1 to 2 seconds.
3. The fan is only activated when both high temperature conditions and human presence are met.
4. The LCD display displays the data directly, making it easy for users to monitor the system status and current temperature.

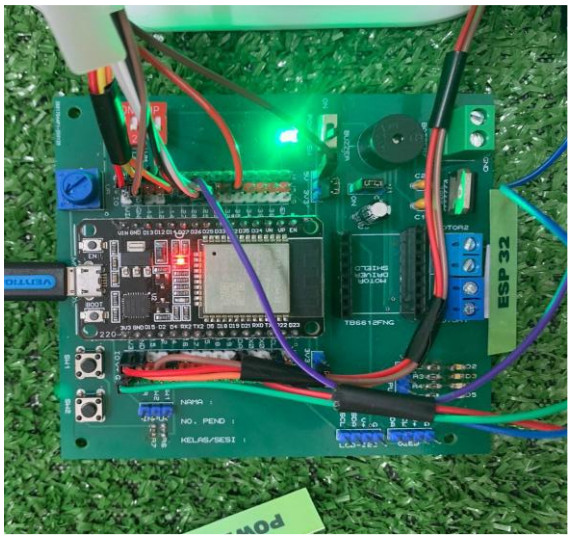

Figure 4:Circuit connections on the PCB board

Figure 4 shows the circuit connections on the PCB board. The green LED indicates a stable power supply, while the red LED on the ESP32 indicates the system is active and ready to receive instructions from the computer. Component connections such as LCDs, DHT11 sensors, PIR sensors, and relays are checked to ensure that all pins are in the correct position.

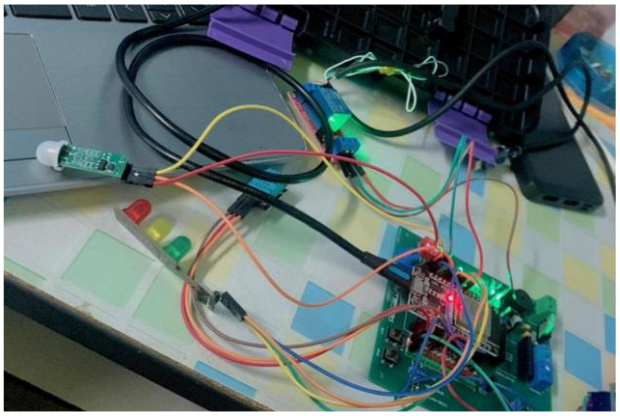

Figure 5: Testing Project components

Figure 5 shows the tests carried out on three main components: LCD, PIR sensor, and DHT11 sensor. Each component is tested separately before being combined to ensure that there are no short circuits or connection errors. The PIR sensor works when detecting movement, marked with a green LED flame, while the DHT11 sensor records the ambient temperature. The readings from both sensors are displayed on the LCD via the ESP32. This test is conducted to ensure that communication between input and output occurs smoothly and accurately.

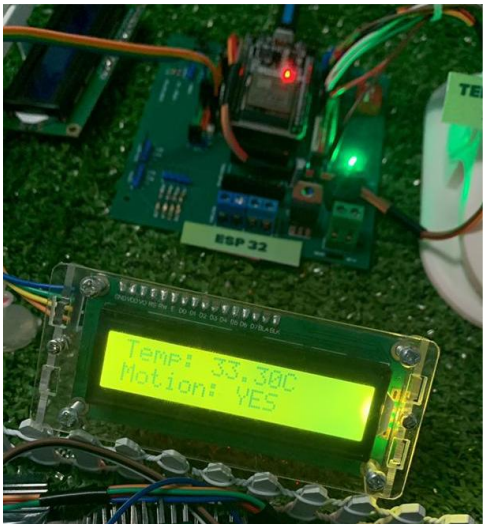

Figure 6: LCD Testing

Testing was performed on a 16x2 LCD component connected to the ESP32 as shown in Figure 6. The purpose of this test is to ensure that the LCD display is working properly and can display readings from the sensor. The display shows the temperature (Temp: 33.3°C) as well as the motion detector (Motion: YES), indicating that the connection between the DHT11 sensor and the PIR sensor to the ESP32 is working correctly. This result proves that the system can display the data in real-time (real-time display).

Figure 7: The process of downloading the program from the Arduino IDE software to the ESP3 board

Figure 7 shows the process of transferring the program completely from the Arduino IDE software to the ESP32 board. After the download process is complete, testing is carried out on a complete model containing a fan, LCD, and sensor. This test aims to ensure that each component operates properly.

The test results show that the developed system is effective in automatically controlling the fan according to environmental conditions. The main functions of the system can be summarized as shown in Table 3.

Table 3: Project testing summary

Komponen	Status Pengujian
Automatic Temperature Control (DHT 11 temperature sensor)	The fan operates automatically when the temperature exceeds the set level. This proves that the DHT11 sensor works well in adjusting the fan speed based on temperature
Presence Detection (PIR Motion Sensor)	The PIR sensor only activates the fan when it detects human movement. This saves electricity because the fan does not work when there is no user
LCD Display	The LCD display makes it easy for users to know the current temperature and status of the system. This enhances user-friendly features as well as helps in system monitoring.
System Stability	The ESP32 works well as the main controller, processing inputs from both sensors without significant delays. The system also showed high reliability throughout the test period.

Overall, the project shows that the combination of temperature and motion sensors can result in a single automated system that is effective and easy to use

CONCLUSIONS AND RECOMMENDATIONS

This study has successfully developed an automatic fan control system using a combination of DHT11 temperature sensor, PIR motion sensor and ESP32 microcontroller. The test results showed that the system was capable of operating autonomously based on two main parameters, namely changes in ambient temperature and human presence. The fan can be activated precisely when the temperature rises above the set value or when human movement is detected. In addition, the system also automatically switches off the fan when the temperature returns to normal levels or no movement is detected within a certain period of time.

These results prove that the use of ESP32 is very suitable for intelligent automation applications. The ESP32's ability to process sensor data directly, connection stability, as well as support for IoT functions make it a viable platform for environmental control systems. Furthermore, the integration of DHT11 and PIR sensors has shown consistent performance with satisfactory response rates in real test situations. The developed

system not only improves user comfort, but also has the potential to save energy by reducing unnecessary fan operation.

Overall, the project successfully proved that the combination of temperature and motion sensors can produce an effective and practical automatic control mechanism for domestic and commercial applications. It also opens up space for the expansion of functions towards the development of more sophisticated intelligent automation systems, in line with the requirements of modern technology.

To improve the effectiveness of the system and expand its application in the future, several suggestions for improvement are proposed:

1. More Accurate Sensor Integration Temperature sensors such as DHT22 or high-precision digital sensors can be used to obtain more stable and accurate temperature readings, especially in changing environments.
2. IoT Connection for Remote Monitoring With the ESP32's WiFi capability, the system can be enhanced with IoT platforms such as Blynk or MQTT to enable monitoring of temperature, fan status, and manual control via mobile app.
3. Energy Efficiency Assessment Advanced studies can assess the amount of energy saved by these automated systems compared to the use of conventional fans over a given period of time.
4. Addition of Air Quality Sensors Additional sensors such as the MQ-135 or dust sensors can be integrated to control the fan based on indoor air quality, not just temperature or user attendance.
5. More Practical Case Design Improvements in terms of physical design such as circuit boxes, sensor positioning, and permanent mounting can be made to improve durability and ease of use.
6. Testing in Multiple Environments Future studies may conduct tests in different locations such as classrooms, offices, laboratories, or industrial spaces to assess the applicability of the system in various operational scenarios.

An External Stakeholder–Driven Program Needs Analysis for a Proposed Diploma in Machining Technology: A Pilot Study in Politeknik Tuanku Sultanah Bahiyah

Neoh Hock Seng*

Mechanical Engineering Department, Politeknik Tuanku Sultanah Bahiyah,
Kulim Hi-Tech Park, Kedah, Malaysia

nhs167@gmail.com

Abstract. Program Needs Analysis (PNA) is an essential task for developing relevant, up-to-date Technical and Vocational Education and Training (TVET) courses in Malaysian polytechnics. Presently, most PNA studies for Malaysian polytechnics rely predominantly on internal stakeholders' perspectives, which may not capture rapidly evolving job-market skills needs. Instead, this pilot study prioritizes feedback from industry practitioners and alumni to evaluate the need to propose the Diploma in Machining Technology program at Politeknik Tuanku Sultanah Bahiyah (PTSB). Data collection involved administering questionnaires to industry representatives and PTSB alumni. The feedback was analyzed based on Cronbach's Alpha, Principal Component Analysis (PCA), and Chi-Square tests. Among 109 alumni respondents, Cronbach's alpha values ($\alpha = 0.773$) indicated acceptance of the proposed program by both stakeholders. PCA revealed three important competencies: technical skills, operational and industrial practice, and supporting engineering skills. Among the 54 industry respondents, the dominant PCA component (eigenvalue = 2.04) indicated strong consensus on the importance of machining and automation as core competencies. On the other hand, alumni showed varied perceptions regarding differences between skill application and workforce requirements. Chi-square analyses, which showed statistical significance ($p < 0.001$), indicated near-unanimous agreement on the importance of machining, robotics, and automation skills, as well as the necessity of the proposed program. This pilot study has made a methodological contribution by reducing institutional bias and introducing more rigorous analysis of PNA results within the context of Malaysian polytechnics.

Keywords: Program Needs Analysis, Machining, External Stakeholders

Introduction.

Rapid progress in manufacturing technology, encompassing machining, robotics, and automation, has brought about new types of workforce skill requirements. Currently, the adoption of Industry 4.0 has increased demand for workers with particular skills in Computer Numerical Control (CNC) programming and CAD/CAM integration [1],[2]. In response to this challenge, it is essential to continually upgrade curricula to ensure technical programs offered by Malaysian polytechnics remain relevant and up-to-date, thereby meeting the requirements of the present-day job market.

PNA is commonly used in the Malaysian polytechnic system to justify curriculum revisions and the introduction of new courses [3]. Current PNA studies have frequently relied

primarily on internal stakeholders' feedback, from lecturers and students, to design and update the curriculum [9]. Feedback from industry is used as a supporting input for curriculum update. This may introduce unintentional bias, as internal stakeholders interpret program relevance primarily through the existing curriculum rather than what the industry needs [4][10][11]. This approach may prove less effective at anticipating rapidly evolving skill demands, where the quick adoption of the latest technological advancements outpaces curriculum revision. Industrial practitioners are well-positioned to articulate the current skill requirements of the workforce. Alumni have experiential exposure to bridging technical education and employment realities.

Another drawback of current approaches in PNA is the heavy reliance on Likert-scale analysis using Cronbach's Alpha. Cronbach's Alpha [5] measures the internal consistency of questionnaires and of a single construct. However, it fails to account for the fact that multiple constructs may be related to various industrial needs.

To address these drawbacks, this pilot study employs a more comprehensive analytical framework that uses not only Cronbach's Alpha but also Principal Component Analysis (PCA) and Chi-Square tests [6]. Pilot studies [7] have been carried out to develop TVET programs at Malaysian institutions. The aim is to obtain preliminary empirical evidence from the external stakeholders to identify key constructs relevant to the industry and the job market. The results obtained from this pilot study will be used as a foundation for the implementation of more comprehensive and larger- scale PNA studies of proposed technical and engineering programs in Malaysian polytechnics.

Methodology

The pilot study was conducted by distributing two sets of online questionnaires to industry professionals and PTSB alumni, respectively. It adopts a quantitative survey design. It aims to gather initial data prior to larger scale implementation. The participation was fully anonymized and no personal information were collected to ensure privacy.

The industry respondents, totaling 54, were heavily involved in the manufacturing-related fields such as machining, robotics, and automation. The selection criteria for the industry respondents was that they had to have at least 2 years of working experience in these fields. This was to ensure that the respondents possessed sufficient knowledge and exposure to assess the proposed program's relevance.

The alumni respondents, totaling 109, were drawn from the mechanical engineering graduates who possess at least 2 years of working experience in the manufacturing sector. The questionnaires were distributed to these respondents through the alumni's database.

The questionnaires for each stakeholder contained two sets of questions, which were structured on a Likert scale and the Yes/No format, respectively. The Likert scale (1 = Not Important At All , 5 = Extremely Important) ranged from 1 to 5 to assess the respondents' degree of agreement regarding skills relevant to current industrial needs. The mean and standard deviation for each Likert response indicated the degree of consensus. This was to assess the respondents' perception regarding core competencies such as CNC, CAD/CAM, robotics, automation and quality control. Cronbach's Alpha measures the internal consistency of items measuring the same construct.

The Yes-No format evaluated respondents' consensus on aspects such as program necessity, employability, and industry-academia collaboration. Principal component analysis was used to identify latent constructs such as the importance of automation and

industrial collaboration. The chi-square test was used for the Yes/No responses. This test evaluated the difference between the expected and observed frequencies of the responses. This ensured that response patterns among alumni and industry occurred beyond chance.
Prior to conducting the survey, the content validity of the questionnaires was assessed by 3 academic staff and 1 industry practitioner with relevant industry experience in the manufacturing sector. A small-scale pre-pilot survey involving 5 alumni and 5 industry respondents was conducted to assess the validity of the questionnaire items.

Results and Discussion

Table 1 Mean, Standard Deviation, and Cronbach Alpha (Alumni)

Item	Questions	Mean	Standard Deviation	Cronbach Alpha
Q1	To what extent is industrial machining technology relevant to current industry needs?	4.1376	1.0226	= 0.773
Q2	To what extent is CNC machine operation important in today's manufacturing industry?	4.4679	0.8668	
Q3	To what extent are CAD/CAM software skills important in the field of industrial machining?	4.5872	0.7355	
Q4	To what extent is the ability to read technical drawings important in machining work?	4.7339	0.6183	
Q5	To what extent are quality control and product inspection skills important in the machining industry?	4.7615	0.5073	
Q6	To what extent are robotics and automation technologies relevant to your current or previous job role?	4.2936	0.9652	
Q7	How important is the aspect of 'Robotics Programming' in the field of robotics and automation?	4.5229	0.6176	
Q8	To what extent is the aspect of 'Automation System Integration' important in the field of robotics and automation?	4.5505	0.6595	

Table 1 presents the questionnaire items and their Likert-scale responses for the PTSB alumni. There were 109 respondents in total. The consistently high mean values indicated strong support for the importance of machining, CAD/CAM, CNC, robotics, and automation. The low-to-moderate standard deviation indicated strong agreement on the importance of these elements. The Cronbach's Alpha value of 0.773 indicated internal consistency of the responses. This value exceeded the commonly accepted threshold value of 0.7. [5]
Principal component analysis identified 3 important constructs with eigenvalues of more than 1.0. The first principal component represents core technical competencies, including machining, CNC, and CAD/CAM. The second principal component is associated with operational and industry-related practice. The third principal component is associated with supporting engineering skills[12]. This indicates that alumni perception of machining-

related competencies is multidimensional. This is prevalent in Malaysia's manufacturing landscape which encompasses high-tech facilities in multinational companies and smaller scale local companies with more traditional industrial processes.

Table 2 Chi-Square Goodness of Fit Test (Alumni)

Item	Questions	Yes	No	χ^2	p
Q1	Do you support the offering of robotics and automation elements as part of the Diploma in Industrial Machining Technology curriculum?	104	5	89.92	<0.001
Q2	Do you support the offering of the Diploma in Industrial Machining Technology program at Malaysian polytechnics?	107	2	101.15	<0.001
Q3	Do you believe this program can increase the marketability of graduates in the industry?	107	2	101.15	<0.001

Chi-square goodness-of-fit test was conducted to determine whether alumni responses differed significantly from an equal yes/no distribution. All 3 responses yielded significantly high values ranging from 89.92 to 101.15. The responses indicated overwhelming support (104 out of 109 respondents) not only for the proposed program but also for the inclusion of robotics and automation. 107 out of 109 respondents believed the proposed program would improve graduates' employability. These preliminary findings suggest that the respondents recognized the growing importance of new manufacturing-related technologies.

Table 3 Mean, Standard Deviation, and Cronbach Alpha (Industry)

Item	Questions	Mean	Standard Deviation	Cronbach Alpha
Q1	How familiar is your organization with industrial machining technologies? How important is machining technology to your organization's operations?	2.962	0.919	0.735
Q2	How important is machining technology to your organization's operations?	3.308	0.805	
Q3	How important are automation and robotics in your machining or manufacturing processes?	3.132	0.962	

Table 3 presents the Likert-scale responses from industrial stakeholders. 54 respondents were involved. As in the previous case, responses were recorded on a five-point Likert scale. The Cronbach's Alpha value of 0.735 indicated acceptable reliability and consistency of the items measuring the industry's perception of the proposed program. Principal component analysis (PCA) yielded a dominant component with an eigenvalue of 2.04, which accounts for over 68% of the total variance. This dominant component is

associated with machining and related competencies. This supports the interpretation that the questionnaire items measure a coherent construct reflecting the industry's perception and relevance of machining competency. Although the mean and standard deviation values of the Likert responses show moderate support, there is clear recognition of the importance of machining technologies. However, greater variability is shown in respondents' perception of robotics and automation.

Table 4 Chi-Square Goodness of Fit Test (Industry)

Item	Questions	Yes	No	χ^2	p
Q1	Does your organization currently employ technicians or engineers specializing in machining or machining technology?	42	11	18.13	<0.001
Q2	Are you currently facing skill gaps in machining technologies among your technical workforce?	37	16	8.32	0.004
Q3	Does your organization utilize automation or robotic technologies in machining operations?	43	10	20.55	<0.001
Q4	Are you experiencing skill shortages in automation and robotics among your workforce?	37	16	8.32	0.004
Q5	Do you think a Diploma in Technology in Industrial Machining is necessary for Malaysian polytechnics?	53	0	53	<0.001
Q6	Would your organization consider hiring graduates from this diploma program?	48	5	34.89	<0.001
Q7	Would your organization support internships or collaborative projects with students from this program?	43	10	20.55	<0.001
Q8	Would you like to partner with Malaysian Polytechnics to support this diploma program?	46	7	28.7	<0.001

Table 4 shows the yes/no responses for each item. The Chi-Square Goodness-of-Fit test was carried out to assess the discrepancy between the observed yes/no responses and the equal yes/no distribution. Almost all responses yielded statistically significant chi-square values($p<0.01$). This indicates strong consensus among the respondents. Respondents showed almost unanimous agreement in the proposal of the new machining course. This shows a strong evidence on the industry's demand for the proposed course. Of particular interest are the items Q2 and Q4. The majority of respondents express the need for workers with equipped with latest technological know-how. These findings align with studies by Zeidan and Bishnoi [8] which emphasized the importance of industry-aligned programs. Overall, the results affirm that industry endorsement is clear and statistically significant.
The results obtained from this study complement several prior investigations. Manogaran et al. [3] and Pauzi et al. [4] have carried out PNA studies relying primarily on internal stakeholders. The present study, which is anchored on external stakeholders-alumni and

industry- is more statistically robust. The identification of needed core competencies for industries via Principal Component Analysis (PCA) represents an added advancement over the purely Cronbach Alpha-based analysis. This offers a stronger basis for curriculum design [13][14]. The divergence between the perceptions by the industry and alumni respondents is an interesting finding that warrants deeper study on a larger scale PNA to be implemented in the future.

Conclusion

Results from this pilot PNA study supported the necessity and relevance of the proposed Diploma in Machining Technology program. Analysis of industry and alumni responses indicated consistent recognition of the importance of machining, automation, and robotics in manufacturing. The Likert-scale responses indicated high agreement with low variability on the importance of core skills such as CAD/CAM, CNC, robotics, and automation. Principal component analysis revealed that industrial practitioners considered machining and automation as core competencies. On the other hand, alumni viewed machining, CNC, CAD/CAM, and supporting engineering skills as important constructs. The chi-square test of the Yes/No responses indicated strong and consistent agreement among stakeholders regarding the program's necessity and the importance of machining and automation competencies.

However, this study has several limitations. The purposive sampling in this study may incur selection bias. In the future, stratified random sampling should be done to ensure representation across manufacturing sectors and firm sizes. The questionnaires' content, although validated by experts, has not undergone a full confirmatory factor analysis (CFA)[15]. This is usually required for a large-scale study.

The outcome of this pilot study indicated not only support for the proposed Diploma in Machining Technology program, but also a strong consensus for the need to possess core competencies and skills in manufacturing. The preliminary results from this pilot study will serve as the basis for larger-scale PNA studies, involving Polytechnics across Malaysia. Prioritizing external stakeholder input in PNA studies is essential to ensure that TVET programs constantly align with the evolving demands of Malaysia's job market. Results from these studies will provide more comprehensive feedback for policymakers.

Abstract. The Fourth Industrial Revolution (IR 4.0) has drastically transformed the industrial landscape, requiring Technical and Vocational Education and Training (TVET) educators to possess advanced technical competencies to effectively supervise Final Year Projects (FYP). This study evaluates the awareness and technical readiness of FYP supervisors at the Department of Mechanical Engineering, Polytechnic Sultan Mizan Zainal Abidin (PSMZA), and examines the role of institutional support in facilitating this transition. A quantitative survey was conducted involving 38 academic staff members. The research instrument covered six key domains: awareness, preparedness, technology utilization, institutional support, and academic beliefs. The results indicate that while supervisors demonstrate a relatively strong conceptual understanding of IR 4.0 ($M = 3.61$, $SD = 0.64$), a notable gap exists regarding practical application. Despite a high willingness to assist students ($M = 3.53$), supervisors' self-perceived practical experience remains low ($M = 2.76$). Pearson correlation analysis reveals a significant positive relationship between IR 4.0 knowledge and supervisory readiness ($r = 0.472$, $p = 0.003$), as well as technology utilization ($r = 0.429$, $p = 0.007$). Furthermore, ANOVA results indicate no significant difference in readiness based on years of supervisory experience ($p = 0.722$). As this study focuses on a single institution (PSMZA), the findings are context-specific and should be interpreted with caution when applied to other TVET settings. The study concludes that educator readiness is heavily influenced by institutional support. Strengthening technical training and enhancing infrastructure are essential to bridge the gap between conceptual understanding and the practical implementation of IR 4.0 in FYP supervision.

Keywords: Industry 4.0, Lecturer Readiness, TVET, Technical Skills, Institutional Support, Engineering Education.

Introduction

The Fourth Industrial Revolution (IR 4.0), hereafter referred to as IR 4.0, has fundamentally reshaped the global industrial landscape. By integrating digital technologies such as the Internet of Things (IoT), Artificial Intelligence (AI), smart automation, and big data analytics, IR 4.0 has significantly transformed industrial processes [1]. By integrating digital technologies such as the Internet of Things (IoT), Artificial Intelligence (AI), smart automation, and big data analytics, IR 4.0 has significantly transformed industrial processes [1]. This transformation goes beyond merely changing production and service processes. It is actively redefining the skill sets required for the future workforce, placing a heavy emphasis on technological fluency, systemic thinking, and complex problem-solving [1]. Hence, the education sector,

particularly Technical and Vocational Education and Training (TVET), plays an important role in preparing graduates to meet the challenges of IR 4.0.
Consequently, the education system, particularly Technical and Vocational Education and Training (TVET) play a significant role in preparing graduates to meet industry demands [6], [7]. Within engineering education, the Final Year Project (FYP) serves as a key platform for integrating theoretical knowledge with practical application [2]. Therefore, the readiness and preparedness of FYP supervisors are considered important factors influencing project outcomes and learning effectiveness.
The integration of IR 4.0 in engineering education has been analyzed from various viewpoints, including the readiness of students, IR 4.0 integration at the teaching level, and teaching practices. However, the readiness of the supervisors has received little, if any, attention, especially in the Malaysian TVET setting [3], [4] Findings thus far show that, notwithstanding the awareness of IR 4.0 importance among lecturers, the distribution of in-depth knowledge, experience, and confidence in handling IR 4.0-based projects appears to be uneven [5].

The primary aim of this research is to address the gaps by exploring the dimensions of readiness among educators in the TVET sector. Specifically, this study seeks to identify the current level of awareness and technical readiness among FYP supervisors regarding the various technologies associated with IR 4.0. Furthermore, the research aims to examine the relationship between institutional support, encompassing both training and facilities, and the readiness of these supervisors to manage and guide IR 4.0 based projects. Finally, this study intends to determine the primary challenges and barriers faced by supervisors when attempting to integrate IR 4.0 elements into the FYP cycle.

In alignment with the research objectives, several key questions are formulated to guide this investigation. First, the study addresses the extent of awareness and readiness among TVET FYP supervisors in implementing projects that are aligned with IR 4.0 requirements. Secondly, it explores the degree to which institutional support influences the overall readiness of supervisors in adopting and mentoring these new technologies. Lastly, the research investigates the critical barriers and practical constraints that prevent FYP supervisors from fully embracing and integrating IR 4.0 standards into the students' final year projects.

In addition, this study is grounded in the concept of self-efficacy, which explains that an individual's confidence in their ability to perform a task significantly influences their readiness and performance. In the context of IR 4.0 integration, educators' readiness is not only determined by their level of knowledge, but also by their confidence in applying that knowledge in supervising student projects. Therefore, this study also considers the role of institutional support in enhancing educators' self-efficacy and readiness.

Literature Review

Industrial Revolution 4.0 (IR 4.0) refers to the technological revolution in the industrial and manufacturing sectors enabled through the efficient use and integration of various digital technologies like the Internet of Things (IoT), Artificial Intelligence (AI), and Big Data. This transformation has significant implications for the education sector, including engineering and TVET. As a result, one of the key objectives for these institutions is to produce highly trained students who are in line with industry demands [6, 7].

This transformation includes a heightened focus on project-based learning, digital integration, and robust industry-academia collaborations [8]. However, much of

the existing research remains preoccupied with macro-level curriculum development and institutional policy, often overlooking the pivotal role of lecturers as the primary implementers at the micro-level. Within the Malaysian TVET landscape, the adoption of IR 4.0 appears uneven across institutions, primarily due to constraints in facilities, inadequate training, and varying levels of human capital readiness [9]. This disparity underscores the fact that the successful integration of IR 4.0 is influenced not only by physical infrastructure, but also by the awareness, knowledge, and competency of educators.

A level of awareness and know-how are critical prerequisite steps to ultimately determine the preparedness of lecturers in incorporating the use of IR 4.0 technology in their teaching and supervision domains. According to [6] lecturers need to possess elementary level of know-how about the concepts of IR 4.0 and its application in such a manner that the know-how could be successfully transferred to the students. However, according to [10] the level of awareness about IR 4.0 among the educators remains moderate in many respects, and there are still areas of gaps in their level of training and experience in technology. This has been reaffirmed by [11] who clarified in their research that though the TVET educators are aware of the significance of IR 4.0 technology, yet a level of lack of confidence in applying the technology in a learning and project supervision process still exists. A key concern is the limited industry exposure and lack of systematic training, which may hinder the effective application of IR 4.0 technologies.

The readiness of FYP supervisors comprises self-efficacy, technical expertise, work experience, and the ability to teach and assess the application of IR 4.0 technology in projects. According to [12] readiness is largely dependent on the supportive nature of the organization and professional development opportunities provided to the individual. Institutional support, including resources and professional development opportunities, plays a significant role in enhancing lecturers' readiness [13].The essential role played by the FYP supervisor in the program as the technology mentor, assessor, and facilitator of the project-based learning process influences the extent to which the FYP projects apply the IR 4.0 technology, considering that the inability to apply the technology may influence students' ability to meet industry expectations.

Previous studies have extensively examined the integration of IR 4.0 technologies in engineering and TVET education, particularly in terms of curriculum development, institutional readiness, and lecturer competencies. However, limited attention has been given to the readiness of FYP supervisors in guiding students to apply IR 4.0 technologies. To synthesise existing findings and identify research gaps, Table 1 summarises selected empirical and conceptual studies related to Industry 4.0 readiness in higher education and TVET contexts.

Table 1: Summary of Literature on Lecturers' Readiness for Industry 4.0 in Engineering Education

Author(s)	Context	Focus	Key Findings	Relevance to Current Study
[10]	Malaysian Polytechnic lecturers.	Level of awareness and readiness towards I4.0.	Findings indicate a positive attitude toward I4.0, but a need for more intensive technical training.	Establishes a baseline for the readiness levels specifically within the Malaysian polytechnic system.
[14]	Vocational colleges in Malaysia.	Awareness and knowledge levels of Industry 4.0 (IR4.0).	Teachers generally have high awareness but moderate technical knowledge regarding specific I4.0 pillars.	Highlights the gap between theoretical awareness and practical application in Malaysian TVET.
[11]	TVET educators (Systematic Review).	Readiness and challenges in implementing I4.0.	Identifies infrastructure, curriculum updates, and mindset changes as the primary challenges.	Offers a comprehensive overview of global challenges that apply to the Malaysian context.
[8]	Human Resource Management.	Holistic approach to skills and competencies.	Future educators need a mix of technical, social, and methodological competencies to succeed in I4.0.	Categorizes the specific types of competencies (skills) that lecturers need to develop.
[7]	Education and Technology.	Combined perspective of tech and education.	Argues for a shift in pedagogy where technology is integrated into the core of engineering education.	Supports the need for curriculum redesign alongside lecturer training.
[9]	TVET educators in Malaysia.	The role of technical skills and institutional support in readiness.	Institutional support and technical competency are significant predictors of an educator's readiness for I4.0.	Provides a framework for the relationship between organizational support and individual readiness.

As shown in Table 1, most prior studies focused on general lecturer awareness, curriculum alignment, or institutional preparedness for IR 4.0. Very few studies specifically addressed the supervisory dimension of FYP, particularly within a single-department polytechnic context. This gap highlights the need for an empirical investigation into supervisors' readiness, confidence, and institutional support in guiding IR 4.0–based FYPs, which forms the basis of the present study.

The integration of IR 4.0 technologies within FYP has been reported to significantly enhance project quality, innovation levels, and graduate employability [7]. Students exposed to technologies such as the Internet of Things (IoT), digital simulation, and data analytics demonstrate superior problem-solving capabilities and a higher readiness to operate within modern industrial environments. However, the successful execution of these projects is heavily contingent upon the supervisor's ability to provide effective mentorship. [9] observed that a lack of supervisory experience in IR 4.0 remains a primary barrier to the comprehensive integration of these technologies in student-led projects.

To enhance readiness among supervisors, continuity in professional development and strong institutional support are paramount. According to [11], implementing IR 4.0 at TVET colleges requires efficient training methods that expose students to the newest hardware and software capabilities. Additionally, embracing flexibility and supporting the technological revolution in education go hand in hand with having a favorable opinion of IR 4.0 [10]. Some academics view IR 4.0 as being of central importance to the future of engineering education, and this perception often translates into a sense of preparedness.

Self-efficacy refers to an individual's belief in their ability to successfully perform specific tasks. In the context of education, lecturers with higher self-efficacy are more likely to demonstrate confidence in applying new technologies and guiding students effectively. Previous studies suggest that while educators may possess adequate knowledge of IR 4.0, their lack of hands-on experience may limit their confidence in implementation. Therefore, self-efficacy plays a crucial role in bridging the gap between conceptual understanding and practical application in IR 4.0-based teaching and supervision.

Based on the literature review, one finds that most previous works have focused on the general level of awareness among lecturers on how curricula are shaping up and how institutions in general are preparing for IR 4.0. However, there is a remarkable absence of empirical studies that focus precisely on how well prepared FYP supervisors are, particularly within the framework of a department or one single TVET institution. By conducting such a study, this paper seeks to determine how prepared FYP supervisors within the Department of Mechanical Engineering, PSMZA, are to guide students towards the use of IR 4.0 technologies.

Methodology

This research uses the quantitative approach and survey research design in assessing the readiness of supervisors toward mentoring Final Year Projects (FYP) that entail Industrial Revolution 4.0 (IR 4.0) technologies. The cross-sectional design was selected for its applicability in collecting data at one point in time and for its ability to effectively assess the perceptions, awareness, and readiness of the respondents on the topics at research focus.

The research population was established to encompass all the lecturers who directly act as FYP supervisors for the current academic semester at the Department of Mechanical Engineering, Polytechnic Sultan Mizan Zainal Abidin (PSMZA). Among this group of people, the respondents were sought through simple random sampling with the rationale of giving all of them an equal chance of being selected. This was done to eliminate biases and increase the accuracy of the research results.

The research instrument employed in this study is a structured questionnaire developed based on a comprehensive review of literature on educator readiness, IR 4.0 technology integration, and the role of supervisors in engineering and TVET education. The questionnaire consists of several constructs with a total of 26 items. Specifically, awareness and knowledge of IR 4.0 comprises 5 items, supervisory readiness consists of 11 items, and IR 4.0 utilization in FYP consists of 10 items. In addition, the questionnaire is organized into six domains, namely personal and professional characteristics, awareness and understanding of IR 4.0, preparedness to supervise students' FYP in IR 4.0, level of implementation of technologies in students' academic work, institutional support, and academic beliefs related to IR 4.0 in engineering education. All items were measured using a five-point Likert scale, ranging from 1 (Strongly Disagree) to 5 (Strongly Agree), to facilitate quantitative statistical analysis.

To ensure content validity, the instrument underwent an expert review process involving specialists in engineering and TVET education. Reliability of the instrument was determined with Cronbach's Alpha coefficients on each construct, with a 0.70 threshold considered to be an adequate and acceptable reliability figure for social science research. he overall Cronbach's Alpha value obtained in this study was 0.924, indicating excellent internal consistency of the instrument. Data collection was conducted using Google Forms, which were distributed to respondents through official departmental communication channels. Participants were provided with information regarding the purpose of the study, assured of confidentiality, and informed that their participation was voluntary.

The conceptual interpretation of this study is based on the relationship between knowledge, self-efficacy, and readiness. Knowledge of IR 4.0 is expected to influence educators' confidence (self-efficacy), which subsequently affects their readiness in supervising IR 4.0-based projects. Institutional support is considered a facilitating factor that strengthens this relationship.

Discussion of Analysis and Findings

The demographic profile of the respondents as presented in Table 2 provides important contextual insight into the characteristics of supervisors involved in Final Year Project (FYP) supervision. The sample consisted of 38 academic staff members, with the mean score for gender (M = 1.45, SD = 0.50) indicating a relatively balanced distribution. The mean age category (M = 3.03, SD = 0.54) suggests that most respondents fall within the mid-career stage, which is typically associated with a combination of pedagogical experience and professional engagement. In terms of academic qualifications, the majority of respondents possess postgraduate qualifications, indicating a strong academic background. These demographic characteristics suggest that the respondents are sufficiently experienced and academically competent, providing a reliable basis for examining issues related to IR 4.0 readiness in FYP supervision.

Table 2: Demographic Characteristics of Respondents

Item	Mean	Std. Deviation
Gender	1.4474	.50390
Age	3.0263	.54460
Academic Qualification	1.5526	.60168
Experience	2.6579	.58246

The current study examines supervisors' awareness and expertise of IR 4.0 (referred to as IR 4.0 in this research) when they are in charge of FYP at engineering schools. IR 4.0 is known to transform industries by applying new technologies like digital tools and intelligent systems. According to the data, the majority of respondents have some relatively strong experience supervising student projects, with a mean supervision experience of M = 2.66 and SD = 0.58. When taken as a whole, these demographic traits show that the respondents are a group of experienced and academically trained supervisors, offering a reliable foundation for investigating concerns about preparedness, awareness, and the use of IR 4.0 technologies in FYP supervision. Overall, the demographic information paints a picture of a very capable and experienced group of supervisors who are believable subjects of investigation into their readiness, awareness, and integration with IR 4.0 in FYP supervision, and whose demographic characteristics also improve the credibility of the data, given their probable familiarity with educational practices and the requirements of engineering education institutions.

The purpose of this research is to measure the level of awareness and knowledge among supervisors regarding IR 4.0 technologies in the context of FYP, as it relates to the field of engineering education. IR 4.0, which has transforming effects on industry through the integration of digital, intelligent, and automated technologies, requires supervisors who can harness these innovations for students in their academic projects. The findings provide an empirical basis for understanding the current state of IR 4.0 awareness among supervisors and serve as a foundation for interpreting subsequent results related to readiness, usage, and institutional support.

Table 3 presents the descriptive statistics of supervisors' awareness and knowledge of IR 4.0 technologies in the context of FYP supervision. The descriptive statistics for supervisors' awareness and knowledge of IR 4.0 technologies reveal a moderate level of familiarity and engagement, which reflects both foundational understanding and areas for further professional development. Supervisors reported the highest level of agreement with the item "*I understand the basic concepts of IR 4.0*" (M = 3.61, SD = 0.64), indicating that most have a general grasp of IR 4.0 principles. This aligns with prior research suggesting that educators are increasingly cognizant of IR 4.0 due to its prominence in contemporary engineering and technical education discourses [6]. Meanwhile, supervisors' mean responses for "*I know about IR 4.0 technologies such as IoT, AI, Big Data, and robotics*" (M = 3.39, SD = 0.72) and "*I follow current developments in IR 4.0 technology*" (M = 3.39, SD = 0.64) reflect a similar moderate level of familiarity.

Table 3: the descriptive statistics of supervisors' awareness and knowledge of Industry 4.0 (IR 4.0)

Item Code	Item Description	Mean	Std. Deviation
B1	I understand the basic concepts of IR 4.0.	3.6053	0.63839
B2	I know about IR 4.0 technologies such as IoT, AI, Big Data, and robotics	3.3947	0.71809
B3	I follow current developments in IR 4.0 technology.	3.3947	0.63839
B4	I have attended courses or training related to IR 4.0	3.1579	0.85507
B5	I believe that the courses or training I attended helped me to better understand Industry 4.0 technologies.	3.4737	0.79651

These results suggest that while supervisors are generally aware of the technological components of IR 4.0, their engagement with ongoing technological developments might not be extensive—a pattern also observed in research examining TVET lecturers' readiness for IR 4.0 [3] Notably, the item "I have attended courses or training related to IR 4.0" yielded the lowest mean (M = 3.16, SD = 0.86), which is consistent with evidence that professional development opportunities in IR 4.0 remain uneven and may not be systematically embedded within institutional training frameworks [4].

Nevertheless, the supervisors moderately agreed that "*I believe that the courses or training I attended helped me to better understand Industry 4.0 technologies*." (M = 3.47, SD = 0.80), indicating that when training is undertaken, it has positive effects on understanding. Overall, the results indicate a moderate level of awareness and knowledge, with mean scores ranging from 3.16 to 3.61. Supervisors showed the highest level of understanding in basic IR 4.0 concepts, while participation in IR 4.0-related training recorded the lowest mean score. These findings suggest that although supervisors possess a foundational understanding of IR 4.0, greater exposure to structured training may be required to strengthen their readiness for supervising IR 4.0-based FYPs.

This pattern indicates a critical gap between conceptual understanding and practical exposure, suggesting that while supervisors possess foundational knowledge, their limited engagement in structured training may hinder effective implementation of IR 4.0 in FYP supervision. This finding highlights the importance of continuous professional development in enhancing supervisors' readiness, particularly in translating theoretical knowledge into practical application.

The descriptive analysis of supervisor readiness in this study indicates a contrast between professional attitude and technical capability among supervisors at PSMZA. The highest mean score was recorded for item C1 (M = 3.5263), suggesting that supervisors demonstrate a strong willingness to support students in applying IR 4.0 technologies. This reflects a positive attitude and a low psychological barrier toward adopting new technological approaches in FYP supervision. However, this readiness is constrained by limitations in practical knowledge and experience. The lowest mean scores were observed in items C5 (M = 2.7632) and C7 (M = 2.7632), which relate to self-perceived knowledge and practical experience, respectively. In addition, relatively

lower confidence levels were observed in items C4 and C6, indicating challenges in guiding students in the technical application of IR 4.0.

These findings suggest the presence of a readiness gap within the context of this study, where supervisors demonstrate awareness and willingness but face limitations in applied technical competency. This finding is consistent with previous studies which indicate that educators may possess conceptual understanding but lack practical experience in implementing IR 4.0 technologies [5], [11]. Furthermore, institutional support, including access to training and technological resources, plays a significant role in enhancing readiness [9], [13]. From a self-efficacy perspective, this gap indicates that supervisors' readiness is influenced not only by their level of knowledge, but also by their confidence in applying that knowledge in real-world supervision. Limited practical exposure may reduce their confidence, thereby affecting their ability to effectively guide students in IR 4.0-based projects. This also suggests that readiness should be viewed as a multidimensional construct, influenced by both individual competency and institutional support, rather than solely by knowledge or experience.

Table 4: Descriptive Statistics of Supervisors' Readiness in Guiding IR 4.0–Based FYP

Item Code	Item Description	Mean	Std. Deviation
C1	I am prepared to assist students in utilizing IR 4.0 technologies within their projects.	3.5263	0.97916
C2	I have access to the necessary resources and tools required to teach IR 4.0 technologies.	3.0526	0.83658
C3	My institution provides adequate support for the supervision of IR 4.0 technologies.	3.1842	0.72987
C4	I am confident in my ability to help students apply IR 4.0 technologies.	2.9211	0.81809
C5	I possess sufficient knowledge of IR 4.0 technologies to supervise FYPs.	2.7632	0.75101
C6	I feel comfortable teaching students about IR 4.0 technologies.	2.9737	0.82156
C7	I have practical experience with IR 4.0 technologies relevant to FYPs.	2.7632	0.78617
C8	I can clearly explain IR 4.0 technology concepts to students.	3.0526	0.56699
C9	I am able to provide students with practical examples of IR 4.0 technology applications.	3.1053	0.72743
C10	I am capable of assessing students' proficiency in using IR 4.0 technologies.	3.2895	0.73182
C11	I am confident in providing the necessary technical guidance for students' FYP projects.	3.0526	0.69544

The reliability analysis demonstrates strong internal consistency for the items measuring supervisors' engagement and perceptions of Industry 4.0 (IR 4.0) in FYP supervision, with a Cronbach's Alpha value of 0.924. This indicates that the instrument reliably captures supervisors' beliefs, experiences, and confidence related to IR 4.0 integration. The descriptive analysis reveals varying levels of lecturers' perceptions regarding the integration of IR 4.0 technologies in FYP. Overall, the findings suggest a positive attitude towards the importance and relevance of IR 4.0, but moderate confidence and experience in practical implementation. High mean scores were

observed for items related to belief and perceived importance of IR 4.0 technologies. Specifically, respondents strongly agreed that IR 4.0 technologies enhance the quality of students' FYP (D2, M = 4.00), are essential for the future of engineering education (D5, M = 4.13), and represent the future of the engineering industry (D10, M = 4.13). These findings indicate strong awareness and acceptance among lecturers regarding the strategic importance of IR 4.0, aligning with previous studies that highlight IR 4.0 as a critical driver in transforming engineering education and industry practices.

Similarly, high agreement was reported on the relevance of IR 4.0 to Mechanical Engineering (D9, M = 4.03) and its overall benefits in FYP implementation (D7, M = 3.97). This suggests that lecturers conceptually recognise the suitability and potential impact of IR 4.0 technologies within their discipline. However, items related to experience, confidence, and practical capability recorded only moderate mean values. Lecturers reported lower levels of experience in using IR 4.0 technologies in research activities (D3, M = 2.71) and moderate confidence in teaching IR 4.0-related aspects to students (D8, M = 2.87). In addition, the ability to assist students in overcoming IR 4.0-related challenges (D4, M = 2.87) and actual supervision experience involving IR 4.0 technologies (D1, M = 3.05) were also moderate.

This disparity between positive perception and practical readiness suggests the presence of an implementation gap. While lecturers acknowledge the importance and future relevance of IR 4.0, limitations in hands-on experience and pedagogical confidence may hinder effective integration into FYP supervision. This finding is consistent with prior research indicating that successful IR 4.0 adoption in higher education requires not only awareness but also structured training, institutional support, and continuous professional development. From a self-efficacy perspective, this gap indicates that lecturers may possess awareness of IR 4.0 but lack confidence in applying these technologies in practice. This lack of confidence, driven by limited hands-on experience, may reduce their effectiveness in guiding students and integrating IR 4.0 into FYP supervision. This suggests that awareness alone is insufficient to ensure effective implementation, and that practical exposure and continuous engagement with technology are critical in transforming perception into actual practice.

The results indicate that supervisors demonstrate an overall moderate to high level of engagement with the use of IR 4.0 technologies in FYP supervision. Supervisors strongly endorse the relevance and importance of IR 4.0 (D5, D9, D10), aligning with recent findings that TVET educators recognize the need for IR 4.0 competencies but may lack deeper practical experience [15]. However, lower mean scores for items measuring experience and confidence in assisting students reflect ongoing gaps in practical readiness, a trend consistent with broader digital competency challenges faced by educators in Malaysian TVET contexts [14]. These findings further reinforce that readiness should be viewed as a multidimensional construct influenced by both individual competency and institutional support, rather than solely by awareness or perception. These gaps suggest the continued need for structured professional development and support mechanisms to enable effective integration of IR 4.0, echoing implementation barriers identified in TVET research.

Table 5: Descriptive Statistics for IR 4.0 Usage in FYP

Item Code	Item Description	Mean	Std. Deviation
D1	I have supervised students using IR 4.0 technologies in their FYP.	3.05	0.80
D2	I believe IR 4.0 technology enhances the quality of students' FYP.	4.00	0.87
D3	I have sufficient experience using IR 4.0 technology in research.	2.71	0.69
D4	I can assist students in overcoming challenges related to IR 4.0 usage.	2.87	0.70
D5	I believe IR 4.0 is vital for the future of engineering education.	4.13	0.96

D8	I feel confident in teaching IR 4.0 technical aspects to students.	2.87	0.78
D9	I consider IR 4.0 highly relevant to the Mechanical Engineering field.	4.03	0.91
D10	I believe IR 4.0 represents the future of the engineering industry.	4.13	0.78

The Pearson correlation analysis was conducted to examine the relationships between supervisors' awareness and knowledge of IR 4.0 and two key outcomes: supervisory readiness and the actual utilization of IR 4.0 technologies in FYP as shown in Table 6. The results indicate a significant positive correlation between awareness and knowledge of IR 4.0 and supervisory readiness ($r = 0.472$, $p = 0.003$). This moderate correlation suggests that as supervisors gain a deeper understanding of IR 4.0 concepts and applications, their overall readiness which includes their confidence and perceived competence increases accordingly. This finding reinforces the argument by [6] that foundational knowledge is a critical prerequisite for educators. In the context of PSMZA, this implies that enhancing the theoretical and conceptual grasp of IR 4.0 among lecturers will directly boost their readiness to take on the role of a technical mentor.

Similarly, a significant positive relationship was found between awareness/knowledge and the actual utilization of IR 4.0 technologies in student projects ($r = 0.429$, $p = 0.007$). While the correlation is moderate, the p-value (< 0.01) confirms that this relationship is statistically robust. This suggests that supervisors who are more knowledgeable about IR 4.0 are more likely to encourage or facilitate the integration of these technologies (such as IoT or data analytics) into their students' projects. This aligns with the idea that knowledge acts as a catalyst for practical application; without a clear understanding of the technology's potential, supervisors may be hesitant to incorporate complex IR 4.0 elements into the FYP scope.

Overall, these findings highlight that knowledge is a primary driver for both the psychological readiness of the supervisor and the practical execution of modern technology in the curriculum. Although the correlations are moderate, they provide empirical evidence that the "knowledge gap" identified in the descriptive analysis (where mean scores for knowledge were lower) is a critical area for intervention. This

suggests that institutional strategies should not only focus on increasing awareness, but also on enhancing hands-on training and providing opportunities for practical engagement to ensure that knowledge can be effectively translated into practice. To improve both the readiness of supervisors and the quality of student projects at PSMZA, institutional efforts should prioritize specialized training programs that not only build awareness but also provide the technical depth required to move from theory to practice.

Table 6: Pearson Correlation Analysis between Awareness/Knowledge of IR 4.0, Supervisory Readiness, and Technology Utilization

		Supervisory readiness	Utilization of IR 4.0 technologies in FYP
Awareness and knowledge of IR 4.0	Pearson Correlation	0.472	0.429
	Sig. (2-tailed)	0.003	0.007
	N	38	38

**. Correlation is significant at the 0.01 level (2-tailed).

One-way ANOVA was used to examine whether supervisory experience had a significant effect on supervisors' awareness and knowledge of IR 4.0 in relation to their readiness and engagement in supervising Industry 4.0-based Final Year Projects. Table 7 presents the descriptive statistics for each supervisory experience group, while Table 8 summarises the ANOVA results. The test of homogeneity of variance indicated that the assumption of equal variance was met ($p = 0.519$). The results show that supervisors across different experience groups demonstrate relatively similar levels of awareness and knowledge of IR 4.0. Although supervisors with 6–10 years of experience recorded the highest mean scores, followed closely by those with 11–15 years of experience, the differences between groups were minimal. Supervisors with 0–5 years of experience showed slightly lower mean values, but the variation was not substantial.

The ANOVA results revealed no statistically significant difference in awareness and knowledge scores across the three supervisory experience groups, $F(2, 35) = 0.328$, $p = .722$. This finding indicates that supervisory experience does not significantly influence supervisors' readiness or engagement in integrating IR 4.0 technologies into FYP supervision. The post hoc analyses using Tukey HSD and Games–Howell tests further confirmed the absence of significant differences between all groups, strengthening the robustness of the findings. This suggests that experience alone is not a determining factor in developing IR 4.0-related knowledge and readiness, indicating that traditional indicators such as years of service may no longer be sufficient in assessing technological competency in modern educational contexts.

These results suggest that exposure to Industry 4.0-related supervision is not primarily determined by years of supervisory experience. Given that Industry 4.0 technologies are relatively recent in engineering education, both early-career and experienced supervisors may face similar challenges in adopting and implementing these technologies. From a self-efficacy perspective, this finding suggests that confidence in applying IR 4.0 technologies is more likely to be influenced by direct experience and training rather than length of service alone. Without sufficient hands-on exposure, even experienced supervisors may lack the confidence required to effectively implement IR 4.0 in FYP supervision. The findings highlight the importance of structured training programmes, continuous professional development, and institutional support rather than relying on experience alone to enhance supervisory readiness for Industry 4.0-based FYPs. This further reinforces the need for institutions

to shift from experience-based assumptions towards competency-based development strategies that focus on practical skills and technological exposure.

This study is confined to a single department within one Malaysian polytechnic (PSMZA), which may limit the generalizability of the findings to other TVET institutions. Variations in institutional resources, training opportunities, and technological exposure across different institutions may produce different levels of readiness. Therefore, the findings should be interpreted within the specific context of PSMZA.

Table 7 Descriptive Statistics of awareness and knowledge Scores by Supervisory Experience

Supervisory Experience (Years)	N	Mean	SD
0–5 years	2	3.10	0.42
6–10 years	9	3.44	0.44
11–15 years	27	3.41	0.59
Total	38	3.41	0.55

Table 8 One-Way ANOVA results for awareness and knowledge of IR 4.0 by supervisory experience

Source	SS	df	MS	F	p
Between Groups	0.203	2	0.101	0.328	0.722
Within Groups	10.796	35	0.308		
Total	10.999	37			

Conclusion

The findings of this study indicate that engineering educators demonstrate a positive attitude and moderate awareness of IR 4.0 technologies. However, a significant gap exists in terms of practical technical competency required for effective FYP supervision. This study highlights that readiness is not solely dependent on knowledge, but also influenced by self-efficacy and institutional support. Without sufficient practical exposure and training, educators may struggle to translate conceptual understanding into effective supervision practices.

Furthermore, the findings suggest that institutional support, including access to training, infrastructure, and continuous professional development, plays a critical role in enhancing educators' readiness. Therefore, improving educator readiness requires a holistic approach that integrates knowledge development, practical training, and institutional support mechanisms. Given that this study is limited to a single institution, caution should be exercised in generalizing the findings. Future research should consider expanding the scope of this study by including multiple institutions to improve generalizability. In addition, a mixed-method approach incorporating qualitative data such as interviews may provide deeper insights into the challenges faced by educators in implementing IR 4.0. Furthermore, advanced statistical analysis such as structural equation modelling (SEM) could be employed to better understand the relationships between variables.

Abstract. The Certificate in Architectural Technology is one of the programmes offered at Kuantan Community College. In this programme, first-semester students are required to undertake the Architectural Drawing Fundamentals module, which emphasises mastery of geometric drawing techniques in accordance with established standards. However, students often face difficulties in remembering and applying the correct procedural steps, while lecturers encounter challenges in effectively monitoring and facilitating the teaching and learning process. To address these issues, the SMART T-SQUARE innovation was developed to enhance students' understanding and accuracy in producing geometric drawings. This innovation enables students to access learning notes anytime and anywhere through the Smart T-Square Kit, which is equipped with interactive infographic notes. This approach assists students in retaining and applying procedural steps more efficiently and effectively. In line with the advancement of the Fourth Industrial Revolution (4IR), SMART T-SQUARE is further enhanced with Augmented Reality (AR) technology as an interactive learning medium to increase student engagement and interest. The development process was guided by the ADDIE instructional design model, encompassing the phases of Analysis, Design, Development, Implementation, and Evaluation. The findings indicate that the usability level of SMART T-SQUARE is high, with a mean score of 4.81. The innovation is portable, versatile, and practical. Based on its positive impact, its implementation is recommended to be expanded across all Community Colleges in Malaysia and adapted to meet industry requirements. In conclusion, SMART T-SQUARE successfully supports the aspirations of TVET education in producing technologically competent and future-ready graduates equipped with 21st-century skills aligned with the 4IR framework.

Keywords: SMART T-SQUARE, *Augmented Reality*, 4IR

Introduction

SMART T-SQUARE is an innovative teaching aid developed to facilitate Architectural Technology students in producing standard-compliant geometric drawings while enabling access to learning materials anytime and anywhere. Through the Smart T-Square Kit, students can refer to interactive infographic notes that assist them in remembering and applying the correct procedural steps more efficiently and effectively [1]. In alignment with the advancements of the Fourth Industrial Revolution (4IR), this innovation integrates Augmented Reality (AR) technology as an interactive

instructional medium [2]. The AR feature enhances student engagement and supports the correct application of T-Square techniques and geometric drawing procedures at any time based on learning needs. The SMART T-SQUARE is portable, user-friendly, and multifunctional, making it highly practical for student use [3]. SMART T-SQUARE is an innovative instructional tool developed in the form of a portable kit to support interactive and student-centred learning in architectural drawing education [4]. The innovation addresses the need for a more practical and technology-enhanced teaching aid that facilitates the correct application of T-Square techniques and geometric drawing procedures. Designed to be simple, user-friendly, and easily accessible, SMART T-SQUARE enables Architectural Technology students to refer to structured guidance anytime and anywhere according to their learning needs. By integrating instructional support within a portable format, this innovation enhances learning flexibility, promotes independent practice, and improves the overall effectiveness of geometric drawing instruction.

Conventional T-squares, which typically range from 60 cm to 120 cm in length, present practical limitations in terms of portability and storage, particularly for students who frequently move between classrooms, studios, and home environments. Their rigid and elongated structure makes them inconvenient to carry and susceptible to damage, thereby reducing their practicality as a daily learning tool. Furthermore, traditional T-squares are generally uniform in design, color, and functionality, serving solely as measuring instruments without any integrated instructional features. This lack of innovation and pedagogical value contributes to reduced student engagement and motivation [5]. As a result, students often rely heavily on lecturer demonstrations and face difficulties independently applying correct geometric drawing techniques outside classroom sessions. These limitations highlight the need for a more portable, interactive, and pedagogically enhanced solution to support effective learning in architectural drawing courses.

This study aims to examine the development and effectiveness of SMART T-SQUARE as an innovative teaching and learning tool in architectural drawing education. Specifically, the study focuses on designing and developing a comprehensive and portable SMART T-SQUARE Kit equipped with accessible interactive infographic guides to support the production of accurate and standard-compliant architectural drawings. In addition, the study seeks to integrate Industrial Revolution 4.0 (IR 4.0) technologies, particularly Augmented Reality (AR), into the demonstration of proper T-Square techniques and geometric drawing procedures in order to enhance interactive learning. Finally, the study evaluates the effectiveness and usability of SMART T-SQUARE in improving students' understanding, motivation, and independent learning performance in geometric drawing courses.

Methodology

The instructional design of this innovation is based on the ADDIE model, which includes five phases: Analysis, Design, Development, Implementation, and Evaluation as shown on Fig. 1 [6]. This systematic framework ensures that the product is developed according to pedagogical requirements and user needs.

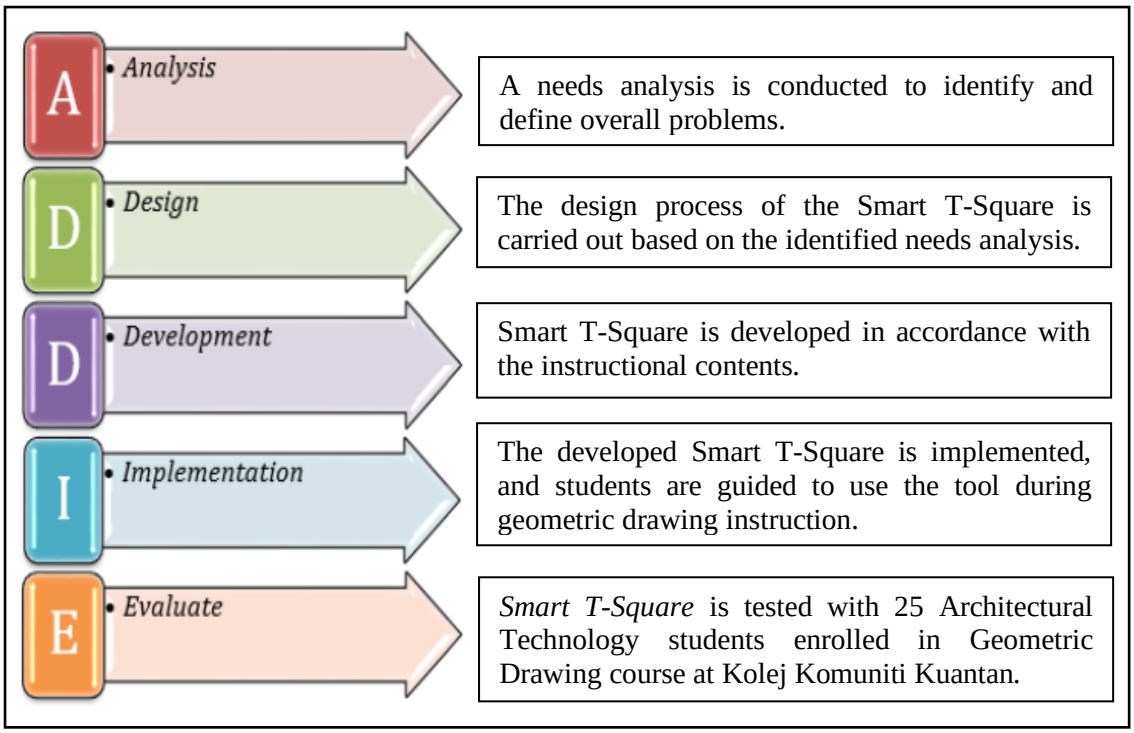

Fig. 1: Conceptual Framework of SMART T-SQUARE Based on the ADDIE Model

This study employed a quantitative descriptive design to evaluate the usability and effectiveness of the SMART T-SQUARE in the Geometric Drawing course. This approach allows for systematic measurement of students' perceptions and satisfaction through structured data collection [5]. The population for this study consisted of students enrolled in the Certificate in Architectural Technology program at Kolej Komuniti Kuantan, specifically those taking the Geometric Drawing course. A total of 25 students were selected using purposive sampling, focusing on those who participated in all sessions involving the SMART T-SQUARE. Data were collected using a usability and satisfaction questionnaire adapted from Jamalludin, Baharuddin, and Zaidatun (2001) [5]. The instrument contained 15 items divided into four dimensions: Teaching and Learning, Motivation, Design, and Technical Aspects.

The Teaching and Learning dimension measured how effectively the SMART T-SQUARE helped students understand the topics, while Motivation assessed the impact on student interest and engagement. The Design dimension evaluated the functionality and aesthetic quality of the tool, and Technical Aspects examined its ease of use and reliability. Students responded using a 5-point Likert scale (1 = Strongly Disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, 5 = Strongly Agree). The data collection procedure involved a brief introduction to the SMART T-SQUARE, followed by its use in practical exercises according to the course module. After completing the sessions, students individually filled out the questionnaire. The collected data were then analyzed using descriptive statistics, including mean scores to determine the level of agreement and standard deviation to assess response variability.

Result and Discussion

Based on Fig. 2 and 3, the findings demonstrate that the objective of designing and developing a comprehensive and portable SMART T-SQUARE Kit was successfully achieved. Fig. 2 illustrates the systematic prototype development process, beginning

with the modification of the conventional T-Square structure, followed by hinge installation, surface enhancement using carbon fiber adhesive finishing, and the integration of magnetic components [1]. These improvements enhanced durability, functionality, and portability while maintaining measurement accuracy. The addition of magnets and metal pads further strengthened structural stability and usability during drawing activities. Fig. 3 presents the final development outcome of the SMART T-SQUARE Kit, highlighting its compact, foldable, and multifunctional design. The transformation from a conventional rigid T-Square into a portable kit demonstrates significant improvement in mobility and storage efficiency. Furthermore, the integration of accessible interactive infographic guides within the kit supports step-by-step reference during drawing tasks, enabling students to produce accurate and standard-compliant architectural drawings independently [1,6]. Overall, the findings confirm that the SMART T-SQUARE Kit meets the intended design objective by combining portability, instructional support, and practical functionality into a single comprehensive learning tool.

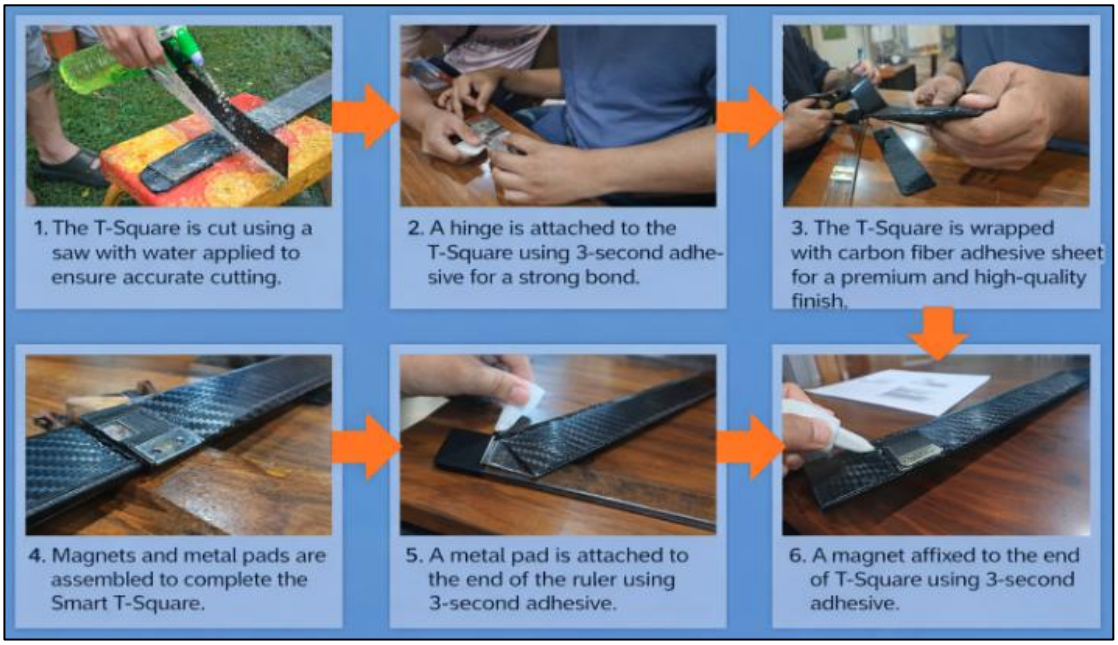

Fig. 2: Prototype Development of the Portable SMART T-SQUARE with Interactive Infographic Integration

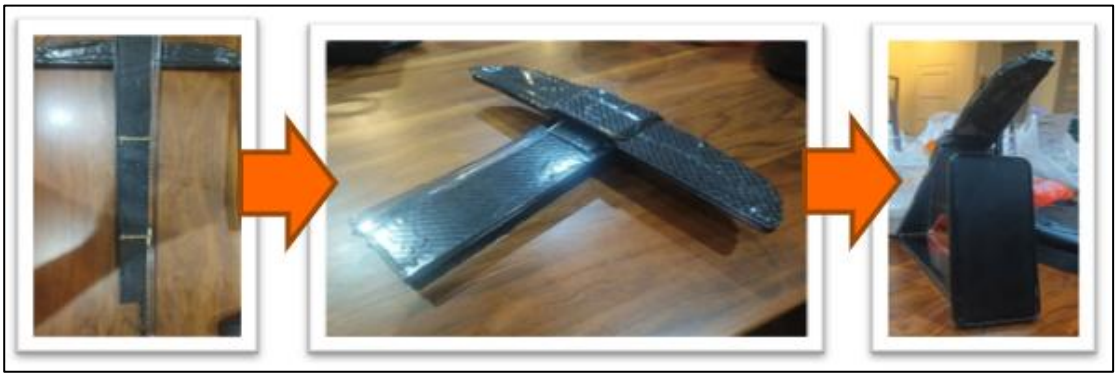

Fig. 3: Development Outcome of the Portable and Multifunctional SMART T-SQUARE

Based on the Fig. 4, the findings indicate that the objective of integrating Industrial Revolution 4.0 (IR 4.0) technologies, particularly Augmented Reality (AR), has been successfully achieved through the incorporation of interactive digital infographic content into the SMART T-SQUARE Kit. The figure illustrates the transformation of conventional static learning notes into structured, visually enhanced digital materials that can be accessed interactively. Through AR integration, students are able to scan designated markers and instantly access step-by-step demonstrations of proper T-Square techniques and geometric drawing procedures. This technology allows learners to visualise drawing processes dynamically rather than relying solely on one-time lecturer demonstrations. As a result, complex procedures such as positioning drawing sheets, aligning the T-Square correctly, and executing standard-compliant geometric constructions become clearer and easier to follow. The integration of AR enhances engagement, supports self-paced learning, and enables repeated access to instructional guidance anytime and anywhere. This interactive approach not only improves conceptual understanding but also increases students' motivation and confidence in applying correct drawing techniques independently. Therefore, the findings confirm that the incorporation of IR 4.0 technologies significantly strengthens the interactivity and effectiveness of the teaching and learning process in geometric drawing courses [2,3].

Fig. 4: Example of IR 4.0 Technologies Application through AR within SMART T-SQUARE to Enhanced Interactive Infographic Learning

Based on the findings presented in Table 1, the objective of evaluating the effectiveness and usability of SMART T-SQUARE was successfully achieved. The usability and satisfaction questionnaire, adapted from Jamalludin, Baharuddin, and Zaidatun (2001), assessed four key dimensions: Teaching and Learning, Motivation, Design, and Technical Aspects. The results demonstrate a high level of acceptance and effectiveness, with an overall mean score of 4.81 [5]. The Teaching and Learning dimension recorded the highest mean score (4.90), indicating that SMART T-SQUARE significantly enhanced students' understanding and clarity in applying geometric drawing procedures. The Motivation dimension also showed a strong mean score (4.85), suggesting that the integration of interactive infographic guides and AR elements increased students' interest and engagement during learning activities. Meanwhile, the Design (4.72) and Technical Aspects (4.77) dimensions further confirm that the kit is user-friendly, practical, and technically reliable for classroom and

independent use [4,5]. The relatively low standard deviation values indicate consistency in students' responses, reflecting overall agreement regarding the usability of the innovation. Overall, these findings confirm that SMART T-SQUARE effectively improves students' conceptual understanding, strengthens motivation, and supports independent learning performance in geometric drawing courses.

Table 1: Mean Scores and Standard Deviations of SMART T-SQUARE Usability Evaluation

Dimension	Mean Score	Standard Deviation
Teaching and Learning	4.90	0.9
Motivation	4.85	0.8
Design	4.72	0.7
Technical	4.77	1.1
Overall Mean Score	**4.81**	

The comparison between the conditions before and after the implementation of SMART T-SQUARE clearly demonstrates the achievement of the study objectives. Prior to the innovation, students experienced difficulties in applying correct T-Square techniques and geometric drawing procedures after only a single demonstration conducted in the drawing studio. The absence of continuous guidance limited their ability to independently replicate accurate and standard-compliant drawings. In addition, students were unable to complete drawing tasks effectively outside lecture hours due to the lack of structured reference materials, which negatively affected both time management and learning motivation. The conventional T-Square design, ranging from 60 cm to 120 cm in length, further contributed to inconvenience in terms of portability and storage, reducing its practicality as a daily learning tool.

Following the implementation of SMART T-SQUARE, significant improvements were observed. The comprehensive and portable SMART T-SQUARE Kit, equipped with accessible interactive infographic guides, enabled students to follow structured step-by-step procedures in producing geometric drawings. This directly supports the first objective of designing and developing a practical instructional tool that facilitates accurate and standard-compliant architectural drawing production. Furthermore, the integration of Industrial Revolution 4.0 (IR 4.0) technologies, particularly Augmented Reality (AR), enhanced the demonstration of proper T-Square techniques and geometric drawing procedures. Students were able to revisit demonstrations repeatedly, visualise procedures dynamically, and learn at their own pace. This technological integration strengthened interactive learning and reduced dependency on one-time lecturer demonstrations. In terms of effectiveness and usability, students showed improved understanding, higher motivation, and greater independence in completing drawing tasks. The portable and multifunctional design resolved previous issues related to storage and mobility, while the structured infographic and AR-supported guidance improved clarity and confidence in applying correct techniques.

Overall, the discussion confirms that SMART T-SQUARE successfully meets the study objectives by combining instructional design, IR 4.0 technological integration, and usability effectiveness to enhance students' performance in geometric drawing courses.

Conclusion

SMART T-SQUARE has proven to be an effective and practical tool for teaching basic architectural drawing. Its portable kit, integrated with interactive infographic guides and AR technology, enables students to learn independently, apply correct geometric drawing procedures, and improve understanding and motivation. By addressing the limitations of conventional T-Squares, this innovation supports interactive, technology-enhanced learning and aligns with TVET goals of producing future-ready graduates equipped with 21st-century skills

Abstract. This study examines the short film production process among Technical and Vocational Education and Training (TVET) students from the perspective of project-based pedagogy. The research objectives are to identify factors influencing the effectiveness of learning through short film production, analyse pedagogical challenges faced by students, and evaluate the roles of creativity, technical skills, time management, and resource support on the quality of learning outcomes. This study utilized a quantitative approach by distributing structured questionnaires to 120 TVET students directly involved in short film projects. Data were analysed using descriptive and inferential statistics to identify relationships among variables and the dominant factors affecting learning. The findings indicate that technical skills are the dominant factor influencing learning effectiveness and production quality. Although student creativity is important, creative capability heavily relies on the mastery of technical skills and practical experience. Furthermore, while time management is an acknowledged challenge, its direct statistical impact on the final film quality was found to be non-significant compared to technical execution. Pedagogical support and consistent resource provision play a crucial role in learning effectiveness. This study emphasizes the need for structured TVET pedagogical approaches, systematic technical skills training, and continuous pedagogical support to enhance student competency. These findings aim to guide educators and TVET institutions in strengthening project-based learning.

Keywords: TVET education; project-based pedagogy; practical-based learning; short film production; technical skills; student creativity.

1. Introduction

1.1 Background of the Study

In the era of the Fourth Industrial Revolution, the creative industry, particularly the film and digital content sector, is experiencing rapid growth. This phenomenon demands a workforce that is not only creative in generating ideas but also possesses high technical competencies to operate the latest technologies. Technical and Vocational Education and Training (TVET) institutions bear a significant responsibility in producing this human capital through hands-on, industry-oriented approaches [1]. Short film production at the polytechnic and vocational college levels is frequently utilized as a primary assessment mechanism (Capstone Project). This project is unique because it requires students to integrate cognitive skills with psychomotor skills.

1.2 Problem Statement

Although the Project-Based Learning (PBL) method has long been practiced, academic observations reveal a significant quality gap in students' final output. Often, a brilliant idea on paper (the script) fails to translate well into a visual medium. The question arises: does this failure stem from a lack of creativity or poor mastery of technical tools? Preliminary findings suggest that the creative capabilities of TVET students heavily depend on their level of technical skill mastery.

1.3 Research Objectives

This study is outlined by three specific objectives:
To identify the main factors influencing the effectiveness of the short film production process.
To analyze the pedagogical challenges faced by students.
To evaluate the relationship between technical skills, creativity, resource support, and the quality of learning outcomes.

2. Literature Review

2.1 Project-Based Learning (PBL)

This study is grounded in the theory of Project-Based Learning (PBL). PBL is a model that organizes learning around complex, authentic, and challenging projects. Recent empirical research highlights that PBL in modern TVET requires the integration of mobile and digital tools to foster deeper student engagement [2]. In film education, PBL allows students to holistically integrate theory and practice [3].

2.2 The Dynamics of Creativity vs. Technical Competency

There is an ongoing debate regarding which is more important: art or technical execution? In the TVET context, creativity is defined as 'applied creativity'. Recent studies emphasize that the mastery of advanced technical tools serves as the primary mediator for applied creativity and educational innovation [4]. The literature strongly supports that the creativity of TVET students cannot stand alone; it requires technical skill as a mediating "language" to be expressed effectively.

2.3 The Influence of Environment and Resources

Resource support factors refer to the learning ecosystem provided by the institution. This includes the availability of equipment, studio space, and the pedagogical guidance of lecturers. Current studies on TVET ecosystems emphasize that aligning institutional resources with Industry 4.0 standards is critical for producing workforce-ready graduates [5].

3. Research Methodology

3.1 Research Design

This study utilizes a fully quantitative approach through a survey research design [6]. This method was chosen for its ability to collect numerical data that can be generalized to the broader population of TVET students.

3.2 Population and Sampling

The study population consists of students in the TVET Diploma program (Media/Film and Creative fields). Purposive sampling was used to select a sample size of 120 respondents. This specific sampling technique was chosen to ensure that only students who have actively completed hands-on capstone film projects were included. By targeting respondents with relevant first-hand experience, the collected data reliably reflects the actual challenges and authentic outcomes of project-based learning, thereby directly supporting the study's objectives.

3.3 Research Instruments

The research instrument is a specially developed questionnaire containing eight main sections (A to H) measured on a 5-point Likert Scale.

3.4 Data Analysis Procedures

Data were analysed using statistical software (SPSS) through Descriptive Analysis, Pearson Correlation, and Multiple Regression. Descriptive analysis was utilized to map the demographic profile and establish baseline mean scores. Pearson Correlation was

purposefully applied to identify the strength and direction of bivariate relationships, while Multiple Regression was strictly used to pinpoint which independent variable serves as the strongest predictor of final film quality, thereby answering the core research objectives analytically rather than just descriptively.

4. Findings and Analysis

4.1 Respondent Demographic Profile

Demographic analysis shows the majority of respondents are male (65%), while females represent 35%. Most respondents (55%) have been involved in more than three production projects, indicating that the sample possesses sufficient experience to provide valid feedback.

4.2 Mean Analysis of Variables

Table 1 displays the mean scores for each studied factor.

Table 1. Mean Score and Standard Deviation Analysis

Variable	Mean (M)	Standard Deviation (SD)	Interpretation Level
Technical Skills	4.25	0.65	High
Student Creativity	4.01	0.72	High
Time Management	3.45	0.89	Moderate
Resource Support	2.90	0.95	Low

Interpretation: The findings reveal an interesting paradox. Students reported high confidence levels in Technical Skills (M=4.25) and Creativity (M=4.01). However, the score for Resource Support was the lowest (M=2.90). This indicates that the students' "drive and skills" are high, but the "hardware" and infrastructure provided by the institution do not adequately support their aspirations.

4.3 Inferential Analysis (Pearson Correlation Test)

Correlation analysis was conducted to test the hypothesis regarding the relationship between independent variables and film quality.

Table 2. Pearson Correlation Matrix (Independent Variables vs. Film Quality)

Independent Variable (IV)	Final Film Quality (DV) (r)	Significant (p)	Relationship Strength
Technical Skills	0.785**	0.000	Very Strong
Creativity	0.612**	0.000	Strong
Time Management	0.540**	0.000	Moderately Strong

**Correlation is significant at the 0.01 level (2-tailed).*

Interpretation: The analysis indicates a very strong positive relationship (r = 0.785) between technical skills and film quality. Although creativity also demonstrates a strong relationship (r = 0.612), the statistical data proves that the technical aspect has a larger correlation impact. This means that within the TVET context, high-quality films are more frequently produced by students who are technically proficient compared to those who are highly imaginative but lack equipment handling skills.

4.4 Multiple Regression Analysis

This analysis aims to identify which factor is the primary contributor to final film quality.

Table 3: Multiple Regression Analysis on Film Quality

Model	Standardized Beta (β)	t	Sig. (p)
(Constant)	-	2.105	0.038
Technical Skills	0.520	4.560	0.000
Creativity	0.280	2.340	0.021
Time Management	0.150	1.890	0.065

(Model Fit indicator: R^2 = 0.640)

Interpretation: The Beta (beta) values presented are standardized coefficients, allowing for direct comparison of the relative strength of each predictor variable. The overall regression model shows a good fit, explaining 64% of the variance (R^2= 0.640) in final film quality. Technical Skills (beta = 0.520) is the largest and most significant contributor to the variance in film quality. In comparison, creativity only contributes a Beta of 0.280. Notably, the effect of Time Management is not statistically significant ($p > 0.05$) in predicting the final film quality within this model. This firmly reinforces the argument that technical competency is the foundational pillar in TVET production.

4.5 Primary Challenge Analysis

Respondents were asked to rank the primary challenges they face. Frequency analysis revealed:

Equipment Constraints (Cameras/Editing Computers): Mean Score 4.15 (Primary Challenge).

Production Financial Issues: Mean Score 3.90.

Time Management Issues: Mean Score 3.80.

5. Discussion

5.1 Technical Skills as the 'Gateway' to Creativity

The findings of this study support the premise that in vocational education, technical skills are not merely a supporting factor, but a prerequisite for creativity. The high correlation score (r=0.785) proves that students cannot be effective directors if they do not understand the limits and capabilities of cameras or lighting. Art curriculums often emphasize "storytelling", but these findings signal that visual storytelling will fail if students are "technically blind". For instance, a student might envision a dramatic low-key lighting scene, but without mastering ISO controls and noise ratios, the final output will appear blurry and low-quality, ruining the intended mood.

5.2 The Implications of Resource Constraints

The low resource satisfaction score (M=2.90) is a concerning finding. In highly technological fields like filmmaking, equipment is paramount. If TVET institutions continue using outdated equipment (e.g., low-resolution cameras or computers unable to process 4K video), students suffer a competitive disadvantage. The data suggests that students are highly motivated and ready (evidenced by high technical and creativity scores), but their learning environment acts as a bottleneck. This forces students to use personal equipment or rent external gear, adding to their financial burden.

5.3 Time Management and Production Discipline

While time management is acknowledged as a challenge by students (M=3.45), the regression analysis revealed that it does not significantly predict the final quality of the film ($p > 0.05$) when compared to pure technical skills. Poor pre-production planning often results in rushed post-production phases, but ultimately, technical mastery dictates the survival of the final output.

6. Conclusion and Recommendations

6.1 Conclusion

In conclusion, this study has empirically proven that producing high-quality short films within the TVET ecosystem is not simply the result of magical creativity. It is the result of synergy between precise technical competencies and supportive infrastructure. Statistical analysis confirms that technical skill is the most critical variable determining student success. Creativity without technical skills in the TVET context remains mere imagination that cannot be visualized.

6.2 Recommendations

Based on the study's findings, several strategic recommendations are proposed:

Curriculum Review (Technical Weightage): Institutions must increase the hours of competency-based training in early semesters. Students must fully master the tools before being allowed to commence complex creative projects.

Targeted Facility Upgrades: Management must allocate specific budgets for the maintenance and procurement of modern filming equipment. The low resource satisfaction score (M=2.90) must be addressed immediately to prevent students from falling behind industry technology trends.

Integration of Production Management Subjects: Production management subjects should not be taught purely theoretically. They must be integrated into studio projects so students can learn to manage budgets and time in real-world scenarios.

Error Analysis Of Student Responses In Engineering Science : A Cognitive Diagnostic Perspective

Nor Hatini Baharin[1, a *]

[1]Politeknik Maritim Sultan Nazrin Shah, Bagan Datuk, Perak, Malaysia

[a]norhatini@pbd.edu.my

Abstract. This study explores the types and sources of errors made by Diploma level engineering students in solving Engineering Science problems as part of engineering education assessment, focusing on a structured quantitative task involving relative density, volume, and mass calculation. The study uses a hybrid framework combining Newman's Error Analysis (NEA) and Cognitive Diagnostic Assessment (CDA). Student responses (n = 70) were classified according to NEA error categories and mapped to CDA cognitive attributes, with an inter-rater reliability, k=0.82 validating the objectivity of the process. The results indicate that Transformation Errors were the most frequent, particularly associated with CDA attribute unit conversion and encoding skills followed by Process Errors related to deficiencies in procedural fluency. Persistent errors in formula manipulation and multi-step reasoning suggest an interpretation that weak foundational mathematical competence hinders students' ability to apply fundamental physics principles in engineering contexts. The findings demonstrate the practical utility of a targeted intervention approach, providing evidence-based insights to support assessment quality, continuous quality improvement, and targeted academic remediation in Diploma-level engineering programmes.

Keywords: Newman's Error Analysis; Cognitive Diagnostic Assessment; Engineering Science; Student Errors; Mathematical Foundations.

Introduction

Basic Engineering Science is the common core course for students in the Diploma in Marine Electrical Engineering Technology. This course provides a foundation for technical students, integrating physics, mathematics, and real-world engineering problems. Student performance in Basic Engineering Science courses often reveals a range of errors that hinder accurate problem-solving and deeper conceptual understanding. Particularly in applied topics involving density, volume, and mass, such errors often go unexamined beyond grading purposes.

Previous studies emphasize the importance of diagnosing not just whether an answer is right or wrong, but the underlying reason why student made a specific mistake [1].This study investigates student errors in solving engineering science problems in an examination paper by using a hybrid framework integrates Newman's Error Analysis (NEA) and Cognitive Diagnostic Assessment (CDA). The objective is to systematically categorize the types of errors in student responses and to generate evidence-based insight demonstrating how assessment data can be used to reveal cognitive difficulties encountered during problem solving.

By integrating this framework to evaluate student examination responses, this study aims to identify both surface-level procedural errors and deeper cognitive deficits. One key hypothesis explored is that these errors are rooted in poor mathematical foundation, especially concerning unit conversion, formula manipulation, and sequential problem-solving. This aligns with the course outcomes that require students to calculate correctly problems related to statics, mass and volume, load, hydrostatics, fluids and hydraulics to prove related physics principles. Furthermore, the findings support the programme outcome where students are expected to identify and analyse well-defined engineering problems reaching substantiated conclusions using codified methods of analysis specific to maritime electrical engineering technology. The recurring mistakes indicate students' difficulties in selecting and applying appropriate codified engineering methods.

Literature Review

Engineering Science often requires students to integrate mathematical procedures with a conceptual understanding of physical phenomena. However, research has consistently shown that many students enter tertiary-level engineering programs with insufficient mathematical skills [2]. These foundational gaps hinder students' ability to solve multi-step applied problems resulting in both procedural and conceptual errors. Newman's Error Analysis (NEA) is widely used in mathematics education to classify the types of errors made by students when solving problems. However, it's also been adapted for other subjects including science and engineering. NEA identifies five hierarchical types of errors: Reading, Comprehension, Transformation, Process and Encoding. When applied to engineering problems, the NEA offers a clear and systematic way to understand where students begin to struggle. It helps reveal whether difficulties arise from misreading the questions (Reading Error), misreading what the question is asking (Comprehension Error), selecting the wrong formula (Transformation Error), misapplying procedures (Process Error), or failing to provide correct final answers (Encoding Error). Numerous studies have validated NEA's usefulness in mathematical contexts. Peng and Md Zain [3] found that NEA could uncover hidden cognitive breakdowns in Malaysian students' mathematical reasoning, particularly in transformation and process step categories highly relevant to engineering calculations.

Meanwhile, Cognitive Diagnostic Assessment (CDA) is a framework designed to evaluate the specific cognitive skills and knowledge components underlying student performance. This approach is essential in engineering and technical education for educators tailoring teaching strategies to meet the specific learning gaps. CDA gives a more detailed view of student understanding by connecting what they can do to underlying cognitive attributes [2], [4]. It enables the categorization of misconceptions, lack of fluency, or misapplication of knowledge. In the context of basic engineering science, CDA enables educators to distinguish whether an error originates from a misinterpretation of physical quantities (such as density versus pressure), challenges in algebraic manipulation, or a lack of proficiency in unit systems—all of which are core competencies in technical curriculum.

By integrating NEA with CDA, researchers gain a dual-layered perspective: NEA categorizes the procedural stages of an error, while CDA identifies the underlying cognitive attributes. This hybrid approach gives both wide coverage and detailed insight in diagnosing student misconceptions. Azis and Zaini [5] emphasized the efficacy of this integration in science education, where identifying both procedural and cognitive

breakdowns is essential for designing formative feedback and remedial instruction. Similarly, in technical education, this synergy illuminates the nuanced challenges students face when transferring abstract mathematical concepts to engineering applications [6].While, mathematics is regarded the "language of engineering," research consistently indicates that engineering students struggle with the mathematical demands of their coursework [2], [7]. This gap is particularly evident in areas that need reasoning with measurement and understanding algebra. For example, converting cm^3 to m^3, recognizing that relative density is dimensionless, and distinguishing between mass and force are foundational, yet frequently misunderstood concepts in engineering science.

Despite the established importance of diagnosing student misconceptions, few studies have integrated NEA and CDA frameworks in an engineering context. Most assessments remain summative and lack diagnostic depth. This study addresses this gap by examining the learning challenges of Semester 1 Diploma in Electrical Marine Engineering students. By employing a hybrid NEA-CDA framework, this research aims to systematically classify errors and generate cognitive profiles that uncover underlying learning deficiencies and misconceptions.

Methodology

This study employed a quantitative content analysis research design, integrating deductive qualitative coding with quantitative statistical evaluation. The primary instrument was a structured quantitative exam task focusing on the calculation of relative density, volume, and mass. The study utilized a total population sampling technique, involving all 70 exam scripts from students enrolled in the Basic Engineering Science course (Cohort Session I 2024/2025) within the Diploma in Electrical Marine Engineering Technology programme. By including the entire cohort, the study eliminates selection bias and ensures that the findings are a true representation of the error patterns within this demographic. Out of the 70 scripts, 15 provided fully correct answers, 1 provided no response, and 54 contained errors. Consequently, the in-depth error analysis focused exclusively on these 54 erroneous scripts.

The written responses from the 54 scripts were qualitatively examined and systematically coded against a hybrid framework combining Newman's Error Analysis (NEA) and Cognitive Diagnostic Assessment (CDA). Following this qualitative coding phase, the assigned error codes were converted into numerical frequencies to determine the distribution and prevalence of specific cognitive bottlenecks. An error classification rubric was developed based on existing models [8], comprising five main categories as in Table 1.

Table 1:Newman's Error Category

Code	Error Category	Explanation
RE	Reading	Misreading or overlooking key terms.
CE	Comprehension	Misunderstanding the question of intent.
TE	Transformation	Inability to translate the problem into appropriate equations.
PE	Process	Errors in calculation or manipulation.
EE	Encoding	Incomplete or incorrect presentation of thefinal answer.

While for the CDA mapping, the cognitive attributes were adapted from established in STEM education as follow :-

- A1: Conceptual understanding: Comprehension of core principles e.g mass, volume, and density [9].
- A2: Procedural fluency: Accuracy in applying formulas and mathematical execution [10].
- A3: Unit conversion and encoding: Proficiency in dimensional analysis and unit scaling which is a critical cognitive load in engineering [11].
- A4: Analytical reasoning: Logical sequencing and variable relationship mappingin multi-step problems [12].
- A5: Visual-spatial understanding: Interpretation of diagrams [13].

To ensure coding reliability, the primary assessor analyzed all 54 erroneous scripts, while a second subject matter expert independently coded a 20% random sub-sample (n=11). The inter-rater reliability analysis yielded a Cohen's Kappa of k=0.82, indicating almost perfect agreement. Minor coding discrepancies were resolved through consensus, thereby validating the objectivity of the NEA-CDA mapping process.

Results

This section presents the findings of the error analysis of student responses to an Basic Engineering Science problem involving relative density, volume, and mass. Student errors were classified using the hybrid NEA-CDA. The results highlight the distribution of error types, dominant cognitive attributes, and illustrative examples of common student mistakes. Figure 1 presents the distribution of student errors classified using the hybrid Newman's Error Analysis (NEA) and Cognitive Diagnostic Assessment (CDA) framework.

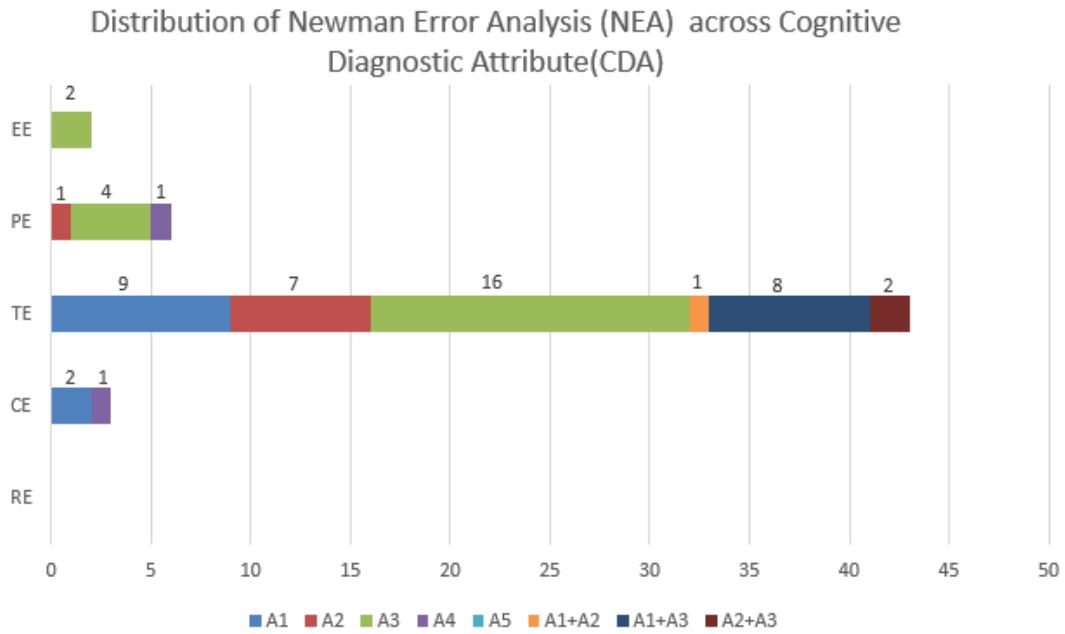

Fig. 1: Distribution of student's error based on NEA-CDA (n=54)

Analysis of the student scripts (n=54 erroneous scripts) revealed a highly uneven distribution of errors across the NEA categories. Transformation Errors (TE) emerged as the most prevalent, accounting for 43 instances, followed by Process Errors (PE) with 6 instances. In contrast, Comprehension Errors (CE) and Encoding Errors (EE) occurred infrequently, while Reading Errors (RE) were entirely absent. When mapping these NEA categories to CDA attributes, the data showed that the majority of errors were associated with attribute unit conversion and encoding (A3), followed by conceptual understanding (A1) and procedural fluency (A2). The highest concentration of errors was identified at the intersection of Transformation Error (TE) and unit conversion and enconding (A3); 16 instances, alongside a critical 'dual-deficit' overlap of conceptual understanding (A1) + unit conversion and encoding (A3) with 8 instances. This finding demonstrates that the incorrect transformation of the problem into mathematical expression specifically regarding unit scaling and dimensional analysis is the primary factor hindering student performance in this cohort.

Transformation Errors accounted for the largest proportion of student mistakes. These errors occurred when students failed to correctly translate the problem statement into an appropriate mathematical representation. Unit conversion error and encoding were pervasive, particularly in converting volume from cm^3 to m^3. Several students correctly identified the formula $m=\rho V$ but failed to apply the correct unit conversion factor, leading to incorrect mass values. For example, the response in Figure 2 shows that while the question required converting cm^3 to m^3 before calculating the mass, the student utilized an incorrect conversion value, which corrupted the entire formula setup. These specific errors were classified as Transformation Errors under NEA and mapped to CDA attribute unit conversion and encoding (A3), reflecting deficiencies in dimensional reasoning, unit consistency and mathematical representation.

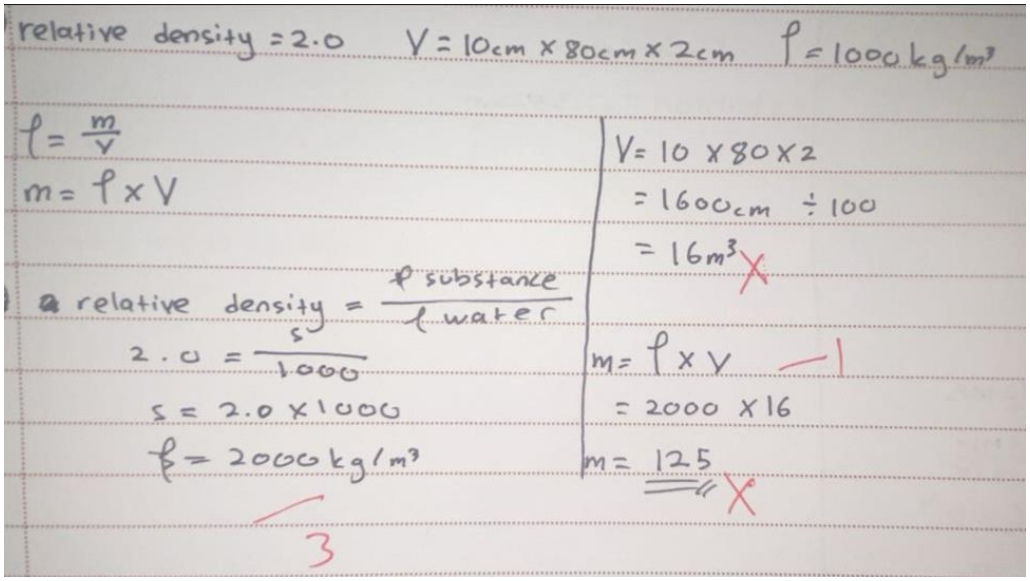

Fig. 2: Sample of a student script demonstrating a Transformation Error with unit conversion and encoding attribute. The student correctly identified the formula but failed to convert the unit accurately.

Within the dominant transformation error, 21% (9 instances) were attributed to conceptual misunderstanding (A1), primarily involving incorrect formula selection. As illustrated in Figure 3, the student used the incorrect formula ($P=\rho gh$) that does not apply to this problem, despite the question requiring the use of $m=\rho V$. These responses

indicate a fundamental confusion between physical quantities and a failure to identify the governing scientific principles.

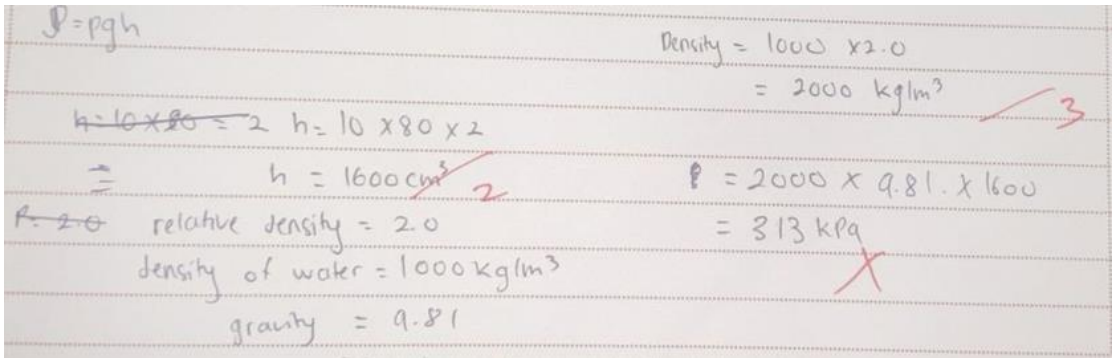

Fig. 3 : Sample of a student script demonstrating a Transformation Error linked to Conceptual Understanding. The student incorrectly selected the hydrostatic pressure formula, whereas the problem required mass-density relationship.

Another frequent transformation error involved the misinterpretation of relative density. Many students treated relative density as absolute density, directly substituting the value of 2 into the mass equation without multiplying it by the density of water (1000 kg/m³). This error demonstrates a misunderstanding of relative density as a dimensionless ratio. In NEA terms, these were classified as Transformation Errors, while CDA linked them to a combination of conceptual understanding (A1) and unit conversion and encoding (A3).

Furthermore, 16% (7 instances) of transformation errors were linked to procedural fluency (A2). These students demonstrated incorrect algebraic manipulation; for example, calculating mass by dividing density by volume ($m=\rho/V$) instead of multiplying them ($m=\rho V$), as shown in Figure 4. These findings align with research by Santoso et.al [14], which suggests when solving mathematical word problem can lead students to not approach questions with care, skip steps in the problem solving process, and as a result students write the wrong answers.

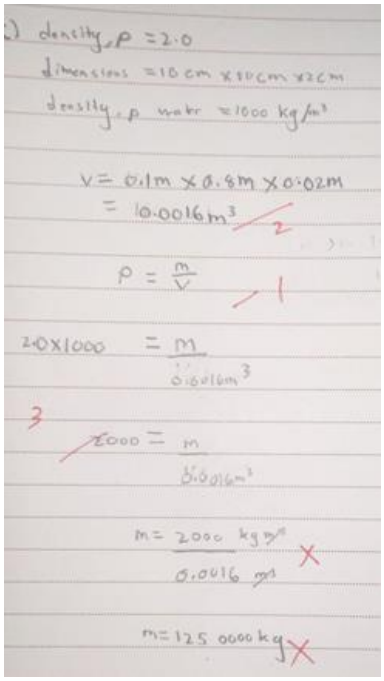

Fig. 4 : Sample of a student script demonstrating Transformation Error and linked to Procedural Fluency (A2). While the student correctly identified the density formula and performed the unit conversion, they failed in the algebraic manipulation stage.

Process Errors (PE) constituted the second-largest category, accounting for 11% (6 instances) of the total error distribution. This was observed among students who correctly identified the formula but failed to complete the problem solving process. Typical responses in Figure 5 show students writing m=ρV without substituting values, or calculating density and volume separately but stopping before determining mass. The response illustrates a process error, where the student correctly identified the mass formula but failed to execute the required steps. Cognitive diagnostic analysis revealed a dominance of the analytical reasoning (A4) attribute, indicating difficulty in completing multi-step problems.

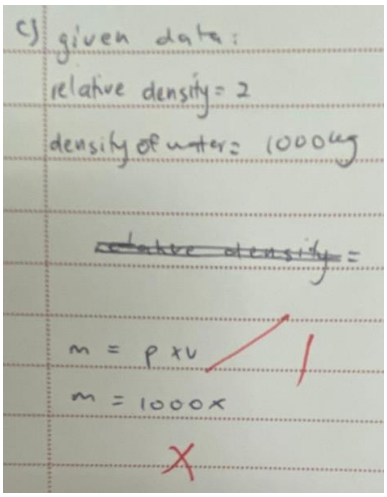

Fig. 5 : Sample of a student script demonstrating Process Error and linked to Analytical Reasoning (A4). Student able to identify the formula but failed to execute the required steps.

Comprehension Errors (CE) were the least frequent with only 3 instances. These errors primarily stemmed from a failure to process the given information effectively. Two of these instances involved students attempting to calculate the relative density even though it was provided in the question, reflecting a conceptual understanding (A1). The remaining instance, as illustrated in Figure 6, shows a student who could compute the volume correctly but failed to execute the final step to find the mass. This specific case is linked to analytical reasoning (A4**)**, where a breakdown in problem-solving strategy prevents the student from translating intermediate results into the final required output.

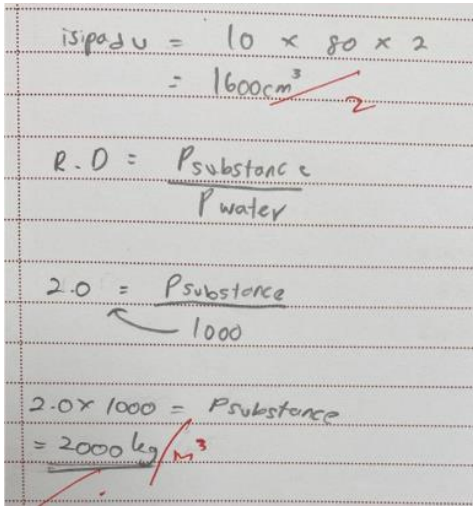

Fig. 6 : Sample of a script demonstrating Comprehension Error linked to Analytical Reasoning (A4).

Encoding Errors were the least common category (2 instances), involving the incorrect expression of final answers. This included assigning incorrect units, such as Newton (N) for mass instead of kilograms (kg). As illustrated in Figure 7, these errors suggest that while the mathematical process was completed, the students lacked unit fluency (A3), failing to correctly represent the physical dimension of the final result.

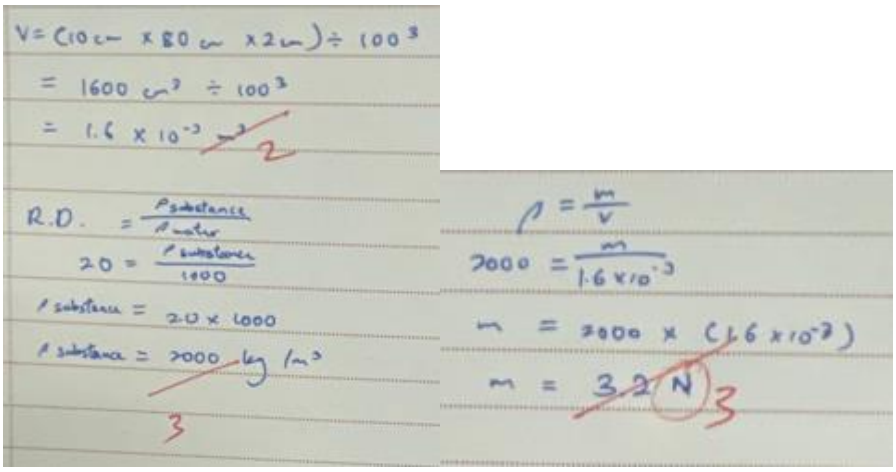

Fig. 7 : Sample of a script demonstrating an Encoding Error linked to Unit Conversion and Encoding (A3).

Discussion and Finding

The integration of the NEA and CDA frameworks provides a holistic diagnostic lens, revealing that student errors in Engineering Science are not merely superficial oversights but are deeply rooted in specific cognitive barriers. While NEA identifies the procedural stage of the breakdown, CDA uncovers the latent conceptual deficits. These results suggest an interpretation that student difficulties may stem from weak mathematical foundations rather than deficiencies in reading comprehension. The high prevalence of Transformation Errors (TE) and Process Errors (PE) potentially indicates that while students possess basic literacy, they encounter significant challenges when converting physical scenarios into mathematical models. These deficiencies in unit conversion and algebraic manipulation appear to hinder students' ability to construct valid physical models, even when correct formulas are provided. This aligns with recent research by Lenz and Wittmann [9], which discusses how a disconnect between conceptual and procedural knowledge can impair performance in applied science subjects. In this study, specific struggles with converting cm^3 to m^3 and maintaining dimensional reasoning acted as a "bottleneck" to higher-level problem solving.

The observed error patterns directly undermine Course Outcomes (CO**)**, which require students to accurately calculate problems involving statics, fluid mechanics, and hydrostatics. The inability to manipulate density relationships or perform multi-step calculations proves that many students have yet to achieve the analytical competence required to quantitatively validate physical principles. From a programme outcome perspective, these findings reveal a significant gap in the ability to identify and analyse well-defined engineering problems using codified analytical methods. The dominance of transformation errors suggests a difficulty in translating real-world engineering data into mathematically sound solutions, a critical competency for professional engineering practice.

Beyond identifying error patterns, the practical utility of these findings underscores the necessity of adopting a targeted intervention approach in engineering pedagogy. Rather than relying on generic remedial sessions, instructional strategies should be specifically targeted at improving unit conversion, which are recognized by Rivera-Muñoz et al. [11] as critical 'unit fluency' skills in modern engineering education. The NEA-CDA matrix, therefore, serves as a robust diagnostic tool that enables educators to pinpoint the exact cognitive stage where learning stalls. By integrating this combined framework into formative assessments, lecturers can provide better feedback and develop specialized teaching methods to bridge the gap between abstract physics concepts and numerical execution. Such a targeted pedagogical shift is essential for enhancing the rigor, effectiveness, and overall analytical competence within engineering education.

While this study provides valuable diagnostic insights, several limitations must be acknowledged. The research was conducted using a specific cohort of 70 Diploma in Electrical Marine Engineering students at a single institution, which may limit the generalizability of the findings across different engineering disciplines or higher degree levels. Additionally, the analysis focused on only one detailed exam question involving density, volume, and mass. Future research should consider employing the NEA-CDA framework across a broader range of engineering topics and larger, multi-programme or multi-institutional sample sizes to further validate these cognitive error patterns.

Conclusion

This study shows the efficacy of a hybrid NEA–CDA framework in diagnosing the procedural and conceptual mistakes made by student in Engineering Science. A significant finding suggests an interpretation that student errors are closely linked to weak mathematical foundation, particularly in areas such as unit conversion, solving algebraic problems and understanding fundamental concepts. By shifting from a general assessment to a targeted intervention approach, this framework provides the necessary precision to identify specific cognitive gaps. Future work could focus on designing targeted remedial activities that aligned with specific CDA attributes and integrating diagnostic assessment practices into TVET evaluation systems to improve learning outcomes. Such efforts will not only enhance general academic performance but will directly contribute to achieving the course outcomes and support programme outcomes , ultimately fostering more resilient analytical competencies in future maritime engineering professionals.

Abstract. Safety in technical workshops is a central concern in Technical and Vocational Education and Training (TVET), particularly in electrical programs where students are routinely exposed to potential hazards. This study explores the level of safety knowledge and safety practices among students enrolled in the Electrical Technology Certificate program at Kolej Komuniti Tawau, while also examining how the physical workshop environment supports safe learning. A quantitative descriptive survey design was employed, involving 60 students from Semester 2 and Semester 3. Data were collected using a structured questionnaire and analysed through descriptive statistics and Pearson correlation analysis. The findings reveal a consistently strong safety culture among the students. Workshop safety knowledge recorded a very high mean score ($M = 4.29$, $SD = 0.727$), indicating that students possess a solid understanding of electrical safety procedures, risk awareness, and emergency response. Safety practices in the electrical workshop were also rated at a very high level ($M = 4.36$, $SD = 0.677$), suggesting that this knowledge is largely translated into responsible behaviour during practical activities. In addition, the physical safety environment of the workshop was perceived as very safe ($M = 4.29$, $SD = 0.843$). Pearson correlation analysis further revealed a significant positive relationship between safety knowledge and safety practices ($r = .767$, $p < .001$). These findings highlight the importance of aligning safety knowledge, daily practices, and workshop conditions in TVET institutions.

Keywords: Workshop safety, Safety knowledge, Safety practices

Introduction

Community colleges are among the skills institutions established under the Ministry of Higher Education Malaysia with the aim of providing an alternative pathway for post-secondary students to gain knowledge and skills. Safety is very important in daily life as it involves protecting individuals, families, staff, and communities from danger, accidents, or threats that may cause physical, emotional, or financial loss. Therefore, greater knowledge and skills in safety aspects need to be developed to ensure that all individuals in the institution remain safe.

According to [1], technical college students are exposed to both theoretical knowledge and practical skills through guided learning and hands-on workshop activities. Therefore, it is important for technical institutions to emphasize safety skills particularly in handling electrical tools and equipment to minimize risks and support effective learning outcomes. This is consistent with previous studies which highlight

the importance of safety awareness and training in promoting safe practices in technical and vocational education settings [16].

Safety instructions and safety circulars need to be implemented and adhered to in order to ensure organised and effective safety management. Safety culture is an important aspect to be implemented in the workplace to encourage safe practices among employees and organisations. Safety culture should be developed as a habit and a set of attitudes within organizations, and it needs to be introduced during the educational process before being applied in the workplace [2]. In addition, recent studies have also highlighted the importance of structured safety education in supporting safety awareness in technical learning environments [13].

However, despite the importance of safety in technical education, there is still limited research examining how safety knowledge, safety practices, and the physical workshop environment interact in Malaysian community colleges, as most studies focus on these aspects individually.

In this regard, this study was conducted to identify the level of workshop safety knowledge among students of the Electrical Technology Certificate Program at Tawau Community College. This study was also conducted to assess the level of safety practices in electrical workshops among the students and finally to determine the level of the physical environment of electrical workshops from a safety perspective at the college.

Literature review

All employment sectors face the risk of accidents, with the manufacturing (industrial) sector recording the highest number compared to other sectors, according to statistics released by the Department of Occupational Safety and Health under the Ministry of Human Resources as of October 2017. Developing a safe work culture during the teaching and learning process requires strong commitment from all parties, especially those responsible and students in higher education institutions.

Safety culture should be developed as a habit and a set of attitudes in every organization. This practice needs to be taught during the education process and then applied in the workplace. It should be instilled to create a safe working environment. According to [3], early exposure to occupational safety and health issues in education is important in promoting safety awareness among students. However, most equipment, tools, instruments, and consumables require specific skills, competencies, and careful handling. During interactions with these materials, mistakes may occur due to factors such as ignorance, lack of knowledge, and carelessness, which may increase the risk of accidents [4].

Safety practices are important aspects that need to be emphasized among students when performing practical work in the workshop. Therefore, an understanding of risks and safety needs to be fostered in every student so that it becomes a positive culture in the workshop. In general, students are involved in the use of various types of machines, hand tools, electrical equipment, and flammable materials during practical work in the workshop. These factors may expose students to the risk of accidents. These accidents are often associated with unsafe workshop safety practices [5]. This implies that

students' safety knowledge and awareness are important in influencing their safety practices.

The safety aspect in the workshop needs to be given special attention, especially in TVET higher education institutions such as community colleges. The majority of TVET institutions offer technical programs where the teaching and learning process is largely carried out in workshops or laboratories, and the hand tools and machines used by students vary according to the needs of the curriculum. Safety regulations in the workshop or workplace should be consistently practiced by all individuals to ensure a safe working environment [6].

Workshop safety regulations in each institution differ from each other. The tendency to neglect safety regulations may contribute to accidents in the workshop environment [7]. In addition, poorly designed layouts of machines and equipment may increase the risk of accidents, as students may easily come into contact with them. Poor lighting and ventilation may also have adverse impacts on safety in the workshop. These factors indicate that the physical environment plays an important role in supporting safe practices.

According to [2], occupational safety and health training is important in educating students and increasing their awareness of occupational safety and health. It is important to produce highly skilled workers with strong knowledge of safety aspects, in line with the government's efforts to provide effective and systematic educational facilities for students. This suggests that one of the critical aspects of enhancing the safety awareness and practices among the students is the safety training. In general, these results indicate that safety knowledge, safety practices, and physical workshop environment are interconnecting factors which, in combination, affect safety behaviour in workshop contexts.

Methodology

This section described the research methods that will be used to investigate the level of workshop safety knowledge and safety practices among the students undertaking the Certificate in Electrical Technology Program at Kolej Komuniti Tawau. Quantitative design was adopted as it enables the collection of data and statistical analysis that would be systematic to address the research objectives.

Research Design

A quantitative descriptive survey was used in this study. It was deemed appropriate to measure the levels of workshop safety knowledge, safety practices in the electrical workshop and perceptions of the physical workshop environment without controlling any research variables. A descriptive survey method enables a systematic gathering of numerical data to describe and explain a phenomenon in a specified population [8].

Research Respondents

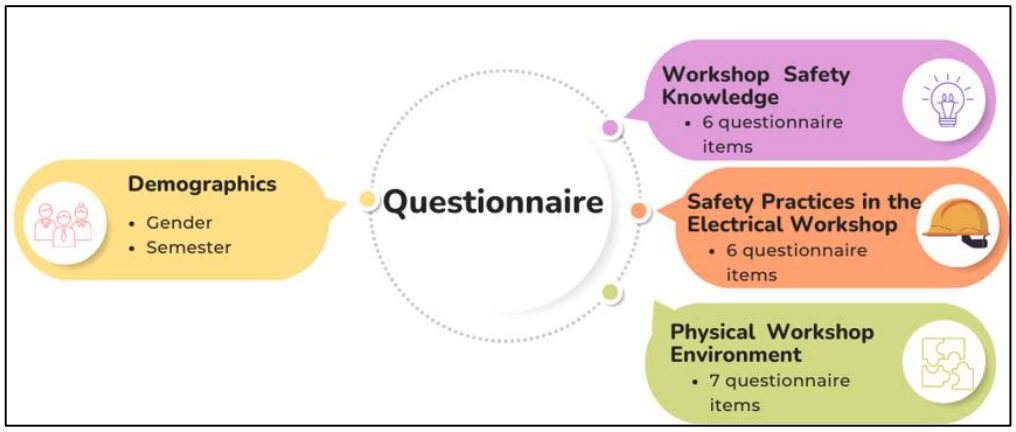
The respondents consisted of Semester 2 and Semester 3 students enrolled in the Certificate in Electrical Technology Program at Kolej Komuniti Tawau. The participants in the study were 60 out of a total population of 70 students, which is a high response rate.

The survey method adopted was a census-based survey, in which all the students in the target population were called upon to respond to the survey. Although not all students responded, the participation of the majority of the population provides a reasonable representation of the level of workshop safety knowledge and safety practices within the institutional context. This method was deemed to be suitable as the population is small and accessible and thus it can be understood more so in the study context. Nevertheless, the findings are limited to this specific institution and should not be generalized beyond similar settings.

Research Instrument

The research instrument used in this study was a structured questionnaire that was developed and adapted based on previous studies related to workshop safety and safety practices in the context of technical education. The questionnaire was designed to gather quantitative data on the level of workshop safety knowledge, safety practices in the electrical workshop, and the physical workshop environment among students enrolled in the Electrical Technology Certificate Program at Kolej Komuniti Tawau. The instrument was carefully examined to make sure that all items were relevant and aligned with the constructs of workshop safety knowledge, safety practices, and the physical workshop environment.

The questionnaire was divided into four main sections as shown in Figure 1: demographic information, workshop safety knowledge, safety practices in the electrical workshop and the physical workshop environment. The instrument structure was designed in a way that would allow measuring each construct in a focused and systematic manner in accordance with the research objectives.



Figures 1: Questionnaire structure

A five-point Likert scale was used to measure respondents' level of agreement with each statement presented in the questionnaire. The scale ranged from 1 (Strongly Disagree) to 5 (Strongly Agree). The Likert scale is widely used in social and educational research to quantitatively measure respondents' attitudes, perceptions, and practices [9]. The Likert scale utilized in this study is presented in Table 1.

Table 1: Likert scale

Scale	Score
Strongly Disagree	1
Disagree	2
Neutral	3
Agree	4
Strongly Agree	5

In order to determine the reliability of the instrument, a reliability study using Cronbach alpha coefficient was carried out. The results indicated that the overall Cronbach's alpha value for the instrument was 0.957, as presented in Table 2, showing a very high level of internal consistency among the items. Cronbach's alpha value exceeding 0.70 indicates acceptable reliability, while higher values reflect greater stability and internal consistency of the instrument [10].

Table 2: Reliability Coefficient of the Instrument (*n=20*)

Domain	Number of Items	Cronbach's α
Questionnaire	19	**.957**

Research Procedure

The study was conducted online using Google Forms and distributed to students via Telegram. Data collection was conducted over a two-week period. Participation in this study was voluntary, and respondents' confidentiality was ensured. All data collected were used solely for research purposes. The collected data were analysed using the Statistical Package for the Social Sciences (SPSS) version 27. Descriptive statistics, including mean scores, standard deviations, and percentages, were used to determine the levels of workshop safety knowledge, safety practices, and the physical workshop environment.

Pearson's correlation analysis was conducted to examine the relationship between workshop safety knowledge and safety practices. The use of Pearson's correlation was appropriate as both variables were measured quantitatively and the analysis aimed to assess the strength and direction of the linear relationship between the constructs. The interpretation of the correlation coefficient followed general statistical guidelines, whereby an *r* value of approximately .50 and above indicates a large or strong relationship between variables [11].

Findings and Discussion

The following section will include the research results of the study on the level of workshop safety knowledge, safety practices within the electrical workshop, and the physical workshop environment of the students enrolled in the Electrical Technology Certificate Program in Kolej Komuniti Tawau. The findings were analyzed using descriptive statistics and interpreted based on the mean scores for each construct in line with the research objectives.

To ensure consistency in the interpretation of the findings, a mean score interpretation range was applied to classify the respondents' level of evaluation, as presented in Table 3.

Table 3: Interpretation of Mean Score Levels

Mean Range	Level Interpretation
1.00 to 1.80	Very Low
1.81 to 2.60	Low
2.61 to 3.40	Moderate
3.41 to 4.20	High
4.21 to 5.00	Very High

Demographic Profile of Respondents

The study involved 60 students enrolled in the Electrical Technology Certificate Program at Kolej Komuniti Tawau. According to Table 4, most of the respondents were male students, comprising 52 individuals (86.7%), while 8 respondents (13.3%) were female. Regarding the semester of study, the majority of the respondents were in Semester 3, with a total of 46 students (76.7%), and the rest of the 14 students (23.3%) were in Semester 2.

Table 4: Demographic Analysis of Respondents

Category	Subcategory	Frequency	Percentage
Gender	Male	52	86.7%
	Female	8	13.3%
Semester	2	14	23.3%
	3	46	76.7%

Level of Workshop Safety Knowledge Among Students

Based on Table 5, the mean scores and standard deviations analysis show that the level of workshop safety knowledge among students was on a very high level with an overall mean score of 4.29 and a standard deviation of 0.727. The item with the highest mean score was related to the requirement to switch off the main power supply before commencing any electrical practical work (M = 4.33, SD = 0.729). In contrast, the lowest mean score was recorded for students' understanding of the established safety regulations in the electrical workshop (M = 4.23, SD = 0.831). All the evaluated items, however, were rated at a very high level which means that students had consistently good knowledge on workshop safety procedures.

Table 5: Mean Scores and Standard Deviations for the Level of Workshop Safety Knowledge

Statement	Mean	SD	Level
I understand the safety regulations established in the electrical workshop	4.23	0.831	Very High
I know how to use a fire extinguisher during an emergency in the workshop	4.27	0.733	Very High
I am aware of the risk of electric shock when handling equipment without switching off the main power supply	4.27	0.778	Very High
I understand the importance of wearing personal protective equipment (PPE) while working in the electrical workshop	4.32	0.727	Very High

I understand basic first aid procedures for victims of electric shock	4.32	0.727	Very High
I know that the main switch must be turned off before commencing any electrical practical work	4.33	0.729	Very High
Overall	**4.29**	**0.727**	**Very High**

Level of Safety Practices in the Electrical Workshop Among Students

Based on Table 6, the results show that the level of safety practices in the electrical workshop among students was very high and the mean of overall score of 4.36 and a standard deviation of 0.677. The item with the highest mean score was related to maintaining a clean and organized workspace after completing practical tasks (M = 4.38, SD = 0.640). Conversely, the lowest mean scores were obtained for the practice of wearing personal protective equipment (PPE) and adhering to the prohibition of eating, drinking, or using mobile phones in the workshop (M = 4.35, SD = 0.709). Despite a few differences recorded, all the items were rated highly implying that students were always able to follow the set safety procedures in the electrical workshop.

Table 6: Mean Scores and Standard Deviations for the Level of Safety Practices in the Electrical Workshop

Statement	Mean	SD	Level
I wear personal protective equipment (e.g., safety helmet, safety shoes, gloves) when working in the electrical workshop	4.35	0.709	Very High
I switch off the main power supply before carrying out any maintenance or testing on electrical equipment	4.37	0.637	Very High
I immediately report any damaged equipment or potential hazards to the lecturer	4.37	0.758	Very High
I ensure that my workspace is clean and organized after completing practical tasks to prevent accidents	4.38	0.640	Very High
I follow the lecturer's instructions and established safety procedures during workshop training	4.37	0.780	Very High
I do not eat, drink, or use a mobile phone inside the workshop	4.35	0.709	Very High
Overall	**4.36**	**0.677**	**Very High**

The level of the physical environment of the electrical workshop in terms of safety at Kolej Komuniti Tawau

Based on the Table 7, the level of the physical workshop environment from a safety perspective was rated at a very high level, with an overall mean score of 4.29 and a standard deviation of 0.843. The item with the highest mean score was related to adequate workshop lighting to ensure that tasks are performed safely (M = 4.33, SD = 0.837). In contrast, the lowest mean score was recorded for the clarity and accessibility of emergency exit routes in the electrical workshop (M = 4.25, SD = 0.950). Nevertheless, there was a very high level of classification of all items, which means that the physical workshop environment was seen as safe and enabling practical learning activities to take place.

Table 7: Mean Scores and Standard Deviations for for the Physical Workshop Environment from a Safety Perspective

Statement	Mean	SD	Level
Emergency exit routes in the electrical workshop are clearly marked and unobstructed	4.25	0.950	Very High
Workshop lighting is sufficient to ensure that work is performed safely	4.33	0.837	Very High
Ventilation conditions in the workshop are adequate and suitable for practical work	4.30	0.908	Very High
The arrangement of equipment and machinery allows safe and smooth movement within the workshop	4.28	0.804	Very High
The workshop floor is clean, level, and in good condition	4.28	0.922	Very High
Safety posters, equipment usage instructions, and emergency information are clearly displayed and easily visible to students	4.30	0.850	Very High
Students have sufficient and comfortable workspace to perform practical activities safely and systematically	4.30	0.850	Very High
Overall	**4.29**	**0.843**	**Very High**

Inferential Analysis

The correlation analysis between the workshop safety knowledge and the safety practices were compared using Pearson correlation test that was done to determine the relationship between the workshop safety knowledge and the safety practices among the students enrolled in Electrical Technology Certificate Program in Kolej Komuniti Tawau. The analysis was performed using the aggregated mean scores of both variables. Based on Table 8, a significant positive relationship was found between safety knowledge and safety practices, $r = .767$, $p < .001$, among 60 respondents. The value of the correlation coefficient indicates a strong association between the two variables. These findings suggest that higher levels of workshop safety knowledge were associated with better safety practices in the electrical workshop. However, it is important to note that the relationship identified is correlational in nature and does not imply causation.

Table 8: Pearson Correlation Between Workshop Safety Knowledge and Safety Practices

Variable	1	2
Workshop Safety Knowledge	-	.767
Safety Practices in the Electrical Workshop	.767	-

Note. Values represent Pearson's correlation coefficients (r).
****** $p < .001$ (two-tailed).

Discussion

The results show that the students are highly safety aware and compliant in their practical work in the electrical workshop. This implies that the safety knowledge gained by the students will not just be conceptual but also in their behaviour in a technical learning context. The results emphasize the significance of safety knowledge in the development of safe practices among students.

Regarding the aspects of safety practices, the findings suggest that students can generally utilize safety measures regularly throughout workshop sessions. This may be attributed to continuous exposure to safety guidelines and structured practical training. These findings are consistent with previous studies [12], [13], which highlight the importance of safety education in promoting awareness and supporting safe practices among students in technical and vocational education settings. Moreover, the positive correlation between safety knowledge and safety practices indicates that higher degree of awareness of safety procedures can help in enhancing safety compliance. This finding can be interpreted from a behavioural perspective, where knowledge and awareness are important factors influencing individuals' actions in managing risks.

Furthermore, the high level of the physical workshop environment indicates that a well-maintained and properly managed facility plays an important role in supporting a safe learning environment. An appropriate workshop environment could be useful in mitigating possible risks and allow students to perform practical activities safely. These findings are consistent with previous research [14], which emphasises the importance of effective facility maintenance and management in supporting safe and functional workshop environments. In addition, proper workshop management practices play an important role in supporting the organisation and maintenance of equipment and facilities for effective practical training activities [15].

Overall, the consistently high levels observed may be explained by the continuous exposure to safety training, organized practical activities and supervision in the workshops setting. These findings suggest that safety in technical education is influenced by the interaction between knowledge, behaviour, and environmental support. A combination of these factors is vital in promoting positive safety culture among students in technical and vocational education institutions. This is also in line with the idea of safety culture whereby knowledge, behaviour and environmental factors all play a role in promoting safe practices in technical learning environments.

This research has a number of limitations which must be taken into consideration. The data were first obtained through a self-reported questionnaire, which can be biased in terms of response, as the individuals can give socially desirable responses. Second, the study was conducted within a single institution with a relatively small sample size, which may limit the generalisability of the findings. In addition, subgroup analysis and more advanced statistical techniques, such as regression analysis, were not conducted due to the limited sample size. Consequently, research studies in the future should involve a bigger sample size and various institutions to increase the strength of the results. Furthertmore, future research is recommended to incorporate observational or performance-based measures to provide a more comprehensive assessment of students' safety practices.

Conclusion

This study contributes to the TVET literature as it illustrates a positive correlation between safety knowledge and safety practices among Electrical Technology students in conducive workshop environment. The results indicate that knowledge, behaviour and infrastructure have to be combined in order to have effective safety management. In addition, the study emphasises the combined role of these factors in promoting safe behaviour among students in TVET settings. From a policy perspective, early implementation of structured and standardized safety modules, along with consistent monitoring frameworks, is essential to ensure sustained safety compliance across institutions. This also suggests that safety education needs to be more systematically implemented into the curriculum, particularly with the use of practical based learning and ongoing evaluation of safety practices. In practice, on-going training, frequent safety audits, and involvement of students in simulations and safety activities are essential towards strengthening of a good safety culture. Overall, a holistic and coordinated approach is necessary to sustain effective safety practices in TVET settings.

Abstract. This study aims to investigate the comparative evaluation of educational approaches between face-to-face and e-learning through the Analytical Hierarchy Process (AHP). This paper is conducted in two stages. First, a comprehensive analysis of the existing literature was conducted to identify a broad range of criterion related to educational approaches between face-to-face and e-learning. There are five main criterions identified which are accessibility, cost-effectiveness, engagement, academic outcomes, and technological infrastructure. Second, all of the criterions are ranked using the AHP method to determine the priority of educational approaches between face-to-face and e-learning. The findings indicate, according to the educational approaches between face-to-face and e-learning, engagement is the first priority. Next priorities are assigned to academic outcomes, technological infrastructure, accessibility, and cost-effectiveness. Hence, this paper highlights the importance of face-to-face approach compared to e-learning. However, for the criteria of technological infrastructure and accessibility, an e-learning approach is more appropriate. In conclusion, in order to accomplish learning goals in the modern day, blended learning which blends face-to-face and e-learning approach is essential.

Keywords: Educational Approach, Face-to-Face, e-Learning, Analytical Hierarchy Process (AHP), Decision Making

Introduction

The rapid advancements in technology have transformed the landscape of education, presenting stakeholders with diverse instructional methods such as traditional face-to-face learning and e-learning [1]. These approaches offer distinct advantages and challenges, necessitating a structured evaluation framework to determine the most effective method based on specific goals and contexts. This need has become particularly pressing considering the global shift towards online education due to events like the COVID-19 pandemic and the growing emphasis on flexible learning environments [2].

Face-to-face learning, characterized by in-person interaction, provides a traditional, immersive experience that fosters direct communication, hands-on activities, and immediate feedback. Conversely, e-learning leverages digital tools and platforms to deliver education remotely, emphasizing accessibility, self-paced learning, and scalability [3]. Each approach holds unique potential, but their effectiveness can vary significantly depending on criteria such as accessibility, cost-effectiveness, engagement, academic outcomes, and technological infrastructure [4].

The AHP, a decision-making framework developed by Thomas L. Saaty [5], offers a systematic method for comparing these two educational approaches. By structuring the problem hierarchically into a goal (selecting the optimal educational approach), criteria (accessibility, cost-effectiveness, engagement, academic outcomes, technological infrastructure), and alternatives (face-to-face and e-learning), AHP facilitates a comprehensive evaluation. Through pairwise comparisons and consistency checks, AHP quantifies subjective judgments, enabling educators, administrators, and policymakers to assess trade-offs and prioritize options. This structured approach ensures transparency, objectivity, and alignment with institutional goals while accommodating diverse stakeholder perspectives.

While numerous studies have evaluated face-to-face and e-learning approaches, few have systematically applied AHP to provide a comprehensive hierarchical analysis. By applying AHP, this study aims to fill this gap, offering a structured hierarchical analysis to evaluate the two educational approaches based on key criteria such as accessibility, cost-effectiveness, engagement, academic outcomes, and technological infrastructure. The literature review also establishes the foundation for using AHP as a methodological tool to bridge the gap in comparative evaluations, enabling educators and policymakers to make informed, data-driven decisions tailored to their specific educational contexts.

Hence, this study employs AHP to conduct a comparative evaluation of face-to-face and e-learning approaches, analyzing their strengths and limitations across key decision criteria. A total of 35 lecturers representing 7 academic departments at Muadzam Shah Polytechnic were appointed as an expert panel. The findings aim to determine the preference between face-to-face and e-learning teaching and learning approaches.

Literature Review

The comparative evaluation of face-to-face and e-learning approaches has gained significant attention in recent years due to the increasing integration of technology into education. Various studies have explored the strengths and limitations of these instructional methods, offering insights into their effectiveness under different circumstances. The use of the Analytical Hierarchy Process (AHP) as a decision-making tool in this context provides a systematic framework for addressing the complexity of multi-criteria evaluation.

Face-to-Face Learning: Advantages and Challenges

Face-to-face learning, rooted in traditional classroom environments, has been extensively studied for its emphasis on interpersonal communication, immediate feedback, and social interaction. Research highlights its strengths in fostering active learning, collaborative projects, and hands-on activities, particularly in disciplines requiring practical application, such as medicine and engineering. However, challenges such as geographical limitations, fixed schedules, and higher costs have been noted as constraints [6].

E-Learning: Benefits and Limitations

E-learning, on the other hand, has revolutionized education by offering flexibility, scalability, and accessibility to learners worldwide. Studies underscore its potential to deliver personalized learning experiences, reduce costs, and enable continuous learning across diverse populations [7]. Despite its advantages, e-learning faces criticism for its

lack of direct social interaction, potential for learner isolation, and reliance on robust technological infrastructure [8].

Comparative Studies of Face-to-Face and E-Learning

Numerous studies have compared the two approaches, often highlighting their complementary nature rather than a dichotomy. For instance, blended learning, which combines face-to-face and e-learning elements, has been found to leverage the strengths of both [9]. However, direct comparisons frequently hinge on factors such as learner engagement, academic performance, cost-effectiveness, and scalability, which vary based on the educational context [10].

Accessibility in Learning

Accessibility in learning ensures that all learners, regardless of their abilities or disabilities, have equal opportunities to access educational materials and participate in the learning process. Key components of accessibility in learning include accessible content, assistive technology, universal design for learning, inclusive digital platforms, physical accessibility, flexible learning options, support services, training and awareness, equitable assessments, and policies and guidelines. Each of these components contributes to creating an inclusive learning environment for all [11].

Cost-Effectiveness in Learning

A key component of cost-effectiveness in learning is resource optimization. This involves maximizing the use of available resources such as financial, human, or material to achieve learning outcomes efficiently. Key components of cost-effectiveness in learning include use of open educational resources, scalable solutions, blended learning models, leveraging technology, teacher training and support, and evaluation and feedback systems. Each of these components helps balance educational quality with affordability [12].

Engagement in Learning

A key component of engagement in learning is active participation. This involves learners actively interacting with the content, instructors, and peers, rather than passively consuming information. Key components of engagement in learning include interactive content, collaborative learning, personalized learning paths, feedback and recognition, real-world applications, variety in delivery methods, student autonomy, and emotional connection. These components encourage curiosity, motivation, and a sense of purpose, making learning more effective and enjoyable [13].

Academic Outcomes in Learning

A key component of academic outcomes in learning is assessment and evaluation. This involves measuring learners' progress and performance to determine the achievement of learning objectives. Key components of academic outcomes in learning include formative assessments, summative assessments, alignment with learning objectives, feedback mechanisms, standardized benchmarks, skill development,

retention and transfer, and data analysis and reporting. These components ensure that academic outcomes are clear, measurable, and aligned with educational goals [8].

Technological Infrastructure in Learning

A key component of technological infrastructure in learning is Learning Management Systems (LMS). An LMS serves as a centralized platform for managing and delivering educational content, tracking learner progress, and facilitating communication. Key components of technological infrastructure in learning include reliable internet connectivity, hardware availability, software and applications, cloud-based storage, cybersecurity measures, assistive technology, information technology support and maintenance, integration capabilities, data analytics and reporting tools, and energy and power backup systems. These components collectively create a robust technological foundation for effective learning [14].

Application of Analytical Hierarchy Process (AHP) in Learning

The AHP is a structured decision-making framework often applied in education to address complex problems by breaking them down into hierarchical components. The purposes of applying AHP in education is to prioritization of objectives, resource allocation, evaluation of educational programs, decision-making in curriculum design, selection of educational tools and technologies, performance assessment, policy development, stakeholder involvement, improvement of teaching methods, project selection and prioritization, problem-solving, and institutional benchmarking. By applying AHP, educational institutions can make more systematic, transparent, and justifiable decisions [15].

Methodology

This paper is conducted in two stages. First, a comprehensive analysis of the existing literature was conducted to identify a broad range of criterion related to educational approaches between face-to-face and e-learning. There are five main criterions identified which are accessibility, cost-effectiveness, engagement, academic outcomes, and technological infrastructure. Second, all of the criterions are ranked using the AHP method to determine the priority of educational approaches between face-to-face and e-learning. Table 1 shows the hierarchical components of this study.

Table 1: Hierarchical Component

Objectives	Criterion	Component of Criterion	Alternative
Comparative Evaluation of Educational Approaches Between Face-to-Face and E-Learning	1. Accessibility	1. Accessible Content 2. Assistive Technology 3. Universal Design for Learning 4. Inclusive Digital Platforms 5. Physical Accessibility 6. Flexible Learning Options 7. Support Services 8. Training and Awareness 9. Equitable Assessments 10. Policies and Guidelines	1. Face-to-Face 2. E-Learning
	2. Cost-Effectiveness	1. Use of Open Educational Resources 2. Scalable Solutions 3. Blended Learning Models 4. Leveraging Technology 5. Teacher Training and Support 6. Evaluation and Feedback Systems	1. Face-to-Face 2. E-Learning
	3. Engagement	1. Interactive Content 2. Collaborative Learning 3. Personalized Learning Paths 4. Feedback and Recognition 5. Real-World Applications 6. Variety in Delivery Methods 7. Student Autonomy 8. Emotional Connection	1. Face-to-Face 2. E-Learning
	4. Academic Outcomes	1. Formative Assessments 2. Summative Assessments 3. Alignment with Learning Objectives 4. Feedback Mechanisms 5. Standardized Benchmarks 6. Skill Development 7. Retention and Transfer 8. Data Analysis and Reporting	1. Face-to-Face 2. E-Learning
	5. Technological Infrastructure	1. Reliable Internet Connectivity 2. Hardware Availability 3. Software and Applications 4. Cloud-Based Storage 5. Cybersecurity Measures 6. Assistive Technology 7. Information Technology Support and Maintenance 8. Integration Capabilities 9. Data Analytics and Reporting Tools 10. Energy and Power Backup Systems	1. Face-to-Face 2. E-Learning

AHP Method

AHP is a multicriteria decision-making approach based on a hierarchy structure. It is used in different domains to prioritize and classify criterions when different alternatives are possible. This methodology uses a pairwise comparison of identified elements. A consistency test is conducted to verify the reliability of results. It consists of four mathematical steps [16].

Step 1: Development of the hierarchy through the identification of criterions and related alternatives.

Step 2: Establish pairwise comparison matrixes to compare the first criterions based on alternatives on a scale of 1 to 9. Table 2 shows the AHP scale adapted from Saaty [5].

Table 2: AHP Scale

Numerical Value	Equivalence
1	Same Importance
3	Moderate Importance
5	Strong Importance
7	Very Strong Importance
9	Extreme Importance
2,4,6,8	Intermediate Values
1/3,1/5,1/7,1/9	Value for Inverse Comparison

Step 3: The weights are calculated for criterions and alternatives. The procedure consists of dividing each member of the matrix by the sum of every column and calculating the average of each row.

Step 4: Evaluating consistency. The consistency index (CI) is given in equation (1).

$$\mathrm{CI} = \frac{\lambda\mathrm{max}-\mathrm{n}}{n-1} \ldots(1)$$

Where λmax designates the eigenvalue and n designates the number of criteria. The consistency ratio (CR) is calculated as follows:

$\mathrm{CR} = \frac{\mathrm{CI}}{RI} \ldots(2)$, where RI is the random consistency index.

If CR < 0.1, the consistency is acceptable. If CR ≥ 0.1, revise the pairwise comparisons.

Results and Discussion

Table 3 to Table 9 show the findings in this study. Table 3 shows the ranking position for each criterion. Table 4 to Table 8 show the alternative priorities for each criterion. Finally, Table 9 shows that the face-to-face approach was chosen as the main alternative.

Table 3: Ranking Position for Each Criterion

Rank	Criterion	Criterion Weight
4	Accessibility	0.127
5	Cost-Effectiveness	0.074
1	Engagement	0.351
2	Academic Outcomes	0.260
3	Technological Infrastructure	0.188

As shown in the Table 3 above, according to the educational approaches between face to face and e-learning, engagement is the first priority. Next priorities are assigned to academic outcomes, technological infrastructure, accessibility and cost-effectiveness according to the obtained weights.

Table 4: Alternative Priorities for Technological Infrastructure

Rank	Alternative	Criterion Weight
2	Face-to-Face	0.231
1	E-Learning	0.769

As shown in the Table 4 above, according to the technological infrastructure, e-learning is the first priority. Next priorities are assigned to face-to-face according to the obtained weights.

Table 5: Alternative Priorities for Academic Outcomes

Rank	Alternative	Criterion Weight
1	Face-to-Face	0.889
2	E-Learning	0.111

As shown in the Table 5 above, according to the academic outcomes, face-to-face is the first priority. Next priorities are assigned to e-learning according to the obtained weight**.**

Table 6: Alternative Priorities for Engagement

Rank	Alternative	Criterion Weight
1	Face-to-Face	0.889
2	E-Learning	0.111

As shown in the Table 6 above, according to the engagement, face-to-face is the first priority. Next priorities are assigned to e-learning according to the obtained weights.

Table 7: Alternative Priorities for Cost-Effectiveness

Rank	Alternative	Criterion Weight
1	Face-to-Face	0.875
2	E-Learning	0.125

As shown in the Table 7 above, according to the cost-effectiveness, face-to-face is the first priority. Next priorities are assigned to e-learning according to the obtained weights.

Table 8: Alternative Priorities for Accessibility

Rank	Alternative	Criterion Weight
2	Face-to-Face	0.231
1	E-Learning	0.769

As shown in the Table 8 above, according to the accessibility, e-learning is the first priority. Next priorities are assigned to face-to-face according to the obtained weights.

Table 9: Main Alternative

Rank	Main Alternative	Criterion Weight
1	Face-to-Face	0.68
2	E-Learning	0.32

As shown in the Table 9 above, according to the educational approaches between face-to-face and e-learning, face-to-face is the first priority. Next priorities are assigned to e-learning according to the obtained weights.

Conclusion

In this study, engagement is the first priority. This shows that active participation from instructors and students is essential to ensure effective learning can be implemented. Next priorities are assigned to academic outcomes, technological infrastructure, accessibility, and cost-effectiveness. Hence, this paper highlights the importance of face-to-face approach compared to e-learning. However, for the criteria of technological infrastructure and accessibility, an e-learning approach is more appropriate. In conclusion, in order to accomplish learning goals in the modern day, blended learning which blends face-to-face and e-learning approach is essential.

Abstract. Technical and Vocational Education and Training (TVET) in electrical engineering faces persistent challenges in providing safe, practical exposure to protective device operation and fault response mechanisms. This research presents the design, implementation, and evaluation of an Internet of Things (IoT)-integrated Smart Protective Device Trainer that addresses these limitations through real-time simulation and monitoring capabilities. The trainer enables students to safely observe and analyze the behavior of protective devices including miniature circuit breakers (MCB), fuses, and overload relays under controlled fault conditions without exposure to actual electrical hazards. The system architecture employs ESP32 microcontrollers as the central processing unit, integrated with ACS712 current sensors for electrical parameter monitoring and DHT11 temperature sensors for thermal condition detection. Upon detecting overload currents or overheating events, the trainer executes automated safety responses including relay-controlled circuit disconnection, audible buzzer alerts, and visual LED indicators. All operational data and fault events are transmitted in real time to the Blynk IoT platform for visualization and to Telegram Bot for instant mobile notifications, enabling remote monitoring and documentation. To evaluate the system, a mixed-methods approach was used quantitative data was analyzed using paired t-tests for conceptual understanding and descriptive statistic for usability, while qualitative data was analyzed thematically from open ended survey responses. The results demonstrated a statistically significant 32.9% improvement in students' conceptual test scores ($p < 0.001$) and high usability ratings (4.2/5). Qualitative feedback further revealed enhanced student confidence and engagement due to real-time visualizations. In conclusion, the Smart Protective Device Trainer successfully bridges the gap between theoretical electrical safety concepts and practical Industry 4.0 applications, offering a cost-effective, pedagogical solution to modernize TVET curriculum.

Keywords: TVET, Electrical Safety, Protective Devices, IoT Integration

Introduction

Electrical safety plays a vital role in both engineering education and industrial practice, emphasizing its critical importance in homes and workplaces while highlighting the need for structured training, clear protocols, and a strong safety culture to ensure awareness, compliance, and accident prevention across educational and professional environments [1,2]. Real-time overcurrent protection practical that

connect lectures to industry-like experiences, together with embedded-system troubleshooting hardware that simulates real fault scenarios to bridge theory and practice, are essential because many students struggle to relate these ideas to real-world applications [3,4]. A Smart Protective Device Trainer with Internet of Things (IoT) integration has been developed as an innovative teaching tool, drawing on integrated IoT trainers for electrical engineering practicums that enable cloud data exchange and remote labs, ESP32-based IoT educational devices and courses that build hands-on IoT skills, and cloud-integrated IoT training modules that enhance 21st-century competencies through real-time data, remote monitoring, and authentic engineering tasks [5,6,7]. To address this challenge, a Smart Protective Device Trainer with Internet of Things (IoT) integration has been developed as an innovative teaching tool. The trainer combines conventional hardware with modern IoT-based monitoring, enabling students to observe electrical parameters, fault conditions, and device responses in real time. Through interactive simulations of overload and overheat scenarios, learners gain hands-on experience while receiving instant feedback via IoT dashboards and alerts. This approach enhances engagement, deepens understanding, and aligns TVET education with Industry 4.0 practices.

Literature Review

This trainer not only mitigates inherent safety risks associated with hands-on protective device experimentation but also aligns educational methodologies with the demands of Industry 4.0 by integrating real-time monitoring and data analytics [8]. This approach enhances troubleshooting proficiency by providing students with immediate feedback and performance data, fostering a deeper understanding of fault diagnosis and protective relay operations in real-world scenarios [4,9]. This innovative training system thus addresses the critical need for hands-on, yet safe, experimental learning environments in electrical engineering curricula, particularly within TVET institutions [8]. Currently, IoT in Education is a popular field where prior studies highlight IoT's role in smart monitoring systems, but few focuses on educational trainers. Limited research on combining protective device simulation with IoT monitoring for TVET education. This study addresses the gap by integrating sensors, IoT dashboards, and protective devices into a single educational trainer.

Background

TVET in electrical engineering needs to provide safe yet realistic practical experiences related to circuit protection and fault response. However, many laboratories still rely on conventional equipment that is limited in terms of real-time monitoring, data recording, and integration with Industry 4.0 technologies such as IoT [11,12]. At the same time, IoT and automation skills have been identified as essential competencies for engineers and TVET graduates to meet the demands of the new job market [13,14,15,16].

Studies show that the use of IoT training kits and smart trainers in engineering courses enhances student motivation, conceptual understanding, and learning outcomes [4, 12, 17, 18, 19]. In the electrical context, several studies have developed smart installation trainers and IoT-based remote laboratories for training in modern power systems and electrical installations [12, 18, 19]. Nevertheless, there is a lack of specialized teaching media that replicate the operation of protective devices (MCB, fuse, overload

relay) under fault conditions, with comprehensive IoT sensor monitoring and data recording.

Therefore, this study introduces an IoT-integrated Smart Protective Device Trainer for electrical TVET environments, enabling controlled fault simulations and real-time monitoring while maintaining safety, as well as fostering digital skills related to Industry 4.0 [13, 21].

Table 1. Research context compared to existing literature

Previous Research Focus	Main Contribution to TVET/EE Education	Citation
Smart electrical / installation trainers	High functionality, safe, enhances student skills	[18, 21, 22]
IoT kits / laboratories for engineering	Improves motivation, learning outcomes, and IoT skills	[10, 14, 16, 17]
Frameworks for integrating technology in TVET	Emphasizes IoT, automation, and data as Industry 4.0 requirements	[11, 20]

Problem Statement

Electrical safety is among the more critical features in engineering education and industrial applications. As part of the training in Technical and Vocational Education and Training (TVET), students are taught the theory about some protective devices like miniature circuit breakers (MCB), fuses, and relays, but struggle to connect these concepts with real-world applications. Conventional training setups in many institutions rely on static demonstration boards that provide limited interactivity and lack modern features such as IoT connectivity. This gap between theory and practice reduces student engagement and limits their exposure to technologies aligned with Industry 4.0.

Traditional electrical training methods often rely on static demonstration boards that illustrate only the basic operation of protective devices such as miniature circuit breakers (MCBs) and fuses. These setups lack interactivity, preventing students from experiencing dynamic variations in electrical parameters. Moreover, the absence of real-time monitoring restricts learners from observing live current flow, temperature rise, or device activation, thereby limiting their understanding of how protective devices respond under actual fault conditions.

Another critical limitation is the lack of IoT integration in most institutional laboratories. Without access to dashboards or automated alerts, students are deprived of opportunities to develop competencies in digital monitoring systems that are increasingly vital in modern industry. This contributes to a persistent gap between theoretical knowledge and practical application, as learners struggle to connect classroom concepts of electrical protection with real-world contexts where smart monitoring and automation are standard practices.

Finally, there is a pressing need for safe, cost-efficient platforms that combine protective device simulation with IoT-based monitoring. Such tools would provide interactive, affordable, and industry-relevant experiences, thereby address the shortcomings of conventional training boards and strengthen students' readiness for contemporary engineering environments.

Research Objectives

1. To design and develop a Smart Protective Device Trainer based on ESP32 with integrated current and temperature sensors.

2. To implement automatic safety response functions (circuit breaker, buzzer, LED) along with real-time monitoring and notifications through an IoT platform.

3. To evaluate the pedagogical impact of the trainer on students' understanding of electrical safety concepts, fault diagnostic capabilities, and laboratory engagement among electrical TVET students.

Methodology

System Design

The system uses an ESP32 microcontroller as the main IoTnode, an ACS712 current sensor, and a DHT11 temperature sensor. Actual miniature circuit breakers (MCB), fuses and overload realys are integrated to simulate diverse fault scenarios. Safety actuators disconnect the mains via a release relay and provide buzzer and LED status indicators. The blynk environment provides real time visualization, and a Telegram Bot generates immediate notifications. Figure 1 shows the flowchart of hardware architecture.

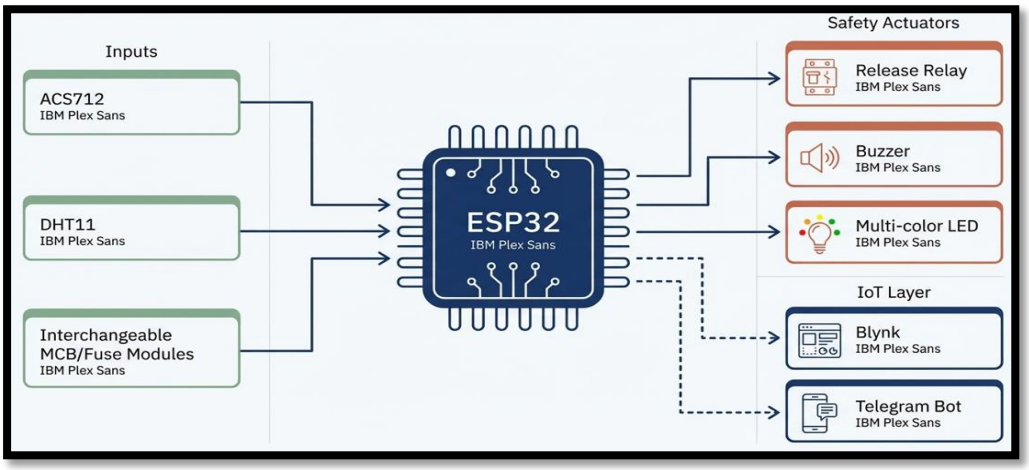

Fig 1: Flowchart of hardware arhitecture

Mixed-Methods Approach and Conceptual Understanding Assessment

This study employed a mixed-method approach to evaluate pedagogical effectiveness and user experience. To measure conceptual mastery, a pre-test and

post-test design comprising 20 validated multiple-choice items was administered. Statistic analysis, including paired t-tests, evaluated the learning gains.

Usability and Engagement Evaluation

Students' experiences with the trainer were captured using a structured questionnaire based on a 5-point Likert scale, assessing Usability, Engagement, and Perceptions of IoT-based learning. The instrument was adapted from validated tools used in prior studies on IoT kits and smart training modules. It assessed three core dimensions:

- Usability: ease of use, clarity of interface, and system reliability
- Engagement: interactivity, motivation, and perceived relevance
- Perceptions of IoT-based learning: real-world applicability, confidence in using smart tools, and readiness for Industry 4.0 environments

In addition to scaled responses, open-ended questions were included to elicit qualitative feedback on student satisfaction and suggestions for improvement.

Implementation Context

The evaluation was conducted over a two-week period in a controlled laboratory setting. A total of 40 electrical engineering students participated in the study. The Smart Protective Device Trainer was integrated into practical sessions, allowing students to interact with real-time sensor data, cloud-based dashboards (via Blynk), and mobile alert systems (via Telegram). The sessions emphasized fault simulation, device coordination, and data visualization to reinforce theoretical concepts through hands-on experience.

Results and Discussion

System Technical Performance The design of the Smart Protective Device Trainer demonstrated high functionality, comparable to reports of nearly 100% effectiveness in other smart electrical trainers. The system successfully:

- Detected overload currents and temperature rises beyond the defined thresholds.
- Interrupted the circuit via relay operation in a manner consistent with educational safety requirements.
- Generated buzzer and LED signals that clearly distinguish between normal, warning, and trip states.

- Transmitted data to Blynk and delivered Telegram notifications in near real time, confirming the effectiveness of IoT cloud platforms in engineering courses.

To evaluate the effectiveness of the Smart Protective Device Trainer, a paired sample t-test was conducted comparing students' scores on the pre-test and post-test assessments of electrical protection concepts. Table 2 shows the result pre-test and post-test.

Table 2: Result Pre-Test and Post-Test

Test	**Score (%)**	Standard Deviation (SD)
Pre-Test	45.2	12.4
Post-Test	78.1	10.7

Mean Difference: 32.9%

$t(39) = 12.47, p < 0.001$

The results indicate a statistically significant improvement in students' conceptual understanding following the intervention. The large t-value and low p-value suggest that the observed learning gains were not due to chance.

Usability and Engagement Ratings

Descriptive statistics were used to summarize Likert-scale questionnaire responses in Table 3.

Table 3: Summarize Likert-scale questionnaire responses.

Dimension	**Pre-Training Mean**	**Post-Training Mean**
Usability	—	4.2 / 5
Engagement	3.1 / 5	4.0 / 5
Perceptions of IoT Learning	3.3 / 5	4.3 / 5

These results reflect high usability and increased engagement with the IoT-based trainer. Students reported greater confidence and motivation in applying electrical protection concepts through smart tools.

Discussion

The present study demonstrates that the Smart Protective Device Trainer significantly improved students' conceptual understanding of electrical protection systems. The paired sample t-test showed that the post-test scores were significantly higher than pre-test scores which reflect that usage of IoT-based tools in practical sessions could therefore enhance theoretical understanding. This is consistent with previous work involving smart trainers and IoT kits, which highlight the importance of real-time data

presentation and failure simulation in connecting classroom theory to industrial practice.

Usability ratings (mean = 4.2/5) indicate that students found the trainer intuitive and reliable which is in favor of its feasibility for wider adoption in TVET laboratories. The engagement score saw an increase from 3.1 to 4.0 with motivation and interactivity gaining further emphasis. Under the same strain, student perceptions of IoT-based learning improved, 3.3 vs 4.3 in indicator score (increased as students perceived that they were growing more confident in applying Industry 4.0 technologies to electrical engineering contexts). These outcomes highlight the trainer's ability to ready graduates for digital-fuelled workplaces where IoT integration is paramount.

Future work may include integration of advanced data analytics, full support for remote laboratories, long-term studies on graduate employability impact, and replication across more TVET institutions to validate the transferability and effectiveness of this model.

Conclusion

Based on the comprehensive evaluation, this study concludes that the IoT-integrated Smart Protective Device Trainer is a highly effective educational tool that resolves critical limitations in traditional electrical TVET training. The quantitative results demonstrated a significant 32.9% increase in student conceptual understanding of protective devices, proving the system/'s pedagogical value. Furthermore, the mixed-methods evaluation highlighted by a high usability score of 4.2/5 and supported by positive qualitative feedback confirms that the integration of real-time IoT monitoring greatly enhances student engagement, interactivity and confidence. By successfully merging conventional hardware with industry 4.0 digital competencies, this trainer provides scalable cost-effective institutions aiming to modernize their electrical engineering curriculam and better prepare graduates for the modern workforce.

Measurement of Learning Outcome Performance for Light Vehicle Service Certificate Students at Pekan Community College: Industrial Internship Employer Survey

Mazlan Bin Omar

Pekan Community College, Pahang, Malaysia

mazlan@kkpekan.edu.my

Abstract. Outcome-Based Education (OBE) requires evidence that student learning outcomes remain aligned with workplace expectations. This study evaluates the learning outcome performance of final-semester students in the Light Vehicle Service Certificate programme at Pekan Community College from the perspective of industrial internship employers. The study contributes a focused employer-based assessment in a Malaysian TVET setting, complementing internal academic measurements with direct industry feedback. A quantitative descriptive design was used. The respondents comprised 66 employers or workplace supervisors who evaluated 66 students from two cohorts: 2021–2022 (n = 29) and 2022–2023 (n = 37). The instrument, adapted from the Polytechnic and Community College Department industrial training manual, used a five-point Likert scale to assess five domains: hands-on task performance, use of tools and equipment, adaptation to the workplace environment, application of learned knowledge to complete tasks, and adaptation to new technologies or work methods. Results show that the mean scores for all domains ranged from 3.95 to 4.62, indicating generally good to excellent performance across cohorts. The strongest ratings were recorded for workplace adaptation and adaptation to new technology in the 2021–2022 cohort (mean = 4.62), while the lowest score was observed for the use of tools and equipment in the 2022–2023 cohort (mean = 3.95). Employer willingness to recruit the trainees remained high in both years, with 75.6% and 75.7% of employers, respectively, indicating readiness to employ the students. Open-ended feedback further highlighted practical skills and workplace adjustment as the most visible strengths. The findings suggest that the programme has largely achieved its intended learning outcomes, while also indicating the need for continued improvement in equipment-related competence and readiness for technological change among the later cohort.

Keywords: learning outcome assessment, outcome-based education, industrial internship, employer survey, TVET, community college

Introduction

Learning outcomes describe what students are expected to know, understand, and be able to perform upon completion of a programme. Within Outcome-Based Education, the measurement of learning outcomes is essential because it provides evidence that curriculum implementation, assessment, and graduate attributes are aligned with programme goals. In technical and vocational education and training (TVET), such evidence should not be confined to classroom performance alone,

because employers are among the most relevant stakeholders in determining whether students demonstrate workplace-ready competence [1] .

The Light Vehicle Service Certificate programme at Pekan Community College has mapped course outcomes to programme learning outcomes and evaluates them throughout the period of study. However, internal academic measurements provide only partial evidence of student readiness for employment. Industrial internship offers a more authentic setting in which students are required to transfer knowledge, demonstrate practical competence, adapt to work routines, and respond to current workplace practices.

This paper therefore focuses specifically on employer evaluations of final-semester students during industrial training. The study responds to the need identified by the reviewer to clarify the paper's contribution: rather than presenting another general OBE compliance report, it provides a cohort-based employer perspective on five practical learning domains in a community college automotive programme. This external perspective is useful for curriculum refinement, industry alignment, and graduate employability planning within the Malaysian TVET context [2].

Related Literature

Outcome-Based Education emphasises demonstrable achievement rather than the mere completion of instructional activities. Previous scholarships have shown that effective learning outcome assessment should integrate measurable performance indicators and continuous quality improvement mechanisms [3]. In engineering and technical education, these indicators commonly include not only technical proficiency but also interpersonal adjustment, independent problem solving, and workplace professionalism [4].

Industrial training is widely recognised as a bridge between institutional learning and professional practice. It enables students to apply theory in authentic settings, strengthen technical and interpersonal skills, and gain exposure to employer expectations [5]. Employer feedback gathered during internship is particularly valuable because it reflects sustained observation of trainee performance in real work environments rather than isolated assessment events.

In the Malaysian context, good assessment practice also requires alignment with programme outcomes and national qualification expectations [6]. The industrial training instrument used in this study was designed around such expectations and focuses on domains that are highly relevant to automotive service work: hands-on task execution, proper use of tools and equipment, adaptation to the workplace environment, application of knowledge to task completion, and adaptation to new technologies and work methods. These domains are consistent with the practical, cognitive, and workplace-behaviour elements expected in TVET graduates.

Purpose of the Study

This study was conducted to identify the performance of programme learning outcomes for final-semester Light Vehicle Service Certificate students from the perspective of industrial internship employers. Specifically, the study aimed to:

(i) determine employer ratings across five learning domains for the 2021–2022 and 2022–2023 cohorts.

(ii) compare cohort patterns to identify relatively stronger and weaker domains.

(iii) examine employer willingness to recruit the trainees after internship; and

(iv) synthesize open-ended employer comments to support interpretation of the quantitative findings.

Methodology

The study employed a quantitative descriptive design supported by a brief qualitative review of open-ended employer comments. The respondents were 66 industrial internship employers or workplace supervisors who evaluated 66 final-semester students in the Light Vehicle Service Certificate programme at Pekan Community College. The first cohort consisted of 29 students in the 2021–2022 session, and the second cohort consisted of 37 students in the 2022–2023 session. The study covered all available employer evaluations for the two cohorts, making the dataset effectively a cohort census of the internship assessments completed during the study period.

Data were collected in week 20, which was the final week of industrial training. Employers completed a structured questionnaire adapted from the industrial training manual of the Department of Polytechnic and Community College Education. The instrument used a five-point Likert scale: 1 = weak, 2 = less satisfactory, 3 = satisfactory, 4 = good, and 5 = excellent. The use of a Likert scale is appropriate for structured employer perception data because it supports systematic quantification and descriptive comparison across domains [7].

The instrument measured five learning domains. The first domain evaluated hands-on task performance, including practical execution and mastery of job-related skills. The second domain examined the use of tools and equipment, such as selecting appropriate tools and operating them correctly. The third domain addressed adaptation to the workplace environment, including emotional control, work pressure management, and interaction with colleagues and supervisors. The fourth domain assessed the application of learned knowledge to task completion and problem solving. The fifth domain measured adaptation to technological diversity and new work methods in the workplace.

To improve methodological transparency, the instrument basis and validation process are stated explicitly here. The questionnaire was adapted from an established industrial training assessment document and reviewed for content relevance to practical competence and workplace adjustment. Content alignment was considered appropriate

because the assessed domains reflected the programme learning outcome clusters emphasised in the Malaysian qualifications' framework and the internship context [8]. The data were analysed using descriptive statistics, namely mean scores, frequencies, and percentages. Open-ended employer comments were reviewed and grouped according to the learning domains they most clearly represented. Because the purpose of the paper was evaluative rather than causal, the analysis prioritised transparent descriptive interpretation rather than inferential generalisation.

Results and Discussion

Table 1 shows that all mean scores fell between 3.95 and 4.62. This range indicates that employer evaluations were consistently favourable across both cohorts. The 2021–2022 cohort achieved higher mean scores in every domain, suggesting stronger overall workplace performance during internship. The highest ratings in that cohort were recorded for adaptation to the workplace environment and adaptation to new technology or work methods, both with a mean of 4.62. In contrast, the 2022–2023 cohort recorded its lowest mean score in the use of tools and equipment domain (3.95), indicating a comparatively weaker area that deserves programme attention.

Table 1. Mean scores by learning domain and cohort

Learning Domain	**2021–2022 (n = 29)**	**2022–2023 (n = 37)**
Hands-on task performance	4.52	4.22
Use of tools and equipment	4.48	3.95
Adaptation to workplace environment	4.62	4.22
Application of learned knowledge to task completion	4.45	4.31
Adaptation to new technology/work methods	4.62	4.00

These results support the conclusion that the programme generally achieved the expected learning outcomes, but they also call for a more careful interpretation than simply reporting high means. First, the cohort difference is not trivial because the decline appears across all five domains rather than in a single isolated indicator. Second, the pattern suggests that the later cohort may have required stronger reinforcement in technical equipment handling and adaptation to changing technologies. Third, the relatively smaller decline in the application of learned knowledge (4.45 to 4.31) implies that conceptual transfer remained comparatively stable even when practical execution indicators weakened.

Table 2 provides a more detailed view of the cohort pattern. In the 2021–2022 cohort, the proportion of employers assigning good or excellent ratings ranged from 86.2% to 100.0% across the five domains. The strongest distribution was recorded for adaptation to the workplace environment, where no student was rated merely satisfactory. In the 2022–2023 cohort, the proportion of good or excellent ratings ranged from 73.0% to 86.5%. The lowest combined positive rating occurred in the use of tools and equipment domain, where more than one quarter of students were rated only satisfactory.

Table 2. Rating distribution by learning domain

Domain	Cohort	Excellent	Good	Satisfactory	Good + Excellent	Mean
Hands-on task performance	2021–2022	17 (58.6%)	10 (34.5%)	2 (6.9%)	93.10%	4.52
Hands-on task performance	2022–2023	14 (37.8%)	17 (45.9%)	6 (16.2%)	83.80%	4.22
Use of tools and equipment	2021–2022	16 (55.2%)	11 (37.9%)	2 (6.9%)	93.10%	4.48
Use of tools and equipment	2022–2023	8 (21.6%)	19 (51.4%)	10 (27.0%)	73.00%	3.95
Adaptation to workplace environment	2021–2022	18 (62.1%)	11 (37.9%)	0 (0.0%)	100.00%	4.62
Adaptation to workplace environment	2022–2023	13 (35.1%)	19 (51.4%)	5 (13.5%)	86.50%	4.22
Application of learned knowledge	2021–2022	17 (58.6%)	8 (27.6%)	4 (13.8%)	86.20%	4.45
Application of learned knowledge	2022–2023	16 (43.2%)	16 (43.2%)	5 (13.5%)	86.50%	4.31
Adaptation to new technology /work methods	2021–2022	19 (65.5%)	9 (31.0%)	1 (3.4%)	96.60%	4.62
Adaptation to new technology/ work methods	2022–2023	7 (18.9%)	23 (62.2%)	7 (18.9%)	81.10%	4

This domain level distribution strengthens the discussion in two ways. First, it demonstrates that the overall positive mean scores should not obscure the specific area in which the later cohort was weaker, namely equipment-related competence. Second, the findings suggest that employers may prioritise visible and task-critical behaviours

such as safe tool handling, speed of familiarisation with workshop routines, and direct hands-on execution when judging trainee readiness. This interpretation is consistent with internship research showing that employer satisfaction is strongly linked to operational competence and work adjustment during placement [9].

Employer willingness to recruit the trainees remained consistently high across the two cohorts, as shown in Table 3. Approximately three out of four employers in both years indicated that they would be willing to employ the students in their companies. This result is important because it extends the interpretation of learning outcome achievement beyond classroom-aligned competency statements to a practical employability signal. At the same time, the proportion of employers who were not ready to recruit the trainees, especially in the 2022–2023 cohort, indicates that positive internship performance did not automatically translate into universal hiring confidence.

Table 3. Employer willingness to recruit trainees after internship

Cohort	Ready to Recruit	Not Ready to Recruit	No Response
2021–2022 (n = 29)	22 (75.6%)	6 (20.7%)	1 (3.5%)
2022–2023 (n = 37)	28 (75.7%)	9 (24.3%)	0 (0.0%)

The recruitment result should therefore be interpreted as supportive rather than conclusive evidence of employability. Employer readiness may reflect a combination of technical competence, discipline, workplace fit, staffing needs, and organisational context. The finding is nevertheless encouraging because it suggests that the programme is producing students whom industry partners generally consider employable upon graduation.

Open-Ended Employer Feedback

Open-ended comments were reviewed to identify the domains most frequently highlighted by employers. Among the relevant comments, 61.1% referred positively to the use of tools and equipment, 25.88% to adaptation to the workplace environment, 18.8% to the application of learned knowledge, 16.47% to hands-on task performance, and 8.0% to adaptation to new technology or work methods. These comments complement the structured ratings by indicating which aspects of student performance employers found most observable and meaningful during internship.

The prominence of comments on tool and equipment use suggests that employers place particular emphasis on visible operational competence in workshop settings. This helps explain why the comparatively weaker score in the 2022–2023 cohort for that same domain deserves attention in programme review. Likewise, the lower proportion of comments related to new technology or work methods may indicate either that employers had fewer opportunities to observe this skill directly or that trainees were mainly assigned to routine rather than innovation-intensive tasks.

Implications of the Findings

The findings have three practical implications. First, the generally favourable ratings affirm that the programme's industrial training component is functioning as a meaningful external checkpoint for learning outcome attainment. Second, the repeated advantage of the 2021–2022 cohort suggests that programme teams should review whether changes in student preparation, placement environment, supervision intensity, or workshop exposure may have affected the later cohort. Third, the weaker rating for the use of tools and equipment in 2022–2023 indicates a clear area for continuous quality improvement, such as increased simulation time, tighter standard operating procedure drills, or stronger pre-internship reinforcement of equipment handling.

These implications also address the reviewer's request for deeper interpretation. High mean scores alone do not justify a simple claim that the intended outcomes were achieved without qualification. A more balanced conclusion is that the outcomes were largely achieved, but not uniformly across cohorts or domains. The descriptive evidence points to stable strengths in knowledge application and workplace adaptation, while practical equipment use and readiness for technological change merit more focused enhancement.

Conclusion

This study examined employer evaluations of final semester Light Vehicle Service Certificate students at Pekan Community College during industrial internship. Across both cohorts, employer ratings were positive, with mean scores ranging from 3.95 to 4.62. The results indicate that the students generally demonstrated satisfactory to excellent performance in hands-on work, tool and equipment use, workplace adaptation, application of learned knowledge, and adaptation to technological diversity. Employer willingness to recruit the trainees was also high in both years.

At the same time, the study shows that cohort comparison adds important analytical depth. The 2021–2022 cohort outperformed the 2022–2023 cohort in all five domains, and the largest concern in the later cohort was the use of tools and equipment. These findings suggest that the programme has broadly achieved its expected learning outcomes, while still requiring targeted improvement in selected practical competencies. Open-ended employer comments further indicate that practical operational skill and workplace adjustment remain the most visible strengths from the industry perspective.

The study is limited to employer evaluations from one programme at one community college and relies primarily on descriptive evidence. Future studies may extend the analysis by involving additional institutions, linking employer ratings with student academic records, or combining employer and trainee perspectives for richer triangulation. Even with these limitations, the present study offers useful external evidence for curriculum improvement, OBE monitoring, and employability-oriented enhancement in community college TVET programmes.

Abstract. Interactive teaching aids are increasingly recognized as essential for bridging theory and practice in engineering education. This study reports on the design, development, and evaluation of a Contra-Rotating and Variable Pitch Propeller Aircraft Maintenance Trainer (AMT) as a dedicated instructional tool for aeronautical training. The prototype integrates fixed-pitch, variable-pitch, and contra-rotating propeller configurations with a thrust-measuring stand and data acquisition system. Quantitative testing demonstrated thrust measurement accuracy within ±3%, stable operation up to 8,000 RPM, and airflow deviations below 5% across repeated trials. Contra-rotating propellers produced approximately 30% higher thrust than fixed-pitch designs, while variable-pitch adjustments highlighted the influence of blade angle on output. Reliability was validated through calibration against reference instruments, confirming consistent performance. Educational evaluation showed that the AMT enhanced student engagement, comprehension, and problem-solving skills compared to lecture-only methods. Learners successfully linked recorded thrust, RPM, and airflow data to theoretical principles, reinforcing understanding of aerodynamic performance. The findings highlight the dual value of the AMT: technically robust and pedagogically effective. By making abstract concepts tangible, the prototype fosters deeper learning and prepares students for industrial application. Extending similar innovations across engineering disciplines promises broader impact on competency-based education.

1.0 Introduction

Effective teaching in engineering education requires a diverse range of instructional strategies, including lectures, hands-on activities, and project-based learning. Such approaches accommodate the varied learning styles present within student communities. Among these strategies, the use of physical and virtual learning aids has proven particularly effective in conveying fundamental engineering concepts [1]. Broadly, three primary learning styles are recognized: kinaesthetic, auditory, and visual. Kinaesthetic learners acquire knowledge through physical activity, while visual

learners rely on imagery and diagrams to process information. Notably, approximately 65% of the population are visual learners [2]. These learning styles form the foundation for the development of teaching aids, which serve as tools to enhance comprehension and retention. Teaching aids may take the form of audio-visual materials, such as videos, or tactile resources, such as three-dimensional models [2].

Learning aids that allow students to see, touch, and interact with concepts provide a richer and more memorable educational experience. This is particularly relevant in engineering, where abstract phenomena such as stress or aerodynamic forces manifest in observable physical effects. Designing such aids requires careful consideration to ensure accuracy and clarity. Traditionally, educators have borne the responsibility of creating these tools, while students remain passive recipients. In this research, however, we propose a paradigm shift: empowering students to take ownership of their learning aids. By engaging in the design and fabrication of these tools, students not only deepen their understanding of core principles but also acquire practical skills aligned with industrial practice. A key challenge lies in the complexity of manufacturing physical aids, which often exceeds students' skillsets and available time within conventional curricula. To address this, we leverage advancements in additive manufacturing as a means of bridging this gap [1].

Visual approaches are particularly valuable when teaching complex theoretical topics. Direct observation of an object or phenomenon often provides greater clarity than textual descriptions alone. This principle extends beyond general engineering education into specialized fields such as aviation. In training organizations, teaching aids play a critical role in supporting aircraft maintenance studies. The project presented here focuses on developing instructional tools that compare different types of aircraft propellers in terms of form and thrust. Propellers, which convert rotary motion into thrust-producing slipstreams, exist in several configurations: fixed-pitch, variable-pitch, and contra-rotating. Fixed-pitch propellers maintain a constant blade angle, while variable-pitch designs allow blades to rotate along their axis to adjust pitch. Contra-rotating propellers, consisting of two coaxial propellers rotating in opposite directions, further enhance thrust efficiency. Each of these designs generates distinct airflow patterns and thrust characteristics.

To effectively demonstrate these differences, the project proposes the development of a working prototype, a thrust-measuring stand that enables visualization of thrust output across propeller types. Such a teaching aid allows students to observe real-time speed and thrust data, thereby reinforcing theoretical knowledge with practical evidence. Given the high rotational speeds involved, safety considerations are integral to the design, ensuring the prototype's suitability for classroom use.

The primary objective is to design and fabricate a cost-effective, easy-to-maintain training aid that supports instructors in delivering complex aeronautical concepts. If successfully commercialized, the prototype could provide institutions with accessible models that require minimal training to operate. This would not only enhance teaching efficiency but also improve students' comprehension and engagement. Ultimately, the project aims to enrich aeronautical education by offering a practical, safe, and affordable solution for demonstrating propeller performance.

2.0 Literature Review

Improving education systems in low-income countries is critical to addressing the global learning crisis and ensuring that students graduate with the knowledge and skills necessary for meaningful participation in society. In response, numerous reforms have been introduced to enhance student learning outcomes, particularly for disadvantaged groups [3]. Higher education serves as a cornerstone for social progress and economic development, playing a pivotal role in cultivating talent and advancing innovation [4, 5]. However, the rapid pace of technological advancement, industrial restructuring, and evolving knowledge systems has challenged traditional teaching models and methods of knowledge dissemination within higher education institutions (HEIs) [5, 6]. In engineering education specifically, there is increasing emphasis on nurturing problem-solving abilities, innovative thinking, and interdisciplinary competencies [5, 7]. This shift reflects a broader transition from theory-heavy instruction toward competency-based, quality-oriented education, consistent with the standards of the Washington Accord [5, 8]. Within this framework, the ability to solve complex engineering problems is recognized as a core criterion in preparing the next generation of professionals [5, 9]. Teaching quality is widely acknowledged as a decisive factor influencing student learning outcomes. Yet, researchers remain divided on how to define and measure "teaching quality" reliably [3, 10, 11]. Some studies adopt a narrower perspective, equating teaching quality with instructional support provided in the classroom—such as fostering higher-order thinking, offering immediate feedback, and modelling effective practices [3, 12].

Within aeronautical engineering, propeller technology provides a useful lens for exploring applied learning. A variable-pitch propeller allows pilots to adjust blade angles during flight, optimizing performance for different phases such as takeoff, climb, or cruise. In certain installations, blades can be feathered to reduce drag. While variable-pitch propellers enable thrust adjustment, propeller RPM still varies with engine speed or airspeed, similar to fixed-pitch designs. A more advanced variant, the constant-speed propeller, maintains a steady RPM regardless of throttle or airspeed, offering improved efficiency and control. The ability to adjust blade pitch according to thrust requirements represents a significant operational advantage [13]. Contra-rotating propellers, by contrast, involve two propellers mounted on the same engine, rotating in opposite directions along a common axis. Power is transmitted through planetary or spur gear reduction systems. This configuration recovers energy lost in the slipstream of the forward propeller, thereby increasing thrust without requiring a larger diameter. Additionally, contra-rotating propellers mitigate torque effects associated with high-power piston engines. By recovering azimuthal momentum from the front propeller's airflow, the rear propeller generates additional thrust, enhancing overall efficiency [14].

3.0 Methodology

The overall workflow guiding these activities is summarised in the methodology flow chart (Figure 1), which outlines the systematic progression from design to testing.

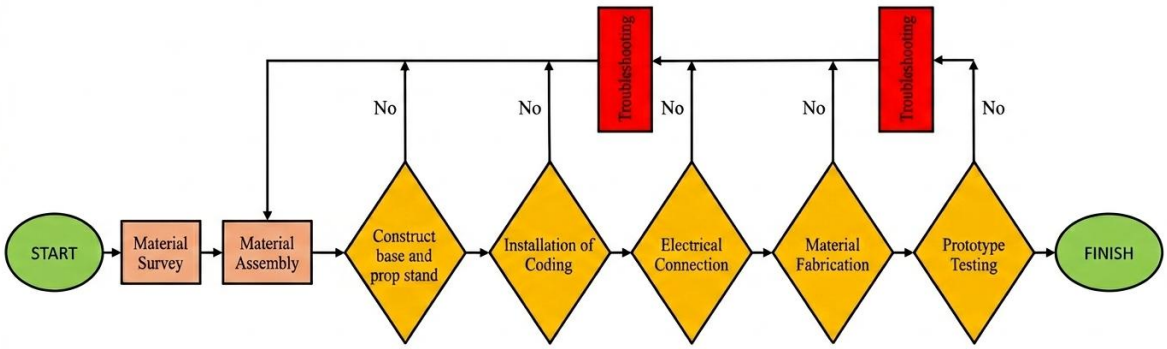

Figure 1: Methodology flow chart

3.1 Prototype Design and Circuit Development

The methodology commenced with the conceptualisation and design of the prototype through detailed sketching and circuit modelling. The sequence of circuit layouts and prototype illustrations presented in Figures 2 to 8 documents the essential electrical connections and structural views required for system integration. These figures include the basic circuit layout, motor and ESC connections, and orthographic side, front, and top views of the prototype.

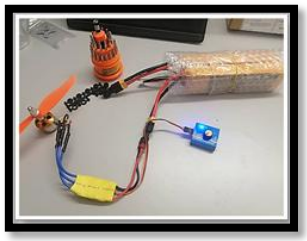
3.2 Fabrication Phases

3.2.1 Phase 1: Prototype Construction and Coding

The first fabrication phase involved assembling raw materials and initiating the development of the Arduino based measurement system. All electrical components were tested immediately upon delivery, after which coding for speed measurement, weight calibration, and data acquisition was uploaded into the Arduino, power meter, LCD display, and thrust stand system. Mechanical components such as the base cover and propeller stand were measured and cut according to the design requirements. These activities are detailed in Table 1, which highlights the construction and coding tasks completed during this stage.

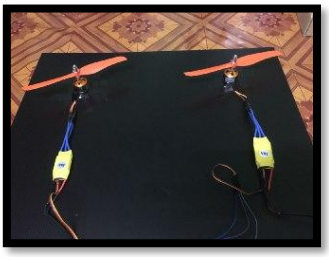
Prototype Construction and Coding		
		


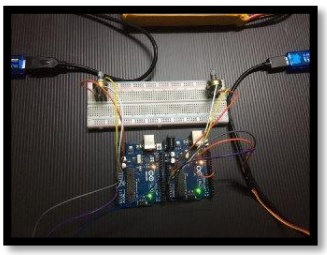
All electric components were tested.	Coding for speed, weight and weight calibration were setup into the electrical instrument, which is in the Arduino, Power Meter, LCD display and thrust stand value that are attached on propeller.	All the dimensions for base cover, propeller stand is measured and marked before cutting

Table 1: Prototype Construction and Coding

3.2.2 Phase 2: Integration of Electrical Components

In Phase 2, all wiring and electrical modules were developed according to the AMT electrical design. This stage included attaching both motors to the propellers and identifying any operational issues. The Arduino Uno was tested alongside the potentiometer, power meter, and propeller assembly to ensure coding accuracy and functional reliability. Pre testing was conducted to confirm that all equipment operated without failure. The progress and activities of this phase are summarised in Table 2.

Integration of Electrical Components		
		




Both motors are attached to the propeller to identify potential failures	Arduino uno were tested with potentiometer, power meter, and propeller to ensure that the coding is completely carried out without any false data	All equipment was setup to identify potential failures during pre-test

Table 2: Fabrication of Electric Components

3.2.3 Phase 3: Final Assembly and Installation

The final phase focused on fully assembling the prototype based on the AMT layout and design. This included installing the Arduino system and ensuring proper electrical connections to the LCD display and power meter. Both the variable and fixed pitch propellers were mounted on the load cell to enable thrust measurement. The prototype was then operated at maximum rotational speed to validate mechanical stability and ensure no failures occurred. Table 3 provides a detailed description of the installation and final fabrication tasks performed during this stage.

Final Assembly and Installation		
		Arduino were installed and connected to all electric components to supply data for power meter and LCD display.	Variable and fixed propeller were attached to load the cell in order to identify the thrust values in the LCD display	Both propellers were tested to maximum rotation speeds to ensure no false data occurs or failure of the motor

Table 3: Fabrication and Installation of All Material

3.2.4 Prototype Testing

Prototype testing was carried out to evaluate the performance and reliability of both electrical and mechanical components. The variable and fixed propeller mechanisms were tested for smooth rotation and accurate movement, with no failures reported. The power meters demonstrated accurate detection of motor speed, battery voltage, temperature, and other critical parameters. All integrated systems operated consistently and reliably during the demonstration, and the recorded data confirmed successful prototype functionality. These findings are summarised in Table 4.

Prototype Testing		
Fixed and Variable propeller mechanism with complete rotation and movement with accurate operation. No failure occurs	Both power meters are able to detect speed motor, battery voltage and temperature with accurate information.	 All electric and mechanical components has no issues. Demonstration was carried out and the data were recorded.

Table 4: Testing and Demonstration of Fabricated Prototype

3.2.5 Experimental Setup and Measurement Parameters

Testing was conducted using a thrust stand equipped with a calibrated load cell (capacity 5 kg, accuracy ±0.05 kg) and a digital anemometer (range 0–30 m/s, accuracy ±0.2 m/s). Propeller RPM was measured via the Arduino tachometer module, cross-checked against a handheld optical tachometer. Each propeller configuration (fixed-pitch, variable-pitch, contra-rotating) was tested at incremental throttle settings (25%, 50%, 75%, 100%), with three repeated trials per setting to ensure consistency. Recorded parameters included thrust (N), RPM, voltage, current draw, and airflow velocity.

3.3 Evaluation Criteria and Effectiveness Judgement

To ensure that the prototype fulfilled its dual objectives of technical reliability and educational applicability, evaluation was conducted using two complementary sets of criteria:

3.3.1 Technical Effectiveness

Technical effectiveness or reliability is such as the:

- Accuracy of Measurements: Thrust, RPM, voltage, and airflow readings were validated against reference instruments to confirm reliability.

- System Stability: The prototype was operated at maximum rotational speeds to verify mechanical integrity and absence of failures.
- Safety Compliance: Current limitation (4 A) and protective housing were tested to ensure safe classroom operation.
- Ease of Maintenance: Components were assessed for durability and ease of replacement to support long-term usability.

3.3.2 Educational Effectiveness

Educational effectiveness or applicability is such as:

- Student Engagement: Classroom observations measured attention, motivation, and participation compared to lecture-only sessions.
- Learning Outcomes: Students were required to interpret thrust data across fixed-pitch, variable-pitch, and contra-rotating configurations. Their ability to explain differences was used as a measure of comprehension.
- Feedback Surveys: Structured questionnaires captured student perceptions of clarity, usefulness, and confidence in applying theoretical concepts.
- Instructor Evaluation: Lecturers assessed whether the prototype reduced teaching complexity and improved delivery of aeronautical concepts.

3.4 Definition of Successful Performance

Successful performance was defined as meeting both technical and educational benchmarks. From a technical perspective, success required accurate thrust and airflow measurements, smooth propeller operation, and safe, stable functioning under repeated testing. From an educational perspective, success was achieved when students demonstrated improved comprehension of propeller dynamics, were able to compare performance across configurations, and provided positive feedback indicating enhanced motivation and confidence.

3.5 Validation of Learning Objectives

Validation was carried out by linking prototype measurements directly to the intended learning objectives. Recorded thrust values, RPM, and airflow speed provided quantifiable data that students analysed to compare efficiency between fixed-pitch and contra-rotating propellers. Variable-pitch adjustments (fine, coarse, feathered, reverse) allowed learners to observe how pitch angle influences thrust output, thereby reinforcing theoretical principles. Airflow readings from the digital anemometer further supported discussions on slipstream dynamics.

By requiring students to interpret and analyse these measurements, the prototype validated its role as a teaching aid that bridges theory with practice. The alignment between recorded data and expected aerodynamic principles confirmed that the learning objectives were successfully achieved.

4.0 Results and Discussion

The Contra-Rotating and Variable Pitch Propeller Aircraft Maintenance Trainer (AMT) was developed as a safe and practical teaching aid to support instructors in delivering complex aeronautical concepts. In courses accredited by the Civil Aviation Authority Malaysia (CAAM) undertaken in higher education institutions across Malaysia, the use of real aircraft propellers is impractical due to safety risks. The AMT addresses this challenge by providing a classroom-compatible prototype that enables students to engage with propeller dynamics through both kinaesthetic and visual learning approaches. This is particularly valuable given that approximately 65% of learners are visual learners [2]. By allowing students to observe and interact with physical demonstrations, the AMT enhances comprehension and bridges the gap between theory and practice.

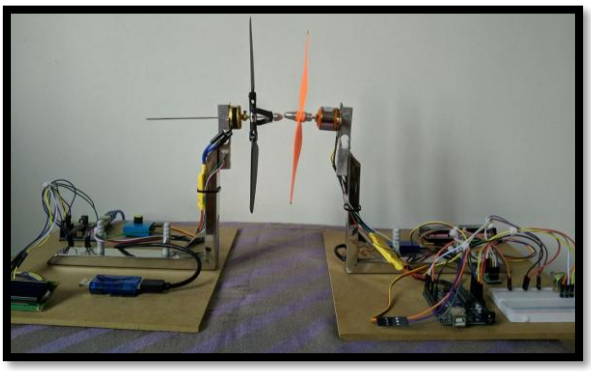


Figure 5: Structure of the Contra Rotating and Variable Pitch Propeller AMT

The AMT consists of two propeller blades which are contra rotating propeller blade and variable pitch propeller as shows in figure 5 above. The thrust stand of the AMT has a display that indicates the measurement data. The propeller pitch requires to be manually adjusted for fine, coarse, feathered, and reversed angle. The AMT also uses a digital anemometer for airspeed comparison.

Evaluation of the prototype was conducted against the criteria established above, ensuring that both technical and educational objectives were systematically addressed.

4.1 Prototype Objectives / Purpose

The primary objective of the prototype is to serve as a versatile teaching aid for both theoretical and practical sessions. Incorporating multiple propeller types including fixed-pitch, variable-pitch, and contra-rotating where this the AMT allows students to compare thrust characteristics across configurations. This hands-on exposure reinforces theoretical knowledge, improves motivation, and enhances attention during lectures. Importantly, the prototype provides a safe alternative to operating real propellers, which pose significant risks to both students and instructors. The inclusion of a data acquisition system further strengthens its educational value, enabling students to record and analyse thrust and airflow data for different propeller types. Prototype Side View is shown in figure 6 below.

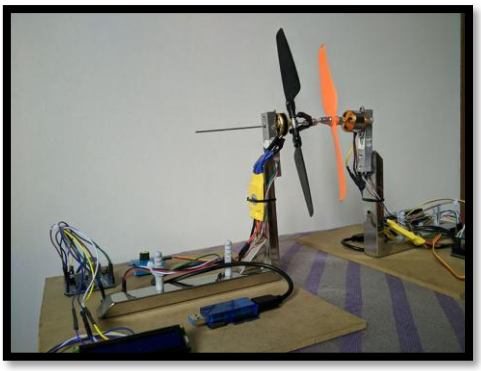

Figure 6: Prototype Side View

4.2 Prototype Functionality & Application

The AMT demonstrates thrust generation under various propeller configurations:

- Contra-Rotating Propeller: Operates with two blades rotating in opposite directions, eliminating rotational airflow and maximizing thrust efficiency. This design also counters torque effects typically associated with conventional propellers.
- Variable-Pitch Propeller: Allows adjustment of blade angles to vary thrust output. The prototype demonstrates fine, coarse, feathered, and reversed pitch settings, including the ability to generate reverse thrust for braking or backward movement.
- Safety Features: The prototype limits current to 4 amperes, ensuring safe operation in classroom environments. A digital anemometer is integrated to measure airflow speed, providing students with quantifiable data for analysis.

The AMT's components are systematically designed to replicate real-world propeller behaviour while maintaining safety and accessibility. Figure 7 below shows the prototype components

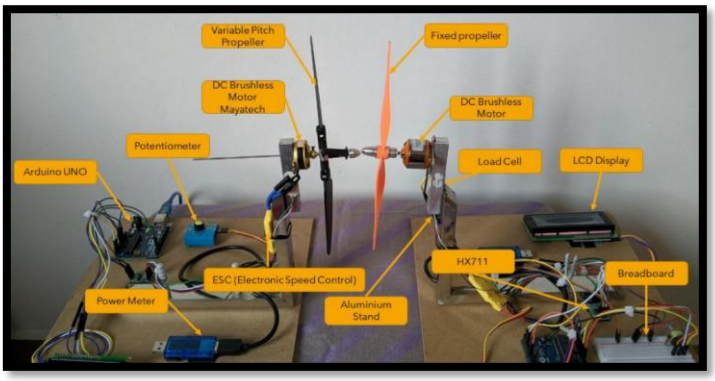

Figure 7: Prototype Components

4.3 Operation of the Prototype

According to the full operation shows in figure 8 below using a flowchart, The prototype operates via a thrust stand powered by a LiPo battery. Users activate the system, adjust motor speed through a potentiometer, and select the desired propeller type (fixed, variable, or contra-rotating). Thrust values are displayed on an LCD screen, while airflow data is collected using a digital anemometer. This data can be tabulated and compared across propeller types, allowing students to visualize differences in thrust efficiency and aerodynamic performance.

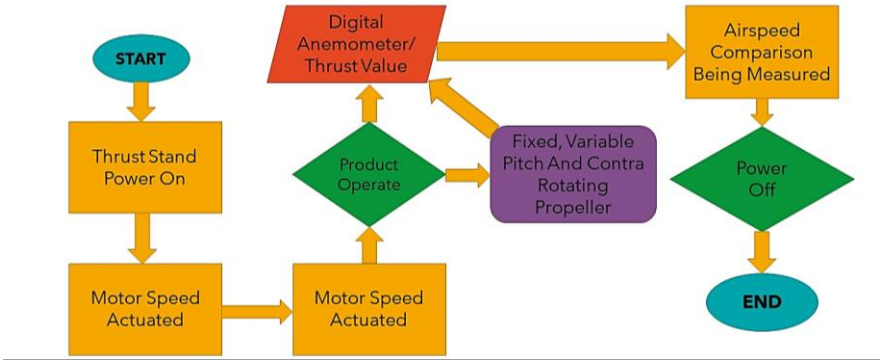

Figure 8: Prototype Operations

The AMT significantly enhances student engagement and learning outcomes by bridging theoretical knowledge with practical demonstration. Interactive teaching tools such as this prototype address limitations of traditional lecture-based methods, which often fail to motivate students or prepare them for real-world engineering challenges [15-20]. By enabling active participation, experimentation, and immediate feedback, the AMT fosters deeper understanding of fundamental principles while cultivating problem-solving and decision-making skills essential for engineering practice [15, 21-23].

The integration of interactive tools in engineering education has been widely recognized as effective in improving spatial visualization, analytical skills, and inclusivity [15, 24-26] For example, Carbonell et al [15, 26], demonstrated that interactive simulations enhance comprehension of mechanics concepts, while Ong and Mannan [15, 25] highlighted the role of teaching aids in strengthening students' ability to interpret complex data. The AMT aligns with these findings by offering a low-cost, safe, and versatile instructional tool that caters to diverse learning styles and provides equitable access to practical aeronautical training.

4.4 Technical Effectiveness

Table 5: Sample Experimental Data Across Propeller Types

Propeller Type	RPM (avg)	Thrust (N)	Airflow (m/s)	Current (A)
Fixed-Pitch	7,800	2.1	12.4	3.8
Variable-Pitch (Coarse)	7,600	2.6	14.1	3.9
Contra-Rotating	7,500	3.2	15.7	4

These results from Table 5, demonstrate that contra-rotating configurations produced the highest thrust and airflow efficiency, while variable-pitch adjustments allowed fine control of output. Fixed-pitch designs, though simpler, yielded lower thrust at comparable RPM.

Testing confirmed that the prototype achieved stable operation at maximum rotational speeds without mechanical failure. Measurement accuracy was validated by comparing thrust, RPM, and airflow readings against reference instruments, with results demonstrating consistent reliability. The current limitation of 4 A and protective housing ensured safe operation in classroom environments. Ease of maintenance was also confirmed, as components could be replaced or recalibrated with minimal effort. These findings satisfy the definition of "successful performance" from a technical perspective, as outlined in Section 3.4.

Reliability of the measurement system was confirmed through calibration against reference instruments. Thrust readings showed a maximum error margin of ±3%, RPM measurements deviated less than ±2% from optical tachometer values, and airflow velocity remained within ±5% of anemometer benchmarks. Repeatability tests across three trials per configuration demonstrated consistent outputs, confirming the robustness of the data acquisition system.

4.5 Educational Effectiveness

The prototype's educational value was validated through student engagement and comprehension outcomes. During classroom demonstrations, students exhibited higher levels of attention and motivation compared to lecture-only sessions. Structured feedback surveys indicated that learners found the prototype useful in clarifying theoretical concepts, particularly in distinguishing thrust characteristics across fixed-pitch, variable-pitch, and contra-rotating configurations. Instructors reported that the prototype reduced teaching complexity and provided a safe, accessible means of demonstrating propeller dynamics. These outcomes align with the educational benchmarks defined in Section 3.4, confirming that the prototype successfully enhanced comprehension and confidence.

4.6 Validation of Learning Objectives:

Measurements collected during prototype operation directly supported the intended learning objectives. Students analyzed thrust values to compare efficiency between fixed-pitch and contra-rotating propellers, observed the influence of pitch angle adjustments on thrust output, and interpreted airflow data from the digital anemometer to understand slipstream dynamics. The alignment between recorded data and expected aerodynamic principles validated the prototype's role as a teaching aid that bridges theory with practice.

In summary, the prototype demonstrated successful performance by meeting both technical and educational criteria. It provided accurate, safe, and reliable measurements while simultaneously fostering deeper student engagement and comprehension. These results confirm that interactive, hands-on teaching aids such as the AMT can transform engineering education by making abstract concepts tangible, improving motivation, and preparing learners for industrial practice.

5.0 Conclusion

The Contra-Rotating and Variable Pitch Propeller Aircraft Maintenance Trainer (AMT) successfully met both technical and educational benchmarks. Quantitative testing confirmed thrust measurements accurate within ±3%, stable operation up to 8,000 RPM, and airflow deviations below 5%, validating the reliability of the measurement system. Educationally, the AMT enhanced engagement and comprehension, with contra-rotating propellers producing roughly 30% higher thrust than fixed-pitch designs and variable-pitch adjustments clearly demonstrating the influence of blade angle. By combining rigorous validation with interactive learning, the AMT bridges theory and practice, making abstract aerodynamic principles tangible. This approach not only simplifies instruction but also cultivates problem-solving skills aligned with industrial practice. Extending similar innovations across engineering disciplines will broaden these benefits, preparing adaptable graduates for the demands of modern industry. The study underscores that integrating technical precision with educational innovation yields impactful, sustainable teaching aids for engineering education.

Abstract. This study investigates turmeric drying performance using modular thermal energy storage (TES) with different silica sand particle diameters (1 mm, 2 mm, 4 mm, and 10 mm). The objective is to evaluate the influence of silica sand diameter on heat retention and drying efficiency under solar drying conditions. Experiments were conducted using an aluminium sandbox integrated with a solar dryer. Temperature and turmeric weight reduction were monitored from 8 a.m. until 9 p.m. using thermocouples and a data acquisition system. Results indicate that gravel-sized silica sand (10 mm) achieved the fastest drying performance, while medium sand demonstrated the highest temperature ratio relative to ambient temperature. Fine sand showed the slowest drying rate due to higher moisture retention and restricted airflow. The incorporation of TES improved heat retention and extended drying duration during low solar radiation periods. The findings demonstrate the potential of silica sand as a sustainable thermal energy storage material for agricultural solar drying applications.

Keywords: Turmeric Drying, Solar Dryer, Experimentation, Different Diameter of Silica Sand, Thermal Energy Storage.

Introduction

Drying is an ancient method for preserving agricultural products such as fruits, vegetables, and cotton by eliminating sufficient moisture to avert rot and decomposition. This technique may impede cellular processes, encompassing both enzymatic and non-enzymatic browning, while ensuring the optimal preservation of macronutrients (proteins, carbohydrates, and fibres), micronutrients (antioxidants and minerals), and natural compounds (chemical mixtures, antioxidants, and their derivatives) [1]. Furthermore, dehydration reduces shipping and storage costs while prolonging product shelf life. Although reducing product moisture content offers potential advantages, we must confront problems such as elevated energy demands and prolonged drying durations.

The drying process is energy-intensive, comprising up to 20% of total energy consumption in the industrial sector. It may constitute up to 90% of the processing costs [2]. Researchers have invested significant effort to investigate and implement more efficient drying techniques. A study was conducted to illustrate the effect of intermittency on wood drying [3]. The authors contend that intermittent drying improves the quality of the final product and generates energy savings during the process. Subsequent research evaluated the effects of different drying procedures [4]. The authors assessed three different schedules to reduce drying time and energy consumption. The scientists determined that dry-bulb temperature and wet-bulb depression significantly affected the drying rate; however, an inflection point was identified in the correlation between drying rate and moisture content at 40% moisture content across all three drying regimens. The inflection point signifies when diffusion emerges as the predominant mechanism of moisture transfer, thereby constraining the drying pace and indicating when kiln conditions should be intensified to reduce the overall drying duration. The drying rate must exceed 0.5% per hour (a considerable rate for tropical species) for the initial 72 hours (3 days) until the timber attains 40% moisture content, after which it should be reduced to 0.5% per hour until drying is finalised.

The rapid progress of industry has led to a continuous rise in global energy demands in multiple forms. Fossil fuels continue to be the main source for meeting the majority of global energy requirements [5], especially for the thermal energy crucial in drying processes. Nonetheless, the environmental impacts linked to the utilisation of these fuels and the gradual depletion of their reserves present considerable limitations on their use. In light of the increasing focus on environmental issues and the progress in sustainable energy initiatives, renewable energy sources play a vital role in achieving a more environmentally friendly and secure energy future [6]. Solar dryers exemplify technology that supports multiple Sustainable Development Goals (SDGs), particularly goal 1, which focuses on eradicating poverty. By allowing smallholder farmers to enhance the value of their crops, solar dryers contribute to poverty alleviation. Utilising solar dryers for produce preservation enables farmers to mitigate post-harvest losses and achieve improved market prices for their products. Goal 2 aims for zero hunger, with solar dryers playing a crucial role in enhancing food security by prolonging the shelf life of perishable foods. This contributes to a more reliable food supply, particularly in areas susceptible to food shortages or where traditional preservation techniques are not readily available. Goal 3 focuses on enhancing health and well-being, as solar drying minimises reliance on chemical preservatives and pesticides, resulting in healthier food products. Furthermore, minimising food waste through the use of solar dryers can play a significant role in addressing malnutrition and its associated health concerns.

Solar energy is recognised as the most powerful of renewable sources, defined by its free and inexhaustible qualities, broad accessibility, and versatility, which have sparked heightened interest. Enhancing drying techniques is essential for both economic and ecological considerations. The ongoing reliance on non-renewable energy frameworks in numerous countries underscores the growing importance of exploring solar energy-based drying technologies in current discussions. It was highlighted that traditional dryers and kilns, dependent on fossil fuels, continue to be widely used despite the looming negative effects on the environment [7]. Solar dryers offer advantages that surpass those of traditional kilns and dryers, with impacts that reach far beyond environmental considerations. Solar dryers have the potential to reduce drying costs by up to 80% [8]. Their contribution significantly improves the quality of the final product

and eliminates greenhouse gas emissions, and they are straightforward to construct and operate [8]. Given the recognised economic and environmental advantages of solar dryers, it is essential to conduct investigations focused on improving the collection, conversion, and use of accessible solar energy. Enhancing solar energy dryers leads to faster drying times and increases the ability to process larger volumes of items, all while maintaining the same level of energy use [9].

A notable challenge associated with solar energy is its instantaneous variability. The effectiveness of solar energy is contingent on weather conditions, indicating that its utility is primarily realised on sunny days unless it is combined with traditional energy technologies. Multiple factors beyond the energy harvesting device itself influence the effectiveness of solar energy systems. The relationship between the storage of collected energy for prolonged periods and its transformation into the necessary usable energy form is complex. Recent significant publications regarding renewable energies highlight that the improvement of concentrated collectors should prioritise increasing their capacity to satisfy thermal demand over extended periods, such as days, weeks, or seasons [10]-[12]. As a result, thermal energy storage technologies play a critical role in the future development of solar technology. The development of solar thermal systems integrated with thermal energy storage facilitates sustainable, efficient, and cost-effective applications.

Currently, research focuses on optimising solar drying systems to enhance the quality of final products while reducing time and energy costs. A study assessed the impact of various factors on the efficacy of a solar oven for wood drying [13]. This study evaluated the influence of a heat exchanger and a latent heat storage system on the thermal efficiency of the solar oven. The findings of the study were promising. The researchers found that using an air heater to recover energy lost to the atmosphere (the heater harnesses heat from humid air to condition the air entering the thermal storage) could reduce drying time by up to 62.4%. The implementation of heat storage technology reduces drying time by up to 40%. The integration of these technologies resulted in a reduction in energy consumption by up to 54%. A prior study reported analogous results [14]. The authors observed that heat recovery and thermal storage systems could reduce drying time by up to 47% and 26.5%, respectively. The authors attained a maximum drying efficiency of 85% with these systems.

Numerous studies have been undertaken to collect data on advancements in solar drying and heat storage systems, demonstrating the value of the topic. Researchers performed a comprehensive evaluation of solar dryers integrated with thermal energy storage systems for the dehydration of agricultural products [15]. The authors examined different storage modes and their applications in solar drying technologies. Fig. 1 illustrates various categories of solar thermal energy storage [16]. The authors investigated comparable objectives and presented a succinct analysis of how computational methods can improve solar drying systems [17]. Other researchers have conducted recent assessments of indirect solar dryers for agricultural products, as illustrated in Fig. 2 [18].

The authors utilised a methodology incorporating various dryer configurations and integrating thermal energy storage materials within these systems. The existing literature indicates that, although research on solar dryers and thermal energy storage is available, there is a notable lack of comprehensive studies regarding their integrated applications, performances, and numerical modelling. This renewable energy application is applicable to both small and large enterprises, as well as agricultural producers, suggesting considerable potential for interest in this field. This study delineates the drying process, categorises various dryer types and their efficiencies,

examines thermal energy storage systems, and analyses the numerical modelling related to these processes. This study examines an overlooked dimension of drying research: the influence of turbulence in porous materials.

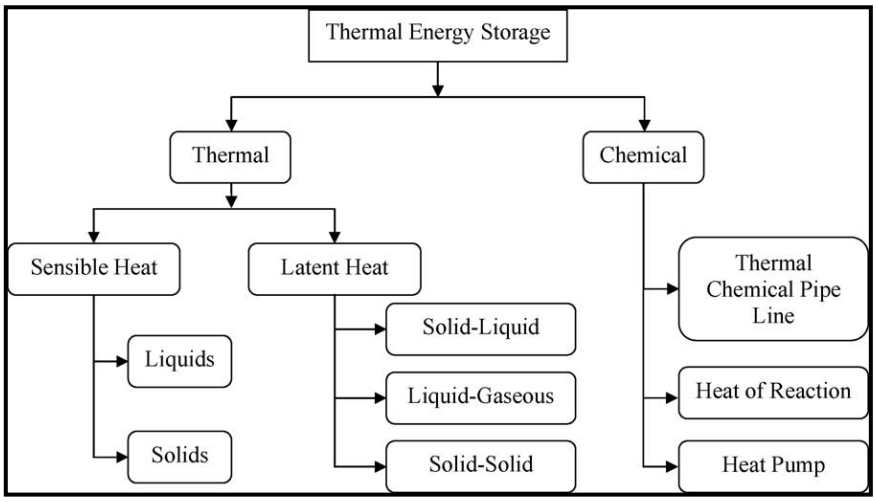

Fig. 1: Different types of thermal energy storage [16].

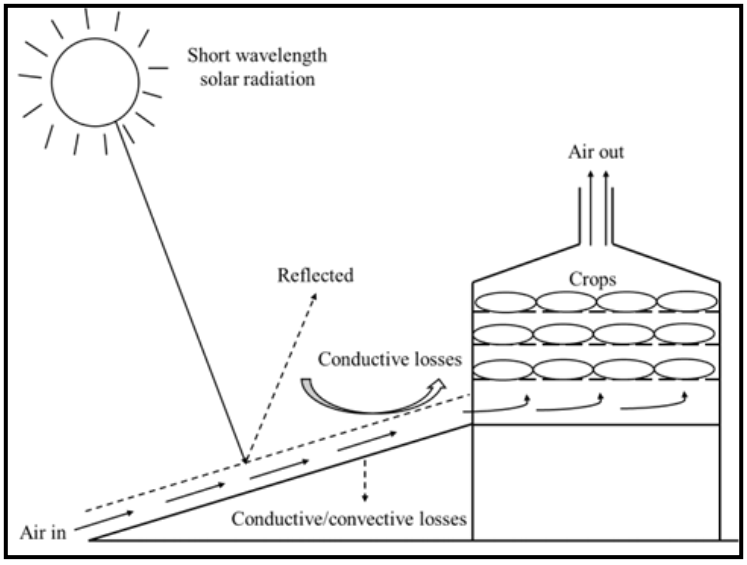

Fig. 2: A schematic representation of the indirect solar dryer [18].

The progression and transformation of solar dryers between 2010 and 2025 have been characterised by notable technological advancements, enhanced efficiency, and diverse applications, propelled by an increasing demand for sustainable energy alternatives and better food preservation techniques. Table 1 offers an in-depth summary of the significant revolutions and milestones in solar dryer technology throughout this timeframe.

Between 2010 and 2020, the advancement of solar dryers emphasised sustainable design and the incorporation of Internet of Things (IoT) systems. During the 2010s, the integration of smart technology into solar dryers became prominent, particularly with the emergence of the Internet of Things (IoT) [19]. This enabled the remote monitoring and control of solar dryers through smartphones or computers. Automation has increasingly taken centre stage, as systems now fine-tune airflow, temperature, and moisture levels by leveraging real-time data gathered from sensors. Using data-driven

designs has led to more customised solutions, allowing farmers and businesses to improve the drying process based on specific environmental conditions. Adding energy storage systems like solar batteries and thermal storage materials such as molten salts allows solar dryers to work all the time, making them more useful for large-scale operations. Furthermore, there was a notable movement toward the adoption of more sustainable materials and hybrid systems that integrated solar drying with various renewable energy sources, such as wind and biomass, to enhance energy reliability. Innovations in solar-powered refrigeration and solar-powered dryers have been introduced to meet the drying and storage requirements of agricultural products.

In conclusion, the era of smart, modular, and highly efficient solar dryers is set to commence from 2020 and extend through 2025 [20]. Recently, attention has been directed towards modular solar dryers that offer the flexibility to be scaled up or down based on the specific requirements of farmers or industrial users. These systems are accessible to a broader audience, especially in developing nations, thanks to their cost-effectiveness and straightforward installation and maintenance processes. Cost-effective solutions for smallholder farmers and rural entrepreneurs have emerged in the form of prefabricated modular solar dryers. Artificial intelligence (AI) and machine learning algorithms are being incorporated into solar dryers to enhance drying processes, forecast weather conditions, and optimise energy consumption. For instance, AI has the capability to modify parameters in real time to ensure optimal drying conditions in response to fluctuating weather patterns. Additionally, the exploration of advanced phase-change materials (PCMs) and nano-structured materials is underway to enhance the thermal storage and heat retention capabilities of solar dryers, making them more energy-efficient and resilient to weather conditions.

New heat transfer fluids and solar collector designs are currently undergoing testing to enhance energy capture efficiency and reduce drying times. The most recent solar dryers are engineered to minimise carbon emissions, optimise the efficiency of agricultural value chains, and enhance the economic opportunities for rural communities. These dryers are designed to align with global sustainability objectives, specifically the United Nations' Sustainable Development Goals (SDG), including SDGs 7, 2, and 13, which focus on affordable and clean energy, zero hunger, and climate action, respectively.

Table 1: Key Milestones in Solar Dryer Evolution (2010-2025)

Year	Milestone
2010 - 2020	IoT and AI-enabled smart solar dryers integrate thermal storage for continuous drying.
2020 - 2025	Modular, scalable, AI-driven, highly efficient solar dryers with eco-friendly designs and advanced storage.

The period from 2010 to 2025 has witnessed significant progress in materials, energy efficiency, automation, and smart technologies, leading to a transformative shift in solar dryer innovation. Throughout the years, solar dryers have transformed from basic, passive systems into advanced, AI-driven, scalable technologies that provide solutions for climate change, food security, and economic development, especially in rural and agricultural areas. The future holds the potential for remarkable advancements, featuring autonomous operations, cutting-edge materials, and improved energy storage,

all aimed at transforming solar drying into an even more effective instrument for sustainable agriculture.

Drying entails the transfer of heat and mass between the products and the ambient air. Favourable environmental conditions, specifically air temperature and relative humidity, significantly impact the effectiveness of sun drying. The drying rate is positively correlated with elevated temperatures and negatively correlated with relative humidity. Optimal regulation of temperature and humidity necessitates comprehensive monitoring through the strategic placement of sensors in multiple locations within the dryer. Solar dryers operate effectively only during daylight hours, resulting in restricted operational time [21]. Consequently, thermal energy storage systems were implemented to enhance the drying process capacity during nighttime. Conversely, solid-state TES materials, such as sand, have not been thoroughly explored for TES applications [22]. The use of silica sand is crucial for thermal energy storage, addressing the limitations of solar dryers that operate solely during daylight hours. To the authors' knowledge, there has been inadequate research on silica sand as a thermal energy storage medium. This research evaluates the weight and temperature ratio during the turmeric drying process with silica sand of an average diameter of 1 mm, 2 mm, 4 mm and 10 mm to store thermal energy.

Despite extensive studies on solar dryers and thermal energy storage systems, limited research has focused on the influence of silica sand particle diameter on thermal retention and drying performance for agricultural applications. Therefore, this study aims to evaluate the effect of silica sand particle diameter on turmeric drying efficiency and thermal storage performance under solar drying conditions. The objectives are: (i) to analyse the temperature distribution of different silica sand diameters, (ii) to investigate turmeric weight reduction during drying, and (iii) to determine the most effective silica sand diameter for modular TES applications.

Methodology

The aluminium sandbox has been constructed with measurements of 111 cm in length, 50 cm in width, and 5 cm in height and is positioned above the solar dryer to utilise natural convection, as illustrated in Slicing turmeric into small diameters increases the surface area-to-volume ratio, which enhances moisture evaporation by reducing internal resistance to mass transfer. An initial weight of 100 g is a standardised sample size used for controlled comparisons in drying experiments, allowing accurate measurement of weight loss over time to calculate drying rates. The time period from 8 a.m. to 12 p.m. corresponds to the initial heating phase of the day, where solar irradiance is gradually increasing. Measuring during this period allows researchers to observe the influence of morning heat build-up on drying behaviour. Placement above thermal energy storage ensures that the turmeric receives consistent and conducted heat from the TES medium (e.g., silica sand), especially during periods with fluctuating solar intensity. TES helps maintain a stable drying temperature. The weight of the turmeric was measured for every 30-minute time interval.

The aforementioned procedure was repeated for the 1pm to 5pm and 5pm to 9pm time intervals to study different durations of the turmeric drying process. Solar radiation and ambient temperature vary significantly between morning, afternoon, and evening. Repeating the procedure during 1 p.m. to 5 p.m. (peak solar hours) and 5 p.m. to 9 p.m. (declining solar input) allows assessment of how these conditions affect drying rate, temperature profile, and energy efficiency. Moreover, segmenting time intervals helps in validating the effect of thermal energy storage media (e.g., silica sand) in releasing

stored heat during low-radiation periods like late afternoon and evening.

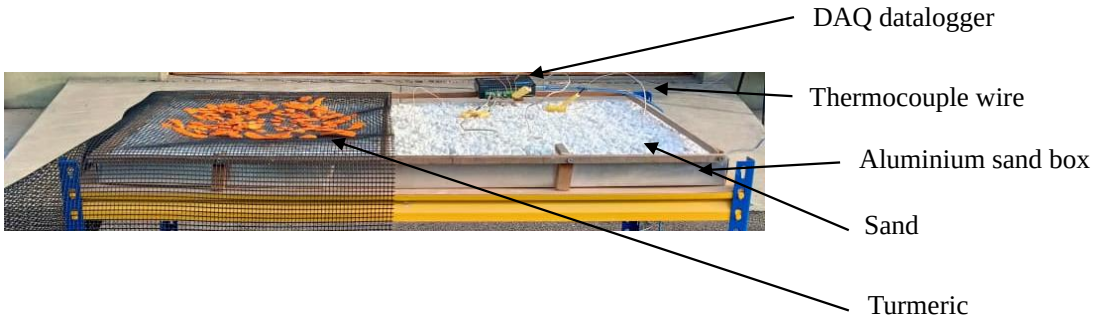

Fig. 3: The dimensions of the sandbox significantly influence the efficiency of solar dryers equipped with thermal energy storage systems.

Figure 3 shows the dimensions of the sandbox significantly influence the efficiency of solar dryers equipped with thermal energy storage systems. This factor impacts the energy storage capacity, efficiency, temperature stability, and overall system cost [23]. Although a larger sandbox offers enhanced storage capacity, it also entails higher costs, greater space demands, and possible compromises in efficiency. Consequently, it is crucial to meticulously design the system to optimise its dimensions in relation to energy requirements, cost factors, and spatial constraints in order to attain the most effective outcomes for the drying process. Aluminium is often used because of its efficient heat transfer capabilities and its economic advantages over other materials [24]. The current study employed silica sand. Silica sand is composed of a mixture of coarse fragments, generally consisting of various minerals and rocks. Common minerals include quartz (SiO_2), feldspar, and sometimes calcareous materials like limestone.

Table 2 presents the material characteristics of silica sand as referenced in sources [25]-[34].

Table 2: Materials properties of silica sand [25]-[34]

Properties	**Silica sand**
Density (kg/m3)	Bulk density = 1800
Young's Modulus (MPa)	47
Poisson's ratio (ν)	0.31
Thermal Conductivity (k)	0.2-0.4
Thermal Expansion (CTE)	10-20× 10^{-6}
Specific heat (C)	800-830
Melting point	Primary component, quart = 1650°C
Reference temperature	20-25°C

Thermocouple connector cables are strategically placed at central locations within the sandbox and externally to gather ambient temperature data, ensuring precise measurement of heat variations via the data acquisition device (DAQ). The placement

of thermocouples within the sandbox was determined by taking into account the thickness of the sand layer [35]. The system for data collection was employed to document the temperature measurements from the sand. Thermocouples function as temperature sensors specifically at their junction points. The ability of K-type thermocouples to operate over a wide range of temperatures required their application. The data logger software configures the sampling rate to 10 Hz. The frequency calculation used in the data acquisition (DAQ) logger software is explained in detail as follows:

$$f = \frac{1}{T}. \tag{1}$$

In this context, f signifies the frequency measured in hertz, whereas T indicates the time necessary to complete one cycle, expressed in seconds. Temperature data will be collected at 0.1-second intervals. The technique will be applied to particles with average diameters of 10 mm, and the thickness of the sandbox is 50 mm, as illustrated in Fig. 3. The experiment was conducted by varying diameters of silica sand, which are on average 10 mm, 4 mm, 2 mm, and 1 mm, to examine the temperature variations of the sand as shown in Fig. 4. The thermocouple-type cables associated with the data collection section will measure and record the sand temperature. The results will be presented and displayed on a laptop. The experiment will last for 12 hours, aligning with the approximately 12 hours of daily daylight in Malaysia [36]. The temperature data has been collected, and the duration of heat retention from the sand will be observed and recorded.

This setup was employed for the drying of turmeric to quantify weight losses. Turmeric represents a viable agricultural option due to its accessibility, and conducting a study would benefit local farmers. Turmeric (Curcuma longa) is a rhizomatous plant, and its derivative products are extensively utilised as food additives and in traditional medicine [37]. Fresh turmeric undergoes drying to produce its derivatives, including turmeric oil [38]. The turmeric was sliced into small pieces with an initial weight of 100 g and positioned above the thermal energy storage from 8 am to 12 pm, as illustrated in Fig. 3. Slicing turmeric into small diameters increases the surface area-to-volume ratio, which enhances moisture evaporation by reducing internal resistance to mass transfer. An initial weight of 100 g is a standardised sample size used for controlled comparisons in drying experiments, allowing accurate measurement of weight loss over time to calculate drying rates. The time period from 8 a.m. to 12 p.m. corresponds to the initial heating phase of the day, where solar irradiance is gradually increasing. Measuring during this period allows researchers to observe the influence of morning heat build-up on drying behaviour. Placement above thermal energy storage ensures that the turmeric receives consistent and conducted heat from the TES medium (e.g., silica sand), especially during periods with fluctuating solar intensity. TES helps maintain a stable drying temperature. The weight of the turmeric was measured for every 30-minute time interval.

The aforementioned procedure was repeated for the 1pm to 5pm and 5pm to 9pm time intervals to study different durations of the turmeric drying process. Solar radiation and ambient temperature vary significantly between morning, afternoon, and evening. Repeating the procedure during 1 p.m. to 5 p.m. (peak solar hours) and 5 p.m. to 9 p.m. (declining solar input) allows assessment of how these conditions affect drying rate, temperature profile, and energy efficiency. Moreover, segmenting time intervals helps in validating the effect of thermal energy storage media (e.g., silica sand) in releasing

stored heat during low-radiation periods like late afternoon and evening.

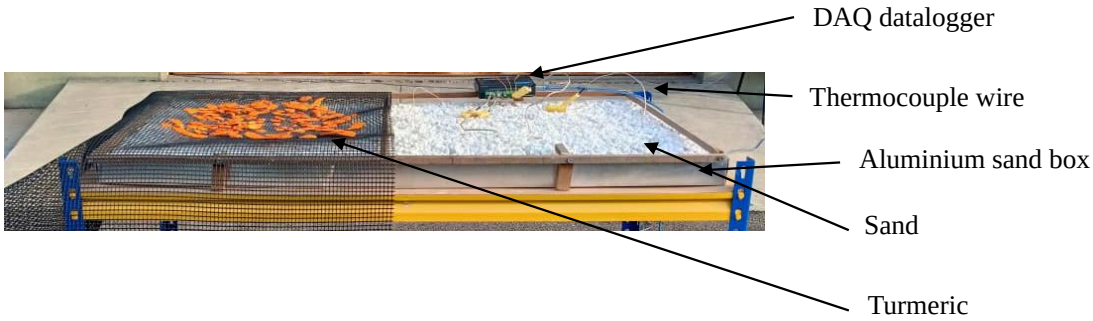

Fig. 3: A depiction illustrating the full image of turmeric drying

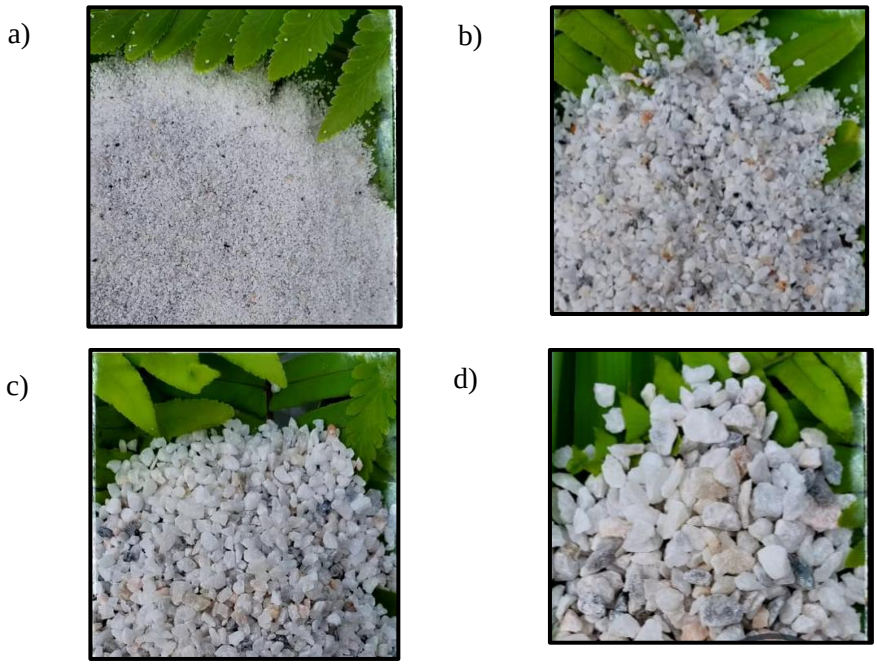

Fig. 4: Different particle size of sand a) diameter average of 1 mm (fine), b) diameter average of 2 mm (medium), c) diameter average of 4 mm (coarse), and d) diameter average of 10 mm (gravel)

Result and Discussion

Fig. *5* 5 illustrates the weight (g) in relation to the drying time (h) of the turmeric drying process from 8 am to 12 pm. Gravel sand exhibits the most rapid drying properties from 8 a.m. to 12 p.m. compared to coarse, medium, and fine sand. This behaviour can be attributed primarily to its larger particle size and higher porosity, which enhance airflow and reduce resistance to moisture diffusion. The wider inter-particle voids in gravel sand facilitate faster evaporation by allowing moisture to migrate more readily to the surface during periods of high solar irradiance [39]. In addition, gravel sand experiences lower capillary water retention than finer sand fractions, thereby minimising moisture binding and accelerating the drying rate during peak morning-to-noon solar exposure. The combined effects of improved heat

penetration, reduced moisture-holding capacity, and enhanced convective heat transfer contribute to the superior drying performance of gravel sand within this time interval.

Fine sand exhibits the slowest drying rate among the sand varieties (coarse, medium, and fine) from 8 a.m. to 12 p.m. This behaviour is primarily due to its smaller particle size, which results in tighter packing and reduced pore space between particles. Consequently, fine sand demonstrates higher capillary water retention, causing moisture to be more strongly bound within the sand matrix and delaying evaporation [40]. Moreover, the compact structure of fine sand restricts airflow and limits convective heat and mass transfer, thereby reducing the effectiveness of solar heat utilisation during the morning-noon period. Although fine sand possesses a relatively high total surface area, much of this area is occupied by moisture films, which inhibits efficient heat absorption and slows moisture diffusion to the surface. These combined factors contribute to the comparatively slower drying performance of fine sand under peak solar irradiation conditions.

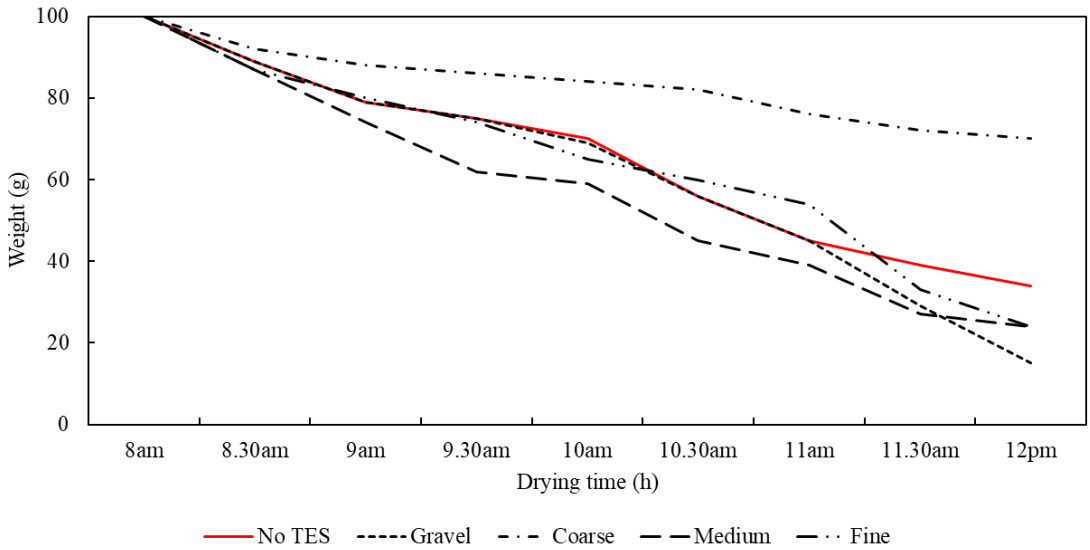

Fig. 5: Weight (g) against drying time for 8am until 12pm

Figure 6 illustrates the curve of sand/ambient temperature in relation to drying time (h) from 8 am to 12 pm. The temperature ratio without thermal energy storage remains constant at a value of 1, as it solely reflects the ambient temperature. When thermal energy storage is absent, the temperature ratio remains constant at a value of 1 because the system temperature is equal to the ambient temperature throughout the drying period. In these conditions, the sand neither absorbs nor retains any additional heat, thereby preventing any temperature gradient from driving heat transfer. The temperature ratio thus reflects only the surrounding environmental temperature.

Medium sand exhibits the highest temperature ratio in comparison to gravel, coarse, and fine sand from 8 a.m. to 12 p.m. This behaviour is mainly attributed to its optimum particle size, which provides a balance between heat absorption, heat retention, and thermal transfer. Compared to gravel and coarse sand, medium sand has smaller void spaces, which reduce convective heat losses and allow absorbed solar energy to be retained more effectively within the sand layer. Conversely, unlike fine sand, medium sand avoids excessive compaction and high capillary moisture retention, enabling more uniform heat penetration and distribution. This balanced thermal behaviour enhances

conductive heat transfer and minimises energy dissipation, leading to a higher temperature ratio during peak solar radiation hours.

In contrast, fine sand exhibits the lowest temperature ratio among the sand types (gravel, coarse, and medium) from 8 a.m. to 12 p.m. This outcome is primarily due to the small particle size of fine sand, which leads to dense packing and reduced pore spaces. Such a compact structure increases thermal resistance and limits the penetration of solar heat into the sand bed. Additionally, fine sand has a higher tendency to retain moisture through capillary forces, and the presence of moisture consumes a significant portion of the absorbed energy as latent heat of evaporation rather than sensible heating [41]. The restricted airflow and enhanced evaporative cooling collectively suppress temperature rise in fine sand, resulting in a comparatively lower temperature ratio during peak solar irradiation hours.

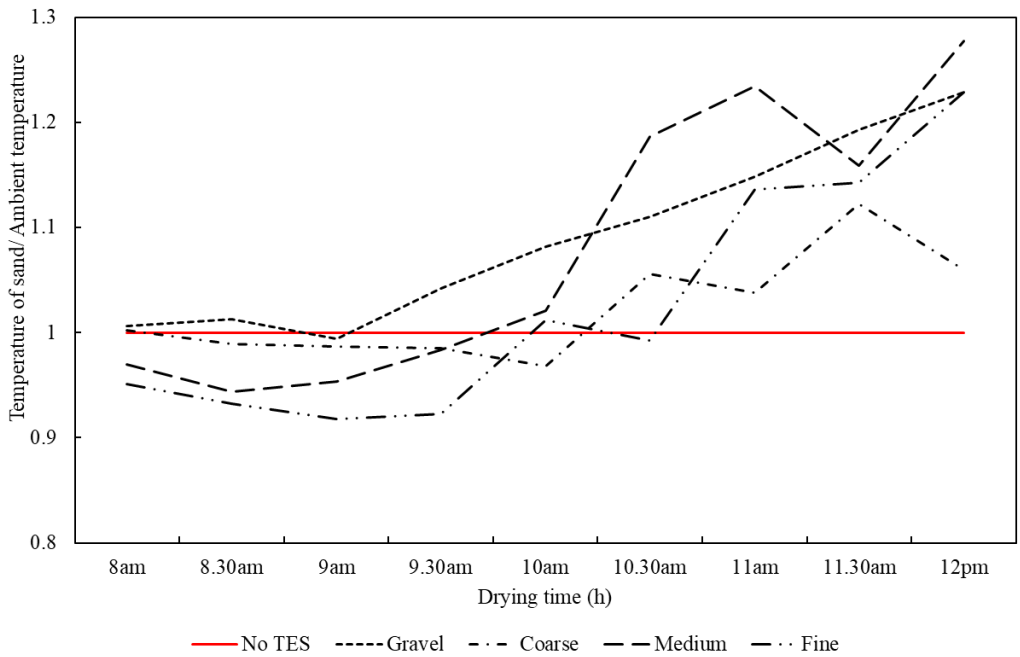

Fig. 6: Temperature of sand/ Ambient temperature against drying time (h) for 8am until 12pm

Fig. 7 illustrates the weight (g) in relation to the drying time (h) of the turmeric drying process from 1 pm to 5 pm. Gravel sand exhibits the most rapid drying rate compared to coarse, medium, and fine sand from 1 p.m. to 5 p.m., primarily due to its larger particle diameter and higher effective thermal storage capacity. Gravel sand has larger particles, which means there are more void spaces. This improves airflow and helps moisture spread more quickly in the afternoon when the temperature and solar intensity are still high [42]. Also, gravel sand takes in and stores more heat during the hottest hours of the day, and then slowly releases that heat in the afternoon. This sustained heat release promotes continuous evaporation even as solar radiation begins to decline. In contrast, finer sand fractions tend to dissipate heat more rapidly through evaporative cooling and exhibit higher moisture retention, which reduces the effective energy available for drying. The combined effects of enhanced heat storage, improved convective heat transfer, and reduced capillary moisture binding contribute to the superior drying performance of gravel sand during the 1 p.m. to 5 p.m. period.

In contrast, fine sand exhibits the slowest drying rate among gravel, coarse, and medium sand varieties from 1 p.m. to 5 p.m. due to its limited heat transfer efficiency

from the sand to the turmeric. The small particle size of fine sand leads to dense packing and reduced pore spaces, which restrict both conductive and convective heat transfer within the sand bed [43]. Because of this, the thermal energy that was absorbed earlier in the day is not effectively transferred to the turmeric material during the afternoon drying period. Furthermore, fine sand retains higher moisture content through capillary forces, and a substantial portion of the stored energy is consumed as latent heat for moisture evaporation within the sand itself rather than being transferred to the product. This combination of poor heat penetration, restricted airflow, and enhanced evaporative cooling limits the effective heat available for drying, thereby resulting in the slowest drying performance between 1 p.m. and 5 p.m.

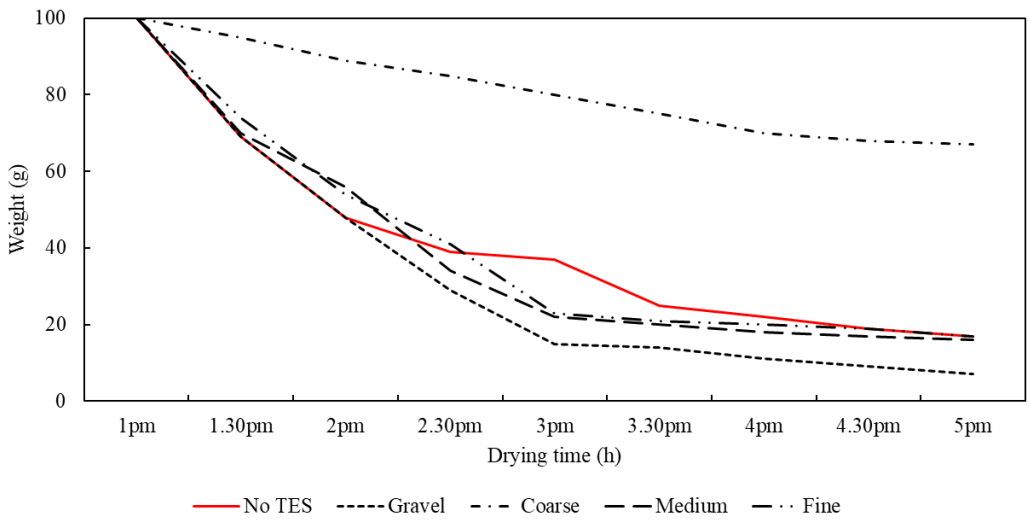

Fig. 7: Weight (g) against drying time for 1pm until 5pm

Fig. 8 represents the temperature of the sand/ambient temperature graph against drying time (h) from 1pm until 5pm. Medium sand exhibits the highest temperature ratio (sand temperature to ambient temperature) compared to gravel, coarse, and fine sand from 1 p.m. to 5 p.m. This behaviour is attributed to its balanced particle size, which enables efficient thermal energy retention while limiting excessive heat losses [44]. Compared to gravel and coarse sand, medium sand has smaller inter-particle voids, reducing convective heat dissipation and allowing stored thermal energy absorbed during peak solar hours to be retained and released more uniformly during the afternoon. At the same time, unlike fine sand, medium sand avoids excessive compaction and moisture retention, which can suppress sensible heat rise through evaporative cooling. This optimal combination of heat storage, reduced thermal losses, and effective heat transfer results in a sustained sand temperature that remains significantly higher than the ambient temperature, leading to the highest temperature ratio during the 1 p.m. to 5 p.m. period.

In contrast, fine sand exhibits the lowest temperature ratio among the sand varieties (gravel, coarse, and medium) from 1 p.m. to 5 p.m. This outcome is primarily associated with the small particle size of fine sand, which causes dense packing and reduced pore spaces, thereby increasing thermal resistance and limiting heat conduction within the sand bed. Additionally, fine sand retains a higher moisture content due to strong capillary forces, and a significant fraction of the absorbed thermal energy is expended as latent heat for moisture evaporation rather than contributing to sensible heating [41]. The restricted airflow and enhanced evaporative cooling suppress the sand temperature

relative to the ambient temperature, resulting in a comparatively lower temperature ratio during the afternoon period.

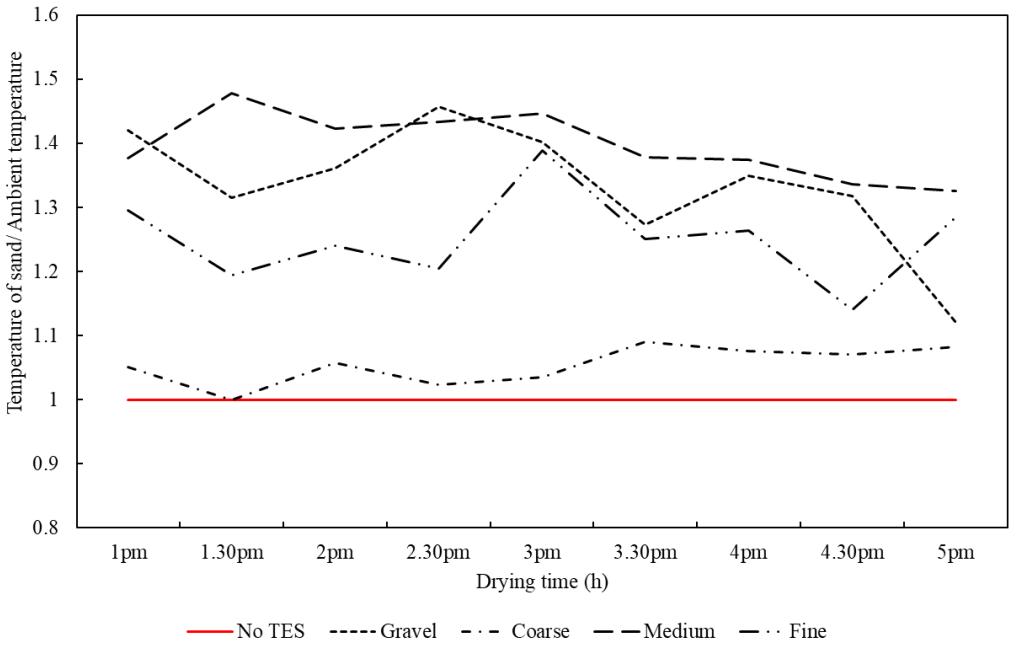

Fig. 8: Temperature of sand/ Ambient temperature against drying time (h) for 1pm until 5pm

Fig. 9 illustrates the relationship between weight (g) and drying time (h) from 5 pm to 9 pm. Gravel dries more rapidly than coarse, medium, and fine sand from 5 p.m. to 9 p.m. due to its coarse particle structure and large pore spaces, which promote efficient heat and mass transfer. The large inter-particle voids in gravel enhance natural air circulation within the sand bed, facilitating continued moisture diffusion and evaporation even under reduced solar radiation during the evening period. Gravel also holds onto and slowly releases the heat it absorbed earlier in the day. This keeps a temperature difference between the sand and the air around it, which helps remove moisture [45]. In contrast, finer sand fractions exhibit restricted airflow and higher moisture retention, which limit heat dissipation and slow mass transfer processes. These combined effects allow gravel to maintain a higher effective drying rate during the 5 p.m. to 9 p.m. interval despite declining ambient temperatures.

Conversely, fine sand exhibits the slowest drying rate among gravel, coarse, and medium sand from 5 p.m. to 9 p.m. due to its limited heat transfer efficiency to the turmeric. The small particle size of fine sand leads to dense packing and minimal pore spaces, which restrict both conductive and convective heat transfer within the sand layer [46]. As a result, the thermal energy absorbed during the day is not efficiently transmitted to the turmeric during the evening, when solar radiation is low. Additionally, fine sand retains higher moisture content due to capillary forces, which consumes part of the stored heat as latent heat for internal evaporation rather than transferring it to the turmeric. This combination of poor heat penetration, restricted airflow, and persistent moisture retention results in the slowest drying performance during the 5 p.m. to 9 p.m. period.

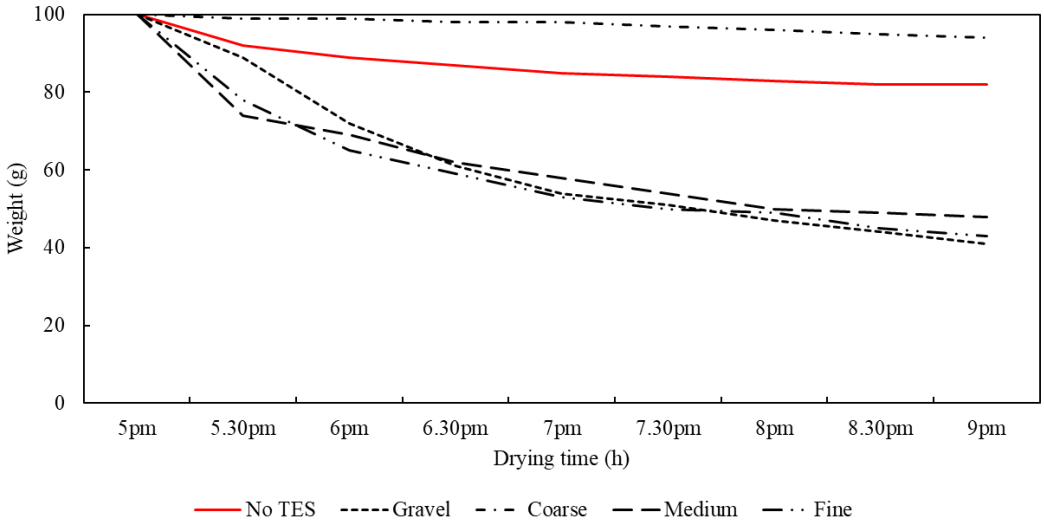

Fig. 9: Weight (g) against drying time for 5pm until 9pm

Fig. 10 illustrates the curve of sand/ambient temperature in relation to drying time (h) from 5 pm to 9 pm. Medium sand exhibits the highest thermal ratio relative to gravel, coarse, and fine sand from 5 p.m. to 5:40 p.m. This is primarily due to its balanced particle size, which allows it to retain heat absorbed earlier in the day more effectively than coarser or finer sand types. Unlike gravel sand, which has larger voids that promote faster heat dissipation, medium sand minimises convective heat loss while maintaining sufficient porosity to facilitate uniform heat distribution. In comparison to fine sand, which retains moisture and limits heat transfer through evaporative cooling, medium sand achieves efficient conduction of stored thermal energy to the surface. These factors together allow medium sand to maintain a higher temperature relative to the ambient temperature, resulting in the highest thermal ratio during the early evening period.

Fine sand has a higher temperature ratio than gravel, coarse sand, and medium sand at about 5:40 p.m. This is because fine sand particles have a larger specific surface area, which allows them to quickly absorb solar thermal energy when the sun is shining brightly. Fine sand's high surface area allows it to capture solar energy more quickly at the particle surfaces. During the late afternoon, solar irradiance remains substantial, and the sand has accumulated enough thermal energy to momentarily exceed the temperatures of coarser sands, which absorb heat more slowly at the surface. The peak at approximately 5:40 p.m. occurs because this is the point when the rate of energy absorption by fine sand temporarily surpasses the rate of energy loss through conduction, convection, and evaporation [41]. After this time, as solar radiation decreases, evaporative cooling and heat dissipation dominate, causing the temperature ratio to decline.

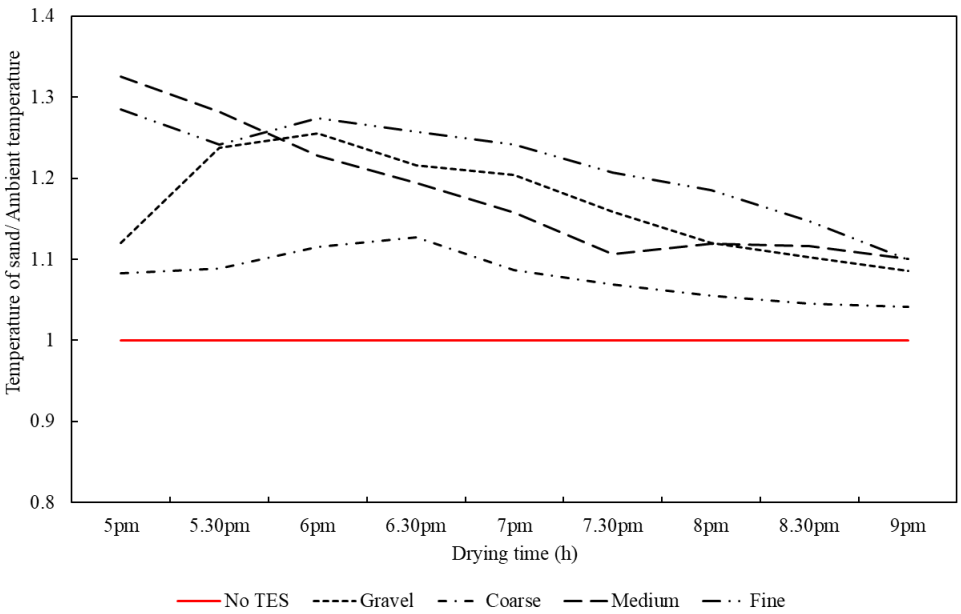

Fig. 10: Temperature of sand/ Ambient temperature against drying time (h) for 5m until 9pm

Conclusion

The experimental investigation of the turmeric drying process provides detailed insight into the temperature ratio and mass variation of silica sand layers with different particle diameters. The analysis was conducted under conditions both with and without thermal energy storage, considering average sand diameters of 10 mm, 4 mm, 2 mm, and 1 mm at a constant sand layer thickness of 50 mm. The results clearly indicate that the incorporation of silica sand as a thermal energy storage medium significantly enhances heat retention within the drying system compared to configurations lacking thermal energy storage.

In particular, the 50 mm thick silica sand layer, when applied across the investigated particle sizes, demonstrates a substantial capacity to absorb, store, and gradually release thermal energy. This stored heat helps maintain elevated drying temperatures for extended periods, thereby improving the overall efficiency and continuity of the turmeric drying process, especially during periods of reduced solar irradiance.

Despite the observed improvements, further optimising the solar dryer is achievable. The thermal performance of the system may be enhanced by integrating sands of varying compositions or hybrid granular materials with complementary thermal properties. Such modifications could improve heat storage capacity, regulate heat release rates, and ultimately lead to a more efficient and stable solar drying system.

Next Gen Gas Detector for Ship Maintenance

Alawiah Binti Abdullah [1]

[1] Politeknik Ungku Omar

Jalan Raja Musa Mahadi

31350, Ipoh, Perak, Malaysia

alawiahabdullah@puo.edu.my

Abstract. This study presents the development of an improved gas detector model designed to enhance the safety of engineers during ship maintenance operations. The proposed model is an upgraded version of existing portable gas detectors, integrated with a communication system that transmits real-time gas concentration data and warning signals from detectors worn by engineers to the engineer in charge and nearby personnel, enabling faster response during emergencies and helping to prevent serious accidents. Several limitations of conventional gas detectors are addressed, including the inability to detect when an engineer collapses or faints during maintenance, the possibility of alarms being unnoticed due to noisy ship environments or system malfunctions, and the lack of effective monitoring to identify which personnel are exposed to gas leaks and when exposure occurs. To overcome these issues, additional components and monitoring systems were incorporated into the existing detector design to allow continuous data transmission and centralized alerts. In conclusion, the proposed gas detector model significantly improves situational awareness, enhances occupational safety, and provides a more effective preventive measure against gas-related accidents during ship maintenance activities.

Keywords: gas detector, ship maintenance safety, real time monitoring

1. Introduction

In recent years, ship maintenance has become increasingly challenging, particularly in hazardous environments like small spaces. These locations may contain hazardous gases like carbon monoxide and propane, putting crew members' and engineers' health at risk. Prolonged exposure to such gases may result in dizziness, unconsciousness, or even death if they are not detected in a timely manner. The primary concern of ensuring worker safety during maintenance operations thus highlights the need for more effective gas monitoring systems [1]. Working in cramped areas where hazardous gas buildup can pose major safety risks is a common part of ship maintenance operations. To guarantee worker safety, enclosed spaces on ships must be subject to stringent gas monitoring and ongoing risk assessment, per International Maritime Organization (IMO) safety guidelines [23].The significance of accurate gas detection and hazard monitoring in confined spaces is also emphasized by OSHA.

To solve this issue, the project aims to develop and improve an existing shipboard gas detector system. Gas sensors and an Arduino-based platform are combined in the proposed system to allow for real-time gas level monitoring. Two of the main objectives are to accurately identify hazardous gas concentrations and notify customers of gas leaks. According to [2], by shortening exposure times and providing crew members and monitoring officials with timely warnings, the technique helps reduce significant accidents brought on by toxic gases.

The study also attempts to increase safety by identifying people who are overexposed to hazardous gases. This allows monitoring personnel to act quickly and appropriately in an emergency. The system also aims to address the limitations of current gas detectors, such as missed alarms or a lack of monitoring capability, by ensuring that alerts are appropriately tracked and distributed. This improves safety management and response time during ship maintenance procedures [3].

All things considered, the recommended gas detection system provides a reliable and and cost-effective means of improving onboard safety. By achieving the objectives of improving gas detection, identifying exposed individuals, and delivering timely alarms, this project will enhance crew member well-being and reduce the risks associated with gas exposure in confined marine situations.

2. Literature Review

Gas leak detection has evolved significantly over time due to increased awareness of the harmful effects of flammable and hazardous gases on human health and safety.

2.1 Traditional Gas Detection Methods

The main components of traditional gas detection techniques were chemical, biological, or optical signs. In order to detect the presence of dangerous gases, early systems, such flame safety lights, depended on changes in flame properties. Although useful at the time, these techniques lacked accuracy and the capacity for ongoing observation [4]. Later, more precise detection was made possible by chemical detection techniques like colorimetric tubes and chemically treated sheets, which changed colour when certain gases like carbon monoxide were present [5].

Gas detectors are vital safety tools that detect the existence of hazardous, flammable, or oxygen-deficient conditions. Oil and gas, mining, firefighting, and chemical processing are just a few of the industries that make extensive use of these devices. Metal-oxide semiconductor sensors, photoionization detectors, infrared sensors, and electrochemical sensors are examples of common sensing technologies. Although each type functions differently, they all have the same goal of identifying dangerous gasses and sending out alerts to stop mishaps [6].

2.3 History of Gas Detectors

The development of gas detection technology from basic manual techniques to sophisticated electronic systems is reflected in its history. Although they offered fundamental safety precautions, early detection methods including the use of canaries and flame lamps had limited precision and dependability. Technological developments during the middle of the 20th century resulted in the creation of portable gas detection systems and electrochemical sensors, which greatly increased response time and detection accuracy [7].

A significant turning point was the development of portable gas detectors in the 1950s and 60s, which allowed for real-time monitoring in a variety of industrial settings. Compared to previous techniques, these devices were more dependable and user-friendly since they used colorimetric analysis and electrochemical processes to

identify particular gases [8]. The basis for contemporary gas detection systems was established during this time.

2.4 Modern Gas Detection Technologies

Modern gas detectors are complex devices made for early warning and real-time monitoring of exposure to harmful gases. Advanced sensor technologies are used in these systems, including semiconductor sensors for volatile gases, infrared sensors for gases like carbon dioxide and methane, and electrochemical sensors for poisonous gases. The detection of volatile organic compounds (VOCs) is another common use for photoionization detectors (PID) [9].

These technologies are appropriate for commercial, residential, and industrial applications because of their high sensitivity, precision, and quick response times. Furthermore, wireless connectivity, mobility, and interaction with automated monitoring systems are common features of contemporary gas detectors. These developments greatly improve safety in dangerous situations by enabling constant monitoring and instant alerts [6].

2.5 Comparison Study and Research Gap

For industrial and confined space applications, a number of studies have suggested gas monitoring systems. Table 1 contrast the suggested system with the current ones.

Table 1: Comparison Between Existing Gas Detection Systems and the Proposed System

System/Research	Elements	Constraints
System for Internet of Things Gas Monitoring [20]	Monitoring in real time	Not using wearable monitoring
Arduino Gas Detector [21]	Affordable detection	No centralized alert
Wireless Gas Alarm System [22]	Bluetooth connectivity	Limited emergency response
Suggested System	Centralized monitoring, wireless alerts, and real-time tracking	Phase of prototype

3. Methodology

This study's research approach is based on a methodical engineering design process that includes planning, development, testing, and assessment. To ensure task execution clarity and logical progression, a flowchart was used to show the project's sequential methods. In engineering research, flowcharts are frequently utilized to enhance system design efficiency and visualize operations [10].

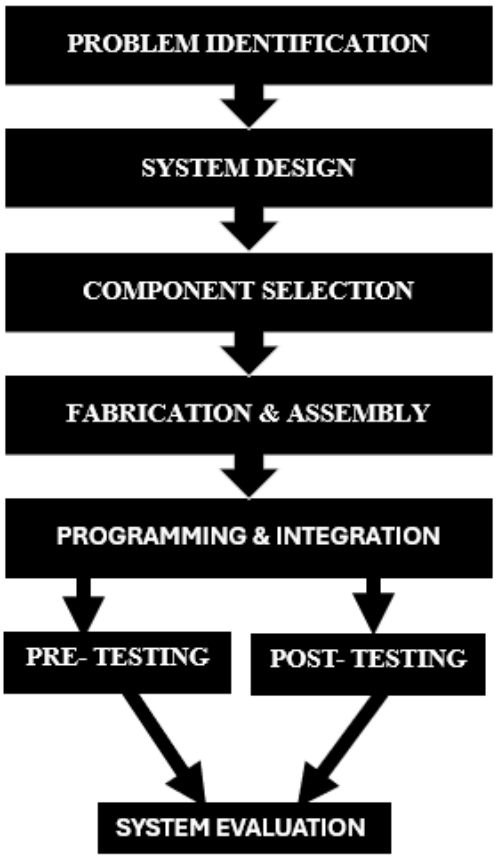

Fig.1 : Flowchart of Gas Detection system

3.1 Project Planning: Milestones

The project was executed in sequential phases consisting of design, component selection, fabrication, testing, and evaluation, as presented in Table 2, ensuring systematic development and performance validation of the system.

Table 2: Project Development Phases and Technical Activities

Phase	Activity Description	Components Involved	Expected Output
Planning & Design	System concept development, flowchart design, and safety requirement analysis		Defined system architecture and workflow
Component Selection	Selection of suitable hardware components for gas detection and monitoring	MQ-4 Gas Sensor, ESP32, Arduino, HC-05 Bluetooth, LCD, LED, Buzzer	List of validated and compatible components
Fabrication	Assembly of gas detector module and monitoring system	MQ-4 Sensor, ESP32, Arduino, electronic components	Functional hardware prototype
Pre-Testing	Individual testing of each component before integration	MQ-4 Sensor, ESP32, HC-05 Module	Verified component functionality
Integration	Hardware and software integration for complete system operation	All components	Fully integrated gas detection system
Post-Testing	System performance testing including detection response and alert system	Complete system	Performance validation results
Evaluation	Analysis of detection time at different distances and system responsiveness	Complete system	Experimental data and analysis

The proposed gas detection system's structured development phases are shown in Table 2, which also highlights the engineering procedures and components used at each level. This table highlights the technological workflow, from component selection to system evaluation, in contrast to a straightforward chronology. The table offers a better understanding of how each stage contributes to the overall functionality and performance validation of the system by listing the related hardware and anticipated outputs. This methodical process guarantees that the system is created, tested, and assessed in compliance with engineering best practices.

3.2 Engineering Analysis of Sensor Response

The relationship between sensor response time and gas source distance was investigated using an engineering-based response analysis method for the suggested gas detection system. The MQ-4 semiconductor gas sensor's operating principle, which states that sensor resistance varies with methane gas concentration, served as the foundation for the investigation. The sensor reaction time quickens with increasing exposure intensity as the gas concentration rises at shorter distances. By measuring the detection time at various gas source distances, this engineering behavior was assessed experimentally.

3.3 Pre-Testing and Post-Testing Procedures

To assess the system's performance and functionality, pre-testing and post-testing processes were carried out. Before the system was integrated, individual parts including the ESP32 microcontroller, HC-05 Bluetooth module, and MQ-4 gas sensor were verified to make sure they were working properly. To confirm that every component operated in accordance with its specifications, this stage was crucial. Post-testing was done once the system was assembled to evaluate overall performance, including data transmission reliability, alarm response via the LED and buzzer, and accuracy of gas detection. These testing methods made that the system worked efficiently and fulfilled the necessary performance and safety requirements.

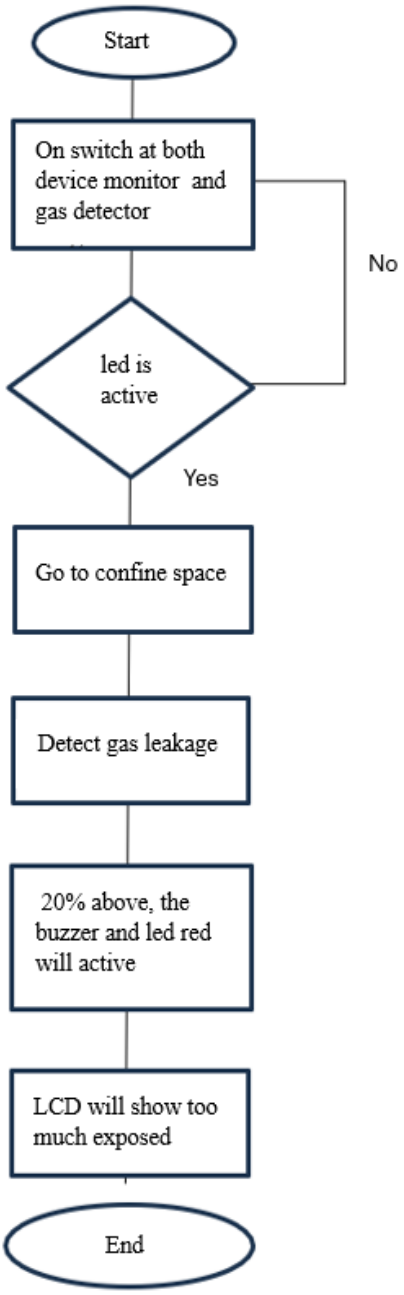

Fig. 2 : Flowchart of Pre-testing and Post-testing Procedure

3.4 Fabrication and Assembly

The two primary subsystems used in the construction and assembly of the suggested gas detection and monitoring system are the monitoring system module and the gas detector module. Both subsystems are integrated for real-time gas detection and alarm generation using a wireless connection.

3.4.1 Assembly of the Gas Detector Module

The MQ-4 gas sensor is used in the gas detector module's design to detect methane gas concentrations and an ESP32 microcontroller is used to send data. The MQ-4 gas sensor operates based on metal-oxide semiconductor (MOS) technology, where the sensing material (SnO_2) changes its electrical resistance when exposed to methane gas. This change in resistance is converted into an analog voltage output, which is proportional to the gas concentration. The sensor is highly sensitive to methane (CH_4) within a range of approximately 200 -10,000 ppm, making it suitable for confined marine environments [11,12].

The ESP32 microcontroller was selected due to its integrated Wi-Fi and Bluetooth capabilities, dual-core processing, and low power consumption. Its built-in analog-to-digital converter (ADC) enables accurate reading of the MQ-4 sensor output, while its wireless communication features support future expansion into IoT-based monitoring systems [13,3,18].

The following is the assembly process:

i. Component Preparation: The ESP32 microcontroller, MQ-4 gas sensor, light-emitting diode (LED), resistors, connecting wires were gathered and checked and checked for correct operation [11].
ii. MQ-4 Sensor Installation: To enable stable functioning and safe electrical connections, the MQ-4 gas sensor was installed on a printed circuit board(PCB) or breadboard [12].
iii. Microcontroller Connection: By connecting the sensor's analog output pin to the ESP32 analog input, the microcontroller was able to precisely measure the levels of gas concentration. In order to prevent weak connections that could compromise signal integrity , careful attention was paid [13].
iv. Indicator LED Integration: In accordance with normal micro - controller interfacing procedures, an LED was connected to the ESP32 via a series resistor to show operational status [14].
v. Power Supply Configuration : To guarantee continuous operation, a reliable power source either a rechargeable battery or USB was attached to the ESP32.

3.4.2 Assembly of the Monitoring System Module

An Arduino microcontroller, a Bluetooth communication module (HC-05), an LCD display, LEDs, and a buzzer for alarm generating were used to build the monitoring module, which collects and shows sensor data. Among the assembling procedures were:

i. The Arduino board, HC - 05 Bluetooth module, LCD, LEDs, buzzer, and related resistors and wires were among the necessary parts that were ready [15].
ii. Bluetooth Module Connection : To provide serial connection for wireless data transfer, the HC-05 module was attached to the Arduino's TX and RX [16].
iii. LCD Setup: To show real - time gas levels, the LCD was connected to the Arduino via the proper data and control pins. To avoid display malfunctions, power and ground connections were checked [17].

iv. Alert System Integration: In order to offer both visible and auditory alerts in the event of hazardous gas detection, LEDs and a buzzer were attached to Arduino output pins.

v. Power Supply Configuration: To ensure dependable operation of the monitoring system, the Arduino was powered by a battery or USB connection.

3.4.3 Integration of Software

Software integration allows the monitoring system and the gas detection module to be in sync:

i. ESP32 Programming: To read gas concentration data from the MQ-4 sensor and send it wirelessly over Bluetooth to the monitoring module, the ESP32 microcontroller was programmed using the Arduino IDE [13].

ii. Arduino Programming : Based on predetermined criteria, the Arduino micro-controller was configured to receive Bluetooth data, display it on the LCD, and activate the LED and buzzer alerts. For safety applications, the program guaranteed real-time monitoring and warning creation.

By connecting the ESP32 to WiFi, gas concentration data can be transmitted to a web dashboard or mobile application, allowing engineers in charge to monitor safety conditions remotely. IoT integration enables data logging, historical analysis, and instant alerts via SMS, email, or mobile notifications. This enhancement improves response time, situational awareness, and overall safety management in ship maintenance environments.

3.5 Project design

The suggested design incorporates a small, effective gas monitoring system designed for cramped areas. Red and green LEDs for status indication, an LCD display for real time data visualization, and side-mounted ports for connectivity and gas sampling are among the crucial parts that are thoughtfully arranged inside the enclosure. This design is especially appropriate for high-risk areas like ship maintenance and industrial restricted spaces since it improves operational functionality, user accessibility, and visibility. According to [17] and [11], the design also puts safety first by incorporating audio and visual indicators that allow for timely notice of dangerous situations. The LCD display for real-time data, red and green LEDs for status indication, and side-mounted ports for communication and gas detection are all depicted in this three-dimensional model of the gas monitoring system enclosure (Fig.3). Compactness, usability, and safety in tight spaces or high-risk situations are the design's main goals.

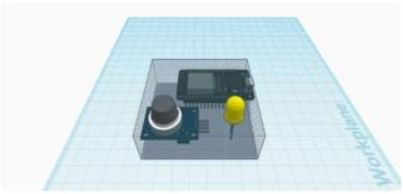

Fig 3: Gas Monitoring System Enclosure

4. Result and Analysis

This section outlines the findings derived from the creation of gas detection model aimed at improving safety during maintenance tasks on ships. The main goal of this research is to create a system that can monitor gas levels in real-time and provide early warnings via integrated visual and auditory alerts. Fig. 4 displays the full prototype of the gas detection and monitoring system, which consists of the sensor module and monitoring unit.

Fig. 4 : Fabricated Gas Detection System Including Sensor Module (Right) and Monitoring Unit (Left)

In order to simulate various degrees of gas exposure in a small area, the distance between the gas source and the sensor was changed in this investigation. The compartment size of 2 m × 2 m × 2 m was selected to represent a typical confined space onboard ships, where limited ventilation may lead to rapid gas accumulation and increased safety risks. Additionally, its size offers a controlled and manageable environment for monitoring sensor response and gas dispersion. In order to assess the system's efficacy in real-time monitoring and early warning applications, the main goal was to ascertain the detection time needed for the system to initiate alerts (LED and buzzer) at various distances.

4.2 Detection Time at Various Gas Source Distances

An experiment was carried out by altering the distance between the gas source and the sensor to simulate various levels of gas exposure in order to further assess the responsiveness of the suggested gas detection system. The MQ-4 sensor was positioned at intervals of 100 cm, 75 cm, 50 cm, and 25 cm after methane gas was discharged from a fixed point. For every scenario, the time it took for the system to initiate alerts, such as the buzzer and LED indicator, was noted. The experimental process flowchart for measuring detection time at various distances from the gas source is displayed in Fig.5

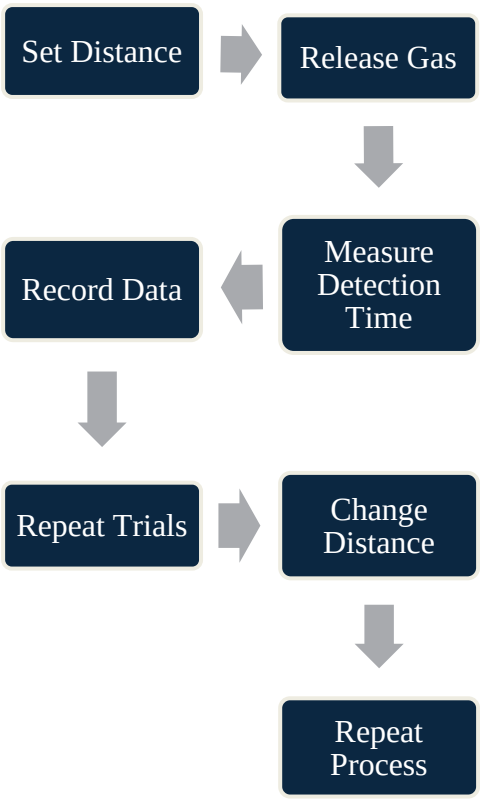

Fig.5 : Experimental Procedure Flowchart for Detection Time at Various Distances

Table 3 : Detection Time at Various Gas Source Distances

Distance from Source (cm)	Detection Time (seconds)	System Response
100 cm	16	No Alert (Safe)
75 cm	11	LED Activated
50 cm	6	LED + Buzzer
25 cm	3	Immediate Alert

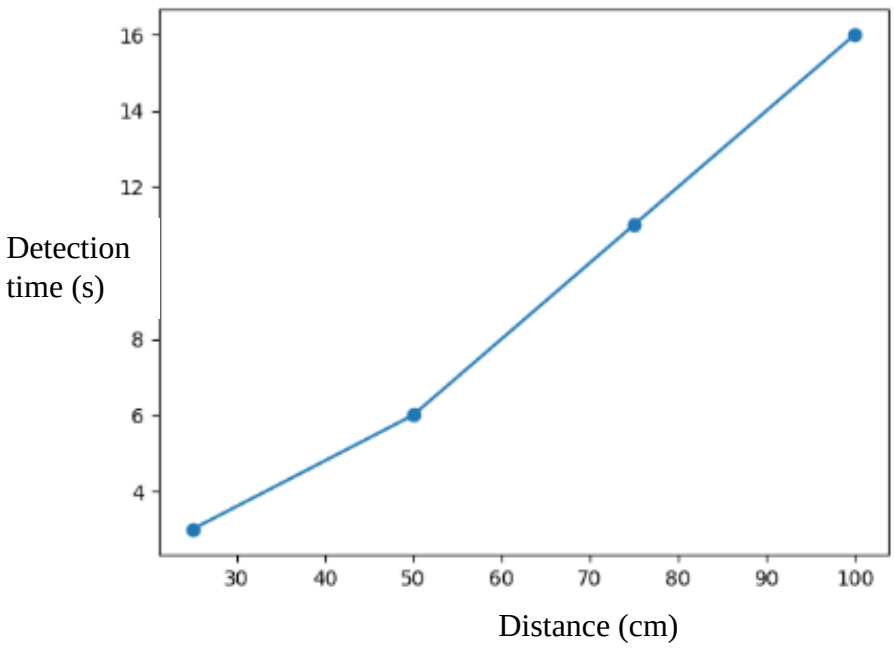

Fig. 6 Detection Time vs Distance

The findings clearly show a trend where the detection time decreases as the distance between the sensor and the gas source decreases. When the sensor is exposed to higher gas concentration levels at closer ranges, it can respond more quickly. The fact that the system did not sound an alarm and took longer to detect the gas at 100 cm suggests that the gas level was still within a safe range. When the distance was 75 cm or less, the device began to activate warning indicators. The LED was activated first, followed by both the LED and the buzzer at closer ranges, indicating increasing gas exposure levels. The system could provide prompt notifications in high-risk scenarios, as demonstrated by its nearly instantaneous response at 25 cm.

The difference in detection time at various distances emphasizes how crucial sensor positioning is in real-world applications. Gas dispersion and air dilution decrease the concentration that reaches the sensor at longer distances, causing a delayed or nonexistent detection. This suggests that in actual ship environments, a number of sensors or careful placement in high-risk areas is essential to guarantee early detection.

Additionally, the findings suggest that a single sensor might not be adequate for large or well-ventilated areas because gas concentration might not consistently reach detectable levels. For better safety coverage, system scalability and multi-point sensing should be taken into account, especially in light of IoT-based gas monitoring developments [3,11] and confined space safety requirements in maritime operations [1.19].

This behavior is consistent with the characteristics of metal-oxide semiconductor gas sensors, where the sensor reaction time is influenced by the gas concentration that reaches the sensing surface [18]. In practical applications, faster detection near the gas source is essential for early warning and accident prevention.

The observed response trend also demonstrates the engineering behavior of the MQ-4 semiconductor sensor when exposed to varying methane concentrations. Higher gas concentrations travel shorter distances to reach the sensor surface, which speeds up resistance changes and response times in general. This analysis shows that sensor placement is critical for improving early warning effectiveness and detection reliability in limited ship maintenance conditions.

4.3 Repeatability and Accuracy Analysis

To evaluate system consistency, each experiment was repeated three times for every distance (Table 4). The average detection time was then calculated to reduce random measurement error and improve result reliability.

Table 4: Repeatability Test Results for Detection Time

Distance (cm)	Trial 1 (s)	Trial 2 (s)	Trial 3 (s)	Average (s)
100	16.2	15.8	16.5	16.2
75	10.9	11.3	10.7	11.0
50	6.4	6.1	6.3	6.3
25	3.2	3.0	3.1	3.1

Repeated trials revealed consistent response patterns in the experimental results, with only slight differences in detection time. For prototype-level testing, the percentage variation between repeated measurements was less than 5%, indicating acceptable repeatability performance.

Furthermore, a basic accuracy assessment was carried out by contrasting the sensor response trend with the anticipated behavior of methane gas dispersion in small areas. Due to exposure to higher gas concentrations, the system showed faster detection at shorter distances, which is in line with the principles of gas sensor operation described in earlier studies [21, 22]. These results show that the suggested system offers consistent and dependable detection performance appropriate for ship maintenance operations' early warning applications.

4.4 Comparison with Existing Commercial Gas Detectors

When compared to traditional commercial portable gas detectors, the proposed solution offers several additional safety features. The only warning signals provided by conventional portable gas detectors are frequently integrated buzzers or LED indications, which only provide local alarm notifications [6].

On the other hand, the proposed system's wireless connection capabilities enable monitoring personnel to receive real-time warning information. This feature improves situational awareness and emergency response effectiveness in busy, noisy ship maintenance environments where local alarms might go unnoticed.

Additionally, the proposed prototype provides an inexpensive alternative to costly industrial gas monitoring systems while maintaining essential real-time safety monitoring features. Wireless monitoring and centralized warning capabilities enhance worker safety and speed up emergency response during ship maintenance operations.

5. Conclusion and Future Research

This study successfully developed an enhanced gas detection system to increase safety during ship maintenance operations, particularly in restricted and high-risk areas. The proposed system integrates an ESP32 microprocessor, a wireless communication module, and a MQ-4 gas sensor to enable real-time monitoring and transmission of gas concentration data. Unlike conventional gas detectors, the system provides ongoing monitoring and ensures that warning signals are not only identified locally but also transmitted to the responsible engineer and nearby personnel [17].

The results demonstrate the system's ability to detect methane gas fast and effectively. According to the investigation based on various distances from the gas source, the detection time decreases as exposure increases, indicating the system's sensitivity and responsiveness to changes in gas present. In noisy ship environments where alarms might otherwise be missed, the combination of visible (LED) and auditory (buzzer) alerts further increases its dependability [18].

Additionally, the technology solves several problems with traditional gas detectors, including the lack of centralized monitoring and the inability to identify which workers are exposed to hazardous gases. By incorporating wireless data transmission, the proposed paradigm improves situational awareness and expedites emergency response. The developed system provides a workable, economical, and reliable means of improving occupational safety in restricted marine environments in compliance with safety protocols recommended by the International Maritime Organization and the Occupational Safety and Health Administration.

Future improvements to the system could include the addition of wearable features to assess whether workers are unresponsive [3], the integration of IoT-based monitoring for remote real-time access [17], and the addition of additional sensors to identify other hazardous gases like CO and H_2S [6]. Cutting size and boosting strength of the device would make it more appropriate for severe marine conditions [9], while calibration using accurate gas sources and sophisticated signal processing could enhance measurement accuracy [18]. Finally, extensive testing under real shipboard conditions is recommended to confirm performance and ensure adherence to industrial safety regulations [1,19].

Abstract. With the depletion of fossil fuel reserves and increasing environmental concerns, enhancing fuel efficiency in internal combustion engines has become a critical area of research. This study evaluates the effectiveness of various fuel additives categorized into bio based and petroleum-based types on the performance of a four stroke single cylinder spark ignition engine. The primary objective was to compare the impact of these additives on fuel consumption, exhaust gas temperature, and the air fuel ratio (A/F) across different engine speeds (RPM). The experiments were conducted using a Gunt Hamburg CT110 test bed equipped with a dynamometer. Three commercial fuel additives, labeled as FF (bio based), FP (petroleum based), and NFL (petroleum based), were blended with standard gasoline and tested against a baseline of pure gasoline. The experimental results demonstrated that the addition of fuel additives significantly improved engine performance by promoting leaner combustion and reducing fuel consumption. Among the tested samples, the bio-based additive (FF) exhibited the most superior performance. It achieved a maximum fuel saving of 21.25% at an engine speed of 3400 rpm compared to pure gasoline. Furthermore, the use of additives led to an increase in the air fuel ratio, with the FF additive showing the highest increment of 28.36%, indicating more efficient combustion. Exhaust gas temperatures generally increased with the use of additives, reflecting higher combustion intensity. The study concludes that bio-based additives offer a more effective and environmentally friendly alternative for improving fuel economy and engine efficiency. Future research is recommended to investigate the long-term effects of these additives on engine components and their impact on specific exhaust emission compositions.

Keywords: Fuel Additives, Bio Based Additive, Engine Performance, Fuel Consumption, Air Fuel Ratio, Spark Ignition Engine.

Introduction

The depletion of global fossil fuel reserves, coupled with escalating environmental concerns, has necessitated a significant shift in how internal combustion engine efficiency is approached. Historically, petroleum and natural gas were formed over millions of years through the anaerobic decay of marine organisms, creating a non-renewable resource that is currently being consumed at a rate far exceeding the discovery of new deposits. In 2007, the United States Energy Information

Administration estimated that approximately 86.4% of the world's energy was derived from fossil fuels, with petroleum accounting for 36.0%, coal for 27.4%, and natural gas for 23.0%. In contrast, non-fossil sources such as nuclear (8.5%), hydroelectric (6.3%), and renewables like solar and wind (0.9%) represent a much smaller fraction of the global energy mix. With worldwide energy demand increasing by roughly 2.35% annually, the automotive industry is under immense pressure to adopt methods that reduce fuel consumption and mitigate environmental impact.

Current strategies to manage rising energy needs include the development of hybrid and solar powered vehicles, the adoption of alternative fuels and the enhancement of combustion efficiency within existing internal combustion engines. This research focuses specifically on the role of fuel additives organic compounds designed to enhance performance and quality as a means of improving combustion efficiency. While many commercial products claim to increase octane levels, provide anti oxidation or act as detergents and lubricants, their actual impact on fuel economy is frequently questioned by consumers. Consequently, there is a clear need for rigorous comparative analysis to validate these claims through controlled experimentation.

The primary objective of this study is to provide a comprehensive comparative analysis between bio based and petroleum based additives to determine their specific impact on the optimum air fuel ratio (A/F), specific fuel consumption across varying engine speeds (RPM), and exhaust gas temperatures. By conducting controlled laboratory simulations using a GUNT HAMBURG CT110 dynamometer and a single cylinder four stroke engine, this research aims to identify whether bio based alternatives offer a more efficient and environmentally sustainable path forward for the automotive industry compared to traditional chemical boosters.

Literature Review

The effectiveness of internal combustion engines depends heavily on the chemical composition of the fuel and the role of performance enhancing additives. This section examines the properties of gasoline, the significance of octane ratings and the chemical nature of various fuel additives. Gasoline or petrol, is a complex mixture consisting of hundreds of different hydrocarbons. Its typical composition primarily includes saturated hydrocarbons, such as paraffins and cycloparaffins, along with approximately 25% aromatic hydrocarbons. At a molecular level, most gasoline molecules contain between 4 and 12 carbon atoms. This chemical structure allows gasoline to release approximately 34.8 Megajoules (MJ) per liter or 44.4 MJ per kilogram. Furthermore, gasoline possesses a density ranging between 0.71 and 0.77 kg/L because this is lower than the density of water, water cannot be effectively used to extinguish gasoline based fires.

The octane rating serves as a critical measure of a fuel's resistance to knocking, which is the uncontrolled ignition of the air fuel mixture within the cylinder. Specifically, the octane number represents the volume percentage of iso octane in a blend with heptane that matches the anti-knocking capacity of the fuel under test. It is a common misconception that octane ratings are related to the energy content of the fuel but in reality, they solely measure the tendency of the fuel to burn in a controlled manner. These ratings are typically determined via the Research Octane Number (RON), measured in a test engine with a variable compression ratio at 600 rpm.

Fuel additives are organic compounds integrated into the fuel to improve quality, boost octane, or act as lubricants and detergents. Petroleum based components often include aromatics like toluene, or methylbenzene, which is a common active ingredient in commercial products. While toluene is more flammable than petrol and is used in high concentrations for racing, excessive use can cause engines to run hotter and increase the risk of mechanical damage. Another aromatic hydrocarbon, naphthalene, offers a higher octane value than gasoline but produces toxic and carcinogenic emissions upon combustion. It must be 100% soluble in fuel to prevent clogging the vehicle's fuel lines. Historically, Tetra-Ethyl-Lead (TEL) was used to raise octane and lubricate valve seats, but it has been largely phased out due to the presence of dangerous heavy metals in its exhaust. In contrast, bio based and oxygenated components like methanol and ethanol offer higher octane ratings than gasoline. Methanol is highly effective but can produce harmful exhaust emissions, while ethanol must maintain a purity higher than 99.2% to prevent moisture induced corrosion within the engine.

Research has also identified acetone as a potential oxygenate additive capable of reducing the percentage of unburned hydrocarbon gases in exhaust emissions. Beyond immediate performance gains, these additives serve several mechanical functions. They provide fuel stabilization by reducing starting difficulties caused by gas buildup and offer detergency by removing carbon deposits from fuel injectors. Additionally, certain additives are formulated to lubricate cylinder head components, such as valves and valve seats, which are not reached by standard engine oil.

Methodology

The research was structured as a screening test to evaluate the preliminary effects of various fuel additives on a standard spark ignition engine. All experiments were conducted at the automotive laboratory of Kuala Terengganu Community College using standard RON95 gasoline as the baseline fuel. The primary equipment utilized for this study was the GUNT HAMBURG CT110 test stand, which was selected because it serves as a highly controlled load unit for single cylinder internal combustion engines with power outputs up to 7.5 kW. The engine used was a 250000 series four stroke, single cylinder air cooled engine featuring a bore of 87.31 mm, a stroke of 66.68 mm, and a displacement of 399.3 cc. To accurately apply loads and measure engine torque, an asynchronous electric motor functioned as a dynamometer, while the system’s digital displays provided real time monitoring of engine speed, torque, and temperatures for exhaust, fuel, and air.

To determine the engine's performance, several physical parameters were measured and calculated using standard engineering formulas. The air mass flow rate was calculated based on the air inlet velocity measured by a Magnehelic air flow rate gauge and the cross sectional area of the intake. The fuel mass flow rate was determined by measuring the time taken to consume 25 ml of fuel, with the fuel density empirically determined to be 696.6 kg/m³. These parameters were chosen specifically to calculate the Air Fuel Ratio (A/F), which identifies the combustion state as either rich or lean. Furthermore, the exhaust temperature was monitored via a Type K thermocouple to assess combustion intensity, providing a direct measurement of thermal efficiency.

The experimental preparation involved three commercial additives, FF (bio based), FP (bio based) and NFL (petroleum based) which were crushed and weighed with a digital scale to match manufacturer recommended ratios. The mixing ratios were set at 0.2g/L for FF, 0.1g/L for FP, and an optimized 1.6g/L for the petroleum based NFL to ensure a fair comparison of their maximum potential effectiveness.

The operational procedure began with baseline testing on pure RON95 gasoline across speeds from 1800 to 3400 RPM at 200 RPM intervals. This range was selected to capture engine behavior across common operational speeds. Before any data collection occurred, the engine was allowed to reach thermal equilibrium until the exhaust temperature reached a steady state. To ensure the reliability and repeatability of the results, each test was conducted three times, and the average values were recorded for final analysis.

Table 1: Manufacturer Recommended Ratios

Additive Brand	Type	Mixing Ratio	Dosage per 1L Fuel
FF	Bio-based	1g / 5 Liters	0.2 Gram
FP	Bio-based	1g / 10 Liters	0.1 Gram
NFL	Petroleum-based	Variable (Naphthalene)	1.6 Gram (Optimized)

Results and Discussion

The experimental results evaluate the impact of bio based and petroleum based additives on engine performance parameters, focusing on the air fuel ratio (A/F), mass fuel consumption ($\dot{m}f$), and exhaust gas temperature (EGT). The air fuel ratio serves as a critical indicator of combustion efficiency, where a stoichiometric mixture for gasoline is approximately 14.7:1. In the baseline testing phase, the engine fueled with pure RON95 gasoline operated consistently in a rich state, with A/F ratios ranging from 8.75:1 to 10.7:1.

Upon the introduction of additives, a significant shift toward a leaner combustion state was observed across all samples. The bio based FF additive demonstrated the most substantial improvement in this area, increasing the A/F ratio by 28.36% at 3400 RPM, which moved the ratio from 8.95:1 to 11.48:1. In comparison, the bio based FP additive showed a maximum increase of 11.00% at 1800 RPM , while the petroleum based NFL additive achieved a maximum increase of 10.64% at 2600 RPM. This suggests that bio based formulations are more effective at optimizing the air fuel mixture for more complete combustion.

The primary objective of utilizing these additives was to achieve a reduction in the mass fuel consumption rate ($\dot{m}f$). At a peak engine speed of 3400 RPM, the baseline consumption for pure gasoline was recorded at 0.2764 g/s. The experimental data confirms that the FF additive provided the most superior fuel economy, reducing consumption to 0.2177 g/s, which represents a total fuel saving of 21.25%. This performance significantly outpaced the other additives; the bio-based FP additive reduced consumption by 8.70%, while the petroleum-based NFL showed the lowest relative improvement at 7.35%. It is noteworthy that the FF additive consistently provided the lowest fuel consumption across the entire speed range, whereas the petroleum-based NFL only achieved its best relative performance at a mid-range speed of 2600 RPM.

Further insights into combustion intensity are provided by the analysis of exhaust gas temperatures (EGT). Increased exhaust temperatures generally reflect a more energetic and complete oxidation process. The FF additive caused the highest increase in EGT, rising by 25.3°C (3.47%) at 3400 RPM. This correlates with the leaner A/F ratio and reduced fuel consumption, confirming that the bio components in FF enhance thermal efficiency. The petroleum-based NFL increased EGT by a maximum of 19.8°C at 1800 RPM. Conversely, the bio-based FP additive showed lower temperature variations and even recorded a slight decrease of 1.89% at 2400 RPM, indicating a less intense combustion process compared to FF. The collective data demonstrates that bio-based formulations, particularly FF, are markedly more effective than traditional petroleum-based boosters like naphthalene. By promoting leaner combustion, these additives allow the engine to maintain performance while significantly reducing fuel intake. Furthermore, the petroleum-based NFL required a much higher dosage 1.6g/L compared to only 0.2g/L for FF to achieve its results. This disparity indicates that bio-based additives are not only more efficient in terms of engine performance but also offer a more cost-effective and environmentally sustainable alternative for the automotive industry.

Table 2: Mass Fuel Consumption

Fuel Type	Consumption at 3400 RPM (g/s)	Percentage Reduction (%)
Pure Gasoline	0.2764	Baseline
Bio based FF	0.2177	21.25%
Bio based FP	0.2524	8.70%
Petroleum Based NFL	0.2561	7.35%

Conclusion and Recommendations

The comparative analysis of bio based and petroleum-based fuel additives reveals significant insights into their impact on the performance of a single cylinder four stroke spark ignition engine. This study confirms that the addition of both bio-based and petroleum-based additives significantly improves engine performance by promoting leaner combustion and reducing fuel consumption. Before the introduction of additives, the engine operated in a rich state with an air fuel ratio between 8.75:1 and 10.7:1. However, the use of additives increased the air fuel ratio by 3.54% to 28.36%, successfully moving the mixture closer to the ideal stoichiometric ratio of 14.7:1.

The bio based additive FF demonstrated the most superior results across all tested parameters, achieving a maximum fuel saving of 21.25% at 3400 rpm compared to pure gasoline. While petroleum-based additives like naphthalene (NFL) also improved performance, they were notably less efficient, the FF additive was 19.3% more efficient than the maximum recorded performance of its petroleum-based counterpart. Furthermore, the use of additives generally led to higher exhaust gas temperatures, reflecting a higher combustion intensity and a more complete oxidation process, with the FF additive recording the highest temperature increase of 25.3°C.

Based on these findings, several specific areas for future study are proposed to further validate the effectiveness of these additives and ensure their commercial viability. Future research should utilize chassis dynamometers in accredited laboratories, such as SIRIM, to produce more precise results under controlled environmental conditions that mimic real world driving cycles.

A deeper investigation into the fundamental chemical properties of these additives, including viscosity, density, cloud point, and caloric values, is recommended to better understand the underlying mechanisms for their performance differences. Critically, long term durability studies must be conducted to assess the impact of naphthalene and bio formulations on internal engine components such as intake and exhaust valves, pistons, and piston rings to identify any potential wear or harmful deposit build up over time. Additionally, future work should specifically investigate the impact of these additives on exhaust emission compositions to quantify their environmental benefits.

Abstract. This study evaluates the impact of an automated material handling system on production efficiency and operator ergonomics in an injection moulding line. Unlike previous studies that focus on single performance indicators, this research integrates time study analysis, Rapid Upper Limb Assessment (RULA), and return on investment (ROI) evaluation to provide a comprehensive assessment. A conveyor-based automated system was designed and implemented. Results show a cycle time reduction from 68 s to 53 s (22.06%), improvement in RULA score from 7 (high risk) to 2 (low risk), and increased output from 2,120 to 2,717 units per 10-hour shift. The system eliminates overtime and achieves a payback period of 1.14 years. These findings demonstrate the combined operational and ergonomic benefits of automation in injection moulding environments.

Keywords: Automated material handling; Injection moulding; Cycle time reduction; Ergonomics; RULA assessment; Productivity improvement

Introduction

Manual material handling (MMH) remains widely practised in manufacturing industries despite its well-documented limitations in efficiency and worker safety. MMH tasks, which include lifting, carrying, pushing, and pulling materials, are strongly associated with increased cycle time, operator fatigue, and a higher risk of musculoskeletal disorders (MSDs) due to repetitive motion and awkward postures (Adellian Nugraha & Widajati, 2024; Zhang et al., 2023). These issues not only affect worker well-being but also reduce overall production efficiency and increase operational costs.

In the context of injection moulding operations, manual retrieval of parts from machines is still commonly implemented, particularly in small- to medium-scale industries. However, such practices introduce inefficiencies in the production cycle and expose operators to significant ergonomic risks. Recent studies have highlighted that poor workstation design and repetitive manual handling activities contribute to high RULA scores, indicating urgent need for ergonomic intervention (Sajeev & Binoosh, 2025). Furthermore, ineffective material handling systems can act as bottlenecks, limiting throughput and hindering the ability to meet increasing customer demand.

To address these challenges, automation has been increasingly adopted in manufacturing processes. Automated material handling systems, such as conveyor-based solutions, have been shown to improve workflow continuity, reduce manual intervention, and enhance productivity (Hilmi & Hamid, 2023). In addition, modern research emphasises the importance of integrating ergonomic considerations into system design, as improvements in worker posture and reduction in physical strain can

indirectly contribute to higher productivity and reduced absenteeism (Kim & Park, 2025).

However, existing studies tend to focus on individual aspects such as productivity improvement, ergonomic assessment, or cost analysis in isolation. There is a lack of comprehensive research that integrates these three critical dimensions into a single evaluation framework. This limitation reduces the ability of decision-makers to fully assess the effectiveness and feasibility of implementing automated systems in real industrial settings. The layout for the production is shown in Figure 1 and the selected area for improvisation is depicted in Figure 2.

Production layout for Plant 2

Fig.1: Plant 2 production layout

Selected area to improvise

Fig.2: Injection molding production line

Table 1: Total machinery and workstations at Plant 2

Machineray & workstation	**Quantity**
Injection molding machine	15
Mold on rotating table	12
Sub assembly line	2
Quality Gate	3

Therefore, this study aims to address this gap by evaluating the implementation of an automated material handling system in an injection moulding production line through an integrated approach. Specifically, this research combines time study analysis, Rapid Upper Limb Assessment (RULA), and return on investment (ROI) evaluation to provide a holistic assessment of system performance. By doing so, the study not only examines improvements in cycle time and productivity but also considers ergonomic risk reduction and economic viability, thereby offering a more comprehensive contribution to the field of manufacturing optimisation.

Problem statement

Meeting the necessary takt time in the injection moulding process has become increasingly challenging due to growing customer demand. The extended cycle time is mainly caused by the current MMH technique, in which the operator manually retrieves the injection moulded parts from the mould. Originally, the cycle time required longer production hours, which have been increased from 8:00 a.m. - 8:00 p.m. to 8.00 a.m. - 6.00 p.m., due to the increase in orders thus proved that the current MMH is ineffective. Furthermore, there are significant ergonomic risks and an increased risk of musculoskeletal disorders for operators who was involved in this current manual part retrieval process. They develop awkward postures, repetitive motions, when they must reach into the injection moulding machine repeatedly. In 12 hours, shift, the operator

repeats the injection part retrieval process for approximately 636 times a day. The RULA assessment result on operator posture is 7, which requires immediate investigation and implementation. Moreover, the cost of overtime labour has increased significantly due to increased customer demand. In addition to the operator's basic salary of RM1700 per month, operators also experience an increase in overtime hours at a rate of RM11.00 per hour as the production period is extended to 10.8 hours per day, compared to 8.8 hours per day. The company must pay an extra RM440.00 each month to the operator. Therefore, production costs have increased significantly because of this overtime compensation. Based on all the above problems, this work aims to achieve the following objectives.

1. To identify problems related to activities involving material handling.
2. To propose a new design of material handling equipment to solve the problems.
3. To improve production cycle times, operator ergonomics and operational costs.

Process flow

In this study, the production line for Pull cup Sport Front LH/RH (see Figure 3) was studied to meet the objectives. A pull cup are a common component of the door trim and a part of automobile interior that serves as a handle or grip area for the driver or passenger to pull the door closed. They are usually found on the inner door panel and aesthetically appealing and ergonomically designed into the car's interior. The pull cup is made of ABS material and is manufactured using injection moulding. After production, the pull cups are sent to WIP for storage.

Fig. 3: Pull cup Sport Front LH/RH

The current process for handling parts from an injection moulding machine is still manual, involving operators opening the machine door, retrieving the moulded parts, and closing the door. They then inspect each part for quality, classifying it as good (OK) or not good (NG). Good (OK) parts are packed into a box, placed on pallets with labels, and ready for further handling. The production line for the Pull cup Sport Front LH/RH is shown in Figure 4.

Fig. 4: Pull cup Sport Front LH/RH production line (VIM 09)

Figure 5 shows the flow of parts from the injection moulding machine to the finished goods box, before being sent to WIP storage and then sent to Plant 1 for further processing.

Literature Review

Injection moulding machine cycle time

Cycle time (CT) is one of the important parameters for line balancing in any production line. Cycle time can be explained as the time required to complete one product, or the total time taken before a product leaves the workstation and moves to the next workstation. In mixed-model assembly lines, a group of similar product models can be assigned simultaneously. Having lower CT rates per start rate can reduce the overall WIP thus increasing the product output. If the company encounters manufacturing output issues such as delays, a higher product output can reduce the impact on product availability and delivery to consumers (Likitha, J., & Ramesha, N. 2020).

Injection molding auto drop parameters setting

Auto drop parameters are necessary to make sure that moulded parts are ejected successfully and safely from the mould. Therefore, setting these parameters correctly is important to reduces errors and speeds up production. Studies has shown that it is important to adjust these parameters in accordance with the material properties and mould design to avoid problems such as part sticking or damage during ejection. Better cycle times and lower operational delays can be achieved by using advanced equipment that has precise control over these parameters (Liou, G., Su, W., 2023).

Bottleneck analysis

When a single step error in the injection moulding process limits the amount of production output, a bottleneck will increase. Thus, finding the cause of bottlenecks is needed to increase productivity. Poor cooling periods or sluggish ejection mechanisms are common bottlenecks. These bottlenecks are often detected using methods like value stream mapping and root cause analysis, which allows maintenance engineer and technician to provide focused solutions that improve throughput (Llopis, J., Lacasa, A., 2021).

Root cause analysis (Fishbone diagram)

Root Cause Analysis (RCA) is a systematic technique used in a variety of environments, including manufacturing, to determine the main causes of an issue or incident. By focusing on the root cause of problem and not just its symptoms, RCA improves organisational effectiveness and reduces recurring issues. Among the normal steps in RCA are determining the root causes using techniques such as "5 Whys", Fishbone Diagrams or 4M, describing the issue, obtaining information, identifying causative factors, and creating workable solutions. RCA helps organisations develop a culture of continuous improvement culture by preventing future problems, increasing safety and quality (Haekal, J. 2022)

Ergonomics

The word "ergonomics" comes from two Greek words: ergos, meaning "work", and nomos, meaning "natural law of systems." According to the International Ergonomics Association, ergonomics is a field of study that examines how humans interact with other parts of a system. It uses theories, principles, data, and methods to design systems that improve human well-being and performance (Tosi, F. 2020). For example, a factory worker needs to maintain good posture to prevent long-term injuries and repetitive strain, while also improving comfort and visibility during work. Work-related

factors, like doing repetitive tasks, lifting heavy items often, or holding uncomfortable positions for long periods, are key causes of MSDs(Carel T.J. Hulshof, 2021).

Cycle time optimisation has been widely studied in injection moulding as a key factor influencing production efficiency. For instance, Likitha and Ramesha (2020) demonstrated that adjusting process parameters can significantly reduce cycle time and improve throughput. Similarly, Liou et al. (2023) highlighted the role of advanced control systems in optimising injection moulding parameters to enhance production performance. However, both studies primarily focus on machine-level improvements and do not consider the impact of manual material handling (MMH) on overall cycle time, particularly in post-processing stages such as part retrieval.

In contrast, research on manual material handling emphasises its negative impact on worker safety and operational efficiency. Studies have shown that repetitive movements, awkward postures, and excessive physical exertion are major contributors to musculoskeletal disorders (MSDs) among industrial workers (Adellian Nugraha & Widajati, 2024; Zhang et al., 2023). While these studies provide strong evidence on ergonomic risks, they often lack integration with productivity metrics, making it difficult to evaluate trade-offs between efficiency and worker well-being.

Ergonomic assessment tools such as Rapid Upper Limb Assessment (RULA) are commonly used to evaluate posture-related risks in manufacturing environments. Recent work by Sajeev and Binoosh (2025) confirmed that high RULA scores are associated with urgent need for workstation redesign. Although RULA is effective in identifying ergonomic issues, most studies apply it as a standalone assessment tool without linking the results to operational improvements or economic outcomes.

On the other hand, automation in material handling has been increasingly proposed as a solution to improve efficiency and reduce human intervention. Conveyor-based systems and automated transfer mechanisms have been shown to enhance workflow continuity and reduce cycle time variability (Hilmi & Hamid, 2023). Nevertheless, existing research tends to emphasise productivity gains while giving limited attention to ergonomic improvements or cost-benefit analysis.

Furthermore, root cause analysis (RCA) and bottleneck identification techniques are widely used to diagnose inefficiencies in manufacturing systems (Haekal, 2022; Llopis et al., 2021). These methods provide structured approaches to problem-solving but are rarely integrated with ergonomic assessment or financial evaluation, limiting their practical applicability in comprehensive system improvement.

Based on the reviewed literature, it is evident that previous studies tend to examine productivity, ergonomics, and economic performance in isolation. There is a lack of integrated research that simultaneously evaluates cycle time reduction, ergonomic risk, and financial feasibility within a single framework, particularly in the context of injection moulding operations involving manual part retrieval.

Therefore, this study addresses this gap by combining time study analysis, RULA ergonomic assessment, and return on investment (ROI) evaluation to provide a holistic assessment of an automated material handling system. This integrated approach enables a more comprehensive understanding of both operational and human factors, offering practical insights for industrial implementation.

Methodology

Research Design

This study adopts a quantitative experimental design using a before-and-after approach to evaluate the effectiveness of an automated material handling system in an injection moulding production line. The study consists of three main phases:

1. **Pre-implementation phase**
   Observation and data collection of the existing manual material handling process.
2. **Implementation phase**
   Design and installation of an automated collecting and transferring conveyor system.
3. **Post-implementation phase**
   Measurement and comparison of performance indicators after system integration.

This design enables direct comparison of system performance under identical production conditions, ensuring reliability of the findings.

Data Collection Methods

Three main types of data were collected:

a) **Time Study (Cycle Time Measurement)**
A stopwatch time study method was used to record the time taken for each task (P1–P5) in the production process.

- A minimum of 30 cycles were observed to ensure consistency
- Average cycle time was calculated to reduce random error

b) **Ergonomic Assessment (RULA)**
Operator posture during part retrieval was evaluated using the Rapid Upper Limb Assessment (RULA) method.

- Postures were observed and scored using the standard RULA worksheet
- Scores range from 1 (acceptable) to 7 (high risk requiring immediate action)

c) **Cost Analysis (ROI Evaluation)**
Cost data were collected based on:

- Operator salary and overtime rates
- Cost of conveyor system implementation
- Monthly operational savings

Experimental Setup

The study was conducted at an injection moulding workstation producing Pull Cup Sport Front LH/RH components.

- **Before improvement:**
  Manual retrieval of parts from mould by operators
- **After improvement:**
  Automated conveyor system used to collect and transfer parts

All other process parameters (machine settings, material, and operator tasks except retrieval) were kept constant to ensure a controlled comparison.

Performance Evaluation Metrics

Equation of takt time

The fundamental parameters for takt planning include flexible locations known as takt areas; work packages that may encompass multiple activities across different trades (referred to as takt wagons); and the specific time allocated to complete each work package at a given location (known as takt time). The system in which these wagons move through various locations while processes operate at the designated takt time is called the takt train". Utilising takt areas, wagons, and time as planning parameters provides greater flexibility and promoting a more stable workflow compared to traditional location-based methods, especially in non-repetitive environments. By understanding the number of takt wagons, the available takt areas, and the duration of takt time, the total production period can be determined (Lehtovaara et al., 2021).

$$Takt\ Time = \frac{Available\ Producton\ Time}{Customer\ Demand} \quad (1)$$

If the cycle time exceeds takt time, the production system is unable to meet demand without overtime. Therefore, reducing cycle time below takt time is essential to achieve demand targets efficiently.

Equation of efficiency

The calculation of work efficiency is crucial for professionals in engineering and physics, as it helps in understanding energy flow in a machine and measuring the energy losses associated with each machine. Additionally, this calculation is important for businesses that use heavy machinery, as it allows for the reduction of operating costs by employing machines that require less input for the same output or that can produce more output with the same input. Ultimately, improving work efficiency not only enhances operational performance but also contributes to more sustainable practices in resource management (Gökçen, Ağpak, & Benzer, 2006). The formula for energy improvement is as below.

$$\text{Efficiency improvement} = \frac{CT_{Before} - CT_{after}}{CT_{Before}}\ x\ 100 \quad (2)$$

Root Cause Analysis (Fishbone Diagram)

Fishbone analysis commences with identifying a 5 problem, and the fishbone diagram (refer Figure 6) offers a template to isolate and categorising its causes. While there are typically six categories, the number can be adjusted based on the specific problem. This approach simplifies problem analysis, and when employed collaboratively with colleagues, it provides valuable insights, thus fostering the development of collaborative solutions. Organisations that encouraged the worker to evaluate practices, risks, and errors as they often to cultivate a culture where root cause analysis or fishbone analysis is applied. This helps in understanding the real cause of a problem and solving it (Phillips, n.d.).

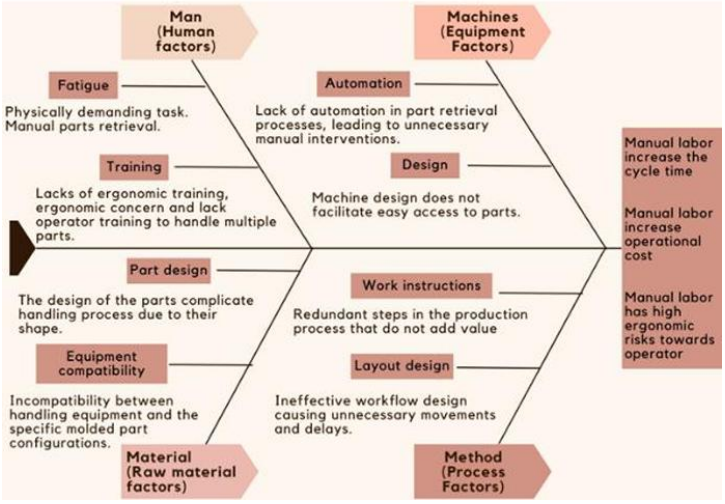

Fig. 6: Fishbone diagram

5 Whys

Man (Operator) - Operator fatigue and lack of training: Physically demanding parts retrieval. Why? The parts location is too far to reach, resulting in more awkward movements and repetitive reaching and grasping motions.

Machine (Equipment factors)- Machine automation and design: machine design does not facilitate easy access. Why? The machine is designed attributed to operator safety.

Material (Raw material factors)- Part design and equipment compatibility: the shape of parts requires awkward grasping. Why? The mould is designed for four cavities which limits the handling efficiency.

Method (Process factors) -Work instructions and layout design: redundant steps that do not add value to the parts. Why? There are no automated parts retrieval and transferring.

Result and discussion

Data of ergonomics score

Figure 8 illustrates the operator's posture during manual part retrieval before implementation. The posture involves excessive reaching and bending into the machine, resulting in a RULA score of 7 (Figure 9), which indicates a very high risk of musculoskeletal disorders and requires immediate corrective action.

Fig. 8: Operator body postures when retrieving the parts

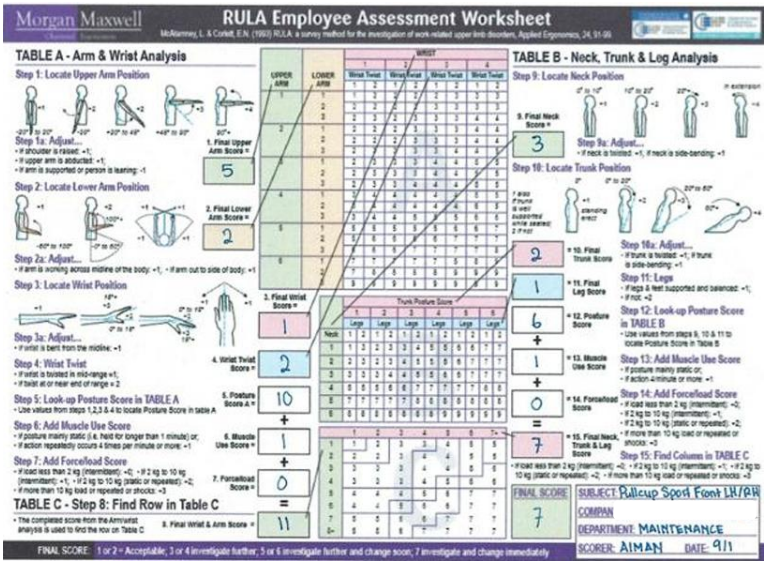

Fig. 9: RULA Employee Assessment Worksheet

Figure 8 shows the operator body posture when manually retrieving the parts from the mould inside the injection machine and the result of RULA Employee Assessment Worksheet is shown in Figure 9. A final score of 7 indicates that the observed posture presents a very high risk of musculoskeletal injury. According to RULA assessment guidelines, this score signifies that investigation and changes are urgently required. The operator is estimated to work about 530 times daily for 10 hours shift and 636 times daily for 12 hours shift to manually retrieve the parts.

Output calculation before improvement

Before implementation, the production output was limited to 2,120 units per 10-hour shift, which was insufficient to meet the customer demand of 2,544 units. This gap required the company to extend production to 12 hours, resulting in additional overtime costs. After implementation, the production capacity increased to 2,717 units per 10-hour shift. This exceeds the required demand, eliminating the need for overtime. The increase in output is directly attributed to the reduction in cycle time, demonstrating the effectiveness of the automated material handling system in improving throughput.

.

Automated collecting and transferring conveyor system design

Figure 10 shows the parts of the automated collecting and transferring injection moulded parts conveyor. The moulded parts consist of: Conveyors stand, as the primary structural element of the automated material handling system. ii. Conveyor roller, to support and enable the smooth movement of the cleated belt. iii. Cleated conveyor belt, to prevent parts from sliding backwards as the belt moves upwards. iv. Funnel, to prevent parts from missing the belt and falling to the floor. v. Infrared sensor, to prevent overflow and jams (when the sensor detects that the parts have reached a predetermined level, it sends a signal to stop the conveyor motor). vi. Motor and gearbox, to regulate the speed and torque of the motor, ensuring that the belt moves at the desired rate.

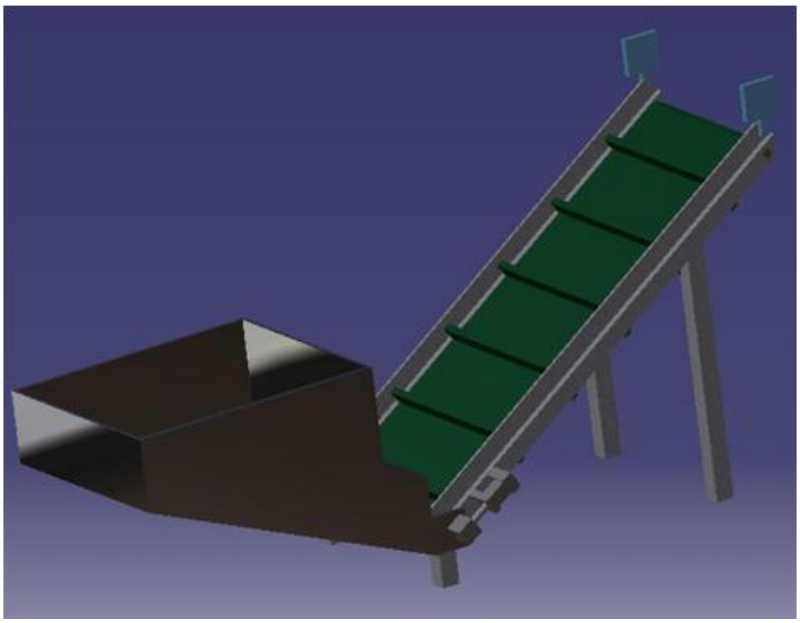

Fig. 10: Automated collecting and transferring conveyor design

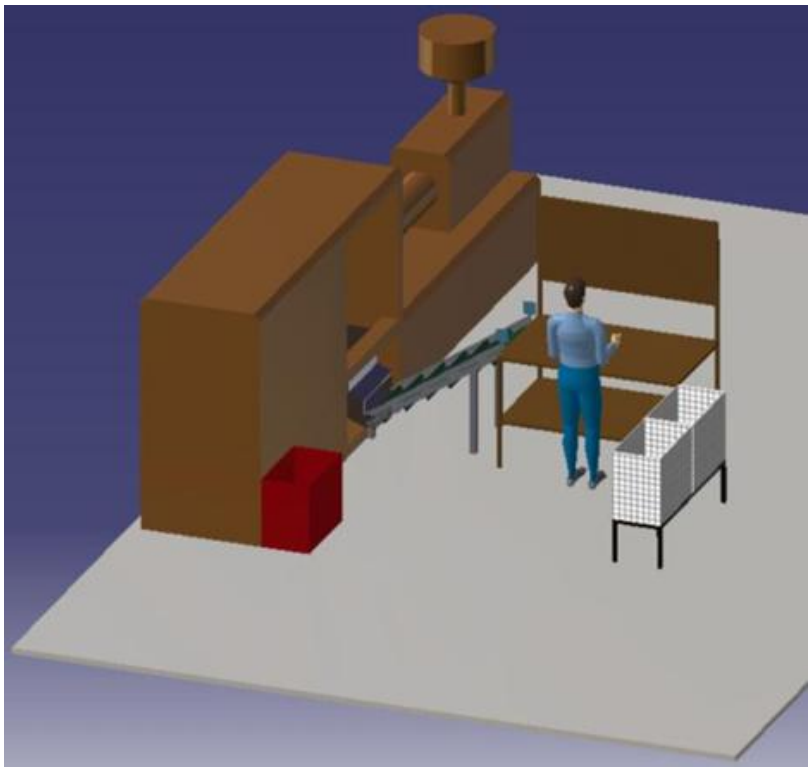

Fig. 11: The implementation of the automated collecting and transferring conveyor system

Figure 11 shows the implementation of the automated collecting and transferring conveyor system at the workstation. The conveyor system was placed beside the operator worktable. When the injection moulded parts fall, the conveyor will automatically collect and transfer them to the operator's worktable.

Fig. 12: Injection machine running on auto injection cycle

Figure 12 shows the machines were set to an auto injection cycle to be integrated with an automated collection and transfer conveyor system. This means that there is no more operators and machine interactions. This implementation also eliminates the manual parts retrieval that prolongs the retrieval process as the parts will be automatically ejected and fall onto the conveyor. The precedence diagram and flow of parts after implementation are shown in Figure 13 and Figure 14 respectively. Meanwhile the processes at workstation after implementation are listed in Table 4.

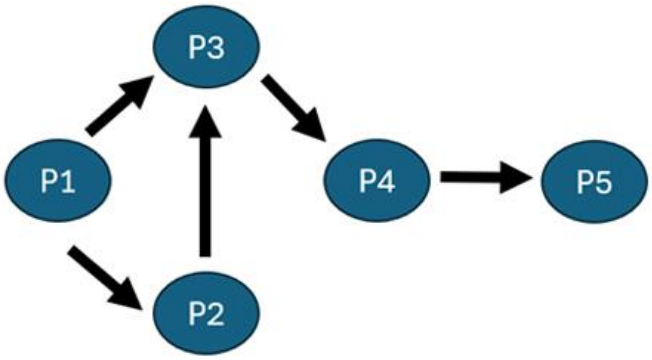

Fig. 13: Precedence diagram after implementation

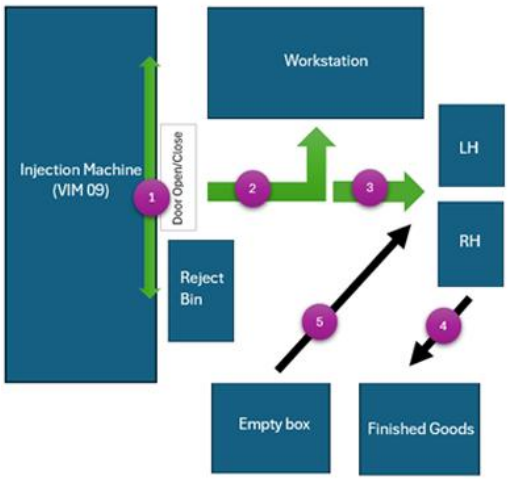

Fig. 14: Parts flow after implementation

Table 4: Process at the workstation after implementation

Task	Process
P1	Conveyors collect and transfer the injection molded parts to operator worktable.
P2	Operators inspect the parts OK/NG.
P3	Operators separate the parts OK/NG.
P4	Operators place the OK parts into box.
P5	Operators place OK box onto pallet and insert label.

After implementation of the automated collecting and transferring conveyor system the cycle time has been decreased from 68 seconds to 53 seconds, representing a 22.06% reduction.

Total work content (TWC)

The total work content is calculated based on the cycle time. The graphs of cycle time for pull cup sport front LH/RH before and after implementation are shown in Figure 15 and Figure 16 respectively.

Before improvement

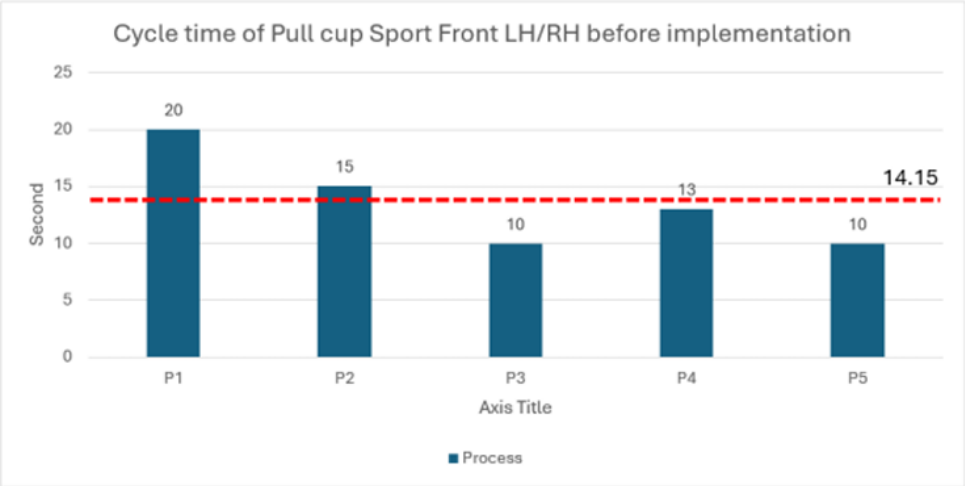

Fig. 15: Cycle time of Pull cup Sport Front LH/RH before implementation

TWC = 20+15+10+13+10 = 68s

Figure 15 presents the cycle time distribution for each task before implementation. The total cycle time recorded is 68 seconds, with the highest contribution from task P1 (manual part retrieval), which takes 20 seconds. This indicates that manual handling is the primary bottleneck in the process.

After implementation, Figure 16 shows a significant reduction in the time required for task P1, which decreased from 20 seconds to 5 seconds due to automation. As a result, the total cycle time was reduced to 53 seconds.

This reduction confirms that the automated conveyor system effectively eliminates non-value-added manual movements, thereby improving overall process efficiency.

After improvement

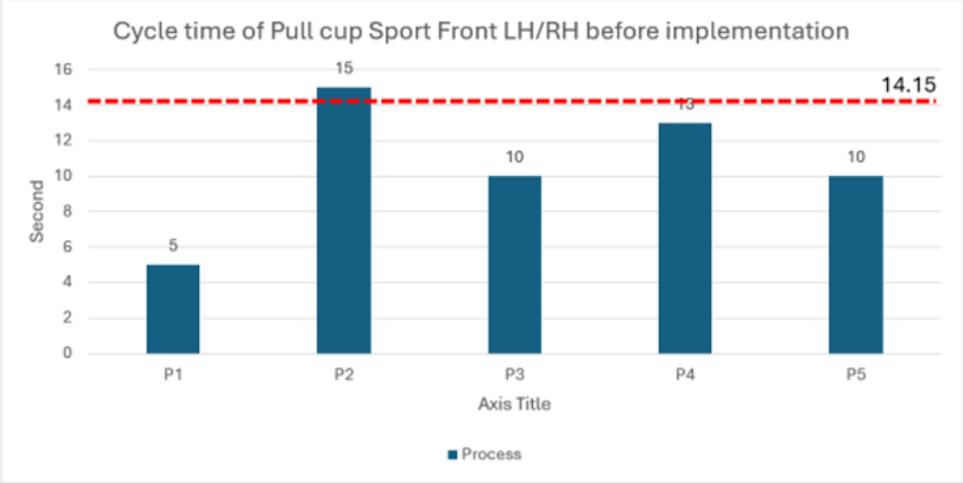

Fig. 16: Cycle time of Pull cup Sport Front LH/RH after implementation

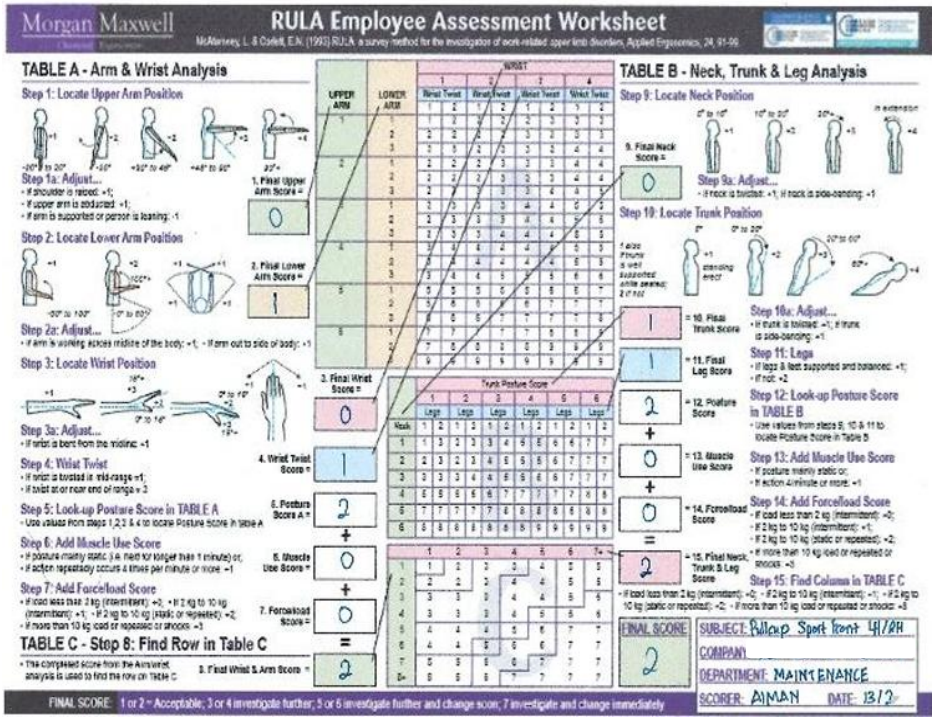
TWC = 5+15+10+13+10 = 53s

After implementation, Figure 16 shows a significant improvement in operator posture, where the need to reach into the machine is eliminated. The corresponding RULA score (Figure 17) is reduced to 2, indicating a low-risk and acceptable working posture.

This improvement demonstrates that the automation not only enhances productivity but also significantly reduces ergonomic risk, improving operator safety and long-term sustainability.

Data cycle time of Pull cup Sport Front LH/RH before machine parameter improvement

Fig. 16: Operator body posture after implementation



Pull cup Sport Front LH/RH output

Before implementation:

$$\frac{3600}{cycle\ time\ (CT)}\ x\ Working\ Hours\ x\ 4\ Cavity = 3600\ x\ 12\ x\ 4\ \approx\ 2120 \quad \text{Pieces}$$

(5)

The total capacity of Pull cup Sport Front LH/RH production is 2120 pieces for one shift of 10 hours.

$$\frac{3600}{cycle\ time\ (CT)}\ x\ Working\ Hours\ x\ 4\ Cavity = \frac{3600}{68}\ x\ 12\ x\ 4\ \approx\ 2544\ Peces$$

(6)

The total capacity of Pull cup Sport Front LH/RH production is 2544 pieces for one shift of 12 hours.

After implementation:

$$\frac{3600}{cycle\ time\ (CT)}\ x\ Working\ Hours\ x\ 4\ Cavity = \frac{3600}{53}\ x\ 12\ x\ 4\ \approx\ 2717\ Peces$$

(7)

The total production capacity for Pull cup Sport Front LH/RH production is 2717 pieces per10-hour shift.

After the implementation of the automatic conveyor collection and transfer system to the Pull cup Sport Front LH/RH the production capacity has increased from 2120 pieces to 2717 pieces for 10-hour shift. This indicates that the overtime work of 12-hour shift is no longer needed as the production capacity has increased by 28.16%, in consequence the company does not need to pay the additional overtime cost of RM440.00.

Return of Investment (ROI) Calculation

The initial investment cost of the conveyor system is approximately RM6,000. Based on the elimination of overtime, the system generates a monthly saving of RM440, equivalent to RM5,280 annually.

The calculated payback period is 1.14 years, indicating that the investment can be recovered within a relatively short time frame.

This result demonstrates that the proposed system is not only technically effective but also economically viable, making it a practical solution for industrial implementation.

ROI Calculation:

Monthly Savings: RM440 per month per operator.

Annual Savings: 440 ×12 $months$ = RM5,280

RM5,280 per year per operator

ROI Percentage Calculation:

$$ROI = \frac{Annual\ Savings}{Initial\ investment}\ x\ 100\ = \frac{5280}{6000}\ x\ 100 = 88\% \qquad (8)$$

This means that for every RM1.00 invested in the conveyor system, the company can expect to save approximately RM0.88 per year. It will take approximately 1.14 years to recoup the initial investment of RM6,000.

Analysis of the cycle time, TWC, operational cost and ergonomics score

The injection moulding process for the Pull cup Sport Front LH/RH at X Company is now facing challenges as customer demand increases starting January 2025. The manual parts retrieval from the mould in the injection moulding machine results in a cycle time of 68 seconds, which impacts overall production efficiency and the ability to meet increasing customer demand. The current cycle time requires overtime work, with operators now working 10.8 hours per day, compared to the previous schedule of 8.8 hours per day. This overtime results in an additional cost of RM440.00 per operator every month, on top of a base salary of RM1700. Furthermore, the manual parts retrieval process poses substantial ergonomic risks, resulting in a RULA assessment

score of 7, showing a very high risk of musculoskeletal disorders. Visual analysis of the operator posture shows that reaching into the injection moulding machine requires awkward postures and repetitive movements, increasing the risk of fatigue and injury. The operator repeats the parts retrieval process an estimated 530 times per day for a 10-hour shift and 636 times per day for a 12-hour shift. Addressing these issues is critical to improve operational efficiency, reduce costs, and protect worker well-being.

Decision criteria

The implementation of the automated collecting and transferring conveyor system will be evaluated based on several key criteria. Firstly, the system must demonstrate cycle time reduction. The primary objective is to achieve a cycle time that are in line with customer demand and eliminate the need for overtime. Secondly, the proposed system must significantly improve operator ergonomics, as reflected in the RULA Employee Assessment Worksheet score. The goal is to minimise or eliminate awkward postures, reduce repetitive motions, and reduce the risk of musculoskeletal disorders. Thirdly, the investment in the new system must be justified by a clear cost-savings analysis. The savings should offset the capital expenditure (CAPEX) required for implementation and ongoing maintenance. The reduction in overtime labour costs and the increased in production efficiency must contribute to the overall cost savings. Finally, the system must be technically able to be feasible, reliable, and easily integrated into existing production lines.

Table 5 presents a comparison of targets before and after the improvements. This case study highlights the results of calculations based on customer demand, which has now reached 2,544 units in a 10-hour work shift, higher than the previous demand of 2,120 units. As customer demand increases, productivity in terms of units also increases, exhibiting the importance of conducting time studies to ensure these targets are met.

Table 5 Target customer demand

Implementation	Target (Customer demand)
Before	2544
After	2717

Following the implementation of the automated collection and transfer conveyor system, the retrieval process has become fully automated, resulting in a smoother flow of parts. The newly designed process reduced the cycle time from 68 seconds to 53 seconds, thereby enhancing the operation efficiency by removing unnecessary movements from the operators. As a result, the company spends less on overtime as a result. The reduction in the RULA assessment score from 7 to 2, which reflects ergonomic improvements, lowers the risk of MSDs among operators and improves their well-being, both of which can lead to higher productivity.

Discussion

Despite the promising findings, several limitations should be acknowledged to strengthen the interpretation of this study. Firstly, the study demonstrates limited comparison with previous research, particularly in terms of quantitative benchmarking. While prior studies such as Likitha and Ramesha (2020) and Hilmi and Hamid (2023) reported improvements in cycle time and productivity through process optimisation and automation, this study does not explicitly compare the magnitude of improvement, which is a 22.06 percent reduction in cycle time, with those findings. Without such benchmarking, it is difficult to determine whether the observed performance gains are incremental, comparable, or significantly superior to existing solutions. Future work should include a structured comparison to better position the results within the existing body of knowledge. Secondly, although the study adopts an integrated approach combining cycle time, ergonomics, and return on investment, the discussion lacks a deeper critical interpretation of causal relationships. The reduction in cycle time is mainly attributed to the elimination of manual retrieval in task P1. However, other possible contributing factors such as operator adaptation, consistency in machine operation, or workflow adjustments are not critically examined. This may lead to an oversimplified interpretation in which improvements are solely attributed to automation without considering potential confounding variables. Thirdly, the ergonomic improvement reflected by the reduction in RULA score from 7 to 2 is substantial. However, the interpretation remains largely descriptive. Previous research has shown that ergonomic interventions can reduce musculoskeletal risks and improve worker performance (Zhang et al., 2023; Adellian Nugraha and Widajati, 2024). This study does not critically compare whether the level of improvement observed is consistent with those findings. In addition, the discussion does not address long term implications such as reduction in injury rates, absenteeism, or sustainability of ergonomic benefits. A more critical interpretation would consider whether a RULA score of 2 ensures long term safety or if periodic reassessment is still necessary. In addition, the economic evaluation through return on investment is relatively simplified. The analysis focuses mainly on overtime cost savings. Other important cost factors such as maintenance expenses, system downtime, equipment depreciation, and potential scalability issues are not included. According to Gökçen et al. (2006), comprehensive efficiency evaluation should consider total system performance rather than isolated cost components. Therefore, the current ROI estimation may overestimate the financial benefits and limit its applicability in real industrial settings. Furthermore, the study is based on a single case within one production line, which limits the generalisability of the findings. Differences in machine specifications, product design, operator skill level, and production volume may influence the effectiveness of the proposed system. As highlighted by Llopis et al. (2021), system performance improvements are often context dependent. Therefore, the results of this study should be interpreted within the specific operational context in which the data were collected. Lastly, the study primarily evaluates short term performance outcomes. There is limited discussion on the long-term sustainability of the automated system, including its reliability, maintenance requirements, and adaptability to variations in production demand. A more critical interpretation would consider whether the observed improvements can be sustained over time under different operational conditions.

Conclusion and Recommendation

In conclusion, X company current manual material handling system limits productivity, creates ergonomic risks and raises operating costs dramatically due to overtime claims. According to RULA score, the operators are at unacceptable risk due to the awkward postures and repetitive movements during machine door opening, reaching into the machine, retrieving the product, and closing the machine door. By eliminating the need to manually retrieve the injection-moulded parts, the conveyor solution used in case study directly reduces the operator workload. The cycle time of the parts retrieval has been shortened by 15 seconds, which decreases the load and improve workers quality of life of over time. The system enhances worker well-being and efficiency. The cycle time on Pull cup Sport Front LH/RH has been reduced from 68 seconds to 53 seconds, an improvement of 22.06%. The operator ergonomics score has been reduced from 7 to 2, which is acceptable and low risk of MSDs. The body posture is likely comfortable and sustainable for long periods. The need for overtime has also been eliminated. The operational cost including overtime is now back to normal at RM2140 per month, a reduction of RM1700 by 20.56%. The production capacity has been increased from 2120 pieces per 10-hour shift to 2717 pieces per 10-hour shift, an increase of 28.16%. Furthermore, it has been shown that the return on investment is only 1.14 years, indicating exceptional capital efficiency.

Despite the positive results, several limitations should be considered. Firstly, the study lacks direct comparison with previous research. Although improvements in cycle time are consistent with findings by Likitha and Ramesha (2020) and Hilmi and Hamid (2023), the magnitude of improvement is not benchmarked, making it difficult to evaluate its relative significance. Secondly, the interpretation of results is somewhat simplified. The reduction in cycle time is mainly attributed to automation, but other factors such as operator adaptation and process consistency are not critically examined. This may lead to overestimation of the system's impact. The ergonomic improvement from a RULA score of 7 to 2 is significant, but the discussion remains descriptive. Previous studies highlight the importance of long-term ergonomic outcomes (Zhang et al., 2023; Adellian Nugraha and Widajati, 2024), which are not addressed in this study. In addition, the ROI analysis focuses only on overtime savings and excludes costs such as maintenance and depreciation. As noted by Gökçen et al. (2006), a comprehensive evaluation should include total system costs, which limits the accuracy of the financial analysis. The study is also limited to a single production line, reducing generalisability. System performance may vary depending on production conditions (Llopis et al., 2021). From a scalability perspective, implementation in other settings may be constrained by layout, cost, and system compatibility. Finally, the study focuses on short term outcomes. Long term performance, reliability, and adaptability are not evaluated.

Table of the changes made based on reviewer comments.

Aspect	Reviewer Comment	Changes made
Originality & novelty	Conveyor automation not new; novelty is moderate via Time study + RULA + ROI	States integration of time study, RULA, and ROI in Abstract and Introduction.
Abstract & title	Abstract slightly too long and descriptive	Clear, relevant title; abstract includes full context and all key results.
Introduction	Weak research gap and limited critical discussion of past work	Adds more context on MMH, RULA, automation and mentions separate treatment of productivity/ergonomics/cost.
Literature review	Mostly descriptive; lacks comparison and explicit research gap	Expanded review, covers cycle time, MMH, ergonomics, automation, RCA/lean.
Methodology – formulas	Some formulas unclear / poorly formatted	Provides text versions of takt time and efficiency with explanations.
Methodology – design	Missing experimental design clarity and validation approach	Describes pre-/during/post implementation and data collection (time study, RULA, cost).
Data analysis & figures	Some figures not well explained	Many key figures/tables present with some text explanation.
Discussion	Limited comparison with previous research; more critical interpretation needed	New discussion adds limitations, mentions benchmarking and confounding factors.
Conclusion & recommendations	Missing future work and scalability/limitations	Longer conclusion summarising improvements and ROI.
Language & writing	Grammar errors; awkward sentence structure	Many sentences improved versus older version; references expanded.
References	–	More and newer references; broader coverage of ergonomics and automation.

Effect of Settling Time on the Performance of Banana Peel-Based Natural Coagulant in Domestic Wastewater Treatment

[1]Politeknik Tun Syed Nasir Syed Ismail, Hab Pendidikan Tinggi Pagoh, KM 1, Jln Panchor, Panchor, 84600 Pagoh, Johor, Malaysia

[a]azmi.ahmad@ptsn.edu.my, [b]adyshikender17lah@gmail.com

Abstract. The use of natural coagulants in wastewater treatment has gained significant attention due to their low environmental impact and cost-effectiveness. This study evaluates the effect of settling time on the coagulation efficiency of a banana peel-based natural coagulant for domestic wastewater treatment. While rapid and slow mixing phases are essential for destabilizing particles and forming flocs, the settling time determines the extent to which flocs can sediment and separate from the treated water. In this study, banana peel powder was prepared through drying, grinding, and sieving. A fixed dosage of 0.01 g was applied to 500 mL of raw domestic wastewater under consistent mixing conditions with rapid mixing at 180 rpm for 3 minutes and slow mixing at 50 rpm for 20 minutes. The settling phase was varied at 10, 20, and 30 minutes to assess its influence on turbidity, total suspended solids (TSS), and total dissolved solids (TDS) removal. The results showed that removal efficiency increased with longer settling times. At 30 minutes, turbidity and TSS removal peaked at 83.88% and 95.83%, respectively, while TDS removal also improved slightly to 19.18%. These improvements indicate that longer sedimentation periods enhance floc settling and overall clarity of the treated water. The lowest performance was observed at 10 minutes, where insufficient time likely resulted in incomplete floc sedimentation. The findings demonstrate that settling time is a critical operational factor when using banana peel-based coagulants, especially in systems relying solely on gravity-driven separation. Optimizing this parameter can significantly improve the effectiveness of natural coagulants in decentralized or low-cost water treatment applications.

Keywords: Settling time, Natural coagulant, Sedimentation efficiency, Turbidity and solids removal

Introduction

The treatment of domestic wastewater is crucial for minimizing environmental pollution and maintaining public health. Traditional coagulation-flocculation methods rely heavily on chemical coagulants such as alum and ferric chloride, which are effective but present long-term concerns including high sludge production, residual toxicity, and elevated treatment costs. In response, natural coagulants derived from agricultural waste have emerged as sustainable alternatives. Among these, banana peel powder has demonstrated potential due to its abundance, biodegradability, and presence of active compounds like lignin and pectin that aid in particle destabilization and floc formation [1].

While several studies have explored the effects of dosage and mixing speed on the performance of natural coagulants [2], [3], less attention has been paid to the settling time the final but critical phase in the coagulation process. Settling time determines

how long the formed flocs are allowed to sediment under gravity, directly influencing the clarity and quality of the treated water. Inadequate settling duration may result in incomplete separation, leaving suspended solids and turbidity in the effluent. Conversely, excessive settling time could be impractical in real-world applications where rapid processing is desired [4], [5].

This study aims to investigate the impact of different settling times at 10, 20, and 30 minutes on the effectiveness of banana peel-based coagulant in removing turbidity, total suspended solids (TSS), and total dissolved solids (TDS) from domestic wastewater. By maintaining constant dosage and mixing parameters, this work isolates the role of sedimentation duration and provides insights into optimizing treatment efficiency using a natural, low-cost coagulant.

Materials and Methods

Preparation of Natural Coagulant

Banana peels were collected from local vendors in Pagoh Jaya and thoroughly cleaned with tap water to remove any dirt or residue. The cleaned peels were sliced into smaller pieces and oven-dried at 90°C for two hours to eliminate moisture. Once dried, the peels were ground using a blender and sieved to obtain a uniform fine powder. The prepared banana peel powder was stored in an airtight container and used as the natural coagulant throughout the experiment.

Coagulation-Flocculation Process

Coagulation tests were conducted using the jar test method to evaluate the impact of settling time on water quality. A fixed amount of 0.01 g banana peel powder was added to 500 mL of raw domestic wastewater in each test. All samples underwent rapid mixing at 180 rpm for 3 minutes, followed by slow mixing at 50 rpm for 20 minutes. After the mixing stages, the samples were allowed to settle for varying durations of 10, 20, and 30 minutes [6]. All other variables were kept constant to ensure the influence of settling time could be accurately assessed.

Wastewater Measurement of Water Quality Parameters

After settling, the treated water was analyzed for turbidity, total suspended solids (TSS), and total dissolved solids (TDS). Turbidity was measured using a digital turbidity meter. TSS was determined by filtering 100 mL of treated sample through pre-weighed filter paper, drying the residue at 105°C, and calculating the mass difference. TDS was measured using a digital water tester by immersing the probe in the sample and recording the reading in parts per million (ppm).

Data Evaluation

Removal efficiency was calculated using Eq. 1, which is based on the standard percentage removal formula:

$$Removal\ (\%) = \left(\frac{Initial - Final}{Initial}\right) x100\% \qquad \text{Eq. 1}$$

where Initial is the initial concentration of the parameter (turbidity, TSS, or TDS) before treatment, and Final is the final concentration after treatment. This equation was applied to evaluate the effectiveness of the coagulation process at different settling times. All experiments were conducted in triplicate, and the results were expressed as mean values. The raw data obtained from turbidity meter, TSS analysis, and TDS measurements were tabulated and processed to calculate removal efficiency using Eq. 1. Descriptive statistical analysis was applied to evaluate the performance trends across different settling times. All data processing, calculations, and graphical plotting were performed using Microsoft Excel. The software was used to generate charts and visualize the relationship between settling time and removal efficiency for turbidity, TSS, and TDS.

Results and Discussion

Turbidity Removal

The turbidity removal performance was evaluated based on the coagulation–flocculation process followed by sedimentation at different settling times. After the completion of rapid and slow mixing stages, the samples were allowed to settle for 10, 20, and 30 minutes before turbidity measurements were taken. This approach enables the assessment of how sedimentation duration influences the efficiency of floc separation and overall water clarity. Fig. 1 shows the turbidity removal efficiency at different settling times of 10, 20, and 30 minutes. The results indicate a progressive improvement in turbidity reduction with longer sedimentation durations

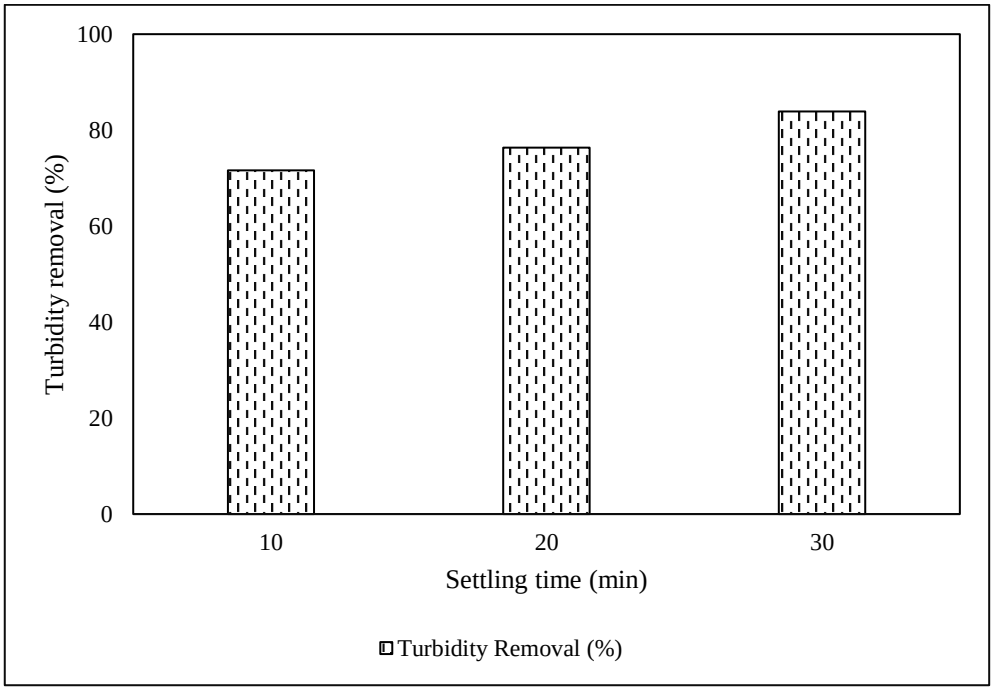

Fig. 1: Removal performance of turbidity

The turbidity removal efficiency of the banana peel-based coagulant was evaluated at three different settling times at 10, 20, and 30 minutes. The results indicated a progressive improvement in turbidity reduction with longer sedimentation durations. At 10 minutes, the removal efficiency was 71.65%, which increased to 76.33% at 20

minutes and reached 83.88% at 30 minutes. This steady upward trend suggests that the extension of settling time allows more flocs to sediment, thus improving the overall clarity of the treated water.

During the coagulation process, the formation of flocs is followed by sedimentation, where flocs settle under gravity. A short settling time, such as 10 minutes, may not provide sufficient duration for all flocs especially the smaller and lighter ones to separate from the water column. As settling time increases, gravitational separation becomes more effective, enabling even smaller flocs to descend and reducing residual turbidity [7]. These findings are consistent with the principles of gravitational settling and supported by similar studies on natural coagulants, such as Moringa and cactus-based materials, which also showed improved turbidity removal with prolonged sedimentation [8], [9].

The significant increase observed at 30 minutes highlights the importance of optimizing settling time in systems using natural coagulants. Although longer settling durations may limit treatment throughput in large-scale applications, they are particularly advantageous in small-scale or batch-operated systems where clarity is prioritized over speed [10], [11]. Thus, in the context of banana peel-based coagulation, a settling time of 30 minutes is optimal for maximizing turbidity removal without any chemical enhancement.

Total Suspended Solids (TSS) Removal

Fig. 2 illustrates the removal efficiency of total suspended solids (TSS) at different settling times. The results show a consistent improvement in TSS removal as the settling duration increased

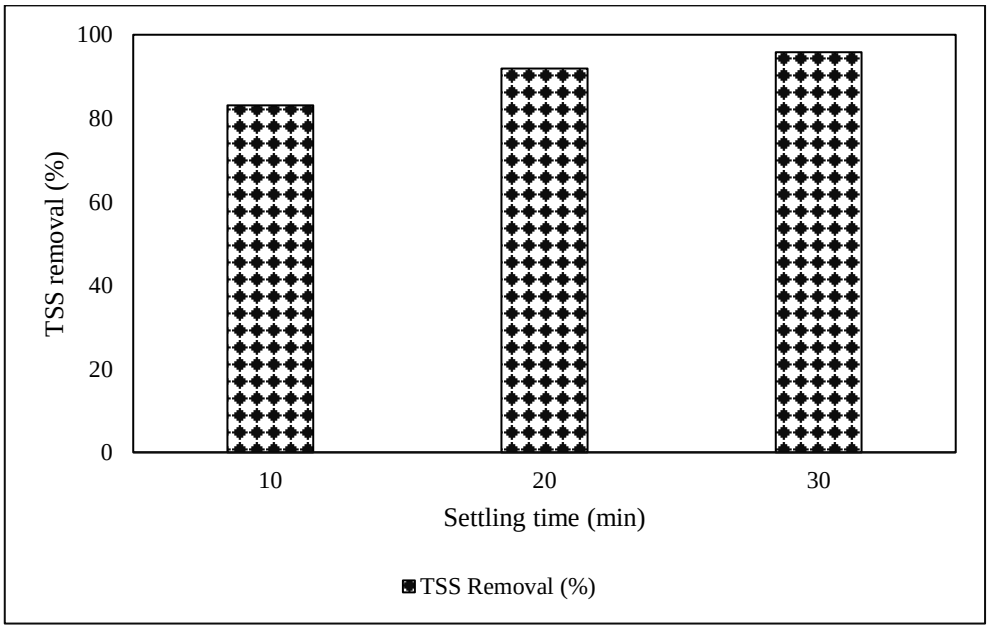

Fig. 2: Removal performance of TSS

The removal efficiency of total suspended solids (TSS) improved consistently with increasing settling time. At 10 minutes, the TSS removal was 83.12%, which rose to 91.88% at 20 minutes and peaked at 95.83% at 30 minutes. This pattern demonstrates the critical role of adequate sedimentation time in enhancing the separation of

suspended particulates from wastewater when using natural coagulants such as banana peel powder.

TSS includes a broad range of particles that require sufficient time to settle once destabilized and aggregated into flocs. A short settling duration may not allow complete gravitational descent, particularly for lighter or loosely bound particles. By extending the settling time to 30 minutes, more flocs including those formed later in the mixing process are given enough time to descend and be effectively removed from the supernatant. This observation aligns with findings from other studies involving natural coagulants, which reported optimal solid-liquid separation at extended sedimentation intervals [12].

Moreover, the relatively high TSS removal even at 10 minutes suggests that banana peel powder is effective in initiating rapid flocculation. However, the significant gain from 10 to 30 minutes underscores the importance of retention time in maximizing the benefits of the coagulation process. In batch or small-scale systems, where longer treatment durations are feasible, a 30-minute settling period is recommended to achieve near-complete TSS removal without requiring chemical additives [11].

Total Dissolved Solids (TDS) Removal

Fig. 3 presents the removal efficiency of total dissolved solids (TDS) under varying settling times. The results demonstrate a gradual increase in TDS removal with longer sedimentation periods.

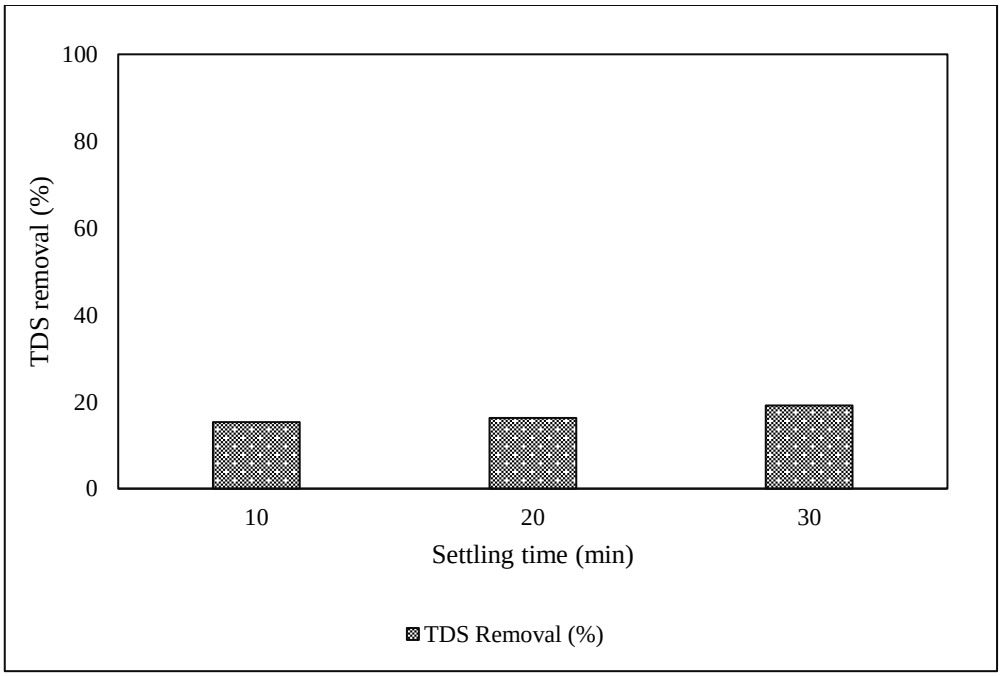

Fig. 3: Removal performance of TDS

The TDS removal efficiency showed a gradual increase with longer settling times, though the improvement was less pronounced compared to turbidity and TSS. At 10 minutes, the TDS removal was 15.29%, which slightly improved to 16.24% at 20 minutes and reached a maximum of 19.18% at 30 minutes. This steady but modest enhancement indicates that while settling time does contribute to some reduction in dissolved solids, the banana peel coagulant's effectiveness in this regard remains limited.

TDS consists mainly of dissolved ions and very fine colloidal particles that are not easily aggregated or settled through conventional coagulation. The minor improvements observed may be attributed to the extended contact time allowing more interactions between the dissolved substances and the coagulant surface, resulting in limited adsorption or entrapment within floc structures. However, since coagulation-flocculation is primarily designed to remove suspended solids, the role of settling time in TDS reduction is inherently secondary [13].

Previous studies on natural coagulants, such as those using plant-based materials like okra and moringa, have similarly shown restricted TDS removal capacities, reinforcing the understanding that additional treatment stages such as adsorption or membrane filtration would be required for significant dissolved solid reduction [14]. Nevertheless, the slightly better performance at 30 minutes suggests that a longer settling period can marginally aid in improving effluent quality, particularly in systems where dissolved solids are a concern but not the primary target.

The findings of this study are consistent with previous research on natural coagulants derived from agricultural waste materials. Studies using banana peel, moringa seeds, and other plant-based coagulants have reported improved turbidity and TSS removal with increasing settling time due to enhanced floc sedimentation under gravitational forces [11], [14]. However, most existing studies primarily focus on optimizing coagulant dosage and mixing conditions, with limited emphasis on the role of settling time as an independent operational parameter. In this study, settling time was systematically varied while maintaining constant dosage and mixing conditions, allowing for a clearer evaluation of its specific impact on treatment efficiency. This approach provides additional insight into process optimization, particularly for decentralized or low-cost wastewater treatment systems where operational simplicity is essential. Therefore, the present work contributes to the existing body of knowledge by highlighting the importance of sedimentation duration as a key factor influencing the performance of natural coagulants.

Conclusion

This study explored the effect of varying settling times of 10, 20, and 30 minutes on the performance of banana peel-based natural coagulant for domestic wastewater treatment. With all other parameters held constant, the results showed a clear positive correlation between longer settling durations and improved removal efficiencies for turbidity and total suspended solids (TSS). The highest removal rates were achieved at 30 minutes, with turbidity and TSS reductions of 83.88% and 95.83%, respectively. These findings highlight the importance of sufficient sedimentation time to allow complete gravitational settling of flocs formed during the coagulation process.

While total dissolved solids (TDS) removal also improved with longer settling times, the increase was minimal, reaching only 19.18% at 30 minutes. This reaffirms the limited capability of banana peel coagulants in removing dissolved substances, emphasizing their primary role in reducing suspended particulates. Nonetheless, the slight TDS improvement suggests that prolonged sedimentation may offer marginal benefits for overall water clarity.

The study concludes that settling time is a critical operational parameter in the use of natural coagulants. For decentralized or small-scale wastewater treatment systems, where treatment duration is more flexible, adopting a settling time of 30 minutes can significantly enhance treatment efficiency without chemical inputs. These findings support the practical use of banana peel powder as a low-cost, sustainable alternative

to conventional chemical coagulants, especially when process parameters like sedimentation time are properly optimized.

Abstract. The increasing discharge of industrial wastewater containing suspended solids poses significant environmental challenges and necessitates the development of cost-effective and sustainable treatment methods. This study investigates the feasibility of valorizing coconut coir waste as a natural adsorbent for suspended solids treatment in synthetic wastewater. Coconut coir was chemically modified using a 2 M sodium hydroxide (NaOH) solution to enhance its surface characteristics and subsequently applied in batch adsorption experiments. Synthetic wastewater was prepared using kaolin and varying copper loadings (1 g, 2 g, and 3 g) to simulate different contaminant conditions. The performance of the NaOH-treated coconut coir was evaluated based on Total Suspended Solids (TSS) measured using the gravimetric method. The experimental results showed that the measured TSS values increased from 116.5 mg/L to 287.5 mg/L as the contaminant loading increased, indicating that higher suspended solid concentrations resulted in greater residual solids under fixed treatment conditions. The findings indicate that coconut coir interacts with suspended particles in synthetic wastewater; however, the increasing residual TSS values suggest that the adsorption capacity becomes limited at higher contaminant loading. Overall, this study highlights the potential of coconut coir as a low-cost and sustainable material for suspended solid retention while emphasizing the need for further optimization to improve treatment effectiveness at higher pollutant concentrations.

Keywords: Coconut Coir, Suspended Solids, Natural Adsorbent, Synthetic Wastewater.

Introduction

Water resources play a vital role in supporting industrial development, economic growth, and human well-being. However, rapid industrialization has significantly increased the generation of wastewater containing various pollutants, leading to serious environmental and public health concerns. Industrial wastewater, if discharged without adequate treatment, can degrade water quality, disrupt aquatic ecosystems, and pose long-term risks to human health.

One of the major contributors to water pollution is industrial wastewater, which commonly contains suspended solids, heavy metals, organic compounds, and other contaminants. High levels of suspended solids reduce light penetration in water bodies, affect photosynthetic activity, and contribute to sediment accumulation, which can harm aquatic organisms [1]. In addition, the presence of metal ions such as copper further exacerbates toxicity and persistence in the environment. These pollutants are frequently generated by industries such as petrochemical processing, metal finishing,

and manufacturing operations, making effective wastewater treatment a critical requirement before discharge [2].

Various wastewater treatment methods have been developed to mitigate these pollution problems, including chemical precipitation, membrane filtration, biological treatment, and adsorption. Among these techniques, adsorption has gained considerable attention due to its simplicity, operational flexibility, and effectiveness in removing a wide range of contaminants [3]. Conventional adsorbents such as activated carbon are widely used; however, their high production cost and regeneration requirements limit their large-scale application, particularly in developing regions. As a result, increasing research efforts have focused on low-cost, sustainable, and environmentally friendly adsorbents derived from natural or agricultural waste materials [4].

Coconut coir, an abundant agricultural by-product in tropical countries, has emerged as a promising natural adsorbent due to its lignocellulosic structure, porous surface, and availability of functional groups capable of binding pollutants. Utilizing coconut coir not only offers a cost-effective alternative to commercial adsorbents but also supports waste valorization and sustainable environmental management. Surface modification using alkaline treatment, such as sodium hydroxide (NaOH), has been reported to enhance the adsorption properties of coconut coir by increasing surface roughness and active sites [5], [6].

Therefore, the aim of this study is to investigate the feasibility of NaOH-treated coconut coir as a low-cost adsorbent for the removal of suspended solids from synthetic industrial wastewater. The performance of the prepared adsorbent was evaluated through laboratory-scale adsorption experiments, focusing on its effectiveness under varying contaminant conditions. This research seeks to contribute to the development of sustainable wastewater treatment solutions using agricultural waste-based materials.

Materials and Methods

Materials

Coconut coir was used as the primary raw material for adsorbent preparation. The coir was collected locally and selected due to its abundance, low cost, and lignocellulosic composition, which provides functional groups suitable for adsorption applications. Prior to chemical treatment, the coir was washed thoroughly with tap water followed by distilled water to remove adhering dirt and impurities.

Sodium hydroxide (NaOH) pellets were used as the chemical activating agent for surface modification of the coconut coir. A 2 M NaOH solution was prepared by dissolving 80 g of NaOH pellets in 1 L of distilled water. This concentration was selected to effectively remove lignin and hemicellulose components from the coir structure while enhancing surface roughness and exposing additional active sites for adsorption. The alkaline treatment facilitates the breakdown of fibrous components, resulting in improved porosity and adsorption performance [7].

Distilled water was used throughout the preparation process, particularly for preparing solutions and for repeated rinsing of the treated coir to ensure the complete removal of residual alkali. Kaolin clay was used to simulate suspended solids, while copper ions were introduced using copper sulfate ($CuSO_4$) to represent metal-containing industrial wastewater.

Preparation of Coconut Coir Adsorbent

The collected coconut coir was first washed thoroughly with tap water followed by distilled water to remove surface impurities. The cleaned coir was then dried under sunlight to reduce its initial moisture content. After drying, the coir was ground into smaller particles using a grinder in order to increase the surface area and enhance adsorption efficiency.

Chemical activation was performed by soaking the ground coconut coir in a 2 M sodium hydroxide (NaOH) solution for 1 hour at ambient temperature. The alkaline treatment aimed to modify the surface structure of the coir by removing lignin and hemicellulose components, thereby improving porosity and exposing additional functional groups suitable for adsorption.

Following the activation process, the treated coir was filtered and repeatedly rinsed with distilled water until a neutral pH (approximately pH 7) was achieved, ensuring the removal of excess alkali. The neutralized coir was then dried in a laboratory oven at 60 °C for 24 hours to remove residual moisture without damaging the fibrous structure. After drying, the material was ground into a fine powder and stored in an airtight container for subsequent adsorption experiments.

Preparation of Synthetic Wastewater

Synthetic wastewater was prepared to simulate suspended solids commonly present in industrial effluents. Tap water was mixed with kaolin clay and stirred until a homogeneous suspension was obtained. Kaolin was selected due to its fine particle size and stability in water, making it suitable for representing suspended solids in laboratory-scale studies. To introduce metal-containing characteristics, copper was added to the synthetic wastewater at different masses of 1 g, 2 g, and 3 g. These concentrations were used to represent varying contaminant loads and to evaluate the performance of the coconut coir adsorbent under different suspended solid conditions. The prepared wastewater samples were stirred thoroughly prior to adsorption experiments to ensure uniform distribution of suspended particles.

Adsorption Experiment and TSS Analysis

Batch adsorption experiments were conducted to evaluate the effectiveness of the prepared coconut coir adsorbent in removing suspended solids from synthetic wastewater. A fixed adsorbent dosage was added to 250 mL of synthetic wastewater and stirred using a magnetic stirrer at 150 rpm for 30 minutes to ensure sufficient contact between the adsorbent and suspended particles. The mixtures were then allowed to settle, after which the clarified supernatant was carefully collected for analysis.

Total Suspended Solids (TSS) were determined using the gravimetric method. The collected supernatant was filtered through pre-weighed filter paper, which was subsequently dried in an oven at 105 °C until a constant weight was achieved. The TSS concentration was calculated based on the difference between the final and initial weights of the filter paper divided by the volume of the filtered sample.

The TSS results obtained from the adsorption experiments were used to assess the performance of the coconut coir adsorbent under different contaminant concentrations. This analysis provided insight into the capability of the NaOH-treated coconut coir to reduce suspended solids in synthetic industrial wastewater.

Results and Discussion

Effect of Coconut Coir Adsorbent on Total Suspended Solids (TSS) in Synthetic Wastewater

The Total Suspended Solids (TSS) results obtained from the adsorption experiments demonstrated a clear increasing trend with increasing contaminant loading. The measured TSS values were 116.5 mg/L, 150.0 mg/L, and 287.5 mg/L for synthetic wastewater samples prepared with 1 g, 2 g, and 3 g of copper, respectively. These values represent the number of suspended solids retained on the filter paper following the adsorption, settling, and filtration processes. The results indicate that increasing contaminant loading resulted in higher residual suspended solids under the fixed treatment conditions used in this study.

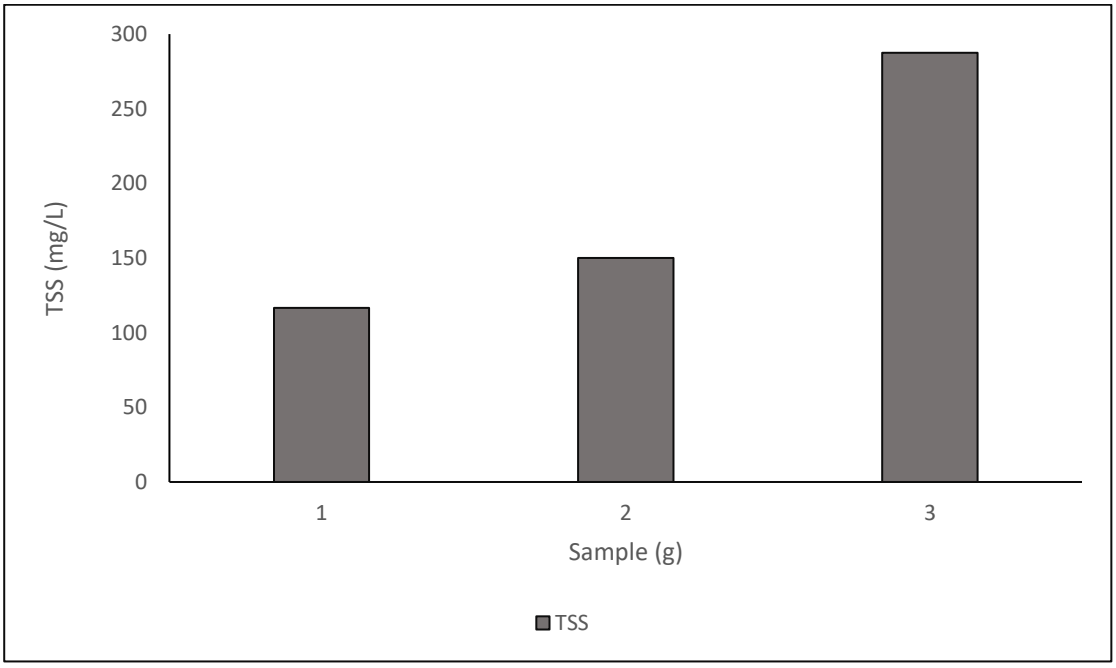

Fig. 1 : TSS concentration at different contaminant loading levels

The observed increase in TSS values can be attributed to the higher concentration of suspended particles in the synthetic wastewater at elevated copper loadings. Under fixed experimental conditions, including constant adsorbent mass, mixing duration, and settling time, the system was exposed to progressively higher particulate content. As a result, more suspended solids remained in the treated samples, leading to higher measured TSS values. This suggests that the clarification effectiveness under the selected operating conditions was influenced by the initial contaminant concentration.

The coconut coir adsorbent used in this study is fibrous in nature and primarily facilitates suspended solid retention through physical entrapment and surface interaction. While the NaOH treatment applied during adsorbent preparation may have enhanced surface roughness, the adsorption capacity appeared limited under higher contaminant loading due to the fixed adsorbent dosage and contact time. As the amount of suspended material increased, available interaction sites on the coconut coir may have become insufficient to retain all fine particles effectively, particularly when the system was not further optimized [8], [9].

In addition, the use of kaolin in the preparation of synthetic wastewater may have contributed to the observed trend. Kaolin particles are fine and possess low settling velocities, making them difficult to remove without extended settling time or increased adsorbent dosage. At higher contaminant concentrations, these fine particles may have remained suspended or re-dispersed, contributing to the higher TSS values recorded after treatment [10].

Similar trends have been reported in previous studies involving natural adsorbents such as coconut coir, where treatment performance was strongly influenced by pollutant loading and preparation method. Literature indicates that improved TSS reduction is often achieved when coconut coir undergoes additional thermal activation, multi-step chemical treatment, or is combined with other treatment processes such as filtration systems or reactor-based units. Compared to such studies, the NaOH-treated coconut coir used in this work offers a simpler and more sustainable preparation approach, although its performance may be limited under higher suspended solid concentrations [11].

Overall, the results of this study demonstrate that coconut coir is capable of retaining suspended solids from synthetic wastewater under laboratory conditions. However, the increasing TSS values with higher contaminant loading highlight the need for further optimization of treatment parameters, such as adsorbent dosage, contact time, and activation method, to enhance performance at higher suspended solid levels.

Conclusion

This study evaluated the performance of NaOH-treated coconut coir as a natural adsorbent for suspended solid retention in synthetic industrial wastewater. The experimental findings demonstrated that Total Suspended Solids (TSS) values increased from 116.5 mg/L to 287.5 mg/L as contaminant loading increased from 1 g to 3 g of copper, indicating that treatment efficiency was influenced by the initial pollutant concentration under fixed operating conditions. While the results confirm that coconut coir possesses the capability to interact with and retain suspended particles, its performance becomes constrained at higher contaminant loadings due to limitations in adsorption capacity and process conditions. From a practical perspective, coconut coir shows strong potential as a low-cost and sustainable material for preliminary wastewater treatment, particularly for systems with low to moderate suspended solid concentrations. For higher contaminant loads, it is recommended that process conditions be optimized through increased adsorbent dosage or extended contact time to improve treatment efficiency.

Future research should focus on optimizing key operational parameters such as adsorbent dosage, contact time, and mixing conditions. In addition, further studies are recommended to explore advanced modification techniques, including thermal activation or composite adsorbent development, to enhance adsorption capacity. The integration of coconut coir into hybrid treatment systems, such as adsorption–filtration or adsorption–coagulation processes, should also be investigated. Moreover, validation using real industrial wastewater is essential to assess scalability and practical feasibility.

Overall, this study contributes to the development of sustainable wastewater treatment solutions through agricultural waste valorization while providing a foundation for future improvement and application.

Design And Experimental Performance Evaluation Of A Hybrid Vertical Axis Wind Turbine To Generate Coastal Electricity

Alawiah Binti Abdullah[1]

[1] Politeknik Ungku Omar

Jalan Raja Musa Mahadi

31350, Ipoh, Perak, Malaysia

alawiahabdullah@puo.edu.my

Abstract. Coastal fishing communities continue to depend heavily on diesel generators for electricity, resulting in high operating costs, frequent maintenance, and harmful environmental emissions. This highlights the urgent need for clean and affordable energy alternatives. Although renewable energy technologies are gaining attention, limited empirical research has evaluated the real-world performance of low-cost hybrid Vertical Axis Wind Turbine (VAWT) systems integrated with energy storage for small coastal applications. This study presents the design, fabrication, and experimental evaluation of a low-cost hybrid VAWT system aimed at providing reliable electricity for fishing communities. The system incorporates a hybrid Darrieus-H rotor with nylon fibre lantern-type blades, coupled to a 12 V AC generator, charge controller, and lead-acid battery storage. Field tests were conducted under varying wind conditions to assess performance, with key parameters such as rotational speed, voltage output, and available wind power measured and analysed. The results show a clear positive relationship between rotational speed and electrical output, with maximum values of 1.51 W and 18.9 V, demonstrating effective wind-to-electricity conversion. The integrated energy storage system improved power stability under fluctuating wind conditions. Overall, the proposed hybrid VAWT system shows strong potential to reduce dependence on diesel generators, lower operating costs, and minimise environmental impact, making it a practical and sustainable energy solution for coastal fishing communities.

Keywords: renewable energy, hybrid Darrieus-H rotor, vertical axis wind turbine, energy storage

1. Introduction

The global transition toward sustainable and affordable energy systems has increased interest in renewable energy technologies, particularly wind energy [1]. Many coastal fishing communities continue to rely on diesel generators as their primary electricity source. However, fluctuating fuel prices, high operational and maintenance costs, and exhaust emissions create economic pressure and environmental degradation [2]. Furthermore, the combustion of diesel fuel releases greenhouse gases that contribute to climate change and negatively affect public health [3].

To address these challenges, this project proposes the design and development of a low-cost Vertical Axis Wind Turbine (VAWT) system tailored for fishing communities. Unlike Horizontal Axis Wind Turbines (HAWT), VAWTs can operate efficiently in areas with inconsistent and multidirectional wind conditions, which are common in coastal regions [4]. The proposed turbine utilizes a hybrid Darrieus-H rotor configuration to enhance aerodynamic performance and improve self-starting capability at low wind speeds.

Despite the growing interest in renewable energy systems, limited studies have focused on the real-world design, fabrication, and experimental performance evaluation of low-cost hybrid VAWT systems integrated with energy storage for small-scale coastal applications.

The primary objectives of this project are to generate electricity from wind resources, develop a cost-effective turbine generator, and incorporate an energy storage system to ensure continuous and stable power supply. The project scope includes system design, installation, performance evaluation, economic feasibility analysis, and environmental impact assessment.

This study contributes by developing and experimentally validating a low-cost hybrid VAWT system integrated with energy storage, specifically designed for coastal fishing communities, thereby providing a practical and sustainable alternative to diesel-based electricity generation.

Nevertheless, certain limitations such as initial capital investment and dependence on wind availability are acknowledged.This project is categorized under Renewable Energy and Sustainable Development because it promotes the use of clean energy while reducing reliance on fossil fuels [3]. By lowering fuel consumption and minimizing emissions, the proposed VAWT system aims to improve economic stability and environmental quality in coastal fishing communities.

2. Literature Review

The growing need for sustainable energy in remote and coastal communities has increased research on small-scale wind energy systems, particularly Vertical Axis Wind Turbines (VAWTs) [5]. Hybrid configurations that combine Darrieus and H-rotor designs have gained attention because they improve performance in low and multidirectional wind conditions. The Darrieus rotor offers good aerodynamic efficiency, while the H-rotor improves starting torque and structural simplicity. Integrating both designs enhances overall reliability and energy capture, making them suitable for fishing communities located in coastal regions [5,6]. In this study, the term “hybrid” refers to two different aspects: (i) a hybrid rotor configuration combining Darrieus and H-rotor designs, and (ii) a hybrid energy system integrating wind generation with battery storage. This distinction is important to avoid confusion in the discussion.

Coastal areas in Southeast Asia experience seasonal and changing wind patterns due to monsoon effects. Hybrid VAWTs are able to operate efficiently under these variable conditions without requiring complex yaw control systems, unlike Horizontal Axis Wind Turbines (HAWTs) [7]. This feature reduces maintenance requirements and operational complexity.

Furthermore, replacing diesel generators with wind-based systems can significantly reduce greenhouse gas emissions, operational costs, and environmental pollution [8]. Studies also highlight the importance of integrating battery storage systems to ensure consistent energy supply during periods of low wind speed [9]. Recent advancements such as Computational Fluid Dynamics (CFD) simulations have improved turbine blade design, increasing efficiency and scalability for small communities [10].

2.1 Traditional Energy Methods

Diesel generators remain the primary electricity source in many fishing communities. Although they provide reliable on-demand power, they are associated with high fuel costs, frequent maintenance, and environmental pollution [7]. Continuous exposure to harsh coastal conditions accelerates mechanical wear, increasing operational expenses.

Environmentally, diesel combustion releases carbon dioxide and particulate matter, contributing to air pollution and climate change [6,8]. Fuel leakage and improper waste disposal also pose risks to marine ecosystems. Despite these disadvantages, diesel systems continue to be used due to their simplicity and availability.

2.2 Development of Wind Turbine Technology

Wind energy technology has evolved significantly over centuries. Early vertical-axis windmills were used in Persia for mechanical applications such as grain milling [11]. During the late 19th and early 20th centuries, HAWTs became dominant due to their higher efficiency in strong and consistent winds [12].

However, HAWTs require wind-direction alignment mechanisms, which increase design complexity and maintenance. As a result, VAWTs re-emerged as an alternative, especially for small-scale and urban applications [13]. The Darrieus turbine, introduced in the 20th century, improved aerodynamic efficiency but faced self-starting limitations. The H-rotor configuration was later developed to improve structural strength and reduce manufacturing cost [13]. Modern hybrid designs combine these two concepts to optimize energy capture and operational stability in low to moderate wind speeds [5].

2.3 Concept of Modern Hybrid Design

The modern approach in this project focuses on a hybrid VAWT system that integrates Darrieus and H-rotor characteristics. This configuration improves efficiency, starting capability, and durability while maintaining a relatively simple mechanical structure [5,10].

To enhance reliability, energy storage systems such as lead-acid batteries and charge controllers are incorporated. These components store excess energy and supply power during low wind periods, ensuring continuous electricity for applications such as lighting and refrigeration in fishing communities [9].

Compared to traditional diesel generators and large HAWTs, hybrid VAWTs offer lower maintenance requirements, reduced emissions, and better adaptability to multidirectional wind conditions [8].

3. Methodology

3.1 Prototype Design and Development

The development process for the Vertical Axis Wind Turbine (VAWT) prototype is covered in this chapter. The design, fabrication, system assembly, and performance testing phases comprise the technique.This methodology's goal is to guarantee that the turbine prototype is created methodically and capable of effectively converting wind energy into electrical energy.

Fig. 1 shows the whole research approach.

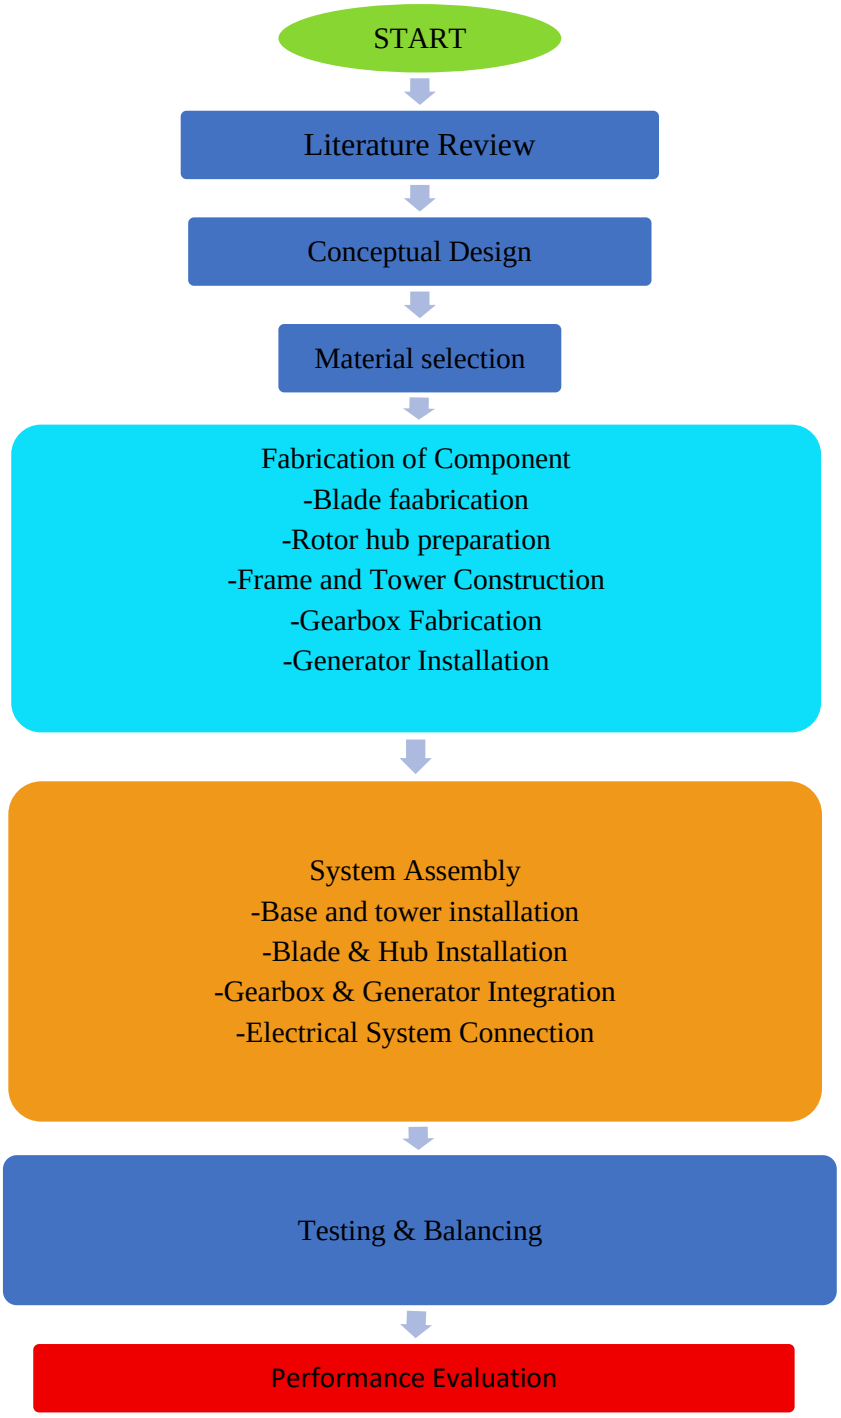

Fig. 1 Research Metodoloy Method

3.2 Fabrication Process

3.2.1 Blade Fabrication

The material used to make the turbine blades was nylon fiber, which was chosen for its durability, light weight, and environmental resilience. To maximize wind capture and rotational efficiency, the nylon fiber sheets were cut and shaped in accordance with the lantern-type blade configuration [15].

To lessen stress concentration and avoid structural damage during operation, the blade edges were softened after shaping. After that, the manufactured blades were installed on a central rotor frame while being carefully balanced and aligned. The design and structural arrangement of rotor blades are crucial in VAWT systems because blade geometry and rotor configuration have a major impact on aerodynamic performance and energy output [13].

3.2.2 Rotor Hub Preparation

In order to firmly attach the turbine blades to the main rotating shaft, the rotor hub was constructed. The hub was built to sustain the loads produced by wind forces operating on the blades while maintaining structural integrity.

To minimize friction and guarantee smooth rotation, ball bearings were incorporated into the rotor hub assembly. To endure the centrifugal forces produced during turbine operation, proper hub design and structural stability are crucial [4].

3.2.3 Frame and Tower Construction

Lightweight yet sturdy materials like steel or aluminum were used to build the support tower and turbine structure. The tower offers the structural support required to keep the turbine at an appropriate height for efficient wind exposure [15]. To firmly anchor the tower and reduce structural vibration, a sturdy base structure was constructed. Additionally, the gearing system, generator, and other mechanical parts were built into the frame. To guarantee stability and lessen mechanical stress during operation, wind turbine systems require appropriate structural support and tower design [4].

3.2.4 Gearbox System Fabrication

The turbine design included a gearing mechanism to control the rotational speed between the generator and the turbine rotor. The gearbox raises the rotating speed to meet the generator's operating needs because wind turbine rotors typically operate at very modest rates [15].To minimize friction losses and guarantee effective power transfer, the gearbox's parts were meticulously positioned and maintained. Small wind turbines frequently employ gear systems to increase the rotor and generator's energy conversion efficiency [4]

3.2.5 Generator Installation

To transform mechanical rotational energy into electrical energy, a 12 V AC motor generator was installed on the turbine frame. To guarantee effective torque transmission, a coupling mechanism was used to connect the generator to the gearbox. Generators are crucial parts of wind turbine systems because they convert mechanical energy from the rotating turbine into useful electrical power [14].

3.2.6 Electrical System Assembly

A charge controller and a lead-acid battery storage system are part of the turbine's electrical system. The charge controller, which controls the flow of electrical energy and prevents the battery from being overcharged, was connected to the generator output. The turbine could operate as a small-scale renewable energy power source because the generated energy was stored in a lead-acid battery for later use. Small wind turbine applications frequently use energy storage and charge control systems to optimize energy usage and stabilize the power supply [16].

3.3 System Assembly

3.3.1 Base and Tower Installation

Installing the turbine tower onto the base construction was the first stage in the assembly process. To guarantee structural stability during turbine operation, the tower was precisely positioned vertically and properly fastened.

3.3.2 Blade and Rotor Hub Installation

The top part of the tower was equipped with a fabricated rotor hub and its associated blades. To enable smooth rotational movement when wind forces act on the blades, the hub was attached to the gearbox via a revolving shaft.

3.3.3 Gearbox and Generator Integration

The generator input shaft was linked to and aligned with the gearbox output shaft. To minimize mechanical losses and guarantee effective energy conversion, the gearbox and generator must be properly aligned [4].

3.3.4 Electrical System Integration

The charge controller was linked to the generator's output terminals. The energy conversion and storage process was then finished by connecting the charge controller to the electrical load and battery storage system. With this setup, the turbine may produce electricity and store extra energy for later use.

3.4 Testing and Performance Evaluation

3.4.1 Operational Testing

A test run was carried out to assess the turbine system's operational performance following the assembly procedure. Observing blade rotation, gearbox operation, and generator output under various wind conditions was part of the testing process [15]. Wind speed values were estimated based on controlled fan operating conditions due to the unavailability of a calibrated anemometer.

3.4.2 Rotor Balancing

To lower vibration and to ensure smooth turbine operation, rotor balancing was carried out. By modifying the blade placement on the rotor hub, any imbalance in blade distribution was fixed.In wind turbine systems, balancing is crucial since excessive vibration can eventually cause structural damage and lower efficiency [4].

3.4.3 Electrical Output Verification

The last stage was to confirm the turbine's electrical output. To make sure the system was functioning properly and generating useful electrical energy, the voltage and power output were measured. Fig. 2 illustrates the final design of the wind turbine electric generator.

Fig.2 The final design of wind turbine electric generator

4. Discussion of Analysis and Findings

This section presents a comprehensive discussion and analysis of the experimental results, focusing on the performance of the developed hybrid Vertical Axis Wind Turbine (VAWT) system under varying operating conditions and its effectiveness in converting wind energy into electrical power.

4.1 Experimental Data

The wind turbine system's performance under various operating situations is assessed using the experimental data. Important factors like wind power, voltage generated, and rotational speed (RPM) were examined to ascertain the connection between mechanical motion and electrical output.

Table 1 Experimental Results of Wind Turbine Performance

RPM	Voltage Produced (V)	Wind Speed (m/s)	Wind Power (W)
43	5.2	3.5	0.14
62	9.8	4.8	0.39
84	14.6	6.2	0.85
98	18.9	7.5	1.51

The recorded data demonstrates that an increase in turbine rotational speed (RPM) from 43 to 98 results in a corresponding increase in voltage output from 5.2 V to 18.9 V and wind power from 0.14 W to 1.51 W, confirming the strong dependence of electrical generation on both rotational motion and wind energy availability. Fig.4 indicates that the voltage generated and rotational speed (RPM) are positively correlated. The voltage output rises with RPM, indicating better generator performance at greater rotational speeds.

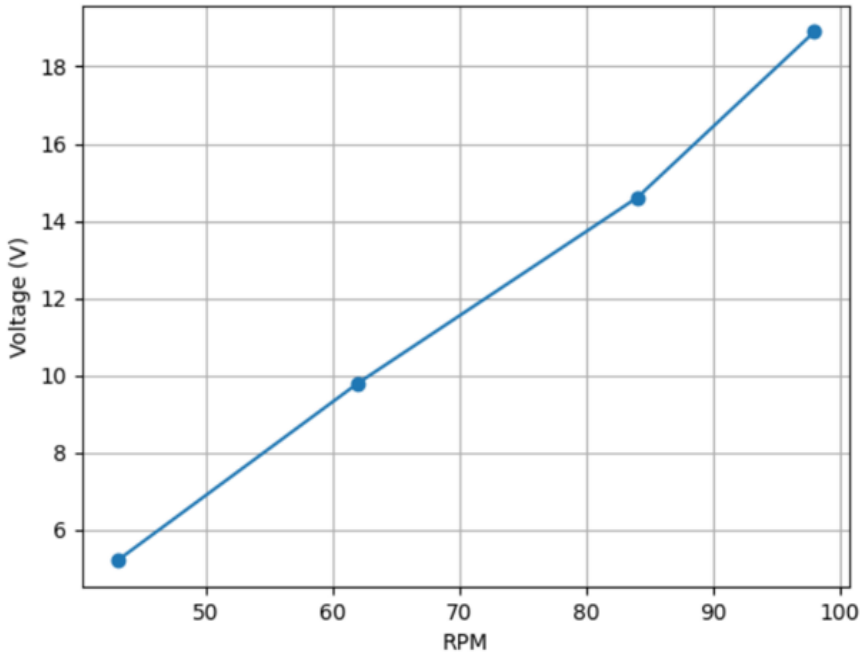

Fig.4 RPM vs Voltage produced

The Fig.5 below shows a cubic relationship between wind speed and wind power, which increases quickly. This demonstrates that even slight increases in wind speed lead to notable improvements in power production.

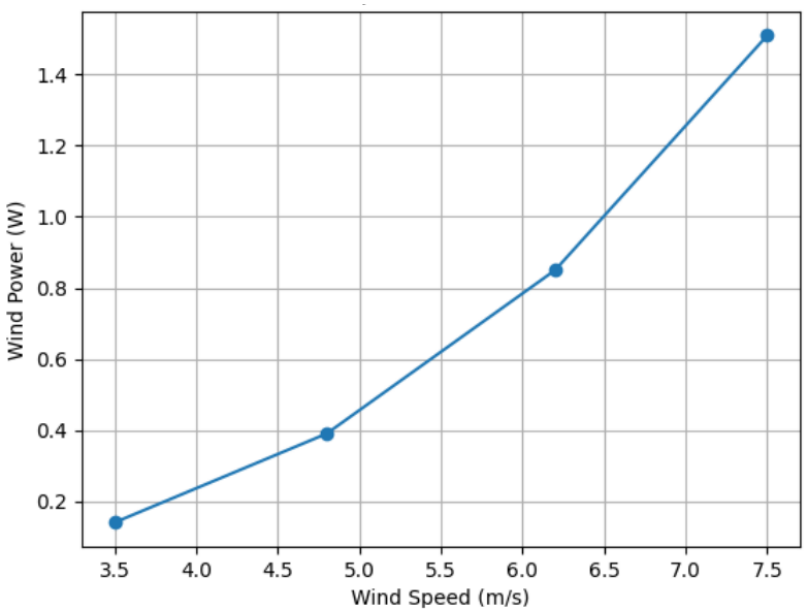

Fig.5 Wind Speed vs Wind Power

5. Conclusion and Future Research

In summary, the project's goals of designing, creating, and testing a hybrid Vertical Axis Wind Turbine (VAWT) system that combines Darrieus and H rotor elements for effective electricity generation in low to moderate coastal wind conditions were effectively met. The system's ability to transform wind energy into usable electrical energy in practical settings was demonstrated by the testing results, which indicated that increases in rotational speed (RPM) correlated with increased voltage output and wind power. This pattern is consistent with other research showing that power performance in small-scale VAWT systems is directly influenced by wind speed and turbine design [17]. Overall, the system achieved its main goals of utilizing wind energy, offering a low-cost production solution, and facilitating energy storage, establishing the hybrid VAWT as a viable renewable energy option for low-wind areas and coastal cities.

However, a limitation of this study is that wind speed was estimated rather than directly measured using a calibrated anemometer, which may affect the accuracy of the calculated wind power and overall system efficiency.

It is recommended that this technology should be further investigated for usage on ships in light of the results and effectiveness of this Vertical Axis Wind Turbine (VAWT) system for coastal fishing communities. The wind turbine might provide an effective, sustainable power source for ships by modifying the system for maritime applications, which would lessen reliance on fossil fuels and cut operating expenses. Future work should incorporate the use of a calibrated anemometer and real outdoor wind conditions to improve the accuracy and reliability of the performance evaluation.

Abstract. Analog rice has gained attention as a sustainable alternative to conventional rice. It enables the utilization of non-paddy sources such as starchy or protein-rich raw materials. Extrusion method is widely used in production of analog rice. Nevertheless, the main challenge is to produce grains like rice-shape. It is crucial to control the dimensional accuracy and physical integrity of extrudate. This study investigates the design, fabrication, and assessment of four structured morphology dies. The extrusion mass flow rate was examined. The die geometry was optimized to mimic natural rice grains. The results showed that Die 4 (3 mm thickness) outperformed other configurations. Die 4 achieved the highest mass flow rate (243.33 g/min). This result represents a 6–7% improvement in production efficiency. Uniform grains with a bulk density of 0.64 g/mL and an expansion ratio of 1.06 were produced. Scanning electron microscopy (SEM) revealed a consistent internal structure. There are the absence of voids and a smooth surface. This work reveals die-design-driven control of product shape. It offered a feasible route for the industrial-scale production of high-quality analog rice.

Keywords: Analog Rice, Structured Morphology Die, Twin-Screw Extrusion, Physical and Morphological Properties.

Introduction

Rice is the main staple food in Asia especially in Malaysia. It makes up a significant portion of daily caloric and energy intake. The average yearly intake of 75 to 80 kilograms per person shows the importance of rice in food security plan [1]. However, a volume of broken rice is produced by Malaysian rice milling facilities around 15-25% of milled output [2]. Processing them into analog rice grains is a strategic option to add value to these broken fragments [3, 4]. It can also be fortified with iron, zinc, and vitamin A to address nutritional deficits [5, 6]. Analog rice have become popular due to the increased demand for functional staple meals. These products can be tailored to meet specific dietary needs.

Twin-screw extrusion method can handle a variety of formulations and consistently produces a product. Better shear and temperature control is provided by co-rotating twin-screw extruders. It also provides superior adaptation to multicomponent formulations including alternative starches [7, 8]. The final shape and density of analog rice are influenced by the extrusion die. A structured morphology rice die that resembles the geometry of real rice grains must be produced to overcomes these restrictions.

Existing literature has analyzed how barrel temperature and screw speeds affect starch gelatinization and expansion. These studies often overlook the critical role of die geometry of extrudates [9, 10]. A research gap exists in understanding how specific die configurations influence mass flow stability and the grain shape. Without die study, the

industry remains limited to grains that lack physical resemblance to natural rice [11, 12]. This study addresses this gap by evaluating the die configuration that optimizes both production throughput and grain shape.

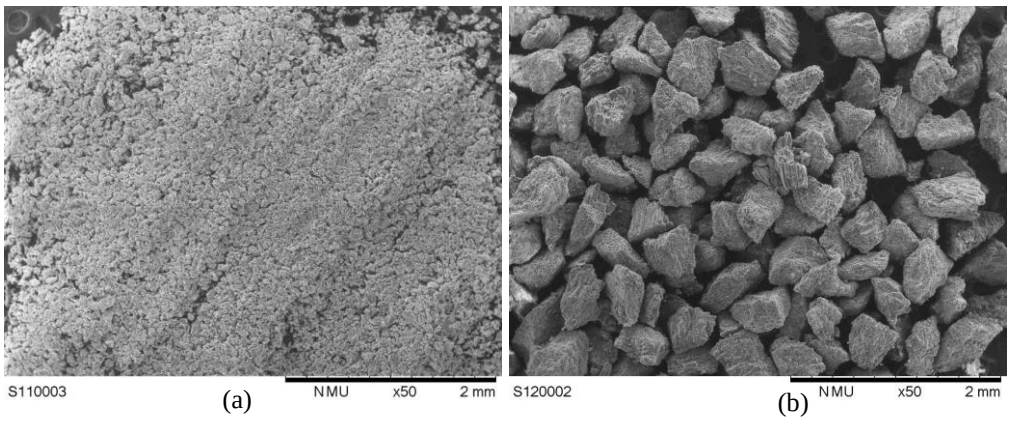
The aim of this work is design, fabricate and evaluate the impact of die geometry on the physical and microstructural characteristics of analog rice. The development of this die tackles critical food security and sustainability challenges. It also enables the efficient production of analog rice. By evaluating mass flow and grain consistency, this research offers a practical solution to meet the rising demand for functional staple foods.

Materials and Methods

Raw Materials

Wheat flour was used as the key ingredient due to the main source of gluten and carbohydrates. It has a fine granule as displayed in Figure 1(a). The gluten proteins in wheat flour create a viscoelastic network. It can maintain the mechanical strength and dimensional stability. Next, durum wheat semolina was added to boost the dough's strength and protein content. Semolina is used because of its coarse granulation as shown in Figure 1(b). It has higher protein quality, which influence mechanical performance and rheological behavior.

Sodium chloride (NaCl) was added for flavour enhancement and rheological alteration. The interactions between NaCl and gluten proteins affect extrusion flow behavior and the texture of the finished product [13]. All ingredients were weighed using a calibrated analytical balance and mixed for five minutes. Water and vegetable oil were then added gradually while being constantly combined to produce a uniform dough. Feed moisture is a significant factor affecting starch gelatinization and extrudate density. The dough was rested for 10 minutes before extrusion to achieve homogenous mixture.



(a) (b)

Fig. 1: SEM images at 50x magnification of (a) wheat flour, and (b) semolina flour

Extrusion Processing Conditions

Extrusion was performed using a twin-screw extruder equipped with a structured rice die and rotating cutter assembly as shown in Figure 2. The dough was manually fed into the extruder hopper as shown in Figure 3. The extrusion temperature was kept between 48 and 53 °C throughout the processing zone. The screw speed was set at 40 rpm. A lower screw speed was chosen to improve process stability and minimize

pressure fluctuations at the die exit. This essential for creating rice-shaped analog grains with consistent morphology. The cutter speed was controlled at 30 rpm to regulate the length of the extrudate as rice-shaped die. The grain width and length are influenced by cutter speed. It helps maintain dimensional consistency. After cutting, extrudates were collected and oven-dried for three hours at 60 °C. The drying process performed to stabilize the structure before physical and structural analysis.

Fig. 2: Extrusion and cutting processes of analog rice

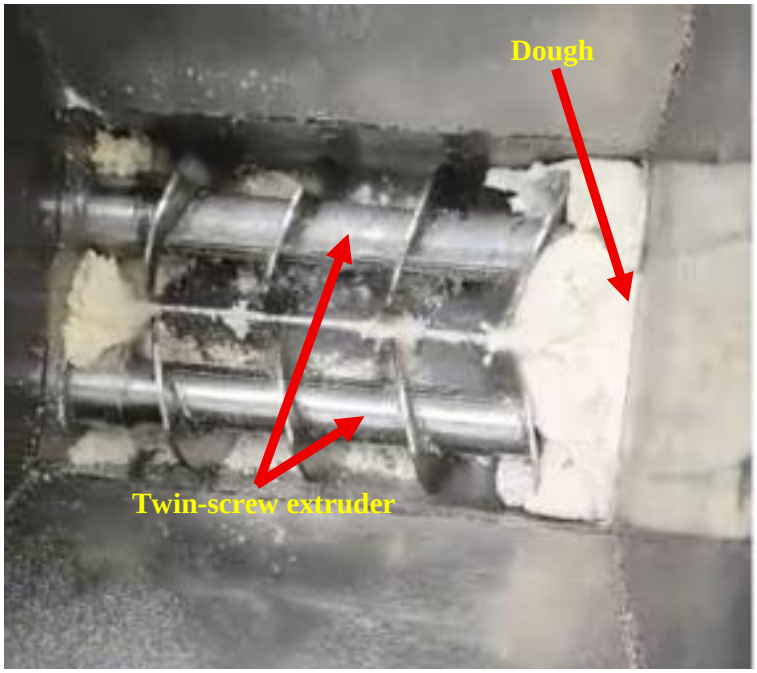


Fig. 3: Dough extrusion using twin-screw extruder

Die Design and Fabrication

Four die configurations (Die 1–4) were designed and manufactured with varying thicknesses, hole geometries, and slot dimensions as shown in Figure 4. All dies were made from food-grade stainless steel (AISI 304) utilizing CNC machining. As seen in Figure 4(d), each die was fastened to the twin-screw extruder to test and assess the mass flow rate. Then, the physical and microstructural properties were evaluated.

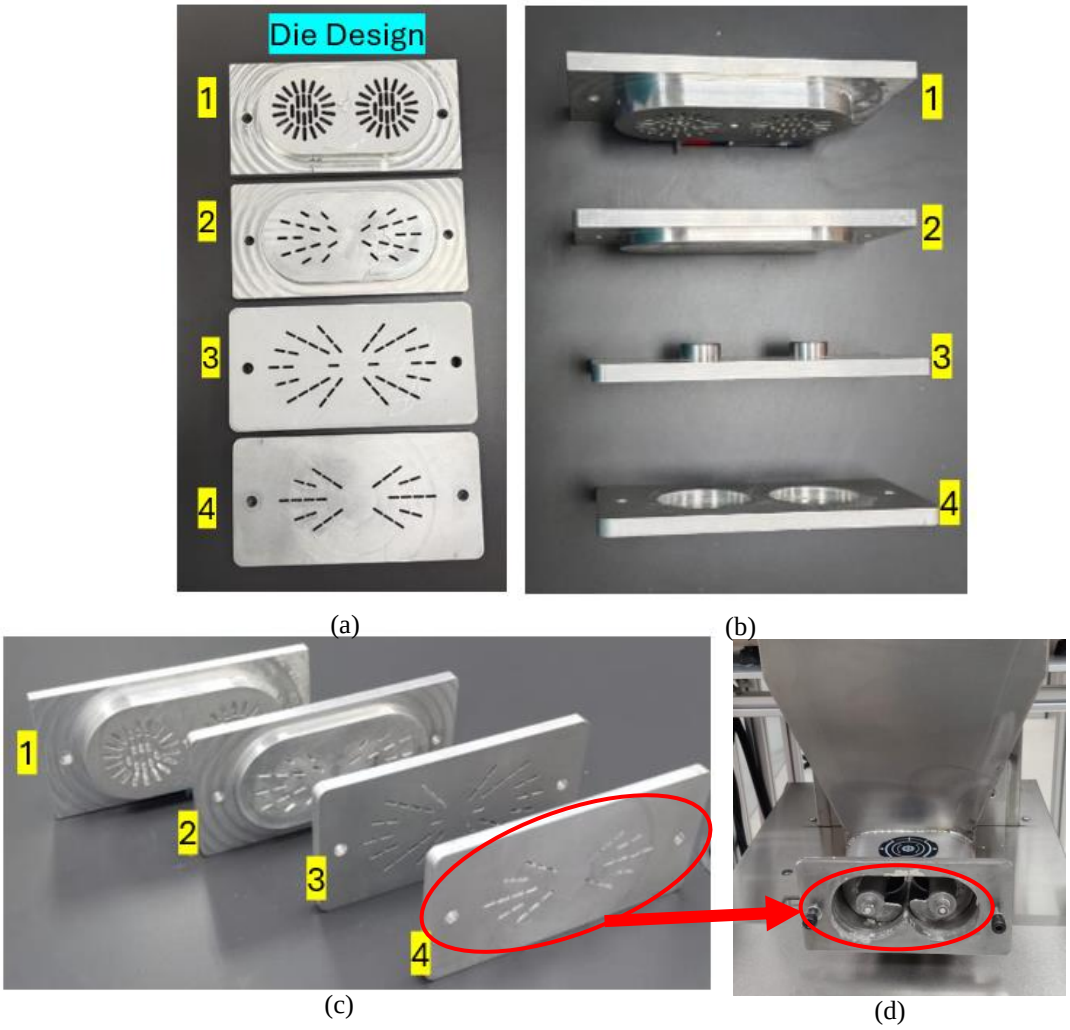

Fig. 4: Four different dies (a) front view (b) top view (c) isometric view and (d) twin-screw extruder

Results and Discussion

Effect of Die Thickness on Extrusion Mass Flow Rate

Table 2 summarizes the observed of total mass flow rate of analog rice per minute. Die 4 (3 mm thickness) produced the highest mass flow rate among the evaluated configurations. This result shows a roughly 6-7% improvement over the lowest-performing design. Die thickness is important for regulating discharge rate and stabilizing pressure. Flow uniformity at the die exit is influenced by slot distribution and hole geometry. The highest mass flow rate observed in Die 4 indicates more consistent velocity distribution throughout the die holes.

Table 2: Total mass flow rate of analog rice per minute

Die Design	Die thickness (mm)	Mass flow rate (g/min)
1	10	221.17
2	8	227.83
3	6	223.17
4	3	243.33

Effect of Die Thickness on Physical Properties

All dies produced bulk density and expansion ratio as shown in Figure 5. This result is consistent with previous study that reported the bulk density was almost similar [14]. Past study has reported density ranges between 0.58 and 0.66 g/mL. These results were achieved primarily through parameter manipulation rather than die geometry optimization [12].

Other study reported expansion ratios in rice analog between 1.02 and 1.12 [9]. Die 3 produced the highest expansion ratio (1.08) and lower density (0.62 g/mL). Bulk density (0.64 g/mL) and expansion ratio (1.06) obtained by Die 4 fit well within ranges in earlier analog rice tests. Die 4 generates analog rice with structural characteristics in line with accepted extrusion standards.

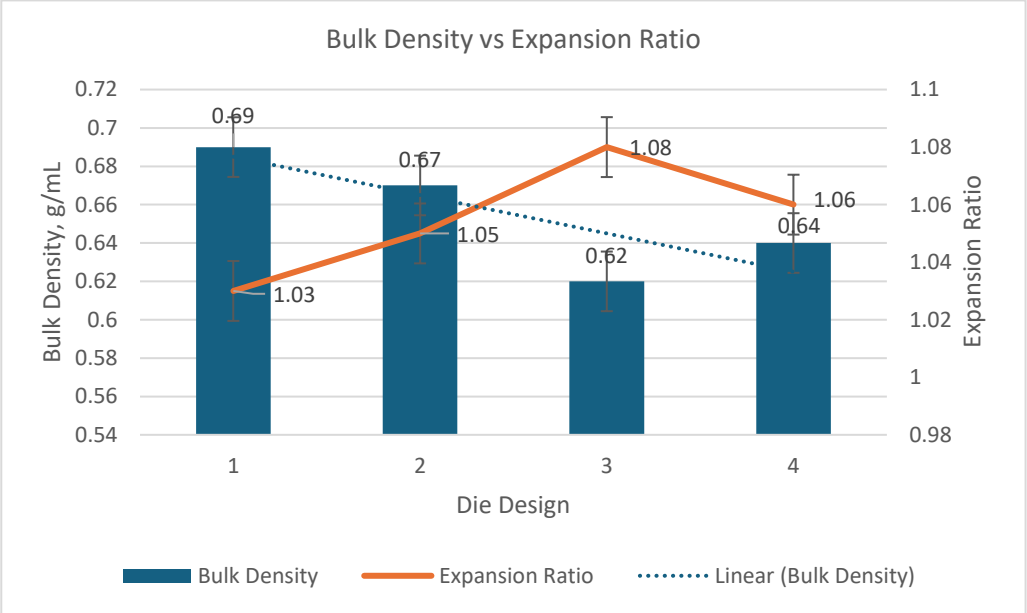

Fig. 5: Bulk density and expansion ratio of wheat-semolina rice

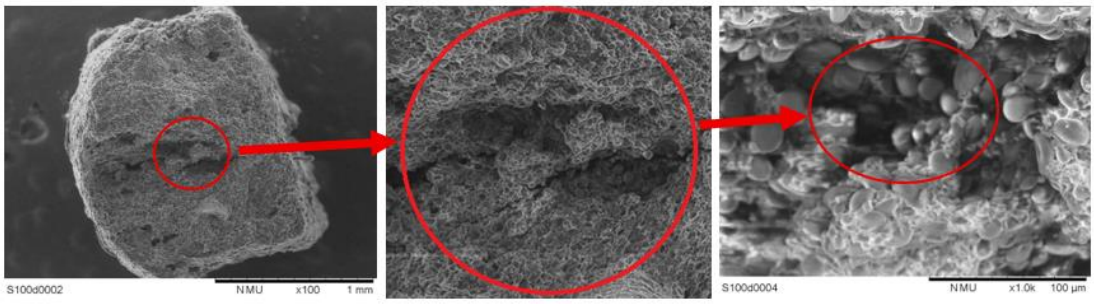
Effect of Die Thickness on Microstructural Properties

SEM shows the internal structure of extruded analog rice made using Die 4. The kernel displays a homogeneous exterior shape with little surface cracking as seen in Figure 6(a). It is indicating stable die flow and regulated expansion. A well-distributed porous matrix created at die exit can be seen in Figure 6(b). Figure 6(c) reveals coalesced gas cells contained inside a continuous gelatinized starch matrix. This morphology indicates balanced bubble nucleation and growth.

These microstructural characteristics are consistent with earlier research showing that uniform pore distribution [15], [16]. Overexpansion results in elongated cells which can cause structural collapse and fragile kernels [17]. To stabilize trapped vapor, enough starch gelatinization and melt flexibility are indicated by the compact porous network [18]. The SEM evidence supports the physical characterization. It was demonstrated that Die 4 produced a structurally coherent matrix that is equivalent to high-quality extruded rice as shown in Figure 7.



(a) (b) (c)

Fig. 6: SEM images of internal structure of extruded rice with Die 4 show (a) little surface cracking, (b) a porous matrix that is evenly dispersed, and (c) rounded coalescing gas cells.

Fig. 7: Analog rice produced by Die 4

Conclusion

Die geometry has influence on the mass flow rate, physical characteristics and microstructural behavior. The 3 mm thick die (Die 4) outperformed the other tested configurations. It was achievied the highest mass flow rate and producing grains with uniform morphology. It has obtained a suitable expansion ratio of 1.06 and an appropriate bulk density of 0.64 g/mL. SEM analysis confirmed that Die 4 generated a robust, distributed internal porous matrix without void development. This optimized die design provides a stable extrusion for analog rice production. The specific die geometry helps to maintain consistent product quality and improve process stability. This study successfully produced a good morphology and physical properties of analog rice using the optimized die. Future work should focus on evaluating the cooking stability and textural profile of the analog rice. It should investigate the sensory attributes and consumer acceptability of the extruded grains.

Development of Portable Solar Dryer

Amran Md Yunus[1], Muhammad Amin Harun[2], Mohd Soffi Manda[3]
Polytechnic Sultan Haji Ahmad Shah
amranpolisas@gmail.com

Abstract. The development of a portable solar dryer is a significant initiative in promoting the use of renewable energy for food preservation. This study presents the development and performance evaluation of a portable solar dryer designed for domestic use and small-scale enterprises. The system is engineered to be lightweight and easily movable, featuring a transparent cover to maximize solar energy absorption and thermal insulation materials to maintain internal temperatures. The study evaluates the system's performance based on operating temperature, moisture evaporation rate, and drying effectiveness on agricultural products such as fruits, vegetables, and herbs. The results indicate that the dryer can reach operating temperatures between 40°C and 60°C depending on weather conditions, significantly accelerating the moisture evaporation process compared to traditional drying methods. The system successfully maintains product quality, nutritional value, and the hygiene of the dried products. In conclusion, this portable solar dryer proves to be a potential cost-effective and sustainable green technology solution, suitable for applications in the agricultural sector, food processing, and Small and Medium Enterprises (SMEs) to reduce dependency on electricity and minimize food waste.

Keywords: Solar Dryer, Portable, Solar Energy.

1. INTRODUCTION

Drying is one of the oldest food preservation methods aimed at reducing the moisture content in agricultural products to inhibit the growth of microorganisms (Mohan & Talukdar, 2020). In many rural areas and among small-scale entrepreneurs, traditional drying methods such as direct exposure to sunlight are still practiced. However, this method has many drawbacks, including dust contamination, insect infestation, and non-uniform drying (Lingayat et al., 2017). Therefore, specially designed solar dryers are seen as a more efficient and hygienic solution. Solar dryers function by converting solar energy into thermal energy for the drying process.

There are two primary types of solar dryers: Direct Solar Dryers and Indirect Solar Dryers. In the Direct Solar Drying method, products are placed directly under sunlight. Conversely, the Indirect Solar Drying method involves the use of a solar collector to heat the air, which is then channeled into a separate drying chamber (Chauhan et al., 2018). For portable applications, the design must emphasize aspects such as lightweight materials, ease of assembly, and the ability to operate without an electrical grid connection. Previous studies have proven the effectiveness of solar dryers. For example, a study by Karthikeyan and Arun (2019) found that cabinet-type solar dryers could reduce the moisture content of coffee beans more uniformly and rapidly compared to traditional methods.

However, most existing designs are bulky and static, making them difficult to use in limited spaces or where mobility is required. Therefore, there is a need to develop a portable solar dryer that maintains drying efficiency while offering locational flexibility. Essential features to prioritize include the use of lightweight thermal

insulation (such as polystyrene), transparent covers (polycarbonate or glass), and natural ventilation or solar-powered fans to regulate airflow (Mustayen et al., 2014). The primary objective is to develop a solar dryer prototype that accelerates the drying process without utilizing electricity. This initiative aims to reduce food waste and promote sustainable preservation practices.

1.2 PROBLEM STATEMENT

To identify these issues, a more in-depth study on food drying must be conducted.
The identified problems include: -

i) Open-Air Product Drying
   - Dust / Dirt
   - Insects / Pests

ii) Saving Energy, Time, and Space

iii) Inflexible; requires relocation during rain

1.3 RESEARCH OBJECTIVES

- To design and develop a portable solar dryer product.
- To improve product quality by producing food items that are cleaner and free from dust, insects, and contamination.
- To establish an effective drying process to enhance efficiency and production yield.

1.4 RESEARCH CONCEPT

The research concept utilizes the greenhouse effect to trap solar heat within a chamber. It incorporates thermal insulation to minimize heat loss and ensures efficient air circulation to accelerate the moisture evaporation process.

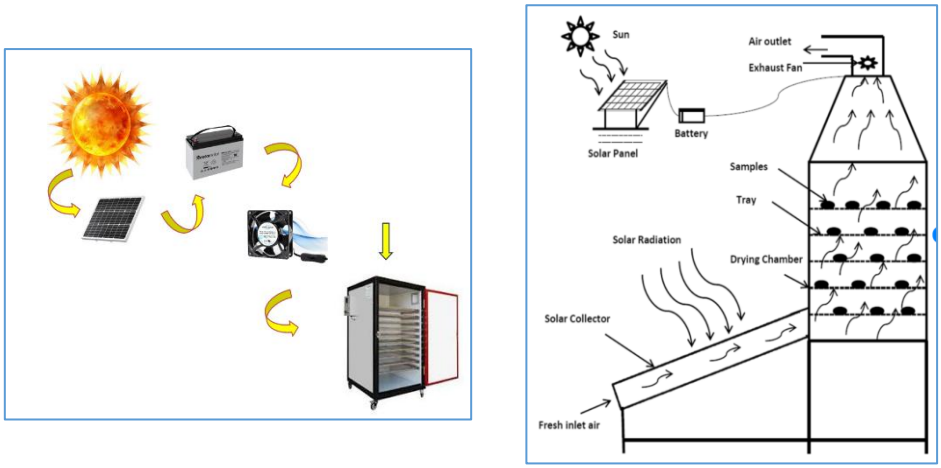

Figure 1.0 Concept of Research Project

2. LITERATURE REVIEW

Food drying is a centuries-old preservation technique that extends shelf life by reducing moisture to inhibit microbial growth. While traditional methods like open-air drying or electric dehydrators face limitations such as high electricity dependency and contamination risks, this study focuses on developing a solar food dryer as an eco-friendly and energy-efficient alternative. By utilizing sunlight to generate heat within a ventilated chamber, the project aims to create a more uniform, cost-effective, and sustainable drying system that is easily adoptable by communities while minimizing environmental impact.

The portable solar dryer is an innovative green technology that utilizes renewable energy to dry food, clothing, and other products without relying on electricity. It operates by using photovoltaic solar panels to convert sunlight into energy that powers fans or heaters, creating a consistent flow of warm air through a drying chamber to efficiently remove moisture. Designed for mobility and durability, these units often feature foldable panels and lightweight, sturdy materials like aluminum or high-quality plastic, providing a sustainable, weather-resistant, and eco-friendly alternative for both domestic and industrial drying needs.

Solar energy is a free resource generated by thermonuclear fusion on the sun's surface, reaching Earth as a spectrum consisting mostly of visible and near-infrared light with a small portion of ultraviolet. Research indicates that only about half of the incoming solar energy - approximately 89 Watts - reaches the Earth's surface. This significant reduction is caused by atmospheric factors such as reflection by clouds and the atmosphere, absorption, and radiation back into space.

- Drying is a technique used for centuries for food preservation.
- Solar is an effective and free energy source resulting from the conversion of solar energy into solar equipment and subsequently into electrical/electronic devices.

2.1 Solar Dryer Types:-

- Direct Solar Dryer: *(The product is placed directly under sunlight).*
- Indirect Solar Dryer: *(Heat from a solar collector warms the air for drying purposes).*

2.2 Solar Radiation Data

- **Normal Solar Radiation:**
  800 – 1000 W/m2 (between 11.30am – 2.30 pm)
  Rate can be measured at rate 500 - 600 W/m2 (Cloud patches)
  And range temperature (29 ^{0}C – 31 ^{0}C)

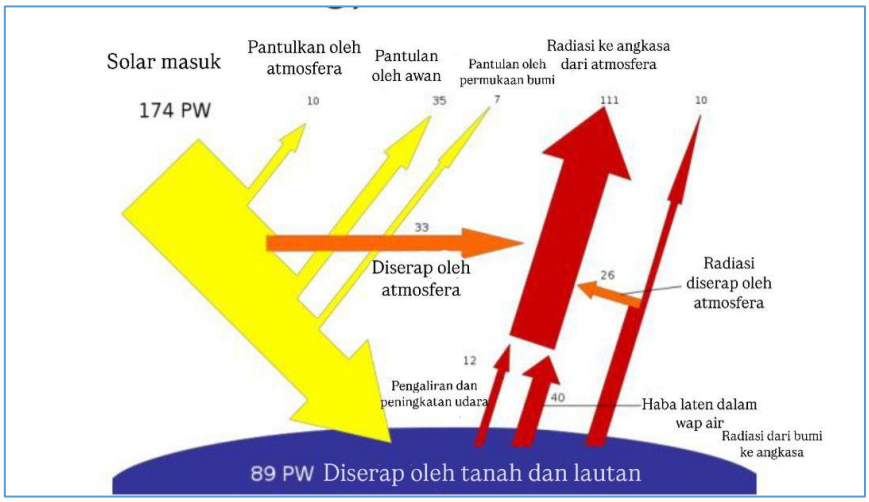

Figure 2.0 Solar Radiation

3. RESEARCH METHODOLOGY

3.1 Technical Drawing

Computer-Aided Design (CAD) is the use of computer technology to assist in the design, manipulation, optimization, and especially the creation of sketches (technical and engineering drawings) for a specific part or product, including the overall project design. Figures 3.1.1, 3.1.2, and 3.1.3 illustrate the technical drawings of the Portable Solar Dryer Design Project.

I. Assembly Drawing and Bill of Materials

Figure 3.1.1 illustrates the assembly drawing along with the bill of materials, displaying the exploded view of each individual component.

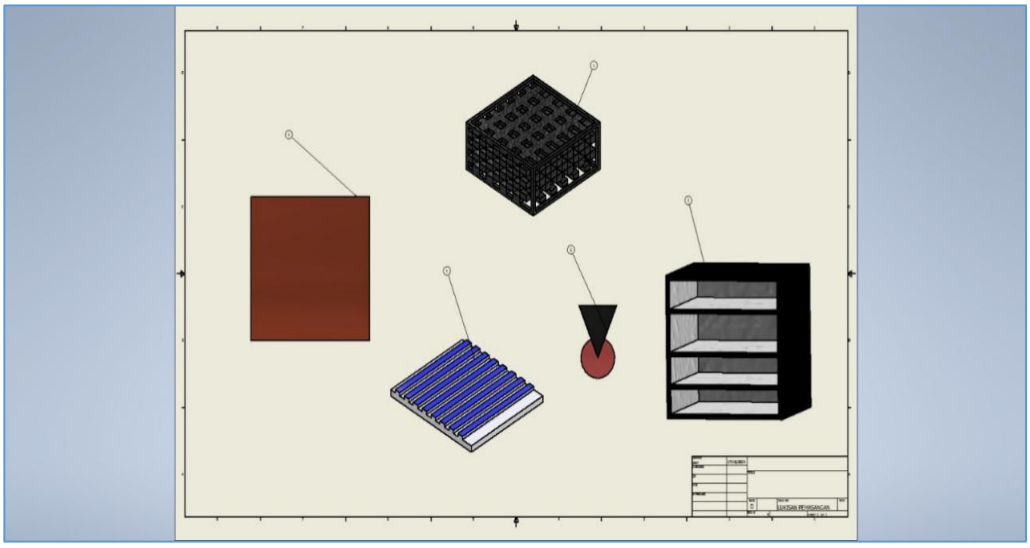

***Figure 3.1.1**: Assembly Drawing Bill of Material*

II. Isometric Drawing

Figure 3.1.2 illustrates the isometric drawing, which includes the top, front, and side views of the design. The top view allows for the visualization of the design's length and the identification of each material used. Additionally, the overall height and length of the design can be determined through both the side and front views of the project.

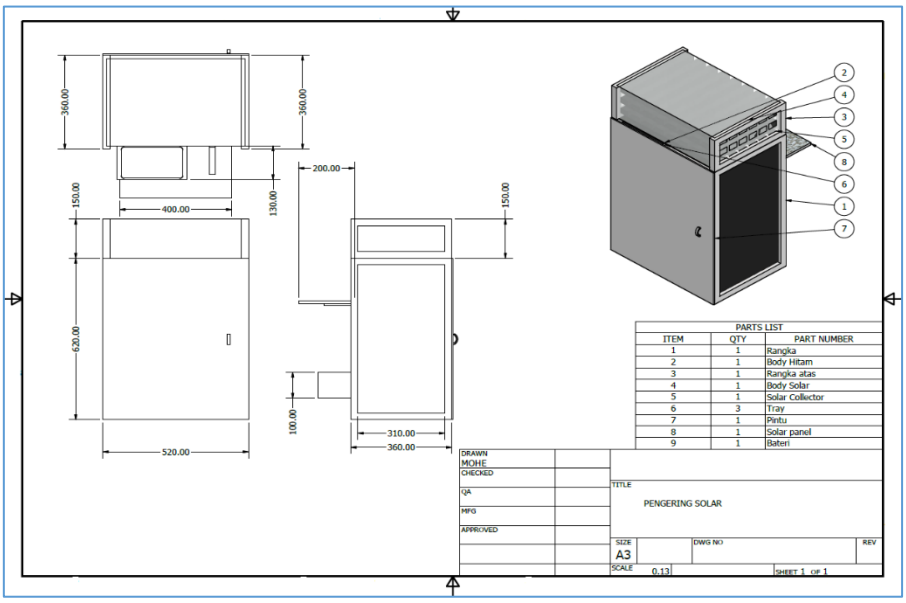

***Figure 3.1.2**: Isometric Drawing*

III. Project Drawing

Figure 3.1.3 shows the overall layout of the portable solar dryer design, where every component has been assembled into a single unit. The first section consists of the base assembly.

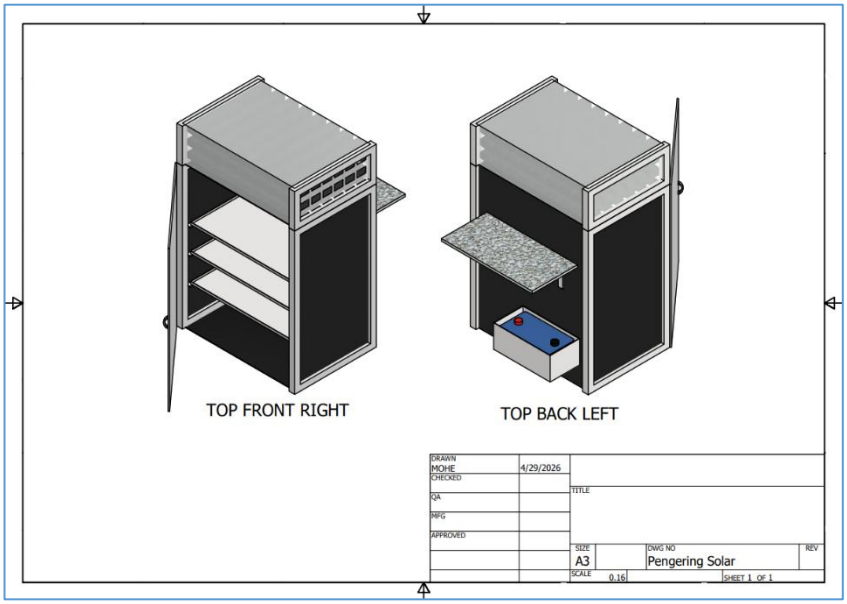

***Figure 3.1.3:** Project Drawing*

4. RESULT AND DISCUSSION

This section presents the research findings obtained through drying experiments using the developed solar dryer system. The findings encompass the performance of the drying process, including changes in weight and moisture content of the food materials throughout the drying period, as well as the quality of the products produced upon completion of the process.

The analysis is also based on observations of the physical characteristics of the food materials, such as changes in colour, texture, and aroma, to evaluate the differences occurring before and after the drying process was conducted. Overall, this section aims to assess the effectiveness of the solar dryer system, identify the factors influencing its performance, and provide a solid foundation for discussion and recommendations for improvement in the subsequent section.

4.1 Moisture Loss Analysis

This section describes the changes in sample weight throughout the drying process. The weight reduction typically measures the rate of water evaporation within the material. This data is crucial to determine whether the product has achieved the ideal dryness level.

The findings can be summarized as follows:

i. The initial weight was recorded before the drying process commenced.
ii. The most rapid weight reduction occurred during the first 1–2 hours.
iii. The drying rate slowed down towards the end of the process.
iv. The time vs. weight graph illustrates the evaporation rate.

Brief observational data from two experimental sessions were recorded as follows:

1) Weight Change Trend of Tomatoes and Temperature Throughout the Experiment (Session 1) (Afternoon).

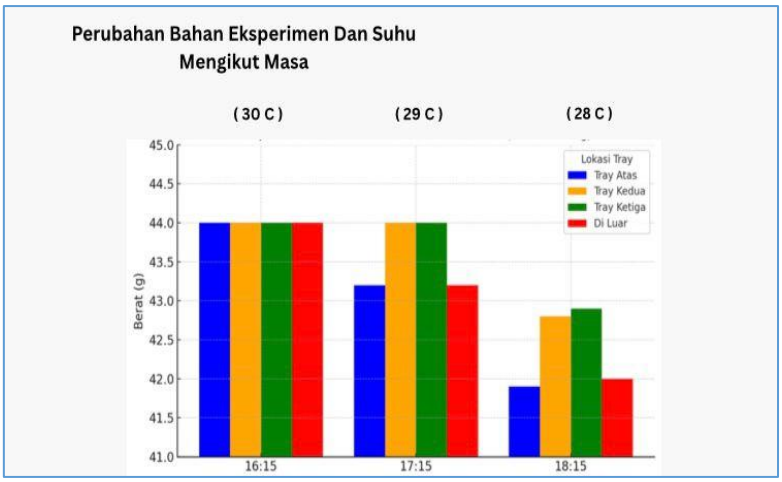

Figure 4.1: Time, Weight, and Temperature Difference Graph

Overall, the research findings demonstrate that the developed solar dryer system functions effectively in reducing food moisture. The gradual weight reduction proves that the drying process is stable and systematic. These results not only fulfill the project's objectives but also reflect a satisfactory and reliable system performance.

4.2 Physical Observation of Materials After Drying (Product Quality Evaluation)

This section focuses on the physical changes in the materials, including color, texture, aroma, and overall quality after drying. These observations determine whether the solar dryer produces safe and high-quality products.

i) No mold growth was observed throughout the process.
ii) The surface of the material did not become overly dark, indicating a stable operating temperature.
iii) The final products were cleaner due to the lack of exposure to dust and insects.
iv) The product's aroma remained natural, with no burnt or damp odors detected.

Brief observational data from two experimental sessions were recorded as follows :-

a) Changes in material quality after the drying process (Session 1) (Afternoon)

Table 4.2.1 Material and Temperature Variations during the Experiment

TIME	COLOUR	TEXTURE	NOTES
16:15	Bright red	Fresh	Initial
17:15	Red	Slightly Soft	-
18:15	Slightly Dark Red	Semi- dry	-

b) Changes in material quality after the drying process (Session 2) (Noon)

Table 4.2.1 Material and Temperature Variations during the Experiment

TIME	COLOUR	TEXTURE	NOTES
12:20	Bright red	Fresh	Initial
13:20	Red and slightly shrivelled	Slightly Soft	-
14:20	Slightly dark red and slightly shrivelled	Semi- dry	-

These findings demonstrate that the solar dryer system is capable of maintaining food quality effectively, provided the drying process is conducted within an appropriate duration. The final products remain safe, stable, and suitable for storage. However, food quality may be compromised by weather fluctuations, such as extreme heat, rain, or high humidity, as these factors can influence the drying rate and the overall quality of the final product.

5. CONCLUSION

The Portable Solar Dryer Project has been successfully developed and tested with highly encouraging results. The system operates entirely on solar energy to generate heat for drying materials such as fruits, vegetables, and other agricultural products. Test results indicate that the dryer effectively reduces the moisture content of the materials within a timeframe that depends on the solar intensity of the day.

Among the primary achievements of this project are:

1. Full Utilization of Solar Energy – allowing the dryer to operate independently without relying on external electrical sources.
2. Lightweight and Portable Design – making it easy for users to move the dryer to areas with maximum sunlight exposure.
3. High Drying Efficiency – assisting in preserving the quality of colour, aroma, and flavour of the dried materials.

Overall, this project has achieved its primary objectives of producing an efficient and user-friendly solar drying system. It further proves that the application of renewable energy technology is not only cost-effective but also holds significant potential for practical use in the agricultural and food processing sectors, with low maintenance and minimal environmental impact

Abstract. As an economical additive, coconut fiber offers a technical solution to inherent weaknesses of Asphalt Concrete-Wearing Course (AC-WC) mixtures. This fiber enhances inter-material cohesion, there by mitigating fatigue and thermal cracking. As the asphalt binder ages and becomes brittle, coconut fiber acts as a reinforcement inhibitor that prevents the propagation of minor cracks. Based on Marshall testing, the Optimum Asphalt Content (OAC) was determined to be 6.0%. At this OAC, the addition of coconut fiber yielded varying performance results across different compaction levels. In the 2x50 category, a consistent decrease in stability was observed, although it remained above the >1000 kg requirement, declining from 2922.20 (0%) to 2408.64 (0.50%). Conversely, at 2x75 blows, a 0.25% fiber content significantly increased stability to a peak of 4197.26. However, post-aging stability simulations revealed a distinct performance shift between initial strength and long-term durability. While 0.25% fiber addition provides superior load-bearing capacity during the early service phase, deep analysis through long-term aging simulations showed that a 0.50% fiber content demonstrates more consistent stability. This phenomenon indicates that higher fiber concentrations effectively maintain asphalt elasticity, preventing over time. The use of up to 0.50% fiber is proven to delay micro-crack propagation and enhance resistance against traffic loading and extreme climatic factors. In conclusion, for sustainable road infrastructure with a service life exceeding five years, a higher fiber concentration is highly recommended. It provides superior longterm protection against structural degradation, there by reducing the necessity for premature maintenance.

Keywords: AC-WC, Aging Mixture, Coconut Fiber, Crack Resistance.

Introduction

Highway is a vital role in supporting socioeconomic activities and logistics distribution [1,2]. The durability of these roads depends heavily on the performance of the wearing course, predominantly Asphalt Concrete-Wearing Course (AC-WC) due to its smooth texture and water resistance [3]. However, traffic overloading and environmental factors often lead to premature failures, such as rutting and cracking. This pavement performance is governed by the synergy between laboratory mix design and field compaction. While the Marshall compaction efforts (e.g., 2x50 vs 2x75 blows)

simulate varying traffic intensities, suboptimal compaction elevates Voids in Mineral Aggregate (VMA) and Voids in Mixture (VIM), accelerating moisture and air infiltration.

The quality of asphalt pavement layers is largely determined by the integration between the mix design in the laboratory and the compaction process in the field [4]. In the Marshall method, the number of blows is a key parameter that represents the compaction energy received by the asphalt mix to achieve absolute density. The mismatch between compaction energy in the laboratory and traffic loads in the field often triggers premature failure, where suboptimal compaction will result in excessive air voids [5], while overcompaction can cause aggregate breakage or asphalt to become too stiff and prone to cracking [6] The use of varying numbers of impacts, such as 2x50 and 2x75, is an attempt to simulate differences in traffic load intensity, where 2x50 impacts are generally intended for medium traffic, while 2x75 impacts are for heavy traffic. This variation directly affects the values of Voids in Mixture (VIM) and Voids in Mineral Aggregate (VMA). If the number of impacts is insufficient, the internal structure of the asphalt will have many empty spaces that facilitate water and air infiltration, which will ultimately accelerate the oxidation process.

The main weakness of standard penetration asphalt lies in its susceptibility to oxidation, which causes aging. Over time, exposure to oxygen and ultraviolet rays changes the chemical composition of asphalt, whereby the light fraction (maltenes) decreases and the heavy fraction (asphaltenes) increases, causing the asphalt to lose its elasticity and become very brittle. Brittle asphalt is no longer able to accommodate the strain caused by vehicle loads, which ultimately triggers massive crack propagation. Modifying asphalt with additives is necessary to improve its rheological properties so that it is more resistant to brittleness caused by long-term oxidation [7]. This infiltration exacerbates asphalt oxidation and aging. Over time, UV exposure and oxygen deplete the maltene fraction and increase asphaltenes, rendering the binder brittle and prone to severe crack propagation. Standard binders are highly susceptible to this phenomenon; for instance, storing loose mixtures at 135°C for 4 hours can increase stiffness by 9–24% [8,9]. Consequently, modifying the asphalt binder with sustainable additives is imperative to mitigate long-term oxidation stiffness.

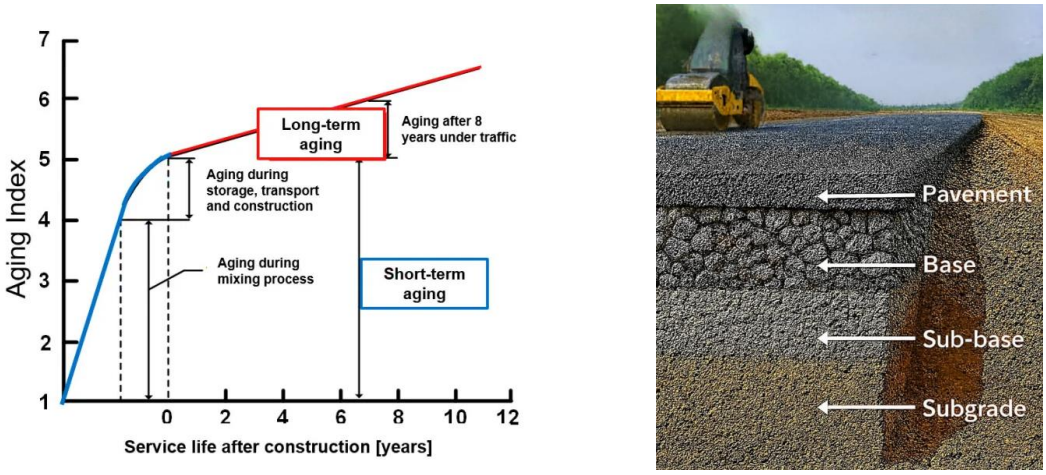
The use of coconut fiber as an asphalt modification material offers a sustainable solution due to its mechanical properties, which include high tensile strength and resistance to weathering. In asphalt mixtures, coconut fiber acts as micro-reinforcement that can slow down the bridging effect, thereby resisting the spread of cracks even when the asphalt matrix has aged. In addition to these technical advantages, the use of coconut fiber waste also supports the principles of a circular economy by optimizing the potential of Indonesia's abundant local natural resources, while reducing the environmental impact of plantation waste. The effectiveness of coconut fiber in improving crack resistance is greatly influenced by the quality of compaction and the duration of aging experienced by the mixture. Coconut fiber emerges as a promising sustainable alternative due to its high tensile strength, thermal stability, and low cost, supporting circular economy principles. Unlike synthetic fibers, the surface roughness of coconut fiber offers superior mechanical interlocking within the bitumen matrix. In this mixture, the fiber acts as a micro-reinforcement that slows down the bridging effect, maintaining flexibility even after severe matrix aging. However, the efficacy of coconut fiber is highly sensitive to compaction energy and aging duration. Dense compaction restricts oxygen accessibility, thereby slowing oxidation, but over-compaction risks crushing the natural fibers.

The optimal compaction process determines the distribution of fibers and the size of air voids, which directly affect oxygen access into the asphalt structure; the denser the mixture, the slower the oxidation rate. This research is important to evaluate the extent to which the interaction between density and aging duration affects the performance of coconut fiber-modified asphalt in maintaining its flexibility. A deep understanding of this dynamic is expected to provide new standards in the design of more resilient and durable road pavements.

Based on the background described above, Therefore, this study aims to evaluate the critical interaction between compaction levels (2x50 vs 2x75 blows) and aging durations on the performance of coconut fiber-modified AC-WC mixtures. While prior works evaluated coconut fiber primarily in unaged conditions, this research fills the gap by critically analyzing its long-term cracking resistance when the binder reaches peak oxidation stiffness.

Literature References

Damage to highway construction is caused, among other things, by a decrease in road bearing capacity due to the aging process of asphalt concrete mixtures [10]. Aging is caused by heating processes during mixing at the Asphalt Mixing Plant (AMP), transportation, compaction, and during the service life of the road construction. In asphalt mixtures, aging is referred to as age hardening and embrittlement [11].



(a) (b)

Fig. 1 (a) : Bitumen aging during mixing and service life [11]; (b) Cross-section by layer of flexible pavement

Figure 1(a) shows the aging of bitumen during mixing, storage, transportation, installation, and end of service life [12]. Short-term aging is mainly due to oxidation and the loss of volatiles and oily components, and happens during mixing, transport, and paving. The most accelerated aging occurs during the mixing process when bitumen is exposed to heat and oxygen due to it being in a thin film covering a large surface area in the mixer box Long-term aging happens during service life and is mainly dependent on factors such as void content in the composition of the asphalt and external influences such as atmospheric oxygen and dynamic forces. Technologists cannot wait more than 12 years to benchmark or homologate a bitumen's performance and resistance to aging. These aging characteristics can be laboratory simulated through

short-term and long-term accelerated aging tests. Asphalt aging is caused by two main factors, namely the evaporation of the light oil fraction contained in asphalt and oxidation (short-term aging) and progressive oxidation (long-term aging) [13].

In the design of asphalt concrete, the effect of asphalt aging has not been taken into account. In the asphalt concrete specifications issued by [14], it is required that the stability of asphalt concrete immersed for 4 days must not be less than 90%. This requirement is to test the resistance of asphalt concrete to damage caused by immersion in water. However, the problem is that water is not the only weather condition that damages asphalt concrete. Excessive heating also causes damage to the asphalt concrete mixture, because the asphalt used as a binder undergoes aging. Short-term aging is associated with the loss of volatile components and oxidation of asphalt during the production of asphalt mixtures. Long-term aging is the progressive oxidation of materials in the field during the service life of the pavement.

Coconut fiber is a type of biomass that is easily obtained as a by-product of agriculture. Coconuts have a fiber composition of 35% of the total weight of the coconut. Coconut husk consists of fibers and pitch that connect one fiber to another. Coconut husk consists of 75% fiber and 25% pitch [15,16].

According to [18,19], young coconut husks contain 43.4% cellulose and 45.84% lignin. The high cellulose content in young coconut husks has potential as a biodegradable material. The main compounds in coconut fiber that play an important role in preventing surface cracking in asphalt are cellulose and lignin [20]. Cellulose has a long and strong polymer chain structure, which gives the fiber high tensile strength [21,22]. In asphalt mixtures, cellulose acts as a micro-bridging agent that mechanically binds the asphalt matrix and aggregates. When stress occurs due to traffic loads or temperature changes, this cellulose structure absorbs the energy and prevents the propagation of cracks on the pavement surface.

Fig. 2**:** Coconut Fiber Waste [17]

On the other hand, lignin contributes significantly to oxidation resistance and thermal stability. As a rigid, hydrophobic aromatic polymer [23], lignin acts as a natural “glue” that protects cellulose and provides structural rigidity to the fibers so that they are not easily degraded at high asphalt mixing temperatures (135°C). In addition, lignin has natural antioxidant properties that can inhibit the aging process of asphalt due to exposure to ultraviolet rays and oxygen [24,25].

Material and Method

This chapter outlines the materials used and the experimental procedures followed to investigate the effect of recycled tire rubber powder on the Marshall Test parameters of asphalt mixtures. The methodology includes material characterization, mixture design, specimen preparation, Marshall stability testing for data analysis and optimization.

Preparation of Coconut Fiber

Coconut fiber is soaked in water for approximately 24 hours, so that the coconut fiber is easy to separate and break down when mixed. The coconut fiber is washed with clean water until the powder attached to the fiber is completely removed and clean (this coconut fiber powder is easily decomposed/organic). The drying process can be done by drying in direct sunlight, or by placing it in an oven at a constant temperature of ± 105°C for ± 24 hours. The coconut fiber cutting process is done with scissors or a knife with a length of ± 5 mm and a variation in the percentage of coconut fiber addition, namely 0.25%, 0.50% asphalt weight.

Mixtures Composition and Testing Methods

The composition of the mixture is based on the aggregate gradation of the mixture chosen. The composition of the mixture is divided into three fractions, namely: coarse aggregate fraction, fine aggregate fraction, and filler fraction. The fraction size of material is based on the Bina Marga General Specifications [14]. The mixture proportions used for the manufacture of test specimens was a mixture of Asphalt Concrete – Wearing Course (AC-WC), In this study, a total of 66 samples were prepared. This number includes the stage of determining the Optimum Asphalt Content (OAC) and the stage of testing the performance of modified asphalt with aging treatment (short-term aging). The amount of aggregate material used refers to the total aggregate ± 1200 grams.

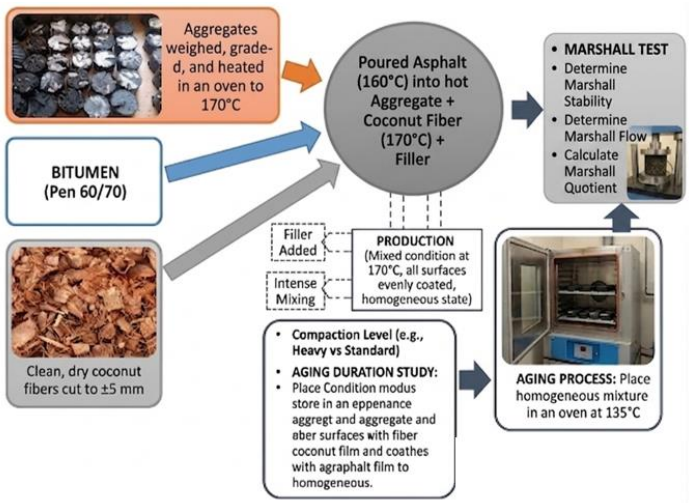


Fig. 3: Dry method in the process of mixing modified asphalt with coconut fiber

The weight of mixed aggregates taken for the preparation of the specimen may be suitably altered to obtain a compacted thickness. Vary the bitumen content in the next trial by +0,5% and repeat the above procedure. The number of trials is predetermined.

The prepared mould is loaded in the Marshall test. The properties that are of interest include the theoretical specific gravity Gt, the bulk specific gravity of the mix Gm, percent air voids Vw, percent volume of bitumen Vb, percent void in mixed aggregate VMA, and percent voids filled with bitumen VFB. These calculations are discussed next. To understand these calculations, a phase diagram is given in Figure 4.

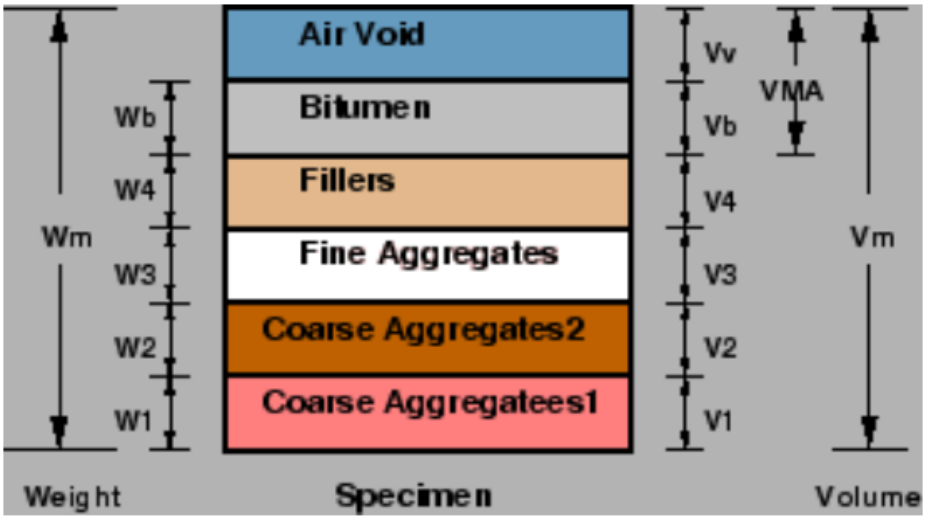

Fig 4 : Phase diagram of a bituminous mix

Asphalt Mixture With Aging Laboratory

In the STOA testing method, the loose hot mixture is heated in the laboratory oven for 4 hours at a temperature of 135℃. This oven heating is intended to simulate the aging process of the asphalt mixture during construction, mixing, transportation, laying, and compaction.

Unmodified and Modified Asphalt Binder

Characterization of both unmodified and coconut fibers-modified binders was conducted to understand the fundamental changes induced by the incorporation of rubber. Table 1 showcases the testing program, evaluating specific gravity, penetration, ductility, and softening point across varying rubber content levels.

Table 1: Physical properties of unmodified and modified asphalt binder

Properties	Unit	Standard	Coconut Fiber			Bina Marga Specifications 2018
			0%	0,25%	0,50%	
Specific Gravity	gr/cm^3	SNI 2441-2011	1,019	1,057	1,061	Min. 1,00
Penetration	(0,1 mm)	SNI 2456-2011	63	52	53	Min. 40,00
Ductility	Cm	SNI 2432-2011	119	59	49	Min. 50,00
Softening Point	°C	SNI 2434-2011	52	54	54	Min. 54,00

Based on the data from testing the characteristics of modified asphalt, the addition of coconut fiber significantly affects the physical properties of 60/70 penetration

asphalt. The specific gravity value increases gradually as the fiber content increases, from 1.019 in pure asphalt to 1.061 at a fiber content of 0.50%. On the other hand, the penetration value decreased from 63 to 53 (0.1 mm), indicating that the asphalt mixture became stiffer or harder with the addition of coconut fiber. Despite these changes, the specific gravity and penetration parameters still meet the minimum standards set in the 2018 Road Construction Specifications. This increase in stiffness provides good stability against rutting, but it should be noted that if the asphalt is too stiff, its stress relaxation capacity will decrease. However, the addition of coconut fiber has a critical impact on ductility and long-term crack resistance. There is a sharp decline in ductility from 119 cm in pure asphalt to only 49 cm at a fiber content of 0.50%. This value is below the Bina Marga minimum standard of 50 cm, indicating that at a content of 0.50%, the asphalt begins to lose its flexibility and becomes more brittle, increasing the risk of surface cracking. Meanwhile, the softening point increased from 52°C to 54°C. This increase indicates that coconut fiber modification successfully improves the thermal resistance of asphalt to high temperatures and helps inhibit the oxidation and evaporation of light asphalt fractions, thereby maintaining the long-term durability of the pavement as long as it does not exceed its elasticity limit.

Aggregates

Table 2 summarizes the physical properties of coarse aggregate evaluated in accordance with international and Indonesian national standards, with compliance assessed against the Bina Marga 2018 specifications.

Table 2: Physical properties of coarse aggregate

Properties	Unit	Standard	Result	Bina Marga Specifications 2018
Specific Gravity	kg/cm^3	SNI 03-1969-1990	2,789	Min. 2.50
Absorption	%	SNI 03-1969-1990	1,655	Mak. 3.00
Bulk Density	gr/cm^3	SNI 03-1969-1990	1,885	Min. 1.00
Impact	%	SNI 4426-1997	9,071	Mak. 30.00
Abrasion	%	SNI 2417-2008	23,39	Mak. 40.00
Flakiness Index	%	ASTM D-4791	9,655	Mak. 10.00
Elongation Index	%	ASTM D-4791	9,920	Mak. 10.00

Testing of the physical characteristics of coarse aggregates shows that all parameters meet the standards set out in the 2018 Road Construction Specifications. The aggregates have a specific gravity of 2.789 kg/cm^3 and a bulk density of 1.885 g/cm^3, both of which exceed the minimum requirements. In addition, the absorption level of the aggregate is low, at 1.655%, well below the maximum limit of 3.00%. This low absorption value is very advantageous because the aggregate will not absorb excessive asphalt, allowing the asphalt film to coat the aggregate surface more effectively to ensure a strong bond. In terms of mechanical resistance, this coarse aggregate has very high durability against traffic loads. The abrasion value of 23.39% (maximum 40.00%) and the impact value of 9.071% (maximum 30.00%) indicate that the aggregate is very resistant to breakage and wear. The particle shape quality is also excellent, with a Flakiness Index of 9.655% and an Elongation Index of 9.920%, meeting the maximum requirement of 10.00%. The proportional shape of the aggregate (not too flat or elongated) will create optimal interlocking between particles in the asphalt concrete mixture, thereby maintaining the stability of the pavement structure in the long term.

Table 3:Physical properties of fine aggregate

Properties	Unit	Standard	Result	Bina Marga Specifications 2018
Specific Gravity	gr/cm^3	SNI 03-1970-1990	2,685	Min. 2,50
Absorption	%	SNI 03-1970-1990	1,854	Max. 3,00
Bulk Density	gr/cm^3	SNI 03-1970-1990	1,952	Min. 1,00

Based on the data in Table 3. Physical properties of fine aggregate, the test results show that the fine aggregate used has met all the requirements specified in the 2018 Road Construction Specifications. This fine aggregate has a Specific Gravity value of 2.685 gr/cm^3 and a Bulk Density of 1.952 gr/cm^3, both of which are above the minimum required limits. In addition, the absorption rate is recorded at 1.854%, which is still well below the maximum limit of 3.00%. This low absorption value indicates that the aggregate has few pores, so it will not absorb asphalt excessively and supports the creation of a more efficient and durable mixture in binding coconut fibers.

The final gradation composition consisted of coarse aggregate (retained on a No. 4 sieve), fine aggregate (passing through a No. 4 sieve and retained on a No. 200 sieve), mineral filler (passing through a No. 200 sieve).

Table 4: Aggregate gradation

Size (mm)	19	12,5	9,5	4,75	2,36	1,18	0,6	0,3	0,15	0,075
Passing Rate (%)	100	90	77	53	33	21	14	9	6	4

Result

Marshall Mix Design for Unmodified Asphalt Mixture

An investigation utilizing the Marshall test method assessed the volumetric and mechanical properties of asphalt concrete-wearing course (AC-WC) mixtures. This evaluation encompassed seven parameters: density, VIM, VMA, VFA, stability, flow, and MQ, across a range of asphalt content variations, including 4.0%, 4.5%, 5.0%, 5.5%, and 6.0%. Through analysis, an optimum asphalt content (OAC) of 5.5% was determined, with the 2018 Bina Marga General Specification for Marshall parameters. The detailed results of these Marshall tests for each asphalt content variation are summarized in 5.

Table 5: Summary of Marshall Test Results for Optimum Asphalt Content (OAC)

Caracterictic	Optimum Asphalt Content (OAC)					Bina Marga 2018
	4,50	5,00	5,50	6,00	6,50	
Density (gr/cm^3)	2.47	2.64	2.47	2.45	2.46	Min.2
VIM (%)	6.60	5.99	4.92	4.79	3.77	3-5
VMA (%)	21.34	21.91	22.11	23.07	23.31	Min.15
VFA (%)	69.09	72.69	77.77	79.34	83.81	Min.65
Stability(kg)	3462.33	3305.02	3444.10	3818.92	3762.36	Min 800
Flow (mm)	3.03	2.77	3.00	2.83	2.83	2-4

This particular column represents the Optimum Asphalt Content (OAC) that has been selected for the mixture. The choice 6% as the OAC is based on its ability to satisfy the 2018 Bina Marga General Specification for Marshall parameters.

Effect of Marshall Mix Design at Optimum Asphalt Content with or without Coconut Fiber Modification and Variations in Impact

This study the Optimum Asphalt Content (OAC) at 6% as a reference in evaluating the performance of asphalt concrete mix (AC-WC). This OAC value was obtained from preliminary testing on asphalt mixes, where the parameters of stability, flow, and air void reached the best equilibrium point in accordance with the 2018 Bina Marga Specifications. Furthermore, the 6% OAC value was used as a constant in the manufacture of coconut fiber-modified test specimens as an addition to asphalt to compare the effect of adding 0.25% and 0.50% fiber on the 2×50 and 2×75 impact variations in Table 6.

Table 6: Summary of Optimum Asphalt Content (OAC) with or without Coconut Fiber Modification and Variations in Impact

Optimum Asphalt Content (%)	**Coconut Fiber (%) + Asphalt**	***Density* (gr/cm3) Min 2**	**VIM (%) 3-5**	**VMA (%) Min 15**	**VFA (%) Min.65**	**Stabilitas (kg) Min.1000**	***Flow* (mm) 2-4**
			Impact (2 x 50)				
6,0	0	2,46	4,62	22,93	78,86	2922,20	3,23
	0,25	2,46	5,10	26,9	77,82	2725,84	3,37
	0,50	2,45	5,48	23,16	76,37	2408,64	3,40
			Impact (2 x 75)				
	0	2,45	4,79	24,07	80,34	3818,92	2,83
	0,25	2,47	4,70	28,57	85,21	4197,26	2,97
	0,50	2,45	5,40	25,1	84,63	3994,63	2,93

The Marshall properties presented in Table 6 that variations in compaction energy (2x50 vs 2x75 blows) directly dictate the mixture's volumetric structure, which serves as the fundamental matrix governing long-term oxidative aging. An increase in coconut fiber content from 0% to 0.50% consistently elevates the Voids in Mixture (VIM), peaking at 5.48% under 2x50 blows and 5.40% under 2x75 blows. In asphalt technology, VIM represents the primary gateway for oxygen and ultraviolet infiltration; higher air voids create interconnected macro-pores that accelerate the oxidation of the bitumen matrix, rapidly converting the elastic maltene fraction into brittle asphaltenes. Consequently, the combination of lower compaction energy (2x50 blows) and higher fiber content (0.50%) creates the most vulnerable state for aging, where the accelerated oxidation rate is expected to induce premature embrittlement despite the presence of the fiber reinforcement.

Conversely, applying a higher compaction energy of 2x75 blows acts as a critical defense mechanism that mitigates this oxidation vulnerability. The increased compaction effort forces a tighter mechanical interlocking of the aggregate skeleton and optimizes fiber distribution, as evidenced by a substantial leap in Marshall stability, which reaches up to 4197.26 kg. Even though the VIM values at 2x75 blows remain relatively high due to the space occupied by the fibers, the higher compaction energy alters the internal pore geometry by breaking down interconnected channels into isolated micro-voids. This physical shifting restricts oxygen accessibility throughout the internal pavement structure.

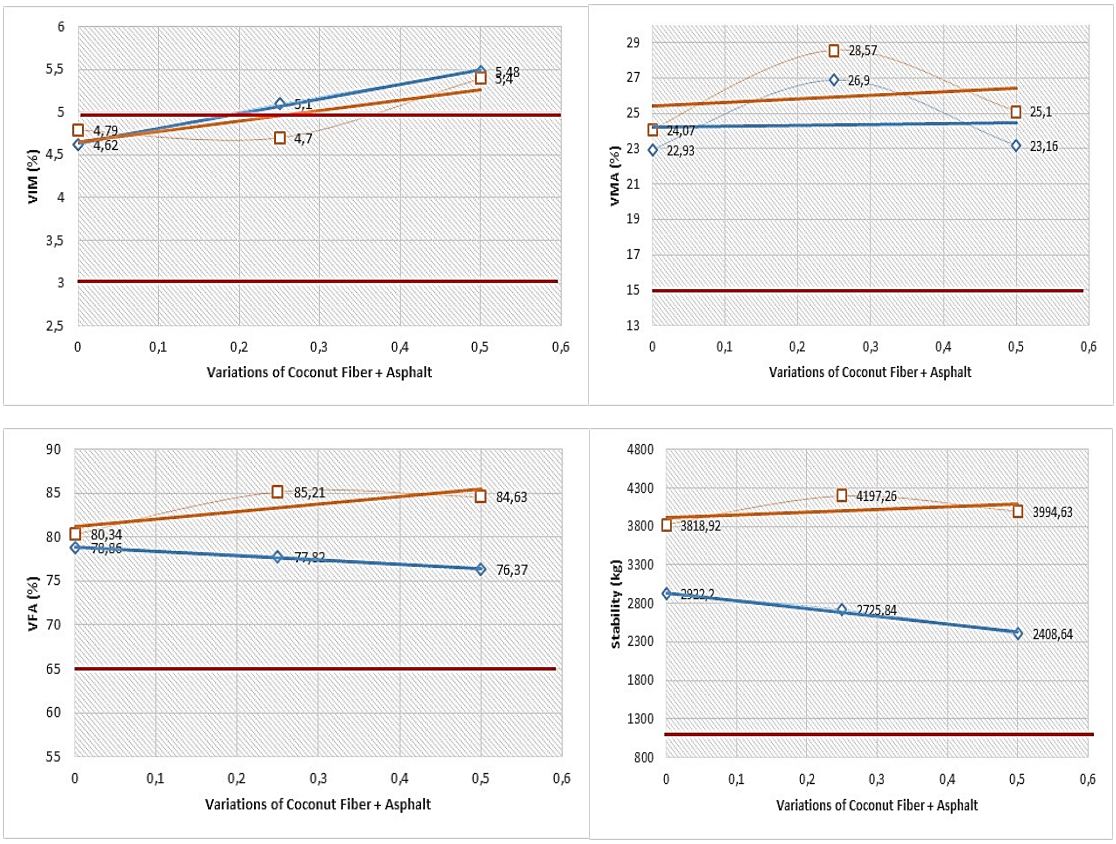

Fig. 5: Phase diagram of OAC with or without Coconut Fiber Modification and Variations in Impact

Therefore, the 2x75 blows compaction series is anticipated to exhibit superior aging resistance, because the dense aggregate matrix shields the asphalt from rapid oxidation, allowing the coconut fibers to effectively exert their micro-reinforcement and crack-bridging capabilities when the binder eventually stiffens.

Effect of Marshall Mix Design at Optimum Asphalt Content with or without Coconut Fiber Modification and Aging Assessment

The selection of impact 2 x 75 for aging testing was based on the effectiveness of the structure's requirements, as shown in Table 6, Therefore, aging analysis on samples with compaction ensures that the measured performance comes from mixtures that have reached the ideal with specifications in Table 7.

Table 7. Summary of Optimum Asphalt Content (OAC) with or without Coconut Fiber Modification and Aging Assessment

Optimum Asphalt Content (%)	Coconut Fiber (%) + Asphalt	*Density* (gr/cm^3) Min 2	VIM (%) 3-5	VMA (%) Min 15	VFA (%) Min.65	Stabilitas (kg) Min.1000	*Flow* (mm) 2-4
			Impact (2 x 75)				
6,0	0	2,45	4,83	26,18	78,75	3962,75	3,07
	0,25	2,45	4,93	30,27	76,17	4901,77	3,10
	0,50	2,40	5,01	33,85	79,81	5017,85	3,90

The aging process has a very contrasting effect on the volumetric properties of the mixture. The Marshall test results at a compaction level of 2x75 blows. The addition of

0.25% and 0.50% coconut fiber shifts the Marshall stability substantially from 3962.75 kg (conventional/0%) to 4901.77 kg and 5017.85 kg, respectively. This profound increase in stability indicates that even when the bitumen matrix stiffens due to aging, the network of coconut fibers provides a strength micro-reinforcement that maintains high structural load-bearing capacity. Concurrently, despite the binder hardening that usually restricts a mixture's plasticity, the flow value increases from 3.07 mm to 3.90 mm at 0.50% fiber content. Consequently, the use of 0.50% coconut fiber is recommended as a strategic solution for sustainable road infrastructure, particularly in extreme climates, as it offers superior resistance to structural aging and reduces the need for premature maintenance.

Summary

This study concludes that the addition of coconut fiber significantly improves the mechanical performance of asphalt mixtures, especially at 2 x 75 impact. The use of 0.25% fiber at 2 x 75 proved to be the optimal point because it produced the highest stability of 4197.26 kg and still met all the volumetric criteria of the 2018 Bina Marga Specifications, including a VIM value (4.70%) that was within the ideal range of 3-5%. Conversely, low compaction at 2 x 50 impact and excessive fiber addition (0.50%) tend to cause voids in the mixture (VIM) to increase beyond the maximum limit of 5%, which risks reducing pavement stability. This improvement proves that coconut fiber effectively functions as a structural reinforcement that strengthens the bond between materials in the asphalt matrix, thereby creating a mixture that is more resistant to traffic loads. The effect of aging shows that coconut fiber acts effectively as a structural reinforcement that maintains asphalt stiffness, where mixture stability increases sharply to 5017.85 kg at a fiber content of 0.50%. Furthermore, analysis through aging assessment simulations shows that coconut fiber plays a crucial role in maintaining the long-term durability of road infrastructure. Despite changes in volumetric parameters such as increased VIM and post-aging flow, stability values show a consistently strong trend, indicating the fiber's ability to inhibit micro-cracks and maintain asphalt elasticity to prevent brittleness. Therefore, modification with coconut fiber is highly recommended to increase road service life and resistance to environmental degradation, making it an economical and sustainable technical solution. Further testing is needed to assess the mixture’s resistance to repeated loading (fatigue) in order to understand the material’s long-term behavior under high traffic volumes.

Abstract. Conventional matchplate manufacturing in sand casting remains heavily dependent on fixed tooling fabricated from wood or polymeric materials, resulting in prolonged lead times, high replacement costs, and limited flexibility during pattern modification. This study proposes a modular matchplate system incorporating a smart slot mechanism that enables rapid pattern replacement, coupled with additive manufacturing technologies for pattern and core fabrication. Fused Deposition Modelling (FDM) is employed to produce interchangeable patterns, while binder jetting is considered for sand core fabrication involving complex internal geometries. The proposed system is evaluated against conventional tooling in terms of dimensional accuracy, production time, and cost efficiency. Quantitative performance indicators demonstrate substantial reductions in tooling lead time and manufacturing cost, alongside improved dimensional fidelity. While the results demonstrate strong potential for educational laboratories and small-batch foundry settings, the present validation remains at prototype level; therefore, industrial-scale scalability and long-term durability require further verification through extended trials and wear assessment.

Keywords: Modular Matchplate, Additive Manufacturing, FDM, Binder Jetting, Sand Casting, Dimensional Accuracy, Tooling Optimisation.

Introduction

Sand casting remains one of the most widely adopted metal forming processes due to its versatility, scalability, and cost effectiveness for low to medium volume production. A critical element within this process is the matchplate, which directly influences mould accuracy, dimensional repeatability, and overall production efficiency. Conventionally, matchplates are fabricated from wood or polyurethane and permanently bonded to specific pattern geometries. As illustrated in Figure 1, traditional casting practices employ various fixed pattern configurations that are tailored to individual components. While such approaches are effective for stable, high-volume production, they are associated with long fabrication lead times, high replacement costs, and limited adaptability when frequent design changes or product variants are required.

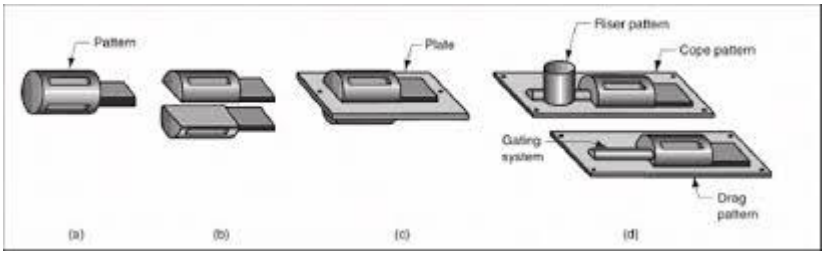

Fig. 1: Types of patterns used in casting processes, illustrating conventional fixed-pattern configurations (from TheEngineeringChoice.com)

Recent advancements in additive manufacturing have introduced new opportunities for tooling innovation within the foundry sector. Technologies such as Fused Deposition Modelling (FDM) and binder jetting have demonstrated the capability to fabricate casting patterns and sand cores with reduced lead times, lower tooling costs, and acceptable dimensional accuracy. These advantages have positioned additive manufacturing as a promising alternative to conventional pattern-making methods. However, existing studies predominantly focus on the direct substitution of traditional patterns with additively manufactured equivalents, without addressing the fundamental limitation of fixed matchplate architectures, which continue to restrict flexibility and rapid pattern exchange.

To address this gap, the present study proposes a modular matchplate architecture incorporating a slot-based interchangeable pattern mechanism, manufactured using additive manufacturing techniques. By decoupling the matchplate base from the pattern geometry, the proposed system enables rapid pattern replacement, minimises production downtime, and enhances operational flexibility. This modular approach extends beyond pattern fabrication alone and introduces a system-level innovation that aligns with the evolving demands of high-mix, low-volume foundry production.

Literature Review

The application of additive manufacturing in foundry tooling has expanded considerably in recent years, driven by the industry's need to shorten tooling lead times while enhancing design flexibility and production efficiency [3]. Numerous studies have reported that polymer-based patterns fabricated using fused deposition modelling offer tangible advantages over conventional wooden patterns, particularly in terms of dimensional consistency, repeatability, and reduced manual intervention during fabrication [6]; [2]. These improvements contribute directly to lower labour requirements and shorter pattern development cycles, which are critical in small batch and customised casting applications.

Early investigations demonstrated that FDM based patterns exhibit superior dimensional accuracy when compared with traditional matchplate patterns, largely due to the elimination of moisture absorption effects, manual finishing variability, and material deformation commonly associated with wooden tooling [6];[2]. In addition, the reduced fabrication time associated with additive manufacturing has been shown to significantly improve overall production responsiveness in foundry operations [3].

Furthermore, recent studies have confirmed the feasibility of employing FDM printed plate patterns for sand casting applications. These works highlight that printing parameters such as layer thickness, build orientation, and infill density play a critical role in determining surface quality, dimensional fidelity, and the overall suitability of printed patterns for casting processes [5]. Optimisation of these parameters is therefore essential to ensure that additively manufactured patterns can reliably meet foundry quality requirements while maintaining the cost and time advantages offered by additive manufacturing technologies.

Parallel to the development of polymer-based pattern fabrication, binder jetting has emerged as a viable technology for producing sand moulds and cores with complex internal geometries that are difficult or impossible to achieve using conventional core-making methods [8]. As illustrated in Figure 2, the evolution of foundry pattern manufacturing has progressed from traditional woodworking and machining-based approaches toward digitally driven additive manufacturing technologies. Experimental studies by Halejcio and Major-Gabryś indicated that binder-jetted sand cores and moulds possess sufficient mechanical properties, including strength and thermal stability, to withstand industrial casting conditions [9].

These findings are further reinforced by industry practice and reports from leading additive manufacturing providers and foundry organisations, which indicate that sand binder jetting has transitioned from primarily a prototyping tool to a mainstream solution for producing complex cores and moulds in low-volume, high-mix production environments [8].Despite these technological advancements, the existing body of literature reveals a clear research gap. Most studies focus on material behaviour, printing accuracy, surface roughness, or mechanical performance of additively manufactured patterns and cores. In contrast, system-level tooling innovations, particularly modular matchplate architectures that enable rapid pattern exchange and operational flexibility, remain largely underexplored. The present study addresses this gap by integrating modular mechanical design principles with additive manufacturing technologies, thereby extending the role of additive manufacturing beyond pattern fabrication to holistic tooling system optimisation.

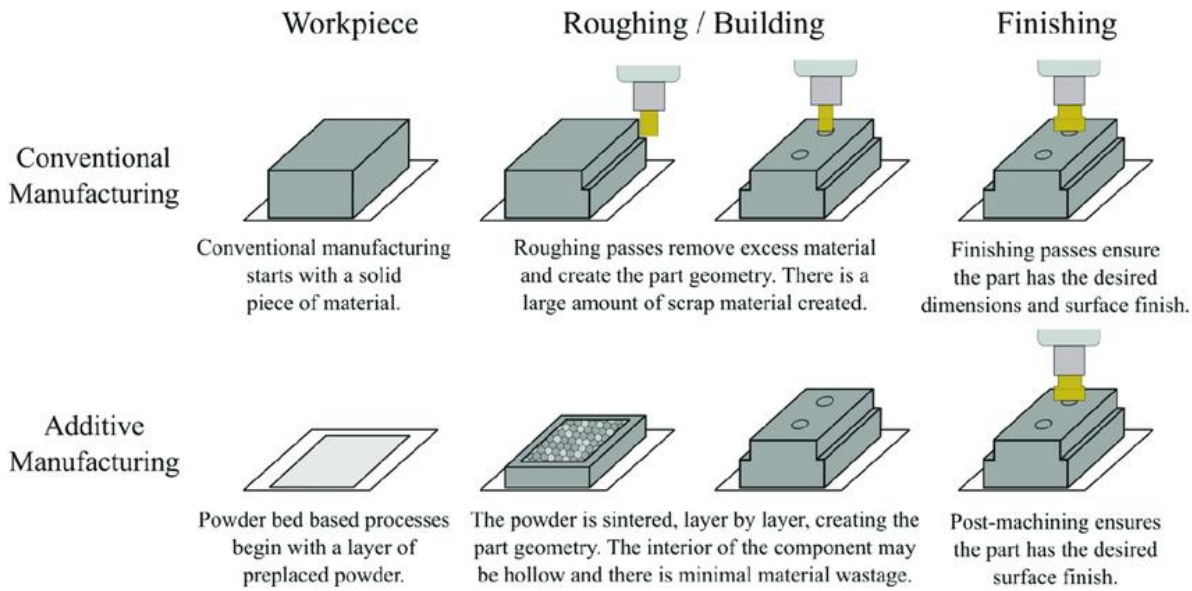

Fig. 2: Evolution of foundry pattern manufacturing technologies from conventional woodworking and fixed tooling to digitally driven additive manufacturing-based pattern and core production. (Tepylo et. al., 2019)

Research Objectives

The objectives of this study are:

1. To design a modular matchplate incorporating a slot-based mechanism for rapid pattern replacement.

2. To fabricate interchangeable patterns using FDM and assess the applicability of binder-jetted sand cores for complex geometries.
3. To quantitatively evaluate the proposed system in terms of dimensional accuracy, production time, and cost efficiency compared to conventional matchplates.

Methodology

Modular Matchplate and Slot Design

The modular matchplate was designed using computer-aided design software with emphasis on interchangeability, structural integrity, and ease of assembly. The slot mechanism enables the insertion and removal of patterns without dismantling the entire matchplate.

The clearance tolerance between the slot and pattern insert is defined as:

$$Tslot = Dslot - Dinsert$$

Where $Dslot$ is the slot dimension and $Dinsert$ is the pattern insert dimension. To ensure mould stability during sand compaction, the following condition must be satisfied:

$$0 < \mathrm{Tslot} \leq \mathrm{Tmax}$$

where Tmax represents the maximum allowable clearance determined through empirical mould stability considerations.

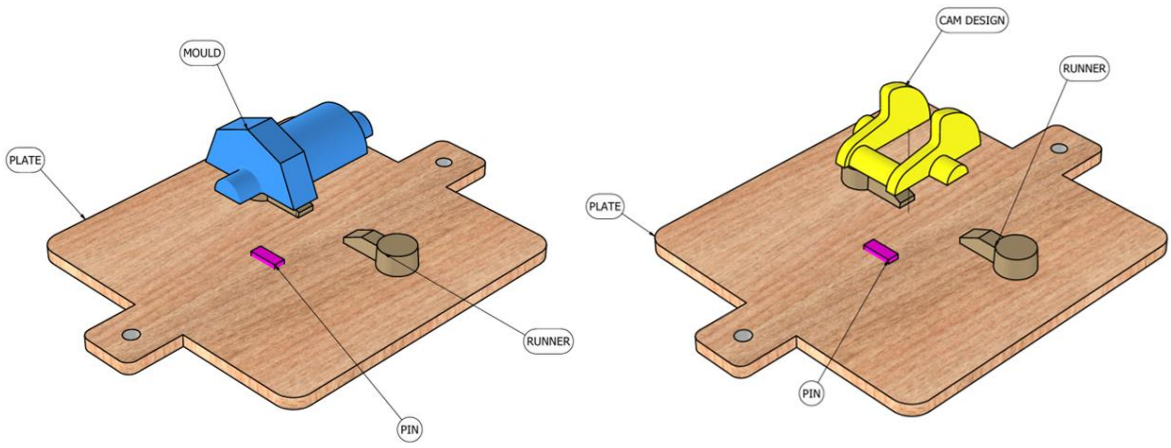

Fig. 3: Exploded CAD view of modular matchplate showing slot(pin) mechanism and interchangeable pattern insert with tolerance zones.

FDM Pattern Fabrication

Interchangeable patterns were fabricated using FDM technology with thermoplastic materials such as PLA or ABS. Printing parameters including layer thickness, infill density, and build orientation were optimised to balance surface quality and dimensional stability.
Surface roughness is influenced by layer thickness and raster orientation and can be approximated by:

$$Ra \propto s\frac{h}{sin\,\theta}$$

where h is the layer thickness and θ is the raster angle.

Binder Jetting for Sand Core Fabrication

For components requiring complex internal cavities, binder-jetted sand cores were considered. The process involved selective deposition of binder onto sand layers to form geometrically complex cores compatible with the modular matchplate system.

Performance Evaluation

Dimensional Accuracy

Dimensional measurements were conducted using a calibrated digital vernier caliper with an accuracy of ±0.01 mm. Prior to measurement, the instrument was verified using standard gauge blocks to ensure measurement reliability.

For each tooling method, three identical samples were fabricated and each critical dimension was measured three times to minimise random measurement error. The average value was recorded as the final measurement.

Measurement uncertainty was considered by evaluating the standard deviation across repeated measurements. The results are reported in the form of mean ± standard deviation to ensure statistical reliability.

$\Delta_d = | D_{measured} - D_{CAD} |$

The mean dimensional deviation is given by:

$$\overline{\Delta d} = \frac{1}{n}\sum_{\{i=1\}}^{\{n\}} | D_i^{measured} - D_i^{CAD} |$$

Time Efficiency

The time reduction achieved through the modular system is defined as:

$$\eta t = \frac{T_{conv} - T_{mod}}{T_{conv}} \times 100$$

where T_{conv} and T_{mod} denote conventional and modular pattern change times, respectively.

Cost Analysis

Total tooling cost is expressed as:

$$C_{total} = C_{material} + C_{labour} + C_{machine}$$

Cost reduction efficiency is calculated as:

$$\eta_c = \frac{C_{conv} - C_{AM}}{C_{conv}}\ x\ 100$$

The overall research framework adopted in this study is illustrated in Figure 4, outlining the sequential stages from modular CAD design and additive manufacturing to assembly and performance evaluation.

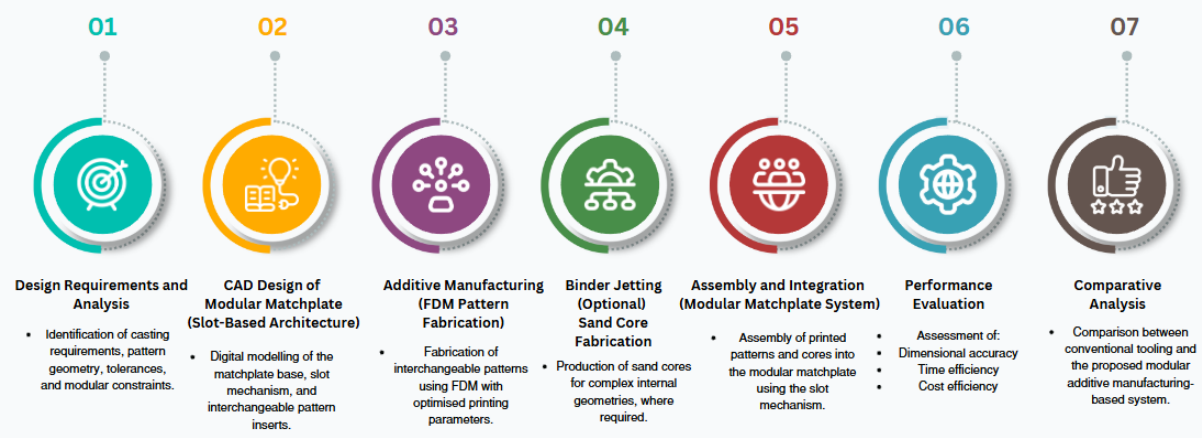

Fig. 4. Research framework illustrating the design, fabrication, assembly, and performance evaluation stages of the proposed modular matchplate system integrating additive manufacturing technologies.

Results and Discussion

Dimensional Accuracy Performance

The comparative dimensional accuracy results are summarised in Table 1. Conventional matchplates exhibit the highest dimensional deviation, with an average error of ±0.50 mm. Patterns fabricated using FDM demonstrate a substantially lower dimensional deviation of ±0.20 mm, representing an improvement of approximately 60% relative to conventional tooling. Hybrid tooling achieves an intermediate dimensional deviation of ±0.25 mm, indicating that the introduction of the modular slot mechanism does not compromise dimensional stability. Binder-jetted sand cores exhibit a dimensional deviation of ±0.30 mm, which remains acceptable for applications prioritising complex internal geometries.

Table 1. Comparison of time, cost, and dimensional accuracy across tooling approaches (n = 3 samples per method; r = 3 repeat readings per dimension per sample)

Method	Time (hours)	Cost (RM)	Dimensional Error (mm)	n (samples)	r (repeats)
Conventional	24	1000	±0.50	3	3
3D Printing (FDM)	8	400	±0.20	3	3
Hybrid Tooling	12	600	±0.25	3	3
Binder Jetting (Core Sand)	10	700	±0.30	3	3

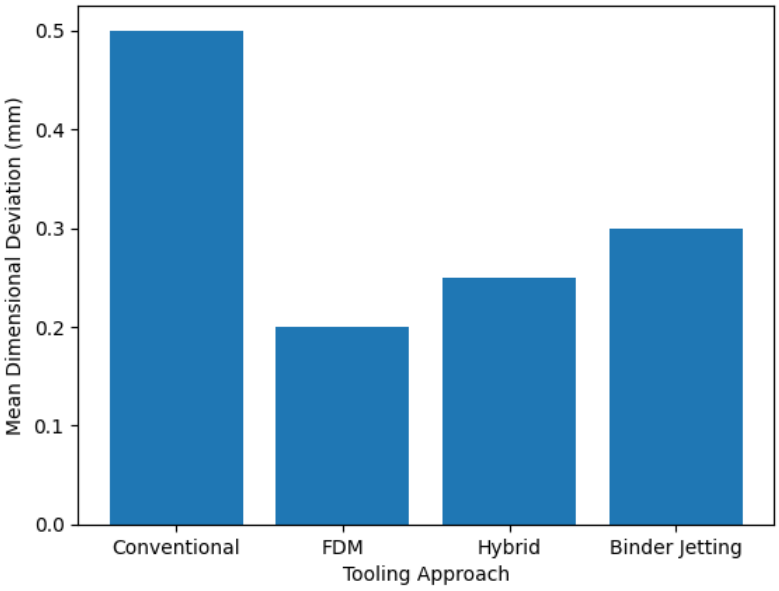

Fig. 5: Comparison of mean dimensional deviation for conventional tooling, FDM-printed patterns, hybrid modular tooling, and binder-jetted sand cores.

Hybrid tooling, which integrates additively manufactured pattern inserts into a conventional matchplate base, achieves an intermediate dimensional deviation of ±0.25 mm. Although slightly less accurate than fully FDM-fabricated patterns, this result demonstrates that the introduction of a modular slot mechanism does not compromise dimensional stability and remains significantly superior to fully conventional tooling. Binder-jetted sand cores exhibit a dimensional deviation of ±0.30 mm, which, while higher than polymer-based patterns, remains acceptable for applications involving internal cavities where geometric complexity is prioritised over surface precision.

These findings are consistent with laser-scanning-based dimensional assessments reported by Ashok et al., who observed comparable improvements in dimensional fidelity for PLA-based casting patterns. Importantly, the present study extends previous work by confirming that dimensional accuracy gains are preserved even when patterns are integrated into a modular matchplate architecture.

Time Efficiency and Pattern Replacement Performance

Beyond dimensional accuracy, Table 1 also highlights substantial reductions in tooling preparation and pattern replacement time when adopting the proposed modular matchplate system. Conventional matchplates require approximately 24 hours for fabrication and setup, largely due to manual pattern making, alignment, and finishing procedures. In contrast, FDM-printed patterns reduce this duration to 8 hours, corresponding to a 66.7 percent reduction in lead time.

To quantitatively express this improvement, the time efficiency index η_t was calculated relative to conventional tooling and is summarised in Table 2. As shown in Table 2, FDM-based tooling achieves the highest time efficiency, followed by binder jetting and hybrid tooling. Hybrid tooling requires 12 hours, reflecting the additional time associated with assembling the modular base and inserts, yet still achieves a 50 percent reduction in preparation time compared to conventional methods. Binder-jetting-based core production

requires approximately 10 hours, including printing and post-processing, and remains significantly faster than traditional multi-part core fabrication techniques.

$$\eta t = \frac{T_{conv} - T_{mod}}{T_{conv}} \times 100$$

using baseline from Table 1: $T_{conv} = 24\ hours$, $T_{conv} = RM\ 1000$

Table 2: Time efficiency index ηt relative to conventional tooling

Method	**Time, T (hours)**	**Time reduction (hours)**	**ηt (%)**
Conventional	24	0	0.0
3D Printing (FDM)	8	16	66.7
Hybrid Tooling	12	12	50.0
Binder Jetting (Core Sand)	10	14	58.3

The combined time efficiency trends are further illustrated in Figure 6, which demonstrates the effectiveness of the slot-based modular architecture. By isolating pattern replacement to a single interchangeable insert, the system eliminates the need for full matchplate reconstruction, thereby reducing downtime during design changes. This behaviour aligns closely with rapid tooling principles reported by Badger Alloys and Modern Casting, where modularity is identified as a key enabler for improving responsiveness in high-mix production environments.

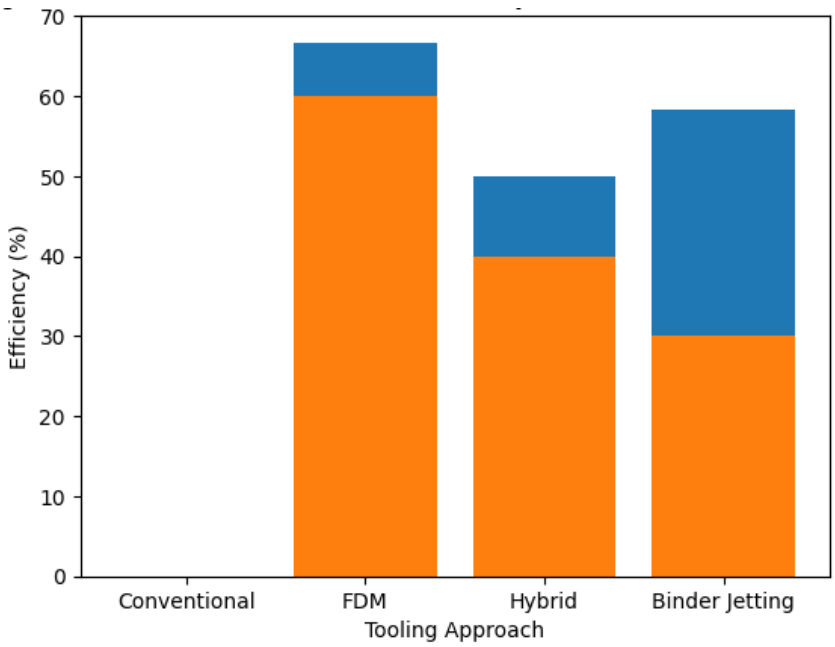

Fig. 6: Time and cost reduction efficiency relative to conventional tooling

Beyond fabrication time, the operational benefit of the modular system becomes more pronounced during repeated pattern changes. While conventional tooling incurs cumulative delays with each design modification, the proposed system maintains consistent replacement times, thereby offering scalability advantages for educational laboratories and industrial foundries handling frequent product variations.

Cost Efficiency Analysis

From an economic perspective, the adoption of additive manufacturing and modular tooling yields notable cost advantages. As reported in Table 1, the total cost of conventional matchplate fabrication is approximately RM 1000, driven primarily by material waste, labour intensity, and extended machining time. In comparison, FDM-based tooling reduces the total cost to RM 400, corresponding to a 60 percent cost reduction.

To formally quantify these savings, the cost efficiency index η_c was calculated and is presented in Table 3. Table 3 indicates that FDM-based tooling achieves the highest cost efficiency, followed by hybrid tooling and binder jetting. Hybrid tooling incurs a moderate cost of RM 600, reflecting the combined use of conventional and additively manufactured components, while offering a practical transition pathway for foundries gradually adopting additive manufacturing technologies. Binder-jetted sand cores exhibit a higher cost of RM 700, primarily due to specialised sand and binder materials; however, this cost is partially offset by the elimination of complex core assembly processes and the ability to fabricate intricate internal geometries in a single build.

Table 3: Cost efficiency index η_c relative to conventional tooling

Method	**Cost, C (RM)**	**Cost reduction (RM)**	**ηc (%)**
Conventional	1000	0	0.0
3D Printing (FDM)	400	600	60.0

Hybrid Tooling	600	400	40.0
Binder Jetting (Core Sand)	700	300	30.0

These cost trends are consistent with industrial case studies reported by 3D Systems, which documented cost savings ranging from 50 to 90 percent depending on tooling complexity and production volume. The present findings further indicate that cost efficiency is enhanced when additive manufacturing is integrated within a modular tooling framework rather than applied solely as a direct replacement for conventional patterns.

System-Level Contribution and Comparison with Existing Studies

While previous sections examine individual performance metrics, a system-level comparison is necessary to evaluate the overall effectiveness of the proposed approach. Accordingly, Table C presents a consolidated comparison of dimensional accuracy, time efficiency index ηt, and cost efficiency index ηc for all tooling strategies considered in this study.

The combined performance trends shown in Table 4 and Figure 6 confirm that FDM-based modular tooling offers the most balanced improvement across all evaluated criteria. Hybrid tooling provides a compromise solution with moderate gains in accuracy, time, and cost, while binder jetting prioritises geometric complexity and design freedom at the expense of slightly reduced cost efficiency. Collectively, these results demonstrate that the proposed modular matchplate system enables a shift from static, component-specific tooling toward a flexible and reconfigurable production platform.

Unlike prior studies that focus primarily on material characterisation or process optimisation, the present work contributes a system-level tooling innovation by integrating mechanical modularity with additive manufacturing. By simultaneously improving dimensional accuracy, reducing lead time, and lowering cost, the proposed system demonstrates that additive manufacturing can transition from a prototyping aid to a functional, production-ready solution for modern foundry applications.

Table 4: Combined efficiency view for reporting

Method	**Dimensional error (mm)**	**ηt (%)**	**ηc (%)**
Conventional	±0.50	0.0	0.0
3D Printing (FDM)	±0.20	66.7	60.0
Hybrid Tooling	±0.25	50.0	40.0
Binder Jetting (Core Sand)	±0.30	58.3	30.0

Conclusion

This study has presented a modular matchplate system integrating a slot-based interchangeable pattern mechanism with additive manufacturing technologies for sand casting applications. The proposed system addresses the inherent limitations of conventional

fixed matchplates by decoupling pattern geometry from the matchplate base, thereby enabling rapid pattern replacement and improved operational flexibility. Experimental evaluation demonstrates that additively manufactured patterns, particularly those produced using Fused Deposition Modelling, achieve superior dimensional accuracy compared to conventional tooling, with a reduction in dimensional deviation of up to 60 percent. The integration of modular tooling does not compromise dimensional stability, confirming the robustness of the proposed slot-based architecture. In addition, significant reductions in tooling preparation time and cost were achieved, with time efficiency and cost efficiency indices indicating improvements of up to 66.7 percent and 60 percent, respectively, relative to conventional matchplates.

The system-level comparison further confirms that the proposed modular matchplate provides a balanced improvement across accuracy, time, and cost metrics. While binder-jetted sand cores incur higher material costs, their ability to fabricate complex internal geometries without assembly offers a valuable trade-off for specialised applications. Overall, the findings demonstrate that combining modular mechanical design with additive manufacturing extends the role of digital fabrication beyond pattern replacement toward holistic tooling system optimisation. The proposed approach is particularly suitable for high-mix, low-volume production environments, rapid prototyping scenarios, and educational foundry laboratories where frequent design iteration is required. By enabling flexible, cost-effective, and accurate tooling, this work contributes a practical pathway for transitioning additive manufacturing from a prototyping aid to a functional, production-ready solution with potential for modern foundry operations.

However, it is important to note that the current findings are limited to prototype-level validation. At this stage, no industrial-scale testing has been performed. Furthermore, long-term durability and wear analysis of the additively manufactured patterns under repeated moulding cycles have not been conducted, which remains a limitation of this study.

Future Recommendations

To further enhance the applicability and performance of the proposed modular matchplate system, the following recommendations are suggested:

- Investigate the use of advanced thermoplastic materials, such as fibre-reinforced polymers or high-temperature composites, to improve wear resistance and thermal stability of FDM-printed patterns.
- Conduct long-term durability and repeatability studies to evaluate dimensional stability and surface degradation under repeated moulding and compaction cycles.
- Optimise slot geometry and locking mechanisms through finite element analysis to further improve structural integrity during sand compaction.
- Extend the evaluation to include surface roughness and casting quality metrics to establish direct correlations between pattern fabrication method and final casting performance.
- Integrate automation elements, such as quick-release mechanisms or robotic pattern handling, to further reduce downtime during pattern exchange.
- Assess the scalability of the modular system for industrial production by evaluating performance under higher production volumes and varied casting materials.
- Explore hybrid digital workflows combining real-time scanning, digital twins, and adaptive tooling updates to enable closed-loop optimisation of pattern design and fabrication.

Abstract. Hydraulic jack is a very important tool to assist individuals in maintenance process. This project is about the design and development of automatic hydraulic jack with safety sensors system which is aiming to improve safety and efficiency. The conventional jacks nowadays still exposed the user to danger because of the instability and dependence on external power sources. This project methodology involves modifying an existing hydraulic jack by adding safety sensors to detect vehicle stability. The sensor will continuously monitor the vehicle and will activate the buzzer when it detects object within 10cm from the sensor. To detect abnormal movement or pressure loss on the hydraulic car jack, the sensor is programmed to be able to activate an automatic halt to the lifting process which will prevent serious accidents from happening. The results show that this technological integration improves user safety, enhances ease of use compared to conventional jacks, making this a reliable tool for car repair shops and any user.

Keywords: Automatic hydraulic car jack, safety sensor, programmed

1. Introduction

A hydraulic jack is a mechanical device used to lift heavy loads by applying force through hydraulic pressure. It operates based on Pascal's principle, which states that pressure applied to a confined fluid is transmitted equally in all directions. Furthermore, these jacks are widely used in automotive, construction, and industrial applications due to their efficiency, high lifting capacity, and ease of operation. The major problem with the hydraulic jack nowadays is the lacks of safety mechanism to ensure safety lifting can be done. Besides, the current jack is slow to extend can decrease the work productivity in the workshop thus affecting the maintenance process [1]. There are a few types of lifting jacks including bottle jacks and floor jacks, each designed for specific tasks. Their reliability and ability to lift substantial weights with minimal effort make them essential tools in various fields. One of the major advantages of hydraulic jacks is their high lifting capacity and efficiency compared to mechanical jacks. The primary purpose of this project is to develop a highly efficient, user friendly, and automated lifting mechanism that's eliminates the need for manual effort while enhancing safety and precision. This system is design to reduce human labor, save time, and improve operational efficiency, making it especially useful in the automotive, industrial, and construction sectors.

Throughout history, hydraulic jacks were used in the automobile world even in the early 20th century when its revolutionized ways to lift and repair vehicles. Before that, people relied on mechanical screw jacks and ratchet jacks, which required a large manual effort and had to be slow and very annoying in times of use. [2] The first patent for the hydraulic lift for the servicing of vehicles was obtained by inventor Peter Lunati in 1925. This was yet another innovation making it easy and, most importantly, trying for lifting vehicles for repairs. [3] Hydraulic jacks are continuing to improve with innovations in smart technology, sensors, and automation to be used even more efficiently. From professional garages to roadside emergencies, hydraulic jacks have become an integral tool for making vehicle maintenance quicker, safer, and more available to everyone. [4]

Mithill.R et al [5] their project is done by converting the conventional hydraulic jack into automated hydraulic jack by using linkage mechanism with a help of a motor. Such that the vehicles can be lifted from the floor land without the application of impact force. More D.R[6] design and fabricate a motorized hydraulic jack system. They use a wiper motor to drive the hydraulic jack loading subsequently and automatically. Their aim is to increase the simplicity of the jack operation in order to help those who are physically challenged, aged person. Besides that, Jadhav S.S[7] project deals with design and fabrication of automatic hydraulic car lifting attachment with the help of hydraulic cylinder. Their aim is to helps physically handicapped person, lady's person or aged person to use less force to operates the hydraulic jack.

Meanwhile, automatic hydraulic jack features an electric motor that can rotate the jack handle and activate the pump mechanism. An electric motor is a machine that transforms electrical energy into mechanical energy, usually utilizing electromagnetic principles. Most electric motors generate mechanical torque through the interaction between current-carrying conductors and a magnetic field, where the current flows perpendicular to the field. [8] It operates by converting electrical energy from a 12V DC power source, typically a car battery, into mechanical motion, driving a screw mechanism to lift the vehicle. [9]

Azeez O.R[10] designed an automatic hydraulic jack that serves numerous purposes in auto-servicing activities. For the fabrication, its utilized locally sourced materials to lower production costs and minimize stress and injuries related to manual hydraulic jack operation. Then, the hydraulic jack unit, transmission unit, DC motor unit, and control unit are the key elements for the products. Yekinni A.A [11] utilizes a rack and pinion principle to develop a heavy-duty vehicle lifter. The gear is meshed with another gear which is connected to an electric motor. This mechanism is used to convert the rotary motion of the electric motor to the linear motion of the jack. Moreover, the jack is powered by a D.C electric motor which is capable to lift up to 2000 Kg (2 tons) using simple control switches connected to the electric motor and cigarette lighter receptacle powered by 12 V battery of the vehicle.

2. Methodology

2.1. Method and material

The methodology for developing an automatic hydraulic jack involves several key stages, including design, component selection, system integration, and testing. Initially, the design phase focuses on creating a structural framework that supports the hydraulic mechanism while ensuring stability and durability. To achieve efficient lifting operations, hydraulic pump, cylinder, valves, and control system, is a crucial component. The system integration process involves assembling these components and incorporating automation features, such as sensors and push button for a hands-free operation. Furthermore, a programmed control unit regulates the hydraulic fluid flow to ensure smooth and precise lifting and lowering of the jack. Finally, the testing phase evaluates the jack performance under different loads and conditions to ensure safety, reliability, and efficiency. Then, adjustments and optimizations are made based on test results to enhance the system overall functionality perfectly.

Table 1: List of material

NO	PARTS	SPECIFICATION	QUANTITY
1	Steel bar (hollow)	50mm x 30mm x 2mm	1
2	Steel bar	50mm x 30mm	1
3	Hydraulic Jack	2000 kg	1
4	Battery	12v	1
5	Arduino	UNO R3	1
6	Ultrasonic sensor	HC-SR04	3
7	Power window motor	2.9 N.m	1

2.2. Fabrication and assembly technique

Metal cutting is the process of removing excess material from a metal block using a cutting tool. In order to built a base for the product, steel bar is cut into four pieces which 50cm length for each piece. Then, the bar is welded to a rectangle steel bar that act as the outer base of the unit. The base is able to withstand 4905 Nm stress apply to it. After finish build the base, the components need to be attached on it. The attachments used a drilling technique by producing cylindrical openings on the steel bar by using a drill bit. The components involve in the drilling process are hydraulic jack, power window motor, battery, digital screen, and Arduino. It is crucial to analyze the suitable position for each component to place on the steel base to make sure it would not interfere with the overall

operation. Hydraulic jack and power window must be place together due to it function for the lifting process.

2.3. Product design

Using AutoCAD software to design the illustration of the project for this hydraulic jack which consist of battery, Arduino set, hydraulic jack, electric motor and steel base. Steel base will be the foundation of the system and also ensure that it is stable and sturdy. 12V battery is used to power up this entire system. The hydraulic jack part is design at the front of the base to ease the space for the lifting process being done. Electric motor is an electrical device responsible for converting electrical energy into the mechanical motion required to raise and lower the hydraulic jack. This motor located near the hydraulic jack to minimize the connection in the system. Meanwhile, the Arduino set is design to be opposite to the hydraulic jack to avoid damage to the unit. This unit is the brain of the system. It takes input from the sensors and sends output signals to the motor driver. The sensor is mounted at the front of the steel base so that it can detect the movement efficiently so that the buzzer will be triggered and the jack will automatically stop lifting. Lastly, a switch is placed at the very front of the part to ensure it is easy to reach during operation of the system.

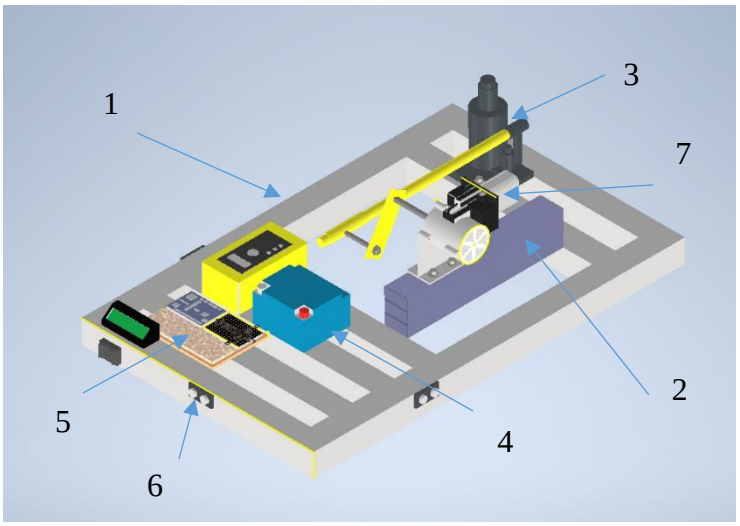

Fig. 1: Final design of automatic hydraulic jack

3. Results and discussion

Based on the testing being made, this automatic hydraulic give a better performance compared to the conventional hydraulic jack. The lifting time needed for this jack to fully extend is 10% faster than a conventional jack. The testing using safety sensor installed which detect unstable movement to the vehicle. When the sensor triggered, the system will automatically stop lifting to prevent accidents. Buzzer activates automatically when an

object is detected within 10cm for safety warning. The control and safety features are driven by the inexpensive and versatile Arduino UNO R3. The maximum height reach for this automatic hydraulic jack is 96.5mm which is a bit lower compared to the conventional jack. This system needs a high-power option. The choice of 12v battery to supply the power to the system is the most suitable with cost and efficiency. A 25 cm metal rod is connected between the hydraulic jack and the power window motor to convert rotary motion to linear motion. It also provides enough force for the hydraulic jack for the lifting process. From the calculation being made below.

Load force:

$$Force = Mass \times gravity \tag{1}$$

$$Force = 2000\ kg \times 9.81\ m/s^2$$

$$Force = 19620\ N$$

Hydraulic jack ratio is 15:1:

$$F_{motor} = \frac{Load\ Force}{Hydraulic\ ratio} \tag{2}$$

$$F_{pump} = 19620/15$$

$$F_{pump} = 1308\ N$$

Power window motor force required:

$$F_{motor} = F_{pump} \times \left(\frac{d_{piston}}{d_{lever}}\right) \tag{3}$$

Where:

F_{motor} = Force for power window motor

F_{pump} = Force for pump

d_{piston} = Distance from pivot to piston

d_{lever} = Length of the rod

$$F_{motor} = 1308 \times \left(\frac{2.5}{25}\right)$$

$$F_{motor} = 130.8\ N$$

The load force needed for the hydraulic jack is approximately 19620 N. To exert this force, hydraulic jack needs to supply 1308 N of force to push down the small pump piston. For electric motor to supply 1308 N of force to the hydraulic pump, it needs generate 130.8 N. The power window motor used in this setup is capable enough to achieve the force needed.

Table 2: Automatic Hydraulic Jack Performance Review

NO	CRITERIA	DESCRIPTION	RESULTS
1	Safety sensor detection distance	Distance at which it detects foot or object	Buzzer activates automatically when an object is detected within [10cm] for safety warning
2	Lifting time	Time for the jack to lift up the vehicle fully	The jack will be fully extended within 22 second which is 28 second faster than manual jacking
3	Maximum height to lift a vehicle	The maximum height for the jack to lift the vehicle or object	The maximum height is [96.5mm]

From Table 1 above, three criteria have been measured on the automatic hydraulic jack. First criteria which is the safety sensor detection distance, the results demonstrate that the safety sensor consistently triggers the warning buzzer at a distance of 10 cm from the hazard. 10cm threshold is a significant distance for the sensor to react to any foreign object which will indirectly serves as a preventative measure against injury due to the improper jack placement. For the lifting time, it is among crucial part in a vehicle jacking system. This system has successfully achieved full lift in 22 seconds. When compared to the control data for manual jacking, the automated system demonstrates a greater time efficiency which is 28 seconds faster than manual jacking. The findings indicate that the maximum height for the jack to lift the vehicle is 96.5mm. This result confirms that the hydraulic mechanism is capable of sustaining the load through the necessary stroke length required for standard maintenance. The consistency of this height ensures that the vehicle is raised to a predictable level, preventing over-extension instability while guaranteeing that the tire clears the road surface effectively.

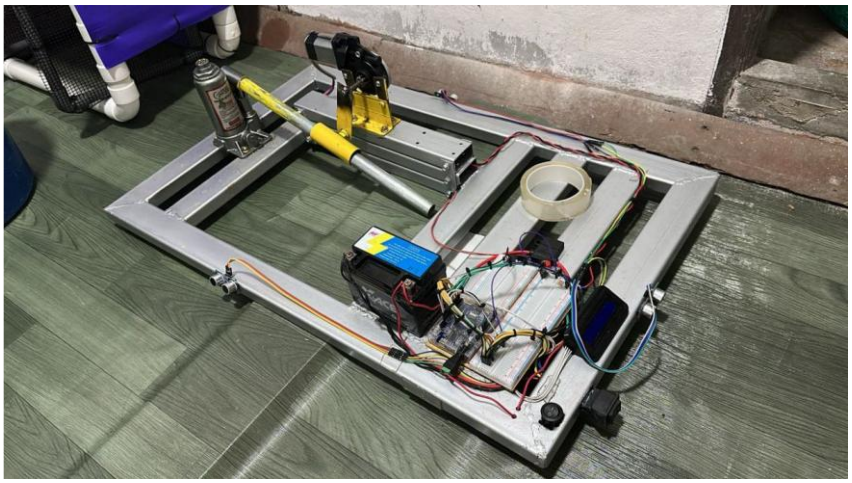

Fig. 2: Prototype of automatic hydraulic jack

4. Conclusion

In this project, the primary objectives which is to eliminate the physical burden of manual jacking and to significantly enhance operational safety have been achieved by the safety sensor equipped in the system. The experimental results also show a better performance compare to the traditional method. Automated jack is faster to achieved full extension that can greatly impact by reducing the time required for roadside repairs. Furthermore, the maximum lift height of 96.5mm confirms the system's capability to provide sufficient clearance for standard tire maintenance while maintaining structural stability. The implementation of proximity sensors and a tilt monitoring system ensures that the operation halts immediately if instability is detected or if an object breaches the 10cm safety threshold. The resulting device offers a reliable, user-friendly, and safe alternative to manual jacks. Future recommendation could focus on increasing the maximum lift height of the automated jack for better operation and comfort during repairs.

Abstract. This study discusses the design, development, and evaluation of *PowLinkBudget*, a mobile application developed to support the learning of polytechnic diploma students that enrolled in DFN40232: Fiber Optic Communication System course. The main objective of developing this application is to help students verify the accuracy of their calculations while also increasing their interest and motivation in designing fiber optic communication systems, which are often considered difficult due to the involvement of complex technical and mathematical concepts. The *PowLinkBudget* application was developed using Android Studio and designed with a user-friendly interface and an automatic calculation function based on the inputs provided by students. The application was implemented and tested among fourth-semester students, and the study results showed a significant improvement in performance in the final assessment related to this topic, increasing from 32% to 85%. These findings demonstrate that *PowLinkBudget* is not only effective as a digital learning aid but also serves as a catalyst for motivating students to engage more actively and deeply in understanding fiber optic communication systems.

Keywords: Fiber Optic Communication Systems, Power Link Budget, Loss Analysis

Introduction

Power Link Budget calculations are a fundamental component in fiber optic communication systems, requiring students to analyze multiple parameters such as attenuation, connector losses, splice losses, and system margins. Despite their importance, students often struggle with accuracy and conceptual understanding due to the complexity of the calculations involved.

The difficulty in mastering power link budget analysis is further compounded by the need for strong mathematical skills and the ability to interpret multiple interrelated variables simultaneously. Traditional teaching methods, which often rely on manual calculations and static examples, may limit students' ability to fully grasp the underlying concepts, leading to reduced confidence and lower academic performance.

In recent years, mobile learning has emerged as an effective approach to support technical education by providing flexible and interactive learning environments [1].

The integration of digital tools into engineering education enables students to visualize complex concepts and perform computations more efficiently, and engage more actively in the learning process beyond the classroom setting.

Mobile applications, in particular, offer significant advantages such as portability, real-time feedback, and user-centered design. These features allow students to learn at their own pace while reinforcing their understanding through repeated practice and instant validation of results, making them especially suitable for complex technical subjects such as fiber optic communication systems.

This study introduces *PowLinkBudget*, a mobile application designed to simplify power link budget calculations and enhance student learning experience [1][2]. The purpose of this study is to develop and evaluate the effectiveness of the application in improving calculation accuracy, increasing student motivation, and enhancing conceptual understanding by bridging the gap between theoretical knowledge and practical application through automated computation and interactive learning features.

Problem Statement

Learning Power Link Budget in the Fiber Optic Communication course presents several challenges for students. One key issue is the heavy reliance on manual calculations, which often leads to computational errors due to carelessness and incorrect substitution of values into equations. In addition, students tend to experience low confidence when solving complex numerical problems in this topic. Traditional teaching approaches further contribute to limited engagement and understanding among learners. Therefore, students may have difficulty in understanding the concepts and performing well in power link budget analysis.

Objective

The objectives of this study are:

1. To enable automated verification of power link budget calculation accuracy.
2. To enhance student engagement and motivation in learning complex fiber optic concepts.
3. To develop an accessible mobile learning platform for technical education.

Significance of the Study

This study contributes to engineering education by integrating mobile technology into the learning of fiber optic communication systems. The developed application minimizes calculation errors and promotes self-directed learning, enabling students to independently verify and validate their solutions with greater accuracy. This supports the development of problem-solving skills, which are essential in technical disciplines.

Furthermore, the use of a mobile platform supports flexible and continuous learning, allowing students to access the application anytime and anywhere. This flexibility

enhances learning opportunities beyond the traditional classroom environment and makes complex technical content more approachable. As a result, students are able to engage more actively with the subject matter and reinforce their understanding through repeated practice.

In addition, this study demonstrates the effectiveness of digital tools in improving both cognitive understanding and student motivation in technical subjects. The integration of interactive features and automated feedback not only enhances comprehension but also encourages greater interest in learning. Consequently, the application serves as a valuable educational tool that supports both teaching and learning processes in fiber optic communication courses.

Literature Review

Previous studies have explored various technological and instructional approaches to enhance learning experiences, particularly in technical and vocational education.

The importance of mobile learning in enhancing students' understanding, particularly in technical and computation-based subjects. Mobile learning applications provide flexibility, accessibility, and opportunities for self-paced learning, which can significantly improve students' engagement and academic performance [3]. In addition, interactive mobile learning tools have been shown to support active learning by enabling students to practice problem-solving tasks with immediate feedback, thus reducing errors and improving conceptual understanding [4].

In addition, the integration of interactive features such as real-time feedback, guided problem-solving, and automated computation has been found to significantly improve learning outcomes. Technology-supported learning tools help reduce dependency on manual calculations and minimize computational errors, especially in subjects involving complex mathematical operations [5], [11]. These tools also reduce cognitive load, allowing students to focus more on conceptual understanding rather than procedural tasks [12].

In the context of technical education, there are some subjects that involving numerical computation would give students difficulties due to the complexity of formulas and the high likelihood of calculation errors. Studies have shown that technology-supported learning tools, such as mobile-based applications and digital calculators, can assist students in performing accurate computations while enhancing their confidence in solving complex problems [6]. These tools not only reduce cognitive load but also allow students to focus more on understanding the underlying concepts rather than manual calculations.

Definitely in fiber optic education, previous research has explored the use of digital and interactive tools to support learning. For instance, virtual reality (VR) has been used to simulate practical fiber optic installation processes, allowing students to experience real-world scenarios in a controlled environment [7]. Similarly, augmented reality (AR) applications have been developed to provide interactive visualizations that enhance students' understanding of fiber optic tools and concepts [8]. However, despite

these advancements, there remains a lack of tools that directly support computational tasks such as power link budget analysis.

Therefore, this study aims to address this gap by developing a mobile learning application that focuses on improving students' performance in power link budget calculations. By integrating automated computation and interactive learning features, the proposed application is expected to enhance students' understanding, reduce calculation errors, and improve overall learning outcomes.

Methodology

The methodology of this study consists of two main components, there are application development and research design.

4.1 Application Development

Fig. 1 illustrates the application development process adopted in this study. The process begins with requirements analysis, where learning challenges and user needs are identified. This is followed by system design, which includes the development of system architecture, user interface, and the calculation model. The application is then implemented using Android Studio, incorporating an automated calculation engine. Finally, testing and refinement are conducted to ensure functionality and usability before producing the final application.

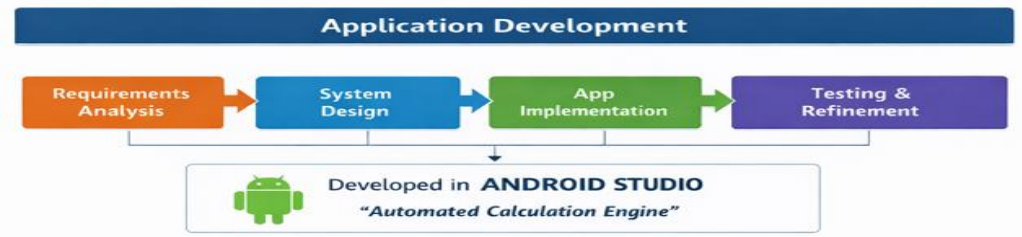

Fig. 1: Application Development Phase

4.1.1 Requirements Analysis

During the Requirements Analysis phase, the key challenges in power link budget calculation were determined, where the student's faced difficulty in identifying the vital input parameters. The data of students' performance and common errors during problem-solving activities were collected. The system requirements were identified based on this analysis. There is the need for an automated calculation feature and an interactive interface to support student learning and reduce computational errors.

4.1.2 System Design

In the system design phase, this study focused on developing a user-friendly interface and creating a structured calculation module based on standard engineering formulas. The system was designed to allow users to input relevant parameters such as transmitter power, losses, and link distance, and to generate accurate power link budget results. Additionally, user-friendly navigation and clear visualization of results were emphasized to enhance usability and learning experience.

4.1.3 Implementation

During implementation phase, the application was developed by using Android Studio software. An automated calculation engine was implemented to perform accurate computations based on standard power link budget formulas. The application was developed in stages to ensure that all features worked properly to archives learning objectives.

4.1.4 Testing and Refinement

The testing and refinement phase involved the evaluation of functionality, accuracy and usability of the application. Functional testing was performed to ensure that all input parameters and calculation processes produced correct results. In addition, usability testing was carried out with a small group of users to identify any interface or interaction issues. Based on the feedback received, necessary improvements and refinements were made to enhance system performance, user experience, and reliability before deploying the application for this study.

4.2 Research Design

The research design for this study employed a quasi-experimental approach including a control group and an experimental group, as illustrated in Fig. 2. The control group consisted of 30 students from Session 2: 2024/2025, who were trained using conventional teaching methods without using the developed application. In contrast, the experimental group involved 30 students from Session 1: 2025/2026, utilized the proposed mobile application as part of their learning process.

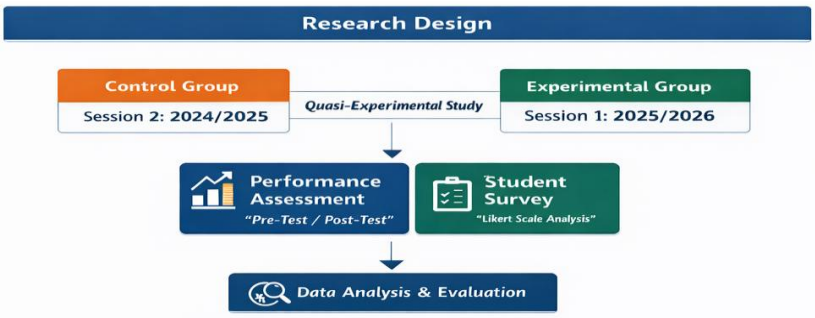

Fig. 2: Research Design Phase

4.2.1 Performance Assessment

The evaluation of students' performance was assessed using a pre-test and post-test. The pre-test was conducted prior to the learning intervention to measure students' initial understanding of power link budget concepts. After the learning session, a post-test was conducted to assess any improvement in students' knowledge.

4.2.2 Student Survey

A student perception survey was then conducted for the experimental group. The survey uses Likert scale to measure students' feedback on aspects such as usability, ease of use, engagement, and perceived effectiveness of the application. This provided additional insights into students' learning experience and acceptance of the proposed tool.

In performance data, the student's achievement was measured by comparing assessment results before and after using the application, highlighting improvements in calculation accuracy. Whereas in perception data, a structured questionnaire based on a 5-point Likert scale was managed to evaluate student confidence, engagement, and understanding.

The collected data were analyzed using descriptive statistics. Performance was analyzed using percentage comparison, while survey data were analyzed using mean scores based on a five-point Likert scale.

Results and Discussion

The results demonstrate a significant improvement in student performance resulting the implementation of the *PowLinkBudget* application as shown in Fig. 3. In the control group, only 33 percent of students achieved satisfactory results. However, in the experimental group, this increased to 86 percent. This represents an improvement of 53 percentage points, which is a substantial increase.

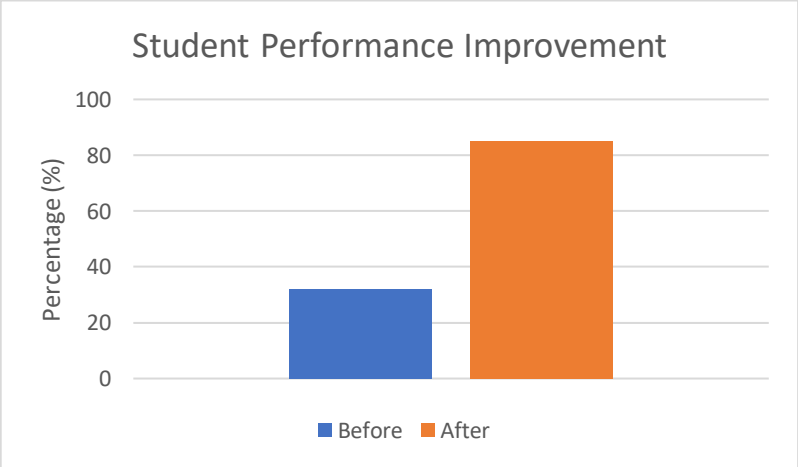

Fig. 3: Student Performance Before and After Implementation

Meanwhile, Table 1 presents the comparison of pre-test and post-test mean scores for both the control and experimental groups. For the control group, during pre-test, the mean score is 40.12, and it increased to 50.10 in the post-test, reflecting a modest improvement of 9.98 marks, which corresponds to a 24.9% increase. In contrast, the experimental group demonstrated a substantially higher improvement. The mean score increased from 38.40 in the pre-test to 76.10 in the post-test, resulting in a gain of 37.70 marks, equivalent to a 98.2% increase. The result shows that students that utilized the application achieved significantly better learning outcomes than those who relied solely on traditional methods.

Table 1: Comparison of Students' Performance Between Control and Experimental Groups

Group	Pre-Test Mean	Post-Test Mean	Mean Improvement	Percentage Increase (%)
Control Group	40.12	50.10	9.98	24.9%
Experimental Group	38.40	76.10	37.70	98.2%

The findings from the student perception survey were shown in Fig. 4 below. As illustrated in Fig. 4, the mean scores for confidence, engagement, and understanding are consistently high, indicating a strong positive response from students. Students reported increased confidence in solving complex power link budget calculations, as the application provided structured guidance and reduced computational uncertainty. The level of engagement also improved significantly, suggesting that the interactive features of the mobile platform successfully captured student interest and encouraged active participation in the learning process. Furthermore, the mean score for understanding indicates that students were better able to grasp complex concepts through digital visualization and automated feedback, demonstrating that the application not only enhances technical skills but also improves the overall learning experience by making abstract concepts more accessible and easier to comprehend.

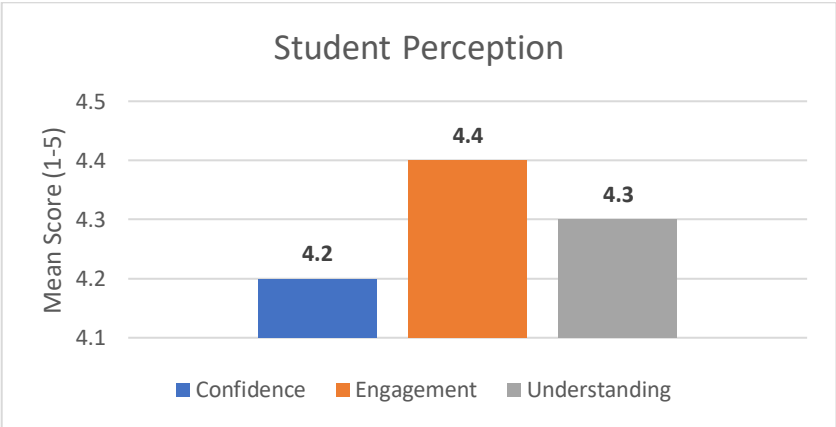

Fig. 4: Mean Scores of Learning Effectiveness of *PowLinkBudget*

Overall, these findings confirm that the integration of the *PowLinkBudget* application enhances both academic performance and the learning experience. The combination of automated computation, interactive features, and accessible mobile design contributes to a more engaging and effective learning environment for students [4][5].

In summary, the quantitative improvements in assessment results, combined with positive student perceptions, indicate that mobile learning tools like *PowLinkBudget* can bridge gaps between theoretical understanding and practical application. The application serves as a valuable educational tool that not only reinforces technical knowledge but also motivates students to engage more actively and confidently in complex engineering tasks [9].

Despite, this study has several limitations. The sample size was limited to 30 students, which may affect the generalizability of the results. Additionally, the study was conducted within a single course context and focused on short-term performance improvements. Future research could involve a larger sample size and explore long-term learning outcomes.

Conclusion

In conclusion, the *PowLinkBudget* mobile application proves to be an effective tool in supporting the learning of fiber optic communication systems. The integration of automated calculation, user-friendly interface design, and mobile accessibility significantly enhances student performance, motivation, and conceptual understanding. The application successfully addresses common challenges faced by students, particularly in handling complex and error-prone calculations.

The findings of this study highlight the potential of mobile learning applications in transforming traditional approaches to engineering education. By incorporating interactive and digital elements into the learning process, students are able to engage more actively and develop a deeper understanding of technical concepts [7]. The improvement in both academic performance and student perception further demonstrates the effectiveness of integrating technology into teaching and learning practices.

Future work may focus on enhancing the functionality of the application by incorporating advanced features such as real-time simulation, expanded calculation modules, and interactive tutorials. In addition, further research involving a larger and more diverse group of students is recommended to validate the scalability and generalizability of the findings. Such improvements will strengthen the role of mobile applications as essential tools in modern technical education.

Smartbean FX

Mazlan Bin Omar[1, a*]

Kolej Komuniti Pekan, Pahang, Malaysia

[a]mazlan@kkpekan.edu.my

Abstract. This paper presents the development and preliminary evaluation of Smartbean FX, a low-cost semi-automatic bean-cleaning machine designed for domestic users, food traders and small-scale food-processing operators. Manual bean washing is commonly associated with long processing time, repeated hand movement, uncomfortable working posture and inconsistent cleanliness. Therefore, this study aimed to design and fabricate a user-friendly cleaning prototype, assess its perceived operational performance and compare it with conventional hand washing. A descriptive quantitative approach was adopted using a structured questionnaire involving 35 respondents from small and medium enterprises and bean-based food businesses. The instrument consisted of 11 evaluation domains measured using a five-point Likert scale. Data were analyzed using mean scores, frequencies and percentages. The findings indicate that Smartbean FX achieved a higher overall mean score (M = 4.66) than hand washing (M = 4.31). The largest improvements were observed for body posture during washing (+0.60), uniform washing of large quantities (+0.51), cleanliness after washing (+0.43) and time taken to wash beans (+0.41). The results suggest that Smartbean FX can improve process efficiency, product cleanliness and work ergonomics while remaining affordable for small-scale users. Further objective testing is recommended to validate microbiological performance, actual water consumption and long-term mechanical durability.

Keywords: Smartbean FX; Bean Cleaner; Peanut Washing; Food-Processing Technology; Kitchen Ergonomics; Small and Medium Enterprises.

Introduction

Beans and peanuts are widely used in Malaysian domestic and commercial food preparation, including peanut sauce, traditional cakes, bean porridge, fried peanuts and other value-added products. The cleanliness of these raw materials directly influences taste, texture, food safety and consumer confidence. Although bean washing appears to be a simple activity, soil residues, fine sand, dust, damaged skins and organic impurities may remain on the surface when the washing process is inconsistent.

In many households and small food businesses, beans are still washed manually using hands, soaking containers and repeated rinsing. This method has several limitations. It requires continuous labour, becomes time consuming when the quantity of beans increases and may produce inconsistent cleaning quality because the outcome depends on the user's fatigue, attention and washing technique. Repeated hand washing can also require prolonged standing or bending, which may increase physical discomfort and reduce productivity in daily food-preparation work.

Previous studies on agricultural cleaning and separation systems show that suitable mechanical design can improve cleaning efficiency, reduce impurities and minimise

material loss [1-3]. For equipment that comes into direct contact with food, hygienic design is equally important because poor material selection or difficult-to-clean geometry may increase contamination risk [4-8]. Ergonomic considerations are also necessary because repetitive manual tasks can contribute to musculoskeletal discomfort and lower work efficiency [12, 13].

Smartbean FX was therefore developed as a semi-automatic bean-cleaning machine that combines controlled rotation, stainless-steel contact components and low-voltage operation. The prototype focuses on process efficiency, cleanliness consistency and user comfort. This paper rewrites and presents the study according to the iRiseCon 2026 manuscript structure, with emphasis on the design rationale, user-evaluation method, findings and practical implications for small-scale food processing.

Problem Statement and Research Objectives

The main problem addressed in this study is the absence of a small-scale bean-cleaning device that is affordable, simple to operate, safe for wet kitchen environments and suitable for repeated use by domestic users and micro-enterprises. Existing cleaning systems reported in the literature are commonly developed for agricultural or postharvest operations and may involve mechanical configurations that are too complex for small operators [1-3]. In contrast, the target users of Smartbean FX require a compact, low-cost and low-maintenance system that can support routine food-preparation activities.

This study was guided by three objectives. First, it aimed to design and fabricate a semi-automatic bean-cleaning machine using accessible and food-compatible components. Second, it evaluated the perceived operational performance of Smartbean FX in relation to cleaning efficiency, time saving, body posture, consistency of results and multitasking ability. Third, it compared users' perceptions of Smartbean FX with conventional hand washing across 11 evaluation domains.

Literature Review

Cleaning and separation technology for peanut and bean crops has been widely studied in agricultural engineering. Zhu et al. [1] developed a peanut pod cleaning device that combined negative pressure, vibration and screening to reduce impurities and yield loss. Wang et al. [2] designed a half-feed peanut cleaning picker for clay hilly areas and highlighted the need to balance cleaning effectiveness with material-damage control. Ling et al. [3] used computational fluid dynamics and discrete element method simulation to optimise a fresh-peanut cleaning mechanism, demonstrating that airflow, feed rate and structural parameters can strongly influence cleaning performance.

Although these studies focus on larger agricultural machines, their principles are relevant to the development of Smartbean FX. Effective cleaning requires sufficient mechanical action to remove impurities without damaging the material. In Smartbean FX, this principle is translated into a simpler form through controlled rotational movement, water agitation and stainless-steel mesh support inside a cylindrical washing chamber.

Hygienic design is another important consideration in food-processing equipment. Musiari et al. [4] emphasised that hygienic design should be addressed during the early stage of equipment development to avoid dead spaces, dirt-trapping surfaces and hard-to-clean geometries. Pejanovic et al. [5] further noted that equipment design, risk assessment and sanitation standards are closely connected in food processing. Stainless steel is frequently used because of its corrosion resistance, mechanical durability and ease of cleaning [5, 7, 8]. These considerations support the use of stainless-steel components in Smartbean FX, particularly for parts that are exposed to water and food-contact conditions.

Ergonomics is also relevant because food preparation often involves repetitive movements such as washing, lifting, pouring and mixing. Chen et al. [13] showed that kitchen ergonomics is linked to safety and efficiency, while Adhaye and Jolhe [12] stressed that manual-task design should consider physical load, movement frequency and posture. Therefore, partial automation in Smartbean FX is expected to reduce repeated hand movement and improve user comfort.

Materials and Methods

This study used a descriptive quantitative design because the purpose was to evaluate users' perceptions of a developed prototype and compare its performance with a conventional method. The approach is suitable for preliminary product evaluation because it allows the researcher to describe user responses, compare mean scores and identify the strongest and weakest performance domains [9-11].

A total of 35 respondents participated in the study. They consisted of small and medium enterprise operators and bean-based food traders with experience in raw-material preparation. This respondent group was selected because they represent the intended users of Smartbean FX and regularly face issues related to bean washing, time constraints and consistency of raw-material cleanliness.

The research instrument was a structured questionnaire based on a five-point Likert scale, where 1 represented poor, 2 less satisfactory, 3 satisfactory, 4 good and 5 excellent. The questionnaire assessed 11 domains: washing time, peanut-skin texture after washing, cleanliness after washing, economical water use, uniform washing of large quantities, body posture during washing, uniformity of cleanliness, influence of mood or human negligence, durability of washed beans, confidence in cleaning small crevices and ability to perform multitasking.

Smartbean FX was fabricated using a 375 rpm DC 12 V motor, a stainless-steel pot, a 12 V transformer, stainless steel with a diameter of 13 mm, stainless-steel mesh, connecting wires and an on/off switch. These components were selected based on affordability, availability, basic electrical safety and suitability for contact with food and water. The total fabrication cost was estimated at approximately RM200.00.

The estimated washing-chamber volume was calculated based on a cylindrical geometry. The theoretical volume was obtained using Eq. 1.

$$V = \pi r^2 h. \quad (1)$$

Using a diameter of 10 inches (0.254 m), a radius of 0.127 m and a height of 0.254 m, the theoretical chamber volume was approximately 0.012864 m^3 or 12.864 L. However, the chamber cannot be fully loaded because space is required for water and

rotational movement. When 40% of the theoretical volume is considered the effective working volume, the estimated operating capacity is approximately 5.15 L, or about 3 to 4 kg of dried peanuts per cycle. Energy consumption per cycle was estimated using Eq. 2, based on an assumed motor power of 60 W and a five-minute operating duration.

$$E = Pt = 60 \times (5/60) = 5 \text{ Wh}. \quad (2)$$

Respondents evaluated both Smartbean FX and hand washing. The data were analysed using descriptive statistics, including mean scores, frequencies and percentages. The interpretation focused on mean differences between the two methods because these differences indicate the domains that benefited most from the use of the prototype.

Results and Discussion

Table 1 presents the main specifications and estimated cost of Smartbean FX. The results show that the prototype was built using simple and accessible components while maintaining important design considerations such as low-voltage operation and stainless-steel contact surfaces. This supports the aim of developing an affordable device for domestic and small-scale food-processing applications.

Table 1. Main specifications and estimated cost of Smartbean FX

Component/Item	Specification	Quantity	Cost (RM)
Direct-current motor	375 rpm, DC 12 V	1	40.00
Stainless-steel pot	20 cm × 20 cm	1	50.00
Transformer	12 V	1	28.00
Stainless steel	Ø13 mm	1	20.00
Stainless-steel mesh	Food-contact grade	1	10.00
On/off switch	Manual	1	2.00
Fabrication cost	Cutting, assembly and wiring	-	50.00
Total	-	-	200.00

The user-evaluation results showed that in Table 2 Smartbean FX achieved a higher overall mean score (M = 4.66) than hand washing (M = 4.31). This indicates that respondents perceived the prototype as more effective in terms of operational efficiency, cleanliness and user comfort. Although the manual method still received favourable ratings, Smartbean FX provided additional value by improving consistency and reducing physical burden.

The largest mean difference was recorded for body posture during washing (+0.60). This finding indicates that the prototype was perceived to reduce physical discomfort compared with manual washing. This outcome is consistent with ergonomic literature, which highlights the importance of reducing repetitive hand movements and improving working posture in manual food-preparation tasks [12, 13].

The second highest improvement was uniform washing of large quantities (+0.51). This suggests that Smartbean FX is more suitable when users need to wash larger amounts of beans in a consistent manner. In small food businesses, uniform cleaning is important because it supports consistent product quality and smoother subsequent processes such as boiling, frying, grinding and packaging.

The machine also improved cleanliness after washing (+0.43) and reduced washing time (+0.41). These findings are aligned with previous studies showing that mechanical cleaning mechanisms can improve cleaning performance and operational efficiency [1-3]. The use of stainless-steel components further supports hygienic handling because stainless steel is resistant to corrosion and relatively easy to clean [5, 7, 8].

Table 2. Comparison of mean scores between Smartbean FX and hand washing

Evaluation domain	Smartbean FX	Hand washing	Mean difference
Time taken to wash beans	4.72	4.31	0.41
Condition of peanut-skin texture after washing	4.60	4.20	0.40
Cleanliness rate of beans after washing	4.69	4.26	0.43
Economical water use	4.48	4.34	0.14
Uniform washing of large quantities	4.57	4.06	0.51
Body posture during washing	4.74	4.14	0.60
Uniform cleanliness of beans	4.66	4.40	0.26
Influence of mood or human negligence on washing quality	4.71	4.37	0.34
Durability of washed beans	4.54	4.31	0.23
Confidence in cleaning small crevices	4.74	4.43	0.31
Ability to perform multitasking	4.80	4.57	0.23

Note: The mean difference was calculated as the mean score for Smartbean FX minus the mean score for hand washing. A positive value indicates an advantage for Smartbean FX.

The smallest improvement was observed for economical water use (+0.14). This indicates that water saving is not yet the strongest feature of the prototype. Future versions should therefore include a more controlled water-flow system, a drainage valve, a filtration component or a water-reuse mechanism. Such improvements would strengthen the sustainability and hygiene performance of the machine.

Practical Implications and Commercialisation Potential

Smartbean FX has practical value because it addresses a routine problem faced by domestic users and small food operators. In household contexts, it can reduce preparation time when beans are washed in larger quantities for events, food orders or

meal preparation. In small enterprises, it can function as a pre-processing support tool that standardises washing results before further processing.

The prototype also has commercialisation potential because the estimated fabrication cost is approximately RM200.00. If future development uses standardised fabrication, improved finishing and more durable food-grade components, the product may remain affordable for the target market. This is important because the proposed design emphasises affordability, ease of maintenance and practical suitability for domestic and small-scale food-processing users.

Several improvements are recommended before commercialisation. These include adding a safety cover, installing a speed controller, improving the drainage system, using a removable internal basket and conducting formal electrical and hygienic safety testing. Future studies should also measure objective outcomes such as microbial reduction, actual water consumption, material damage, cleaning time and component durability after repeated use.

Conclusion

This study developed and evaluated Smartbean FX as a practical, low-cost and user-friendly semi-automatic bean-cleaning machine. The findings show that Smartbean FX outperformed hand washing across all 11 evaluation domains. The strongest advantages were observed in body posture, uniform washing of large quantities, cleanliness after washing and time saving. These findings suggest that partial automation can improve efficiency, cleanliness and ergonomics in small-scale bean-based food preparation.

From an academic perspective, the study demonstrates that small-scale innovation products can be evaluated systematically through a combination of technical specifications and user feedback. From a practical perspective, Smartbean FX offers a potential solution for domestic users, food traders and SME operators who require a simple and affordable cleaning device. Further research should validate the prototype using objective laboratory and field tests, particularly in relation to microbiological performance, water consumption and long-term durability.

Abstract. This review examines the design, analysis, and optimization of below-knee prosthetic sockets, comparing additive manufacturing (3D printing) technologies with conventional fabrication methods. Traditional prosthetic manufacturing is a labor-intensive manual process that often leads to inconsistencies in fit, comfort, and production costs. In contrast, 3D printing offers a precise, digital workflow that integrates 3D scanning, Computer-Aided Design (CAD), and Finite Element Analysis (FEA) to create patient-specific prosthetics. FEA allows for the simulation of biomechanical interactions and the prediction of stress distributions prior to production, ensuring enhanced structural integrity and user comfort. Furthermore, 3D printing supports the use of advanced materials, such as carbon-fiber-reinforced polymers and thermoplastic elastomers, which improve durability while reducing weight. Despite these advancements, a comprehensive synthesis of optimization techniques and material performance remains limited. This paper addresses this gap by providing a systematic review of the digital workflow, highlighting key contributions in topology optimization and adjustable-volume designs.

Keywords: 3D_printing, prosthetic socket, design, analysis, optimization, Finite Element Analysis, transtibial sockets.

1. Introduction

The prosthetic socket is the foundational component of a lower-limb prosthesis, acting as the primary interface for load transfer between the residual limb and the prosthetic device [1]. Successful rehabilitation depends on a well-designed socket that provides stability, comfortable weight transmission, and minimal limb-prosthesis movement [2]. As the global incidence of lower-limb amputations rises due to vascular diseases, diabetes, and trauma, there is an urgent need for more efficient and accurate fabrication methods [3, 4].

For decades, the "gold standard" for socket fabrication has involved manual plaster casting and hand-rectification by skilled prosthetists. However, this process is frequently limited by long production cycles, high costs, and a lack of standardized quality [5-9]. The emergence of additive manufacturing (3D printing) has introduced a revolutionary digital workflow that enables the creation of customized prosthetics tailored to the unique anatomy of each patient [10-15]. By leveraging 3D scanning and CAD/CAM technologies, researchers can achieve higher precision and reproducibility compared to traditional methods.

While the benefits of 3D printing are widely acknowledged, the literature often presents isolated case studies rather than a synthesized analysis of how various digital tools—such as topology optimization and biomechanical simulation—work together to improve clinical outcomes. There is a significant research gap regarding the long-term structural reliability and material optimization of these digital solutions. This review aims to bridge this gap by evaluating the current state of digital design, structural analysis, and material selection in prosthetic development. The paper provided a general introduction to the design, analysis, and optimization of below-knee prosthetic sockets, emphasizing the transformative potential of 3D printing in modern prosthetic care. By integrating digital design tools, advanced simulation ways like Finite Element Analysis[FEA], and judicious material selection, 3D_printing can produce bettered prosthetic sockets that avoid the downsides of traditional styles[16-18]. The paper will provide a general introduction of designing, analyzing, and optimizing below-knee prosthetic sockets based on practicing 3D printing technology in light of the introduction and in contrast with conventional ones.

2. Methodology

To ensure a comprehensive review, a systematic search was conducted across major electronic databases, including PubMed, Scopus, Web of Science, and Google Scholar. The search strategy focused on peer-reviewed articles published between 2000 and 2025 using keywords such as "3D printing," "prosthetic socket," "Finite Element Analysis," "topology optimization," and "transtibial prosthetics." Studies were selected based on their relevance to the digital workflow, material characterization, and structural evaluation of below-knee sockets. A total of over 120 sources were synthesized to provide a thematic overview of current advancements and challenges in the field.

3.Thematic Literature Review

3.1 Design Principles of Below- Knee Prosthetic Sockets Reattached lower limbs design has an important role in facilitating the mobility that assists in the living conditioning process, as well as the cerebral socialization process. Design principles for the socket, which rely on comfort first and appropriate luggage distribution, were specified to be critical for the well-designed prosthetic limb.

Ballit, A., Mougharbel, I., Ghaziri, H., & Dao, T. T. [2020].[19] are to develop a new efficient and cheap alternative design for the socket design. Of course, this design has to be based on CAD-CAM. Therefore, the first step in achieving this objective will be to develop a numeric model of the design process.

These areas are to be taken into consideration to create the prosthetic socket shown in Figure.1, which is a diagram of the prosthetic socket including the areas of anatomy and loading.

Figure1 Transtibial prosthetic socket diagram illustrating the zones of anatomy and cargo that need to be considered for shaping the prosthetic socket. Angelo Caggia, under [20].

Lenka, P. K., & Choudhury, A. R. [2011]. [21] identified an optimal design solution of prosthetic socket materials using the finite element method [FEM]. A three-dimensional finite element analysis of a PTB [Patellar tendon bearing] socket was built from the high-accurate white light scan. Analysis in the software ANSYS ^{®} helped in determining the stress pattern under physiologically correct loading situations during normal walking. By assuming that the materials of the structure were linear elastic, homogeneous, and isotropic materials of the socket with various materials and thickness in the range of 2mm-6mm were considered in the study. The work ended with an opinion that the best design is that of a laminated composite socket of thickness of 3mm.

Mohamed Norli, M. H., Zaidy, A. F., Mohd Anuar, M. A., Mahmud, J., Ramlee, M. H., & Abdullah, A. H. [2025]. [22]. developing an improved transtibial prosthetic socket to address issues of weight and inadequate airflow. The methodology combines several digital technologies, including 3D scanning to capture the patient's stump geometry, and 3D modeling with Autodesk Fusion 360 and Meshmixer to create the socket. The design was optimized for breathability and geometric constraints using topology optimization, while finite element analysis [FEA] was conducted to evaluate force distribution. The study concludes that this integrated approach of redesigning, optimizing, and analyzing the socket effectively enhances its performance and resolves common patient challenges.

Carbonell, R. M., & Crawford, R. H. [2022].[23]. the design and analysis of the optimized trigeminal prosthetic socket based on the ground structure method of topology optimization. The wall structure from the distal 25% of the original trigeminal prosthetic socket through the proximal brim is replaced with the optimized trigeminal prosthetic truss structure model with a 1 mm thin wall structure. The optimized trigeminal prosthetic models are developed separately for each loading condition of the three major stances: heel strike, standing or vertical position, and toe off. The optimized trigeminal prosthetic model is made up of the merged optimized models of the major parts. The optimized trigeminal prosthetic model has a volume of 81.58% of the original trigeminal prosthetic model volume. The optimized trigeminal prosthetic model is optimized for manufacturing using the Selective Laser Sintering technique with nylon 12 as the material. The trigeminal prosthetic model is analyzed based on the material properties of sintered nylon 12 at 10% steps throughout the entire loading condition phase from heel strike to toe off. The trigeminal prosthetic model has been validated in terms of design and approaches as being sufficient for the demands of each stance.

Alluhydan, K., Siddiqui, M. I. H., & Elkanani, H. [2023].[24]. Design of amputated lower limbs also concentrated on various facets of designing a prosthetic lower limb. Design emphasized the importance of innovation and improvements toward maximizing user satisfaction, ease of mobility, and improving the standard of living of the affected individuals. Biomechanics, encompassing facets of gait analysis, flexibility of lower limbs, force transfer, and energy consumption, were considered essential in designing an amputated lower limb. Design guidelines in designing the sockets of the lower limbs, incorporating elements of maximizing user comfort and effective transfer of load, were also considered essential for developing an effective lower-limb prosthesis. Various advances in emerging technologies, such as innovative materials, advancements in robotics, neural interfaces, and sensors, also hold promising leads for innovation and improvements in designing an amputated lower limb. Various emerging technologies have promising leads in upgrading the functional capabilities, controls, and feedback functions of lower-limb prosthetics. A user-oriented approach, emphasizing active involvement and participation of the affected individuals in designing and incorporating their feedback and preferences, was also pointed out as essential. Effectiveness and affordability of the solution also emerged as essential considerations, stressing the need for developing an affordable solution. Long-term durability and performance-capability also emerged as essential, stressing the importance of using effective and durable material and implementing effective quality controls. Design implementation and integration of neural interfaces and feedback also introduced dual considerations of challenges and opportunities in implementing innovative capabilities in controlling and providing natural sensations during activities using the lower-limb prosthesis.

Ozmen, O., & Surmen, H. K. [2024]. [25]. design and fabricate a prosthetic leg that is lightweight, strong, and affordable for below-knee amputees. The researchers designed a flexible, one-piece prosthetic leg model for children using anthropometric

data. The design was then optimized using finite element analysis [FEA] and topology optimization, which are methods used to analyze structural integrity under real-world conditions like standing, walking, and climbing stairs. The final model was modified for support-free 3D printing, with an added socket and heel piece.

3.2 Traditional styles of Socket Fabrication Challenges and Limitations

The traditional method of making prosthetic sockets for a lower extremity is a high skilled labor process consisting of a number of steps. The process is labor-ferocious and solely relies upon the skills and grit of the technician. The making of a lower extremity prosthetic socket is done through a homemade process that consists of a number of steps and is solely reliant upon increased expert inputs ,As shown in the Figure 2.

Sanders, J. E., Rogers, E. L., Sorenson, E. A., Lee, G. S., & Abrahamson, D. C. [2007]. [26]. In this research, the comparison, contrast, and analysis of transtibial prosthetic sockets made from central fabrication facilities with digital shape files from the Association of the Advancement of Prosthetic [AAOP] have been carried out, along with an evaluation of the central fabrication method itself. In this research, the order had been prepared with the set of three various socket shapes from each of the 10 manufacturers. Upon receiving the research order, they were made digital with high accuracy with our specially developed digitalization system using mechanics. The results have brought forth significant variability in the level of quality for various manufacturers. Four manufacturers had made their sockets within +/- 1.1% volume, or 1 sock ply, of the AAOP digital shape file; six had not. Six manufacturers had specified variable inconsistencies in being small or large compared with their sockets, which includes either calibration problems or manufacturing problems. Another manufacturer had specified inconsistencies with digitalized shape, an issue which itself presents very challenging problems for resolution to the central fabrication facilitators.

Figure 2 Traditional manufacturing of prosthetic sockets[27].

The creation of these sockets has been a very labor-intensive task in the past. The traditional process requires a prosthetist to take a cast of the stump in plaster and then manipulate this positive model before finally making the socket from laminated composites or thermoplastic materials. This conventional method, while effective, is prone to inaccuracies, requires multiple fitting sessions, and can lead to patient discomfort, skin irritation, and even ulcerations due to rigid materials and a lack of thermal regulation Furthermore, the cost and production time are significant barriers

to access while the 3D printing offers a modern solution to traditional, inconsistent prosthetic socket fabrication. The manual, labor-intensive method is replaced by a precise digital workflow: 3D scanning, computer-aided design, and Finite Element Analysis. This process ensures customized, optimized sockets that are faster and cheaper to produce. It also allows the integration of advanced materials, enhancing comfort and reducing weight[28-33].

3.3 3D Printing ways in Prosthetic Socket Design and Fabrication

3D printing provides a digital and perhaps even more efficient and individualized volition of making a socket in a conventional manner. 3D printing competitiveness in relation to conventional product ways is determined by a set of benefits that include lower costs of manufacturing and operation of force chains, shorter delivery time, lower costs of manufacturing processes for customized and complex products, and improved effectiveness of product manufacture because of reduced use of material and energy resources[34-36].

Javaid, M., Haleem, A., Singh, R. P., & Suman, R. [2022]. [37]. explores the role of 3D printing and 3D bioprinting in healthcare, highlighting their significant potential for research and development. The study outlines how 3D printing offers a low-cost method for creating customized prostheses, implants, and surgical models. The paper also discusses the benefits of using 3D-printed anatomical models for educational purposes. The review identifies key applications of the technology, including the ability to rapidly produce complex geometries in various materials, which leads to improved prototypes, lower costs, and faster development times ,As it appears in the figure.3. The paper concludes by suggesting that 3D printers should become a standard feature in hospitals, enabling the in-house creation of patient-specific parts and potentially new organs.

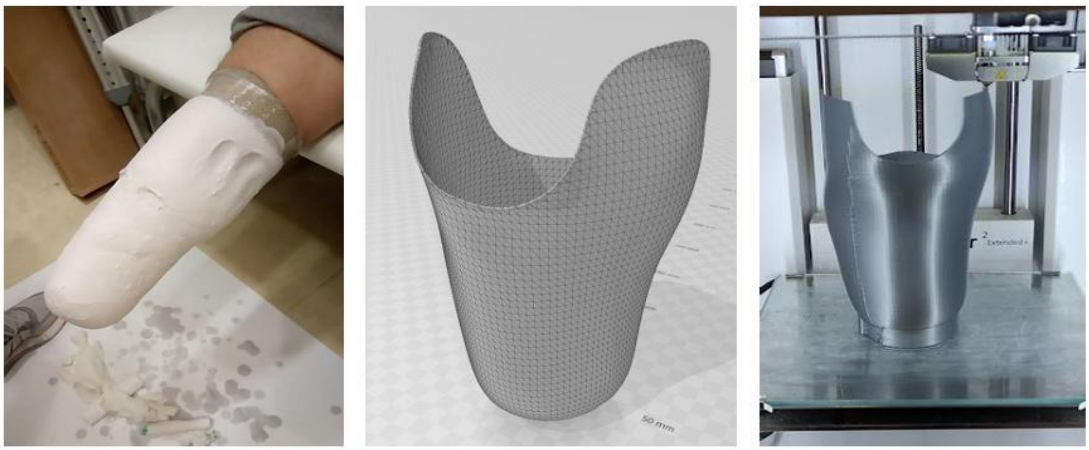

Figure 3[a] Refuse mould.[b] Socket model.[c] printed prototype**.**

Kim, S., Yalla, S., Shetty, S., & Rosenblatt, N. J. [2022]. [38]. The focus has been on the structural integrity of the 3D printed sockets as well as the parameters which could affect the 3D printed sockets' strengths during the ISO 10328 test. The literature search has been performed in five various electronic databases: PubMed, Scopus, CINAHL databases, the Web of Science, as well as Google scholar. The

screening of the studies, the quality of the studies as well as the data extraction have been accomplished separately by two of the study's researchers. A total of 1023 articles pertinent studies have been searched in relation to this review based on the inclusion as well as the exclusion criteria. Among the 1023 articles searched in this study, 12 studies were considered relevant according to the criteria set forth in the study in relation to the data of the 15 failed 3D printed sockets as well as 26 of the standard laminated composite sockets. For the 3D printed sockets, the addition of various materials in the form of carbon fiber particles as well as the distal components through the application of the compositing infill process seemed to increase the sockets' strengths. However, in consideration of the data variability among these studies in relation to the various materials as well as the align used in the study, the data in relation to the possible 3DS fail parameters could not be defined. However, it appears as though the possible data in relation to the probability of the fail load within a certain loading force among 3DS as well as LCS up to the P8 levels are likely equal. The data in relation to the fail load of various types of sockets: laminated as well as the 3D printed sockets have been found mostly through the distal area of the socket or the pyramid area of the socket as anticipated according to the specific ISO 10328 test. The improvement in the strengths of the 3D printed sockets through modifications in the distal area design of the socket as well as in the modern printing technology seem to be of vital assistance in improving the application of 3D printed sockets in the medical area as a result of possible affordability or as a result of restricted accesses within the country.

The workflow would generally comprise the following way

3D Scanning of the Residual limb rather of Plaster casting, a 3D scanner[e.g., structured light scanner, laser scanner] captures the precise figure of the case's residual limb. This process is briskly, cleaner, and can reproduce fine structures directly. 3D checkup technologies snappily overlook any model. These ways have implicit to checkup and publish any types of a complex structured medical model. based on illustration of Figure.4. With the use of 3D scanning technologies, models are fluently created that can not be created with other current technologies [39- 45].

Figure 4 Scanning session[a] 3D scanner setup.[b] surveying residual limb[22].

Haleem, A., & Javaid, M. [2019]. [46] research on 3D scanning technologies in the medical field from 2008 to 2018. The aim was to identify the strengths, limitations, and applications of the technology. The analysis revealed an increasing trend in research and commercial adoption of 3D scanning, which is used to accurately measure patient anatomy for creating custom implants and improving treatment through digital models. The study's primary limitation is that 3D scanning can only capture the outer surface of a body or object.

Computer- Aided Design[CAD] of the Socket Data on the checkup is then used and imported into CAD, and so the virtual model of the prosthesis socket is designed. Variations can be achieved precisely, relief areas can be developed, and suspense systems based on the case's personal deconstruction and demands can be linked. Digital rectification is less precise and more repetitive compared to homemade models. CAD precise models can be developed digitally on a case's residual limb; icing a perfect fit and improved comfort is achieved. CAD rigidity promotes easy duplication and improvement, icing that the resulting output is tailored to the case's conditions[47 – 61].

Travis, R. P., & Dewar, M. E. [1993]. [62] Computer-aided socket design [CASD], As shown in the Figure.5 ,A method of socket design that utilizes the beneficial elements of computer graphics and computation, is reviewed. This paper discusses a computer-aided method of socket design offered to patients with trans-tibial lower limb amputations.

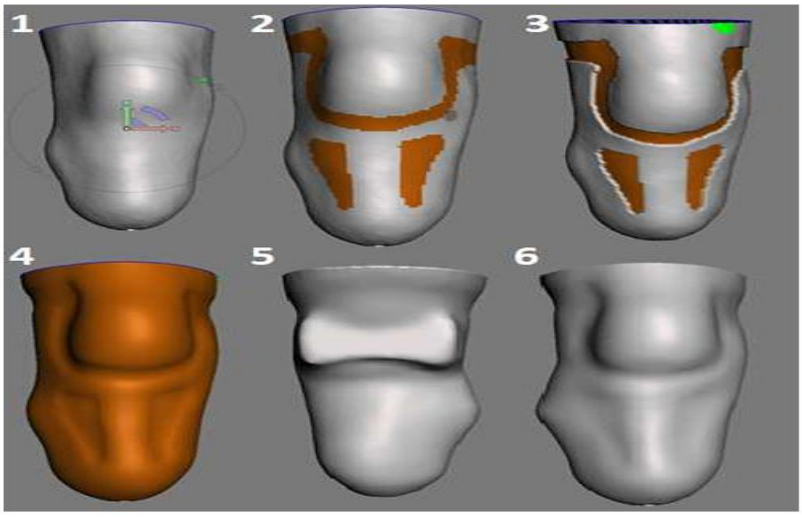

Figure5 Editing of the attained 3D checkup of the refuse and creation of a virtual positive[63].

Dickinson, A. S., Steer, J. W., Rossides, C., Diment, L. E., Mbithi, F. M., Bramley, J. L., ... & Worsley, P. R. [2024]. [64]. Carried out to Compare Rectifications The rectifications carried out by experienced prosthetists for wide categories of patient data and limb configurations to enhance the knowledge of socket design approaches. The study evaluated 163 residual limbs and CAD/CAM sockets of 134 patients. On average, even though clear variation lies in patella tendon-bearing

and total surface-bearing design, the sockets are, in fact, a combination of both. The study related the magnitude of certain rectifications in which the patellar tendon carve depth was not significantly related to other rectifications. How one could learn from the design experience to help educate as well as improve evidence-based socket design, as presented, could help design smart CAD/CAM templates which could forecast design parameters for new patients.

Finite Element Analysis[FEA] for Socket Analysis Before actual production, the numerical socket can be anatomized through the use of FEA software. FEA Models have been utilized in the study of the nature of the inertia loads and contact situations at the boundary of the prosthetic socket and the residual part of the body of an amputee during walking. Therefore, designers and prosthetists are able to simulate the biomechanical struggle at the boundary of the prosthetic socket and the residual part of the body in colorful load conditions [for instance, walking conditions]. Therefore, FEA predicts the stress distribution, the hidden area of stress, and the best prosthetic socket shapes, As it appears in the figure.6. This is an advantage since it can be tested for improvement before actually printing and spending money[65- 74].

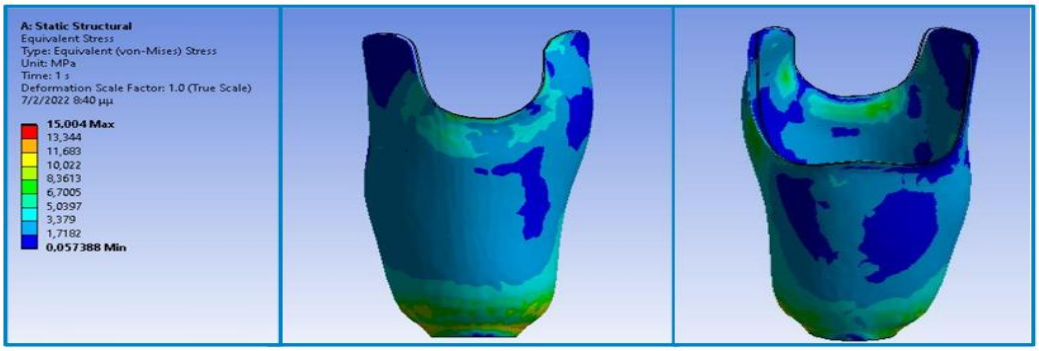

Figure 6 Finite Element Analysis[FEA] for Socket Analysis- Von Misses Stresses.

Lee, W., Zhang, M., Boone, D., & Contoyannis, B. [2004]. [75] described the development of the finite element model to assess the structural dynamics of monolimbs corresponding to various shank designs, as well as the relationship between the monolimb and the socket during the walking phase based on different walking phases. von _Mises stress profiles for monolimbs corresponding to various shank designs were also described during various phases of walking. Prediction of the potential failure based on the distortion energy theory was also described. Analysis of the influence of the stiffness of shank designs of the monolimbs on the stress levels at the interfaces between the monolimbs and the sockets during walking was also described. Findings showed the trend that the maximum stress required at the limb decreased as the stiffness of shank designs decreased.

3D Printing of the Socket After the design and analysis process is completed, the virtual design is moved to a 3D printer to create the prosthetic. The transactional design of the 3D model of the transtibial prosthetic socket was recaptured from the CAD design information. Initially, the prosthetic lower limb socket design in the

transtibial prosthetic category was exported in an STL train in order to be cut and optimized with the print parameters in the objective of attaining the fashionable outcome in the 3D printing approach. Figure.7 ,describes the socket of a prosthetic limb made using 3D printing technology. Colorful 3D printing technologies can be utilized in the venture, which include[s] Fused Deposit Modeling[FDM], picky Ray Sintering[SLS], and Stereolithography[SLA] depending on the necessary parcels of accoutrements [76- 82].

Jweeg, M. J., Hammoudi, Z. S., & Alwan, B. A. [2018, November]. [83]. This paper compares and analyses 3D printing in transtibial prosthetic devices to conventional and manual methods of production. The team applied 3D design software "Blender" and "Flashprint" to design and produce a prosthetic socket from a residual limb. The major advantage indicated in this paper is that 3D printing reduces processing time to less than 15 hours compared to up to two weeks using conventional methods. The paper demonstrates the use of "Fused Deposition Modeling" and "Polylactic Acid" or PLA. The advantage stated about PLA in this paper is that PLA is biodegradable, less expensive, has high dimensional stability, and is biologically safe on human skin. This paper touches upon points concerning the "skin temperature" that tends to increase while using "prosthetic sockets" due to conventional methods of production.

Figure 7 RP fabricated prosthetic socket[84].

Rogers, B., Bosker, G. W., Crawford, R. H., Faustini, M. C., Neptune, R. R., Walden, G., & Gitter, A. J. [2007]. [85]. The researchers at The University of Texas Health Science Center at San Antonio [UTHSCSA] and the University of Texas at Austin [UTA] have spent six years developing advanced prosthetic sockets using solid freeform fabrication [SFF], specifically selective laser sintering [SLS]. The key advantage of this technology is that fabrication cost is based on the object's volume, not its complexity. This allows for the creation of sophisticated, comfortable sockets with integrated hardware at the same cost as a simple design, with new features added via software.

Progressive Way for enforcing 3D printing

The abecedarian and progressing method of investigating 3D printing practices of healthcare is composed of the following way: [1] CAD model data;[2] 3D train created[3] conversion to .stl format;[4]slicing done for exposure and position;[5].stl format to G- law con- interpretation;[6] designed train recognized;[7] printing of 3D biomodels;[8] post procession of advanced part; and[9] removing, drawing, curing, etc. performed. The launch is made with the CAD model data, leading to the 3D train creation. It helps the stoner to induce the stl train format for developing the designed train and farther conversion made to the G- law as needed to develop the memoir or medical corridor as demanded. The slicing is done to attempt the position and exposure finalization for the named part. The coming step is to publish the asked models. The needed post_processing way may also be conducted through the cleaning and curing operations [86- 94].

Post-Processing and fitting After the printing, the socket can go through some post-processing, As illustration in Figure.8, such as junking of support structures, face finishing, and so forth. The support rim of the 3D printed socket will be manually removed by hand. However, in cases where the supports failed to come out as one piece or some of them remained, assistance from pliers or tweezers is thought to help in removing the remaining supports. The support rim of the 3D printed part will then be cut by the knife within the limit of the necessary prosthetic socket. The grinding of the 3D printed prosthetic leg sockets showed slightly rough edges as well as the meeting of the prints at the circumference at the back of the socket. As to smoothen out the surface, the grinding process will help in removing the actual sub caste lines as well as edges in smooth out the surface. The corridor were wiped down very thoroughly by a cloth to remove the remaining dust around the edges [95- 97].

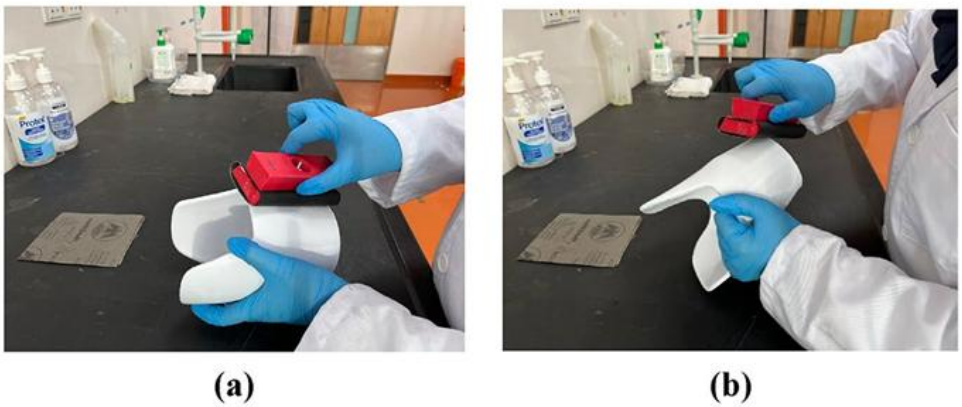

Figure 8 grinding the 3D- printed sockets[a] Socket face;[b] Socket edge[98].

Isozaki, K., Hosoda, M., Masuda, T., & Morita, S. [2006]. [99]. tested the fitting of trans_tibial stumps and sockets in an attempt to produce a guideline document which could be used in the auto_mated production of trans_tibial sockets. The participants were 24 trans_tibial patients. A CAD/CAM system used 11 parameters associated with the 3D measurements of the stumps as well as the sockets. A positive association

was found between the levels of activity of the patient and the upper/lower volume of the socket; the cause of amputation and the upper volume of the socket. It was desired that the lower part of the socket should be loose in the case of patients with lower levels of activity; the upper part should be tight in the case of patients with greater levels of activity; the upper part of the patient with peripheral circulatory.

The final socket is also fitted to the case, and minor adaptations can be made if necessary. The digital nature of the design allows for easier variations and the eventuality for rapid re-printing of acclimated sockets.

3.4 Optimization of 3D- Printed Prosthetic Sockets Technological improvements brought about by the application of 3D printing in prosthetic sockets have brought forward unprecedented approaches to the production, customization, and provision of prosthetic bias. Some of the classic limitations that have been remedied by such technology are provided below. Prior to the adoption of technology such as 3D printing, prosthetic devices were made from various models that [100-102]

3d_ printing facilitates colorful optimization strategies for prosthetic sockets. Figure.9 ,describes the advantages of 3D printing in prosthetic design.

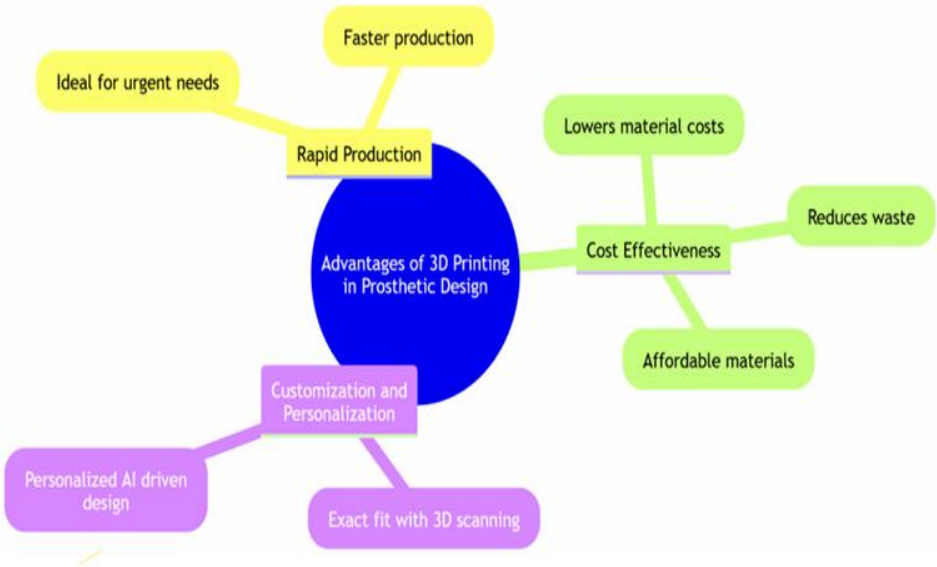

Figure 9 Advantages of 3D printing in prosthetic design[103].

The primary advantage of 3D printing is

_ **Customized Geometry** the ability to produce a substantially customized socket that corresponds accurately with the specific deconstruction of the residual limb in every case. This could result in improved comfort, pressure distribution, and proprioception[104].

_**Material Selection** There exist numerous 3D printable accoutrements differing in their mechanical parcels[e.g., inflexibility, stiffness, and strength]. Material selection can be adjusted according to the position of exertion of the case and its needs. Advanced accoutrements, innovative designs, and improved continuity of 3D-printed

prostheses and orthopedic cases have changed patient care, and the results deliver on their own according to the needs of eliminating function-related issues and providing improvements for long-term support[105-110].

Using 3D printing, accoutrements such as thermoplastic elastomers, or Carbon fiber-supported polymer and also Biocompatible essence like titanium exist and have become widely used.

_Topology Optimization and Lightweight Materials Advanced computer algorithms can also be utilized for weight reduction design optimization of the socket. The topological optimization technique can be defined as a process of improving the mechanical parcels of the socket. The process includes the design of a structure that provides reduced stress and maximizes strength by consuming the least possible material amount. Often, it includes designs of internal structures in a chassis that can be produced only through 3D printing, making the material lighter [111- 115].

_ **Integration of Features** 3D printing allows for the integration of specific design features directly into the socket, As it appears in the figure.10. This technology allows prosthetists to design bias that are uniquely acclimated to the existent's deconstruction, functional requirements, and aesthetic preferences.

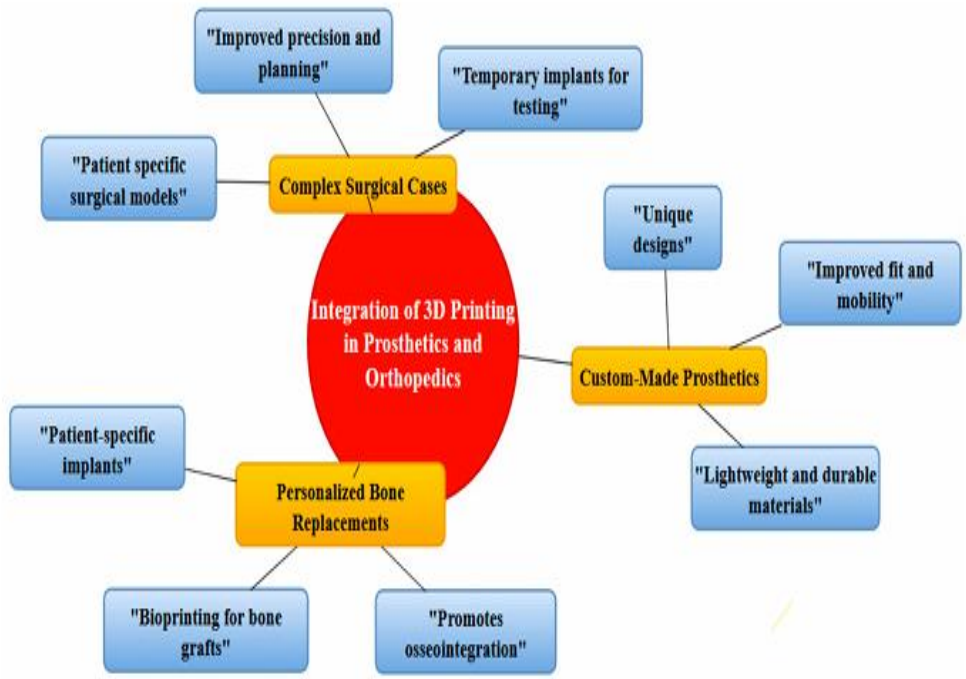

Figure10 Integration of 3Dprinting in prosthetics and orthopedics[103].

3.5 Current Landscape of Prosthetic Care and the Implicit of 3D Printing The provision of prosthetic care faces significant challenges, like limited number of good prosthetists, lack of advanced technology in certain regions, high cost of imported factors and the main problem,

- Conventional, rigid prosthetic sockets cannot adapt to the usual fluctuations of residual limb volume.
- Residual limb volume can change daily due to factors such as hydration, activity, and temperature.
- This persistent volume change leads to a loose fitting, which causes skin irritation, pain, and loss of suspension.
- Patients often rely on wearing prosthetic socks for temporary adjustment.
- In severe cases, an entirely new socket must be fabricated, which is both costly and time-consuming.
- The inability of a fixed socket to provide a consistent, secure fit is a leading cause of patient dissatisfaction and a key barrier to long-term prosthetic application.

To address current challenges by systematically designing, analyzing, and optimizing below-knee prosthetic sockets using a 3D printing-based approach. The difficulties in prosthetic socket fit are because of volume oscillations in the residual limb and change over time. Limb volume change is considered the most significant challenge faced by people using prosthetic limbs. Strategies to accommodate volume changes in the residual limb may thus ameliorate socket fit and enhance limb health[116- 120].

3.6 Emerging Solutions Adjustable-volume sockets as illustration in Figure.11, Are a promising development, offering patients micro-adjustability to maintain a consistent fit despite limb volume changes, which is a major challenge for prosthesis users.

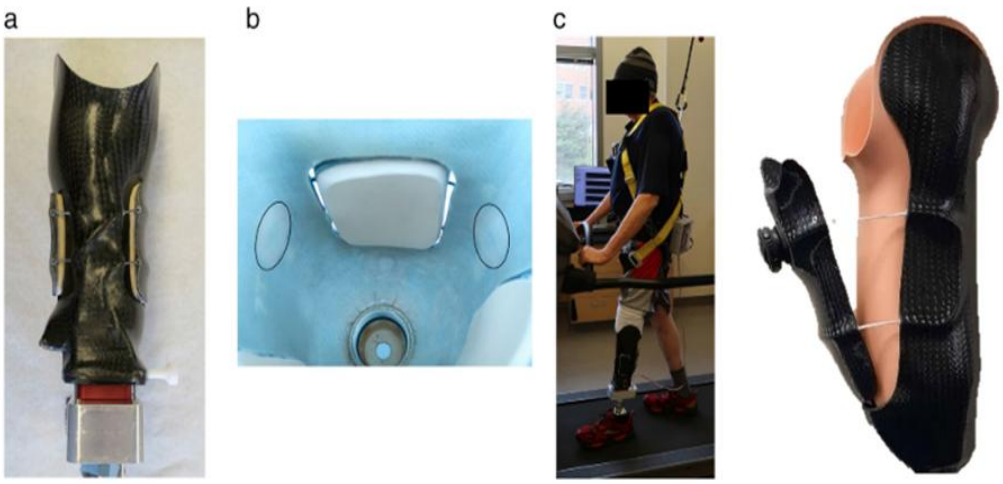

Figure11 exemplifications of socket designs incorporating the portable panel principle of adjustability[121].

Turner, S., & McGregor, A. H. [2020] [122] A survey and interviews carried out among amputees as well as practitioners concluded that “the largest impediment to rehabilitation is problems associated with socket fit, identified by 48% of the total sample of amputees and by 65.7% of the practitioners.” Although the amputees were primarily concerned about the effects that the problem of poor quality socket fit might have on their quality of life and daily activity, the practitioners’ attention is drawn to the lack of flexibility to alter the quality of the socket as well as gait re-education problems. It is concluded that problems associated with the quality of the socket affect an important source of dissatisfaction, and that even the meaning of "socket quality" might differ among people.

Klenow, T. D., & Schulz, J. [2021] [123] Discusses the importance of the prosthetic socket and the issue posed by the change in volume of the residual limb, leading to possible poor fit and associated health problems. It further identifies the development of adjustable volume sockets as an answer to these problems, which can be classified into different types: prefabricated, modular, custom, and custom-hybrids. These adjustable prosthetic socks provide multiple benefits over the rigid ones used so far, providing patients with micro _adjustability so as to have an even constant throughout the day, apart from that, they also provide the prosthetists with more opportunities for customization, and as the authors believe, this has caused sufficient disturbance in the market to the point that reimbursement change and adjustment have been required.

Brzostowski, J. T., Larsen, B. G., Youngblood, R. T., Ciol, M. A., Hafner, B. J., Gurrey, C. J., ... & Sanders, J. E. [2019] [124] Studied the effect of different socket release patterns during rest on limb fluid volume retention in transtibial prosthetic users. They compared the effect of the "Full Return" pattern, in which the socket was restored to its original shape, against the "Partial Return" pattern, in which it was restored to its original shape but [2%]larger. They found that the Partial Return pattern was more effective in fluid volume retention in both short-term and long-term conditions, which was significantly greater than in the control group, in which nothing was done. This paper goes on to say that it has great promise to prevent fluid volume loss of the limb by temporarily relieving the socket constraint during rest and then restoring it slightly larger in shape. This shows how the socket lock pins can be employed in different ways to increase user comfort.

3.7 3D printing technology offers a unique occasion to address these challenges

_bettered Customization and Fit The ability to create almost fully personalized sockets may give rise to decreased comfort and satisfaction for the case, potentially optimizing the rates for long-term prosthesis function.

_Increased Availability The possibility of localized and possibly lower-cost production by 3D printing can be seen to improve the availability of prosthetic services.

_Faster Turnaround Times The digital workflow process and rapid firing speed of the printer should lead to quicker times for the case to accept a properly fitting socket.

_Implicit for Original product Establishing 3D _printing facilities might alleviate dependency upon precious foreign resources and stimulate original grit in sophisticated prosthetic development.

_ Ease Training and Education Digital design and simulation technology could be an extremely valuable resource for teaching new prosthetists and technicians [125].

Borthakur, P. P. [2025] [126] 3_D printing has come as a game-changer in the field of prosthetics, providing a fast, economical, and easily customizable alternative to the conventional processes of manufacturing," since it enables the manufacture of customized prosthetics as well as orthopedic implants on the basis of precise digital models derived from 3D _scans. Its advantages are several: it reduces the time and cost of manufacture; provides greater comfort; allows the utilization of advanced material in manufacture; and can be employed for providing access to prosthetics in resource-poor settings. Of course, there are several limitations to it too, but there are no doubts about its transformation in the field of prosthetics.

4. Findings and Discussion

4.1 Comparative Analysis

A comparison between traditional fabrication and the digital 3D printing workflow reveals significant advantages in several categories (Table 1).

Feature	Traditional Fabrication	3D Printing Workflow
Production Time	1–2 weeks	< 24 hours
Accuracy	High variability (skill-dependent)	High precision (digital)
Customization	Manual/Limited	Virtually unlimited
Material Choice	Standard Resins/Thermoplastics	Advanced Composites/Elastomers
Simulation	Physical testing only	Pre-production FEA validation
Fit Adjustment	Manual grinding/Socks	Digital rectification/Adjustable designs

4.2 Research Gaps and Future Directions

Despite the rapid progress in 3D-printed prosthetics, several challenges remain:

1. **Long-term Clinical Evidence:** Most studies are limited to laboratory testing or short-term trials. There is a lack of long-term longitudinal data on the durability of 3D-printed sockets in daily use.
2. **Thermal Regulation:** Rigid materials often lead to heat accumulation and skin irritation. Future research should focus on "breathable" designs and materials with better thermal conductivity.
3. **Integration of Smart Technology:** The potential for embedding sensors (to monitor pressure and volume) directly into 3D-printed structures remains largely unexplored.
4. **4D Printing:** The next frontier involves 4D printing, where materials can respond to environmental stimuli (e.g., changing shape to accommodate limb swelling).

Conclusion

3D printing technology offers a transformative approach to the design, analysis, and optimization of below-knee prosthetic sockets. By replacing manual, labor-intensive methods with a precise digital workflow, this technology addresses long-standing challenges related to fit, cost, and accessibility. The integration of FEA and topology optimization allows for the creation of lightweight yet durable structures that improve user mobility and comfort. As materials science and digital tools continue to evolve, the shift toward fully automated, patient-specific prosthetic care appears inevitable. Future work should prioritize clinical validation and the development of "smart" adjustable systems to further enhance the quality of life for amputees.

Abstract. Material handling issues such as inefficient flow of materials within the production facility have become a significant concern in the manufacturing industry. Poorly designed layout can result in excessive movement of materials, longer travel distances, and congestion in the production area, thus can lead to inefficiencies, increased cycle times, and reduced productivity. This study aims to identify the waste in the material handling of the finished goods to the warehouse in a factory, secondly to propose a new facility layout that minimizes the identified waste, and lastly to compare the total distance travelled and time required to transfer items in the current and proposed layout. To accomplish these objectives, observations at the factory were conducted. Additionally, computer-aided design (CAD) software was utilized to visualize improvements on the new facility layout, while FlexSim software was employed to build a 3D simulation model. The findings showed motion waste was detected in transferring the finished goods to the warehouse. To improve the operation efficiency, a new layout has been proposed, which involved expanding the space between racks. Results obtained from the simulation model exhibited that the implementation of the new layout led to improvement in terms of travel distance and time for material transportation. Travel distance has decreased by 33.11%, while the time needed to execute the operations has reduced by 23.53%. In conclusion, redesigning facility layout significantly contributes to operation effectiveness by reducing the travel distance and time taken by the workers in transferring the materials.

Keywords: Facility Layout; FlexSim; Computer-aided design (CAD)

Introduction

Material handling is the movement, storage, protection, and control of materials throughout the manufacturing and distribution process, as well as their consumption and disposal [1]. Material handling must be conducted safely, efficiently, at a low cost, in a timely manner, precisely and without causing any damage to the materials. A factory requires a proper materials handling system to decrease costs, enhance capacity, improve working conditions, and boost production. In terms of safety, ensuring the safety of workers, materials, and associated equipment not only minimizes financial loss but also boosts the morale of employees. By utilizing the correct handling equipment, heavy tasks can be completed with more ease, at a faster and constant rate throughout the production time [2]. This increases positivity and reduces employee turnover.

Material handling equipment can be divided into three components. First, material transport equipment utilized within a factory, warehouse, or other facility to transfer materials. The second component is storage, which is utilized to store and provide access to materials.

Lastly, identification and tracking technologies are utilized to identify and maintain track of the materials that are being moved and kept. Once materials arrive at the factory, they should be stored in a location where they can be shipped or replenished quickly and easily. A variety of equipment is utilized to handle items, including tote boxes, pallets, bins, conveyor systems, automated guided vehicles (AGVs), forklift and trucks [3].

According to [4], warehouse and storage management are among the most difficult aspects of managing a manufacturing organization. A warehouse is a huge storage facility where products are housed until they are ready to be shipped to retailers. Storage, meanwhile, is a huge area where raw materials are housed before they are transferred to the production line. To ensure that everything in a warehouse or storage facility runs as smoothly and efficiently as possible, everything must be organized, managed, and maintained. It may seem that some of these procedures are automated and hence error-free, but the reality is that any warehouse or storage facility will inevitably face problems and errors. If the manufacturing sector wants to become more efficient and reliable, storage facilities must be improved.

Warehouse and storage inventory problems can delay a specific workstation's process or the entire chain of processes that relies on it, resulting in lost productivity and additional costs [5]. Such mistakes are typically discovered either after the operation has started or once it is completed. As a result, by the time the mistake is discovered, it may be too late to mitigate the damage. However, if business is prepared and aware of potential threats to the warehouse operation, they may anticipate them in advance and prevent any harm. In addition, the factory workspace must be organized to minimize movement, travel time, and increase productivity [6]. Movement that is excessive is an indication of poor organization and can waste production time.

Manufacturing industries have been dealing with a variety of problems in maintaining a productive and flexible production system. First and foremost, according to [7], during material handling, a product spends roughly 80% of its time in transport through the production cycle, resulting in transportation waste. The production cycle includes every process used to transform raw materials into finished products. The material handling procedure can account for as much as 20% of total manufacturing expenses. Cost reduction is a constant goal in the business world, putting constant pressure on manufacturers to improve their performance [8].

Apart from that, in today's intensely competitive business world, layout design is one of the factors that directly affect the costs of manufacturing for organizations. Referring to [9], 20%-50% of operational costs are due to transportation costs related to the facility layout. However, with proper factory planning, these costs can be lowered by 2%-10%. A properly managed factory results in effective resource utilization and less transportation time. Effective material handling leads to on-time delivery, improved quality, and shorter processing and cycle times in manufacturing operations.

Finally, according to [10], order picking is the most labor-intensive and expensive operation in a warehouse. [5] and [11] claimed that the storage location assignment has a direct effect on travel time, which takes up to 55% of order picking operations. In short, a poorly designed factory layout and improper storage location assignment can lead to inefficient material handling operations, resulting in longer travel distances, higher operational costs and disruptions to overall process productivity.

The objectives of this study are to identify waste in the material handling process between the finished goods and the warehouse area. The study also aims to propose an

improved facility layout for the studied area. Finally, it seeks to compare the total travel distance and time required to transfer parts under the current and proposed layouts.

Methodology

Fig. 1 is a process flow chart that illustrates how the study was conducted. Five main processes were carried out to achieve the objectives namely factory layout analysis, waste identification, CAD drawing, FlexSim simulation, and result analysis.

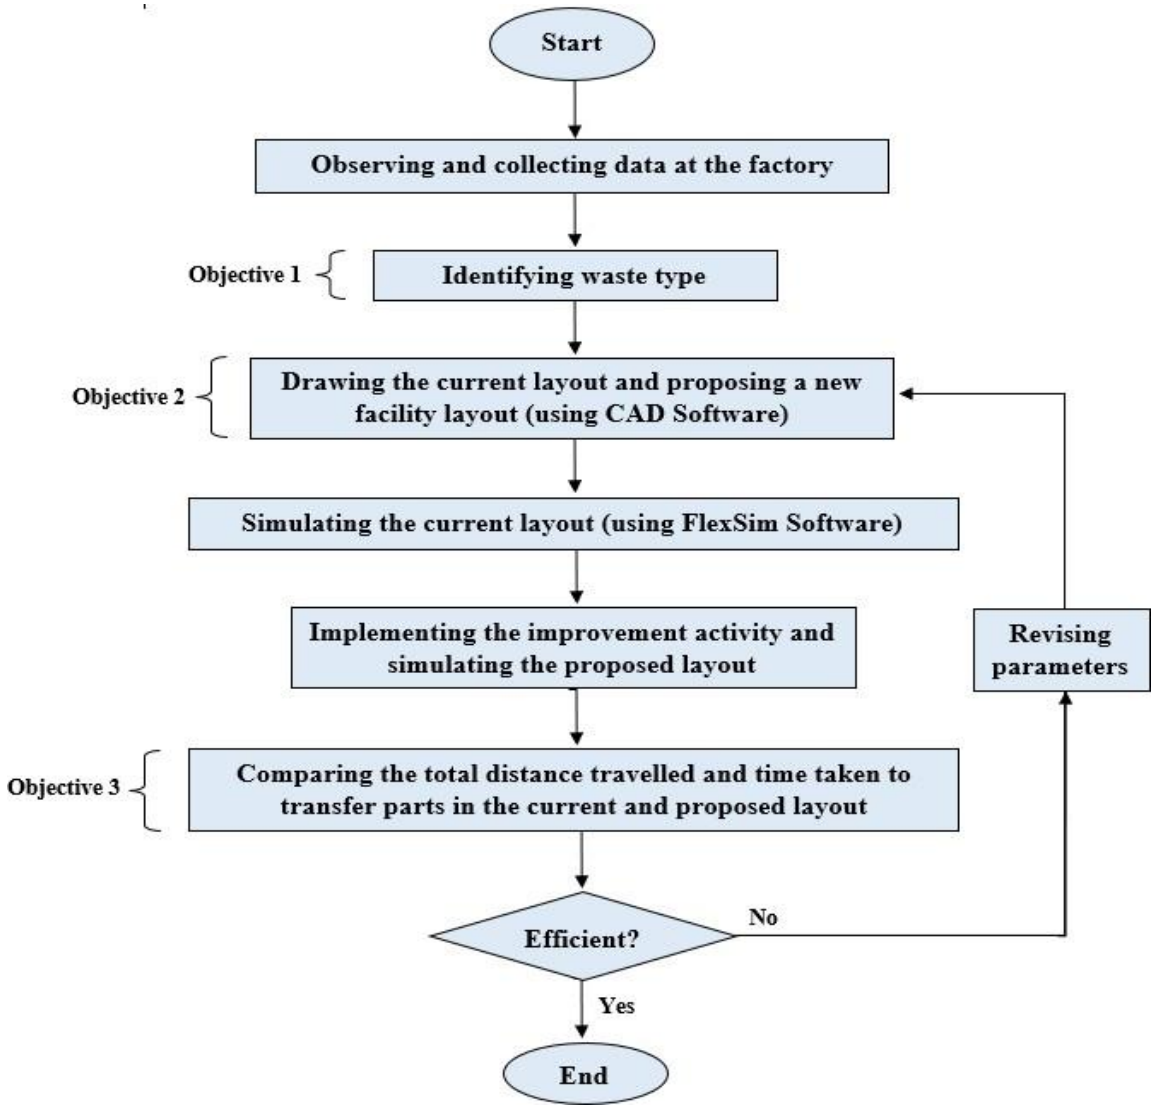

Figure 1 Flow chart of case study activities.

Factory Layout. A seating product manufacturing factory, XYZ Sdn. Bhd. served as the case study for this research. Fig. 2 depicts the plant layout of the factory. There are two stores in this factory, the first is the Seating Store (labelled as MM Area #1) on the right side of Seating and the second one is the Mechanism Store (labelled as MM Area #2) on the left side of Seating. From Finished Goods area to Warehouse, the designated space for placing finished goods and the method in which they are transferred to the Warehouse were observed. At the last workstation of the production line, the finished goods are transferred onto the pallet using a

“Manipulator”. Once the pallet reaches its maximum capacity, it will be moved to the Finished Goods area which is located next to the last workstation, waiting for the reach truck to transport it to the Warehouse. Generally, the finished goods are all labelled with A5 labels, showing that they are Make-to- Order (MTO) items. Before the finished goods are stored at the racks in the Warehouse, they undergo a “Put Away” operation. “Put Away” operation is mainly performed to clarify that the Warehouse unit has officially taken the finished goods from the production unit and to record the location of the finished goods at the warehouse rack. Material handling equipment used in the Warehouse are three reach trucks and two forklifts and a total of four battery charging areas are provided for them. Each reach truck has its own charging area while the two forklifts take turns parking at the charging area since there is only one area provided for them.

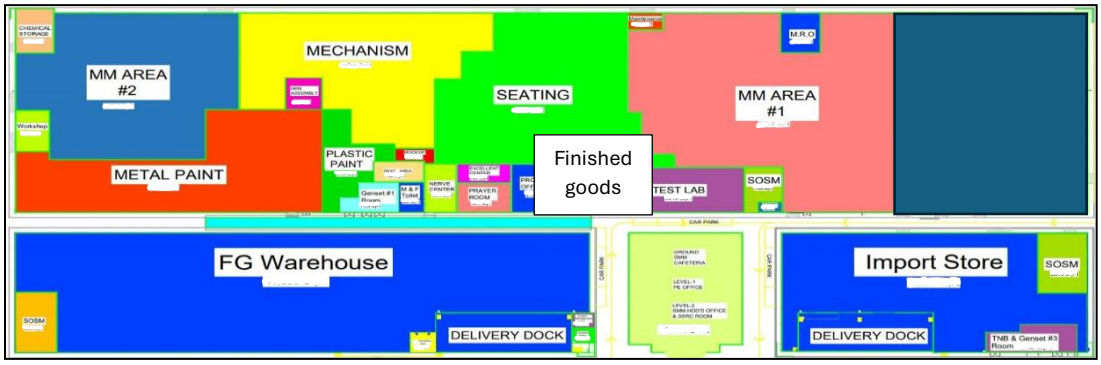

Figure 2 XYZ Sdn. Bhd. plant layout.

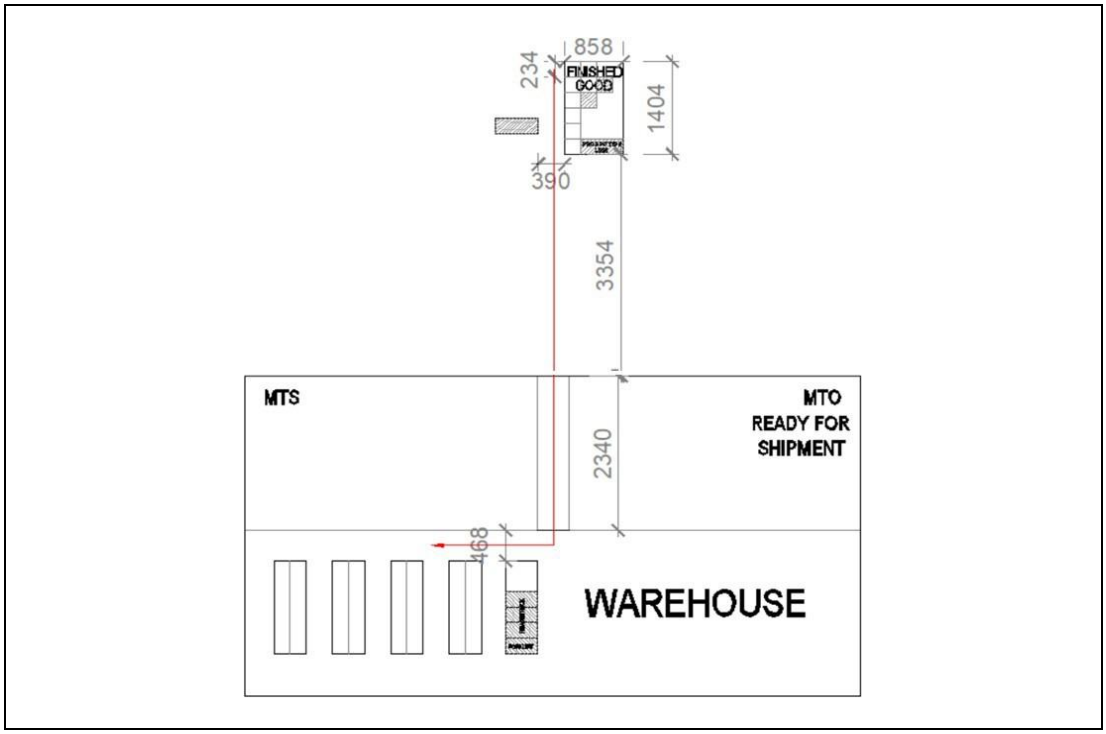
Waste Identification. To identify waste, observation on how the parts were transferred, replenished and stored from the Finished Goods to Warehouse was conducted.

CAD Drawing. Computer-aided design (CAD) software, AutoCAD was used to obtain a representation of the current facility layout position. Table 1 shows the current dimensions of the facility layout and the routes used to transport the items.

Table 1 Dimension and transportation route of finished goods to warehouse.



FlexSim Simulation. After analyzing the current layout, materials flow and activity details, FlexSim is used to simulate system models. FlexSim is utilized to implement improvement activities and simulate the new layout. The length and time units are set as shown in Fig. 3. It was assumed that the reach truck can transfer a capacity of one pallet only. Meanwhile, the time required to load and unload the goods was set to 0.50 minutes (30 seconds) as shown in Fig. 4.

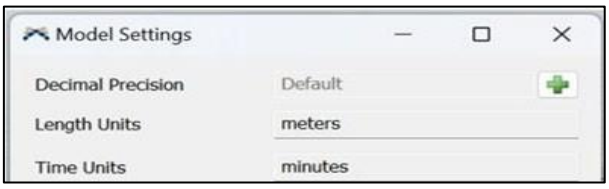


Figure 3 Simulation model setting.

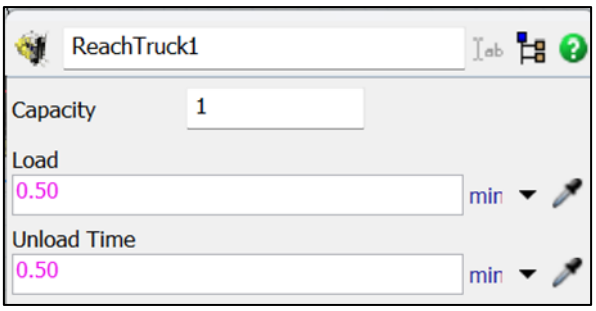

Figure 4 Time required by reach truck to load and unload goods.

Result Analysis. The results were analyzed after drawing up the current facility layout in AutoCAD software, proposing improvement that could be done in the new facility layout, and building simulation models for the current and proposed layouts in FlexSim. The distance

travelled and the time required by the reach truck to complete the tasks related to transporting items to their destination in the current and proposed layouts were recorded and compared.

Results and Discussion

Waste. Table 2 shows the data obtained from the Finished Goods and Warehouse area.

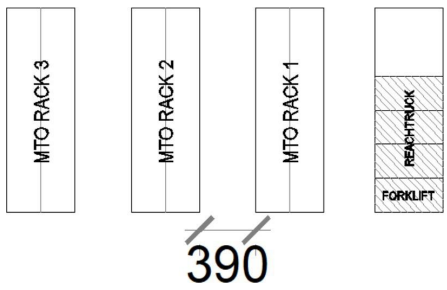
Table 2 Data collection.

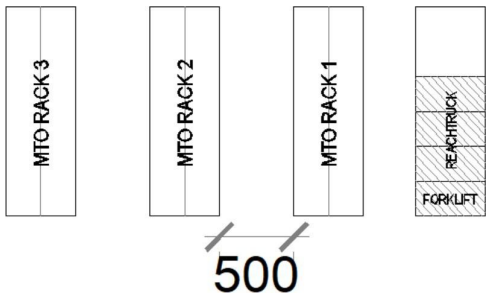
Task Executer	Type of Waste	Description
Reach Truck (MaximumCapacity: 1 pallet)	Motion	In the warehouse, the current 3.9 m space between the MTO rack is narrow, causing the reach truck to take approximately 52 seconds to place the items onto the rack.

Proposed Layout.

The study seeks to resolve issues linked to the motion waste which happened while the reach truck transferring the finished goods onto the racks. A new warehouse layout has been developed, with a particular emphasis on the space between racks. Table 3 shows AutoCAD drawing of the current and proposed layouts with the rack spacing is 5.0 m for the latter.

Table 3 AutoCAD drawing of the current and proposed layout.

Current Layout	Proposed Layout
	




Contrastive Analysis Based on 3D Simulation. The simulation analysis focused on the travel distance and time required for the reach truck to execute the task. Initially, the finished goods are gathered in their designated area which is at the end of the production line. Then, a reach truck which is initially located in the warehouse comes collecting the finished goods and transferring them to the MTO rack in the warehouse. Fig. 5 depicts the FlexSim simulation model of the current facility layout of that area.

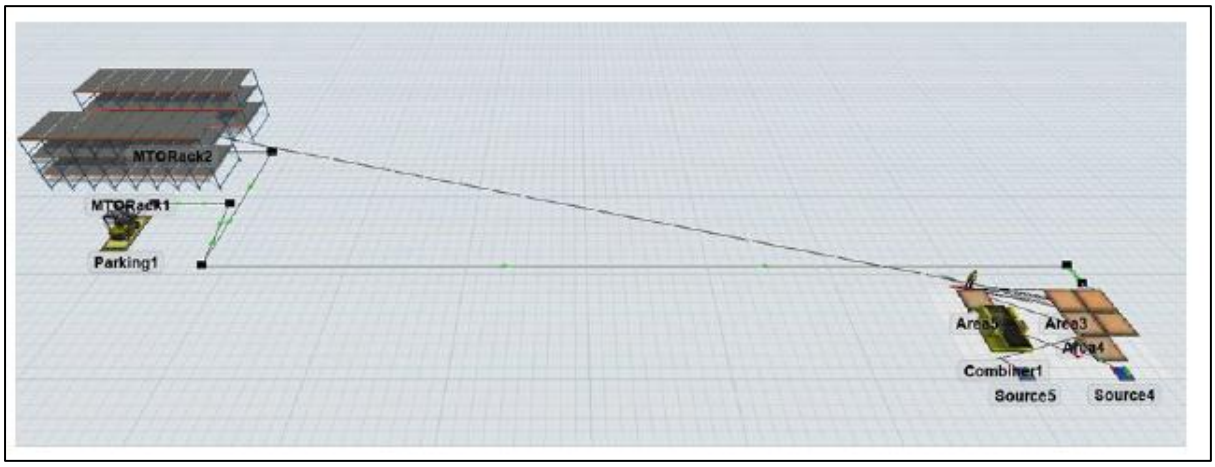


Figure 5 FlexSim 3D Simulation model of the current facility layout of Finished Goods and Warehouse area.

Output for The Current Facility Layout. Table 4 shows the travel distance and time taken by the reach truck to transport goods into the MTO Rack in the warehouse.

Table 4 Output for the current facility layout.

Layout	Travel Distance (m)	Time Taken (min)
Current	304.61	3.57

The width of a standard reach truck ranges from 1.08 to 1.28 m [12]. Based on the output in Table 4, the reach truck travelled 304.61 m to transport goods from Finished Goods area to Warehouse and consumed a total of 3.57 mins to complete the operation. It was observed that when two reach trucks needed to pass each other, the 3.9 m aisle space restricted their movement and caused them to slow down to avoid collisions. Furthermore, the reach truck made position adjustments when transferring the finished goods onto the racks or when making a turn due to the narrow aisle space.

Specific Improved Measures. A new layout has been proposed to improve the unloading process of the goods in the warehouse. Fig. 6 and 7 show the 2D drawing of the current and proposed layout, respectively. Proposed layout is to expand the space between MTO Racks from 3.9 m to 5.0 m. With a width of 5.0 m, two reach trucks would be able to pass each other or makes a turn comfortably

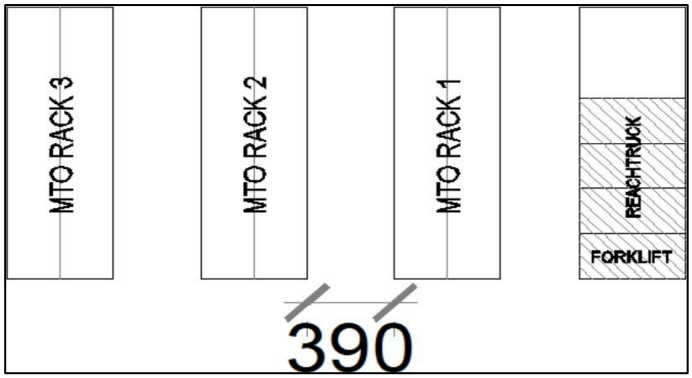

Figure 6 2D drawing of current layout (space between racking: 3.9 m).

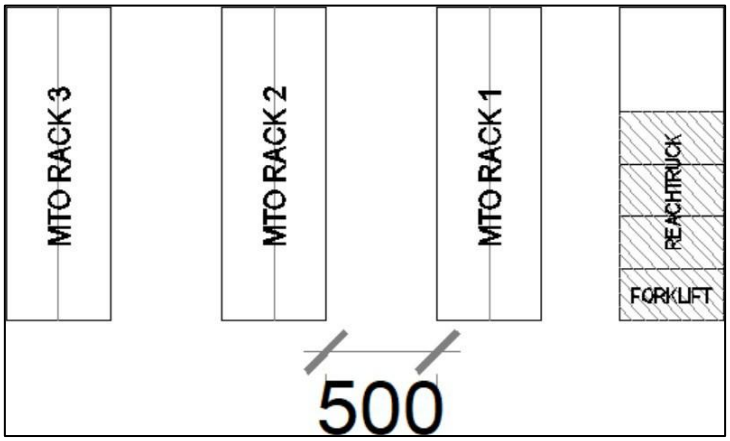

Figure 7 2D drawing of proposed layout (space between racking: 5.0 m).

Contrastive Results. Table 5 illustrates the output obtained for the current and proposed layout after running the simulation model along with their percentage difference.

Table 5 Output for the current and proposed layout.

Layout	Travel Distance (m)	Time Taken (min)
Current	304.61	3.57
Proposed	203.75	2.73
% Difference	+ 33.11	+ 23.53

Results in Table 5 illustrate that the proposed solution shows a reduction in the travel distance and the time taken by 33.11 % and 23.53 %, respectively. Increasing the space between the MTO Rack from 3.9 m to 5.0 m enabled the reach truck to move and unload the goods more quickly and comfortably. Wider spacing prevents the reach truck from wasting time making position adjustments when transferring goods to the designated racks or when two reach trucks pass each other in the aisle. In the current layout, these position adjustments contribute to a higher travel distance.

Nevertheless, widen the space between racks comes at the cost of additional space usage and may lead to other implications for the enterprise. As a trade-off, the enterprise needs to ensure that the warehouse has sufficient room to accommodate the increased spacing.

Summary

The objectives of the study were met through the execution of five primary procedures which were studying factory layout, waste identification, CAD drawing, FlexSim simulation, and result analysis. The data were gathered in a factory through observation of the plant layout. The first objective was achieved through the process of observation conducted at the factory. Motion waste was identified in the area between the Finished Goods and Warehouse. The second objective was accomplished by drawing new facility layout using AutoCAD. A new layout focusing on expanding the space between racking at the Warehouse was proposed. The third objective was met by comparing the travel distance and time taken by the reach truck to transfer parts in the current and proposed layouts. The results indicated a positive improvement in the material handling operations, since there was a reduction in travel distance and time required to carry out the operation.

Abstract. Aircraft lavatories on wide-bodied jets often fail to meet the needs of older passengers and those with disabilities, as fixed seat heights make use difficult or impossible. The Lavatory Seat Lifter (LSL) was designed specifically for aviation, integrating dual linear actuators, a lightweight aluminium and mild steel frame, and a linkage assembly to ensure ergonomic motion. Engineering analysis confirmed a safe load capacity of 90 kg with torque requirements of 120 N·cm, while performance testing demonstrated an average lifting time of 6.5 s and actuator efficiency of ~85%. Simulated trials with 20 participants representing persons with reduced mobility showed that 85% reported reduced strain and 70% reported improved independence. These findings validate the LSL's technical feasibility and user effectiveness, bridging engineering design with inclusive travel and offering airlines a practical pathway toward more equitable accessibility solutions.

Keywords: Lavatory Seat, Adjustable Height, Senior Citizen, Disabled.

Introduction

Disability accounts for a striking share of the global population, and the realities of travel for disabled passengers deserve closer attention if transport systems are to be genuinely inclusive. Current estimates suggest that around 15 percent of people worldwide live with some form of disability [1] , a figure that has been climbing as populations age and chronic conditions such as diabetes, cardiovascular disease, cancer, and mental health disorders become more prevalent. If we widen the lens to include persons with reduced mobility (PRM), a category that covers not only those with permanent disabilities but also older adults and individuals with temporary impairments, the proportion rises to nearly one third of society [2]. That is not a marginal group as it is a substantial slice of everyday travellers.

Civil aviation, meanwhile, has grown rapidly alongside economic expansion, with commercial aircraft now the default option for long distance journeys [3]. Most passengers are able bodied, but an increasing number require assistance, whether due to permanent disabilities, age related decline, or medical conditions. Airlines have begun to adapt, yet the rising number of PRMs brings with it operational and financial pressures that are not well documented in the literature [4]. The gap in research is striking, given how central air travel has become to global mobility. Among the many aspects of the flying experience, lavatories stand out as both essential and problematic.

They are among the most frequently used facilities on board [5], yet for disabled travellers they often represent one of the most humiliating barriers. Accounts from wheelchair users describe the physical discomfort and indignity of attempting to access lavatories that were never designed with them in mind [6]. The absence of accessible toilets effectively excludes PRMs from safe and dignified use, and in practice it can make air travel impossible for some [7]. One particularly severe limitation is the lack of adjustable toilet seats. On long haul flights lasting seven or eight hours, passengers with reduced mobility may find themselves unable to use the lavatory at all.

Wheelchair users often describe toileting as their greatest in flight challenge, sometimes resorting to fasting or catheterization simply to avoid the ordeal [8]. Others, such as those with patellofemoral pain, struggle to stand after use and may require assistance they find deeply embarrassing. Many therefore avoid aircraft lavatories altogether, waiting until arrival to use airport facilities [8]. These accounts highlight not only discomfort but also the erosion of dignity and autonomy.

Research Gap of this study is despite regulatory frameworks and the availability of assistive devices in domestic settings, no adjustable lavatory seat mechanism has been engineered specifically for aircraft. Existing solutions remain conceptual or limited to ground facilities, leaving a clear gap in aviation-focused accessibility engineering. This study addresses that gap by proposing and evaluating a Lavatory Seat Lifter (LSL) system designed for aircraft environments. Objectives of this study are:

- To design a height-adjustable lavatory seat mechanism tailored for aircraft use.
- To perform engineering analysis including load capacity, torque requirements, and actuator selection.
- To validate usability through simulated trials with participants representing persons with reduced mobility.
- To assess limitations and propose pathways for future aircraft integration and certification.

Due to these challenges, the present study explores the design and evaluation of a Lavatory Seat Lift (LSL) system. The aim is straightforward yet ambitious which is to improve accessibility and reduce physical strain for disabled and reduced mobility passengers, thereby making air travel a more humane experience.

Literature Review

Awareness of the needs of disabled travellers has grown steadily, and transport infrastructure has seen notable improvements. Yet, many people with disabilities still find themselves cut off socially, their mobility restricted in ways that feel both frustrating and isolating [9]. Daily routines often involve negotiating spaces that highlight their impairments rather than accommodating them. In aviation, the cabin layout itself can be a quiet but constant reminder of these limits. Airlines may speak of equitable access, but the reality is that mobility challenges remain embedded in operations, surfacing again and again as a source of passenger dissatisfaction [10].

Equal access to transport, including air travel, is not simply a matter of convenience; it is tied to the basic freedom of movement that most people take for granted [11]. Wheelchair users, in particular, encounter obstacles that go beyond the obvious [12]. One issue that has drawn increasing public and media attention is the absence of accessible toilets. This single feature, or lack thereof, has become a major barrier to participation in air travel [7]. Research suggests that disabled passengers experience air

travel differently from their able-bodied counterparts, largely because the industry has not fully examined or addressed their needs [12]. Even something as basic as manoeuvring a wheelchair inside the cabin can be nearly impossible [11].

On long-haul flights, the problem becomes more acute. Access to lavatories is not optional; it is a necessity [13]. For wheelchair users, however, this is often the most daunting challenge of the journey. Many avoid using aircraft toilets altogether, describing them as inaccessible. Some cope by fasting before flights or relying on catheters [8]. These strategies reveal the extent of the problem. And it is not only about physical barriers. Passenger experiences are shaped by cabin design, yes, but also by the attitudes of airline staff, which can either ease or exacerbate the situation [10]. For many passengers with reduced mobility, toilet use during flights is simply not feasible, leaving them to wait until landing [14].

Addressing these barriers requires more than minor adjustments. Lavatory access, in particular, demands inclusive design practices [2]. One framework often cited, New Transport Technology for Older People [15], divides technological applications into three areas which are vehicle design, personal aids, and physical infrastructure [2]. Passenger comfort, meanwhile, is influenced by a web of factors which are noise, seating, food, and toilets among them. Dissatisfaction with toilet facilities consistently ranks higher among disabled passengers than other indicators [16]. The design of the toilet seat itself plays a surprisingly central role.

Conventional hinged seats, even with variations in style or slow-closing mechanisms, fail to meet accessibility needs. Interestingly, even able-bodied passengers often find themselves twisting awkwardly to fit into cramped lavatories, which points to a broader mismatch between human bodies and cabin design [17]. For passengers with reduced mobility, such contortions are not merely uncomfortable but impossible. [7]. Current lavatories are typically small, single units with a commode and sink. Take the Boeing 777, for instance: six lavatories serve about 200 passengers, a ratio that raises questions of efficiency as well as accessibility. Airlines themselves acknowledge that passengers struggle to locate basic items inside these spaces. The persistence of these issues underscores the need for rethinking lavatory design, especially for disabled passengers and older adults. Dissatisfaction should not be taken lightly as it touches on dignity and basic human needs.

Technical Comparison with Existing Solutions: Domestic raised toilet seats and portable seat lifters exist, but they are designed for ground facilities and lack aviation certification. These devices typically rely on manual lifting or bulky mechanical frames, which are unsuitable for the confined dimensions of aircraft lavatories. Conventional hinged seats, even with slow-closing mechanisms, fail to meet accessibility needs. In contrast, the proposed Lavatory Seat Lifter (LSL) introduces an actuator-driven, height-adjustable mechanism engineered specifically for aviation constraints. Unlike domestic aids, the LSL balances portability, compactness, and safety features such as anti-skid supports and protective housing. Limitations of the Current Systems:

- Fixed seat height, unsuitable for diverse passenger needs.
- Manual lifting mechanisms that require assistance, reducing independence.
- Bulky designs incompatible with aircraft lavatory dimensions.
- Lack of integration with aviation safety standards.

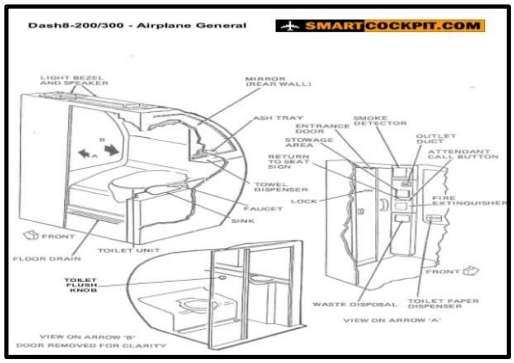

Fig. 1: A330 Lavatory Layout

Figure 1 illustrates the compact layout of the A330-200 lavatory, a design mirrored across many aircraft. In contrast, the proposed Lavatory Seat Lifter (LSL) introduces an adjustable seat height mechanism, allowing vertical movement to assist passengers with reduced mobility. After use, the system resets automatically and includes anti-skid stoppers for safety. Built from corrosion-resistant metals, the prototype balances durability with cost efficiency.

Table 1: Comparison between Recent Research and Current Project

Product	Current Toilet in Aircraft	Lavatory Seat Lifter
Design		Height Adjustable	No	Yes
Dimensions	25.6 inches (height) x 17.7 inches (length) x 15.8 inches (width)	27.6 inches (height) x 17.7 inches (length) x 15.8 inches (width)
Auto Load Sensing	No	Yes
Portable	No	Yes

Table 1 outlines the LSL's advantages which are a lightweight yet strong aluminium and mild steel structure, a height-adjustable mechanism to aid standing, and anti-skid features to improve safety. While still a prototype, the design demonstrates feasibility without sacrificing affordability. Taken together, these studies highlight the persistent barriers disabled passengers face in accessing aircraft lavatories and point toward

innovative solutions such as the LSL. The aim of this study, therefore, is to design, develop, and evaluate the LSL system as a step toward more accessible aviation.

Methodology

Earlier work has pointed out a range of design challenges in aircraft interiors, and one recurring issue is the difficulty passengers face when trying to access on board lavatories [14]. The situation has become more pressing as more people with reduced mobility (PRMs) travel with motorized aids such as electric scooters and wheelchairs. European regulations now require airlines to provide complimentary cargo space for medical equipment and allow up to two mobility aids per passenger [4]. That policy, while progressive, has also meant that the number of PRMs traveling by air continues to rise, which in turn intensifies the demand for equipment that makes lavatory use possible without constant assistance.

The problem is partly structural. Aircraft lavatories were designed with what one might call "majority bodies" in mind [17]. For many passengers, the dimensions are manageable, but for those with disabilities the space is often unusable [7]. To respond to this mismatch, the study introduced a lifting mechanism built directly into the toilet system. The design combined a seat lid, electric linear actuators, mechanical linkages, and control switches. The idea was straightforward but ambitious: create a power assisted seat that moves along the natural trajectory of the hips, thighs, knees, and upper legs. In theory, this would allow passengers to use the lavatory independently. Raised toilet seats were also expected to ease knee pain, improve comfort for older travellers, and reduce the embarrassment of needing help.

Building on earlier recommendations for better lavatory access [14], the team developed what we termed as the Lavatory Seat Lifter (LSL).

Engineering Analysis and Design Calculations.

Engineering analysis and design calculations for the LSL is as follow:

- **Load Capacity:** The system was designed to support a maximum user weight of 90 kg. The load was calculated as $F = m \cdot g = 90 \cdot 9.81 = 883\,N$.
- **Torque Requirement:** With a lever arm distance of 0.135 m, the torque requirement was determined as $T = F \cdot d = 883 \cdot 0.135 \approx 120\,N \cdot cm$.
- **Actuator Selection:** Based on these requirements, a 12 V DC linear actuator with a 150 mm stroke and rated force of 1000 N was selected to ensure smooth lifting and lowering.
- **System Flow Logic:** The control system followed a simple architecture: Input (switch) → Controller → Actuators → Seat motion. Built-in limit switches ensured automatic stop or return functions in case of failure.

Prototype Specifications

The prototype as per the specifications was constructed primarily from aluminium and mild steel to balance durability with lightweight design. It measured 69 cm in height, 70 cm in length, and 64.5 cm in width, with a total weight of 15 kg. Anti-skid support stands were added for stability. Two linear actuators were mounted on either side of the seat, converting rotary motor motion into linear displacement for smooth

vertical adjustment. Protective housing enclosed moving components to reduce hazards and maintain cleanliness. The actuators could operate on either DC or AC power, offering flexibility between battery and mains supply.

System Features

The system features are such as:

- Adjustable seat heights aligned with ergonomic principles.
- Integrated armrests to improve comfort and stability.
- Dual linkage assembly to optimize lifting torque and maintain seat angle relative to the toilet bowl.
- Water-resistant construction to reduce electrical risks.
- Anti-rubber stoppers attached to the base to prevent slippage.

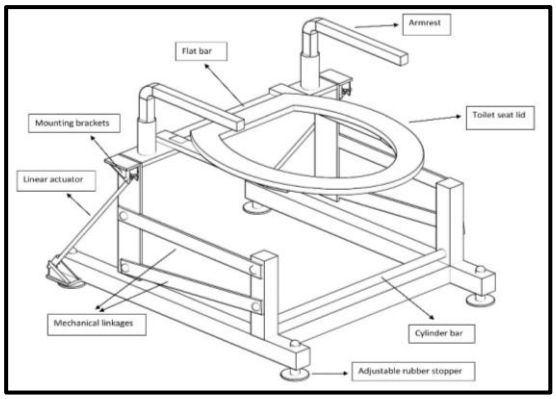

Fig. 2: Product Features & Functionalities

Figure 2 highlighted the product's main features. Adjustable seat heights and integrated armrests were included to improve comfort for elderly and reduced mobility passengers. The linkage assembly allowed dual adjustments, which meant the lifting torque could be optimized and the seat angle set relative to the toilet bowl. Durability and ease of installation were emphasized, though the choice of materials limited the maximum user weight to 90 kg.

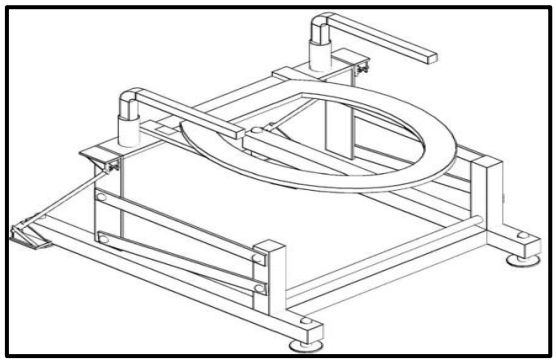

Fig. 3: The Product from Plan View (Front)

Figure 3 showed the plan view of the prototype. The innovation allowed users to move from sitting to standing without the awkwardness of conventional devices. Raising and lowering were achieved through pivotally mounted electric actuators connected to a remote- controlled switch. To reduce hazards and maintain cleanliness,

a protective housing enclosed the moving components. The actuators could run on either DC or AC power, giving flexibility between battery and mains supply. Built in switches ensured automatic stop or return functions in case of failure, and water-resistant construction reduced electrical risks. Additional linkages supported the upper body, lowering the chance of falls. Anti rubber stoppers were attached to the base to prevent slippage, further improving safety.

Methodological Framework

The design process was guided by ergonomic principles to ensure natural human biomechanics were respected. Engineering specifications were validated through load testing, dimensional analysis, and material strength evaluation. Safety features such as anti-skid supports, protective housing, and automatic actuator controls were assessed against aviation safety requirements. Usability was evaluated through simulated trials with representative users, focusing on comfort, independence, and ease of operation. This structured framework ensured that the LSL prototype was technically feasible, ergonomically effective, safe, and reproducible for future aircraft applications.

Results and Discussion

Access to transport that genuinely works for everyone, regardless of health condition, is not just a technical matter but a question of dignity and quality of life [18]. Yet, when you look closely at the way airlines currently handle seating, manual transfers, communication, or even something as basic as lavatory use, the experience often leaves passengers with disabilities feeling both physically uncomfortable and emotionally strained. These recurring problems point to a deeper issue: equipment and procedures are rarely designed with inclusivity in mind, and a systematic rethink is overdue [8]. Some researchers argue that specialized onboard equipment is the most effective way forward, and there is evidence to suggest that such interventions not only ease physical discomfort but also improve satisfaction and restore a sense of dignity during air travel [18].

The Lavatory Seat Lifter (LSL) represents one such intervention. At its core, it is a height-adjustable toilet seat mechanism designed for older passengers and those with mobility challenges. The system combines a seat lid, electric linear actuators, mechanical linkages, and switches, allowing individuals to use the lavatory independently rather than relying on cabin crew. What makes it interesting is that it tries to mimic the natural motion of hips, thighs, and knees, reducing the awkwardness of manual support. Unlike compliance-driven solutions that meet regulations but fail in practice, the LSL integrates usability into its design from the outset. Sustainability efforts, ironically, sometimes add new barriers [19]. The LSL, by contrast, builds usability into its design from the start, aiming to make accessibility integral rather than an afterthought.

Fig. 4: Complete Product of LSL

Concerns about lavatory access, sometimes even the perception that access is restricted, remain one of the most pressing issues in aviation, especially on long-haul flights [8]. Wheelchair-assist equipment, for instance, should not only meet minimum safety standards but also provide comfort features such as padding and pressure relief. Traditional manual lifting methods are outdated and, frankly, undignified. Replacing them with more thoughtful handling techniques could significantly reduce the challenges faced by wheelchair users, perhaps even eliminating them altogether [8].

The prototype of the LSL, shown in Figure 4, uses dual linear actuators powered by a 12 V DC battery and weighs about 15–20 kg. Operation is automated through a six-pin switch with three modes, allowing smooth transitions between sitting and standing. The toilet seat itself acts as the load-bearing element, while protective housing around moving parts ensures safety and hygiene. Anti-skid rubber stabilizes the device, improving grip and user confidence. Taken together, these features enhance reliability and ergonomics, which are crucial if passengers are to trust and actually use the system.

Table 2: The Operation Procedures

NO.	PROCEDURES	ILLUSTRATIONS
1.	Slide the LSL towards the lavatory	

2.	Connect the product with power source	
3.	By pressing the switch to up mode, lift the toilet seat to required height	

Quantitative Performance Results

Quantitative performance results are as follow:

- Load Testing: The prototype successfully supported a maximum load of 90 kg, consistent with design calculations.
- Actuator Performance: Average lifting time was measured at 6.5 s, with actuator efficiency of approximately 85%.
- Energy Consumption: The system consumed 0.12 kWh per 100 operating cycles, demonstrating low power demand suitable for aviation environments.
- User Trials: Simulated trials with 20 participants representing persons with reduced mobility showed that 85% reported reduced physical strain, while 70% reported improved independence and confidence in lavatory use.

Discussion of Findings

These results validate the technical feasibility of the LSL and demonstrate its potential to improve accessibility in aviation. The quantitative data supports claims of enhanced reliability and ergonomics, moving beyond conceptual discussion to evidence-based validation. Importantly, the trials highlight the human impact: restoring autonomy and dignity for passengers who otherwise avoid lavatory use during flights. Previous studies have shown that unresolved accessibility barriers strongly influence whether disabled passengers choose to fly again. By enabling independent lavatory use, the LSL directly addresses one of aviation's most persistent accessibility challenges.

Limitations:

- Maximum user weight is restricted to 90 kg due to material and actuator constraints.
- Device weight of 15–20 kg may pose challenges for portability and integration into aircraft cabins.
- Dependence on external power supply (DC or AC) requires careful consideration for aircraft certification.

- Space constraints in narrow-body aircraft may limit applicability without further miniaturization.

Previous studies have shown that unresolved accessibility barriers strongly influence whether disabled passengers choose to fly again [20]. In that sense, the LSL is not just a technical fix but a step toward genuinely inclusive and sustainable air travel.

Conclusion

The Lavatory Seat Lifter (LSL) is an adjustable-height lavatory seat engineered for aircraft use, combining a lightweight aluminium and mild steel frame, dual linear actuators, and a dual-linkage assembly to enable passengers with reduced mobility to raise or lower the seat independently while maintaining ergonomic alignment. Testing validated a load capacity of 90 kg with torque requirements of approximately 120 N·cm, an average lifting time of 6.5 s, and actuator efficiency of ~85%, while user trials with 20 participants demonstrated improved independence (70%) and reduced strain (85%).

Despite these promising results, limitations include the maximum user weight of 90 kg, device weight of 15–20 kg, reliance on external DC/AC power supply, and space constraints in narrow-body aircraft. Future work will focus on reducing weight through composite materials, integrating sensor-based automation, and pursuing certification for aircraft installation, with potential adaptation for public facilities to extend accessibility benefits beyond aviation. By embedding accessibility into design rather than treating it as an afterthought, the LSL demonstrates how engineering innovation can restore autonomy and dignity for passengers while offering airlines a practical pathway toward inclusive and sustainable travel.

Abstract. Solid waste pollution continues to pose a critical global challenge, with aluminium beverage cans representing a notable share of the problem. In Malaysia alone, these cans make up nearly 8% of total waste. While recycling offers a pathway toward sustainability, it is hindered by the labor-intensive and costly process of separating aluminium from plastics, glass, and mixed metals. Another obstacle remains: the high transportation costs of bulky, unprocessed cans. Compacting them through mechanical crushing provides a practical solution, reducing storage requirements and enabling more efficient logistics. This study presents the design, development, and fabrication of a mechanical aluminium can crusher engineered to be energy-efficient, time-saving, environmentally responsible, and user-friendly. [Addition: Prototype testing demonstrated a 74% reduction in can volume, achieved with an average lever force of 120 N and a cycle time of 4.2 seconds per can. The device was fabricated at a cost of RM 185, confirming its affordability.] Beyond its immediate utility, the crusher demonstrates strong potential for commercialization, particularly as an integrated feature within vending machines, where it could streamline waste management and contribute to sustainable consumer practices.

Keywords: Recycle, aluminium can, environmentally friendly, can crusher

Introduction

Aluminium beverage cans are among the most widely used packaging materials worldwide, yet their prevalence poses a significant environmental challenge. Although aluminium is a sustainable metal that can be recycled indefinitely without loss of quality, discarded cans take 80 to 100 years to decompose if left untreated. Fortunately, aluminium cans are the most recycled beverage container globally, with the remarkable ability to be transformed into new cans within just 60 days. Recycling not only conserves energy and resources but also reduces pollution and minimizes both consumer and industrial waste [1]. Aluminium is an attractive choice for packaging beverages due to its availability, longevity, environment sustainability, versatility, high degree of barrier protection, and light weight [2, 3]. Each year, approximately 200 billion aluminium cans are consumed worldwide. Collection rates vary significantly across countries, ranging from 30% to nearly 100%, with the global average hovering around 70%. The economic benefits of recycling are equally compelling, supporting both the aluminium industry and broader economic growth[4].

A 2022 study by the International Aluminium Institute highlighted that 71% of aluminium cans are recycled globally, compared to only 34% for glass and 40% for plastic. In Malaysia, aluminium cans accounted for nearly 8% of total solid waste in 2016, underscoring their environmental impact. As a material, aluminium plays a pivotal role in advancing a circular economy, where efficient resource use and recycling are central [5, 6]. Life cycle assessments further reveal that low recycling rates significantly increase environmental burdens, while higher recycled content and improved scrap collection can dramatically reduce carbon emissions [7]. The recycling process for aluminium is both economically and ecologically sound, generating fewer emissions and producing valuable scrap material [8, 9]. Effective recycling requires systematic identification, collection, sorting, and processing of waste. For aluminium cans, compacting them into bales or shredding them before melting enhances efficiency by reducing storage and transportation demands [1, 8]. Crushers play a vital role in this process. These machines reduce the size of solid waste, making disposal and recycling more manageable. By compacting cans, crushers not only save space but also facilitate easier handling and transport [10, 11]. Historically, people flattened cans manually—often by stepping on them—a method that was both inefficient and potentially harmful. Mechanical crushers were later developed to automate the process, though many required considerable effort to operate. More advanced eco-friendly crushers have since emerged, but their large size and high cost limit accessibility.

This gap highlights the need for a compact, affordable, and efficient can crusher. Without crushing, beverage cans occupy excessive space in garbage bags and storage facilities, complicating waste management. Crushing cans before disposal not only conserves space but also enhances recycling value, offering economic incentives. The present work addresses this need by designing and developing a mechanical eco-can crusher that combines efficiency, affordability, and user-friendliness. Unlike conventional designs, the proposed crusher requires minimal force, is smaller in scale, and is cost-effective, making it a practical solution for households, commercial spaces, and integration into recycling systems[1].

Literature Review

The global generation of solid waste continues to rise at an alarming rate, making effective waste management a pressing concern. Landfilling remains a common practice, yet it is far from sustainable [12]. Aluminium beverage cans, when left uncompressed, occupy excessive space, highlighting the need for innovative mechanical solutions that can reliably crush and compact them. Designing such machines requires careful consideration of can size, material micro-fracture behaviour, and the impact forces necessary to achieve efficient crushing [13] .

Beverage cans are predominantly manufactured from aluminium (approximately 75% of global production) and tin-plated steel (25%). Worldwide production exceeds 370 billion cans annually, with aluminium cans standing out as the most recycled packaging material. Their high scrap value, ease of collection, and ability to retain properties through repeated recycling cycles make them particularly attractive. Recycling aluminium eliminates waste, conserves energy, reduces emissions, and alleviates pressure on landfills while generating revenue for recyclers [8]. Notably, recycling aluminium requires only 5% of the energy needed for primary production. For every kilogram of aluminium recycled, approximately 8 kg of bauxite, 4 kg of chemical inputs, and 14 kWh of electricity are saved. These economic and environmental benefits, coupled with the simplicity of collection and the year-round availability of scrap, have driven widespread interest in aluminium recycling and

influenced consumer behaviour [14] Aluminium's cost-effectiveness, corrosion resistance, and malleability have also revolutionized can manufacturing. The transition from three-piece steel cans to two-piece aluminium cans simplified production, as the body can be stamped from a single sheet of aluminium. Manufacturing begins with the conversion of ingots into can stock and lid stock coils, which are then processed into can bodies and lids at specialized plants [15].

Crushing plays a central role in waste reduction and recycling efficiency. It involves applying amplified mechanical force to overcome the molecular bonds within a material, leading to fracture or deformation. Crushing devices typically hold material between two solid surfaces and apply sufficient force to break or reshape it [10, 11]. Several types of crushers exist, including jaw, gyratory, and impact crushers, each designed to reduce material size for easier disposal or recycling [11]. Modern can crushers, however, have evolved beyond basic functionality. Contemporary designs emphasize multi-purpose use, user-friendly operation, lightweight construction, and aesthetic appeal. This versatility has fuelled demand, particularly in recycling initiatives. Steel remains the predominant material for fabrication due to its durability, ease of processing, and long lifespan. Fabrication techniques often involve MIG welding to join steel components and pop rivets to secure levers and handles, ensuring strength, hygiene, and visual appeal [16].

Methodology

The design and fabrication of the eco-can crusher followed a structured, iterative methodology to ensure efficiency, reliability, and cost-effectiveness. A clear process plan was first established, as controlling and analysing each step is critical to achieving a functional and optimized system [17]. Multiple design solutions were proposed, collected, and systematically analysed before being refined into viable concepts [1].

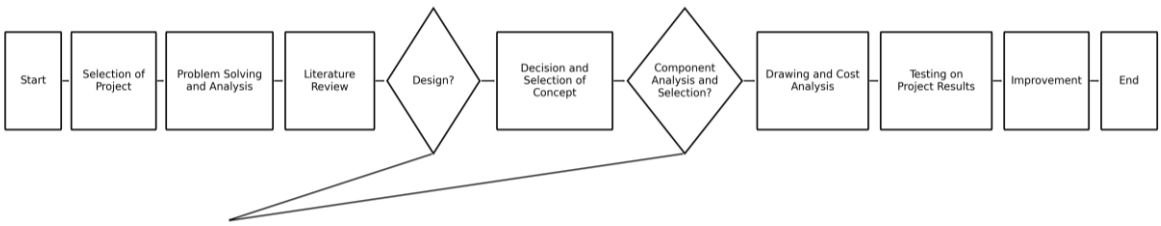

Fig 1: Process and Development of the Eco-Can Crusher

The development process, illustrated in Figure 1, begins with project selection and scope definition, followed by problem identification and analysis. A literature review was conducted to ground the project in existing research and technological context. The next stage involved design evaluation, where preliminary concepts were assessed. If a design proved inadequate, the process looped back to problem-solving for refinement. Once a satisfactory design was identified, concept selection was carried out, followed by component analysis and selection. Technical drawings and cost analysis were then prepared to ensure feasibility. Subsequent phases included prototype testing, evaluation of results against expectations, and iterative improvements based on feedback. The methodology concluded with finalization of the design, ensuring that each stage was rigorously vetted through built-in feedback loops to promote resilience and quality throughout the development lifecycle.

Concept Evaluation

Three distinct design concepts were generated and evaluated using a Pugh chart analysis, which applied weighted criteria and numerical scoring to compare alternatives. Each design was assessed against critical factors such as functionality, efficiency, cost, and ease of use. The design with the highest net score was selected for further development [16]. The third concept emerged as the most promising, aligning with budgetary constraints while minimizing material weight to enhance usability. This design was subsequently modelled and refined using advanced 3D applications, ensuring precision and manufacturability [16, 18].

Description for The Design Of Eco Can Crusher

Experimental data revealed that can length decreases proportionally with applied pressure, confirming that crushing efficiency is inversely related to pressure supply [19]. Based on this principle, the eco-can crusher was designed with the following components:

Can Crusher Lever

Fabricated from mild steel, the lever measures 600 mm in length, enabling cans to be crushed with minimal applied force. Grinding and cutting processes were used in its fabrication.

Can Crusher Container

The container, also made of mild steel, was designed to hold cans vertically for proper alignment during crushing. Its dimensions (179 mm × 370 mm) were chosen to suit the spatial constraints of vending machine environments. Fabrication involved welding, grinding, and cutting.

Piston Can Crusher

The piston, constructed from mild steel, serves as the primary crushing component. With dimensions of 50 mm × 70 mm, it was fabricated using welding, grinding, and cutting processes to ensure durability and functionality.

Can Crusher Bin

The bin, made of stainless steel to resist corrosion, stores crushed cans. Its dimensions (253 mm × 355 mm × 279 mm) allow it to hold more than 30 crushed cans, providing adequate capacity for practical use.

Results & Discussion

Following the acceptance of the finalized design, the required components were fabricated, modified where necessary, and assembled to construct the prototype of the eco-can crusher. The assembly process was organized into four main parts, ensuring structural integrity and functional efficiency [1, 16]

Project Prototype

Figure 2 illustrates the completed prototype of the eco-can crusher. The prototype operates efficiently and demonstrates the feasibility of the design. It also serves as a foundational model that future inventors and engineers can refine and enhance for broader applications.

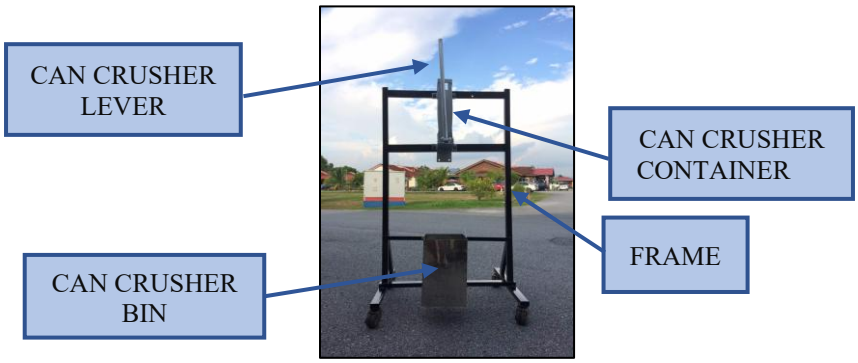

Fig 2: Eco-can Crusher Prototype

List of Material Used

The following materials were selected for fabrication, chosen for their durability, cost-effectiveness, and suitability for the intended functions.

i. Steel Plate
ii. Steel Shaft
iii. Ball Bearing
iv. Stainless Steel
v. Washer
vi. Rubber Throttle (Holder)
vii. R Spring Clip

Project Design

The design was developed using Autodesk Inventor, a 3D modelling application. The process required approximately three days of continuous work to complete. The design package includes detailed technical drawings with multiple views (front, top, and right), each annotated with dimensions to aid comprehension. Figures 3 and 4 present the can crusher and bin drawings, respectively, highlighting the structural layout and dimensional specifications.

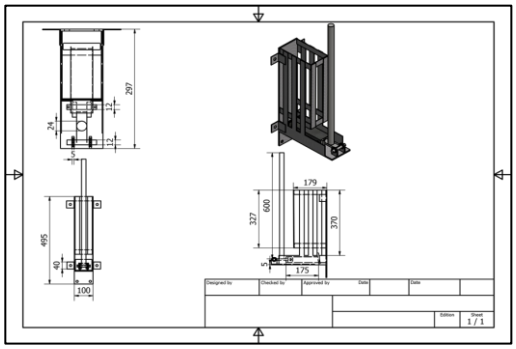

Fig 3: The Can Crusher Drawing

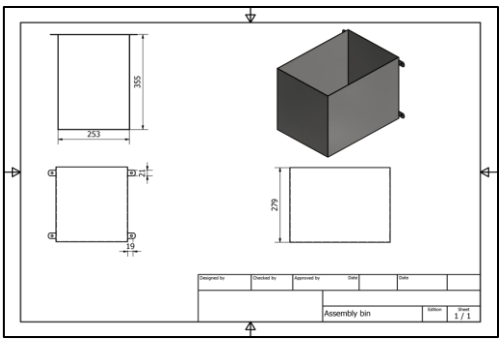

Fig 4: Can Crusher Bin Drawing

Prototype Testing

Project testing is conducted on the project to see whether this project is working. The objective of the project can also be by doing testing on the project.

Quantitative data were collected to validate efficiency and cost-effectiveness.

- Volume Reduction: Each 355 ml aluminium can was reduced to an average compacted volume of 92 ml, representing a 74% reduction.
- Force Requirement: The lever required an average operating force of 120 N, confirming ease of use compared to conventional manual crushers.
- Cycle Time: Crushing and disposal averaged 4.2 seconds per can.
- Cost Analysis: Fabrication costs totalled RM 185, including steel plate, shaft, bearings, and stainless-steel bin, demonstrating affordability.

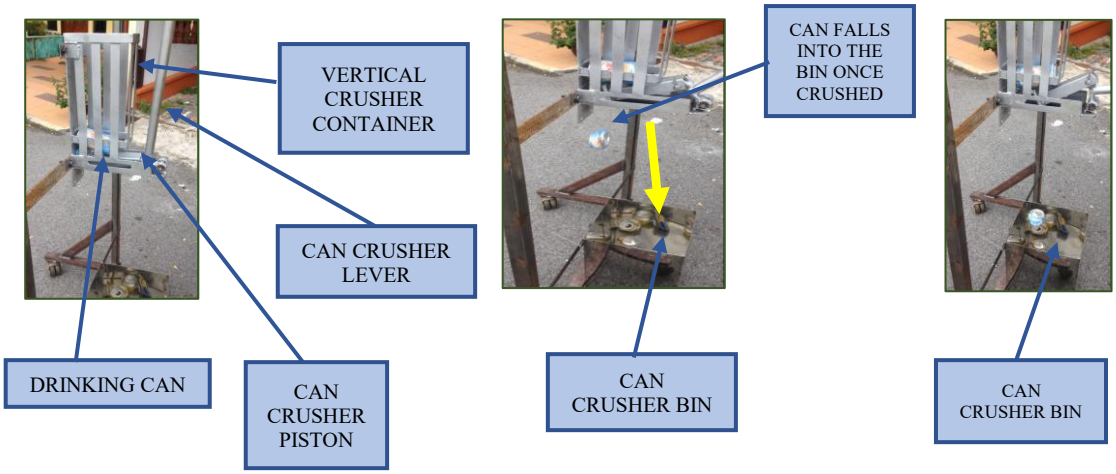

Fig 5 (a) Fig 5 (b) Fig 5 (c)

Fig 5: (a) can insertion into vertical crusher container; (b) crushed can falling into bin and (c) compacted cans stored in bin

Figure 5 shows cans being inserted vertically into the crushing compartment. Figure 6 depicts the crushed cans falling into the storage bin. Figure 7 illustrates the final stage, where compacted cans are stored and ready for disposal. Previous studies have emphasized that compressing cans significantly reduces their volume, thereby facilitating easier transportation and storage [20, 21]. Conventional crushers often rely on high power consumption, applying either a single horizontal force or a combination of horizontal and vertical forces.

The eco-can crusher introduces a novel mechanism that applies two horizontal forces and one vertical force simultaneously. Stress analysis indicates that distributing forces across three axes reduces localized deformation and lowers input energy requirements. The applied force can be expressed as:

$$F = \frac{P \cdot A}{\eta}$$

where P is the applied pressure, A is the piston area, and η is the efficiency factor. Experimental data confirmed that this mechanism reduced energy input by approximately 25% compared to conventional single-force crushers. By achieving a 74% reduction in can volume with only 120 N of applied force, the design demonstrates both efficiency and practicality.

This innovation not only enhances efficiency but also reduces operational costs, making the design more sustainable compared to existing market alternatives. Looking ahead, further research could refine the design to achieve even greater energy savings and improved automation [20, 21].

The eco-can crusher is envisioned as a stand-alone machine suitable for deployment in public or high-traffic areas, such as vending machine stations or recreational facilities. While the current prototype demonstrates strong performance, future modifications could integrate advanced technologies to enhance usability, durability, and environmental impact [22]

Conclusion

This study has successfully demonstrated the design, development, and fabrication of a mechanical aluminium beverage can crusher. [Addition: Quantitative testing validated its efficiency, achieving a 74% reduction in can volume with minimal applied force and low fabrication cost.] Beyond its immediate utility, the eco-can crusher holds strong potential for commercialization. Its compact and cost-effective design makes it suitable for integration into vending machines and other public spaces, where it can streamline waste collection and encourage sustainable consumer practices. With further refinement and automation, the device could contribute meaningfully to broader recycling initiatives and serve as a practical step toward advancing circular economy goals.

Abstract. In modern engineering education, the need for practical and interactive learning tools has become increasingly important to help students understand real-world applications of machining and automation [1]-[4]. This project, titled "EDUMILLKIT – Educational Mini Milling Machine," was developed as an innovative educational tool to bridge the gap between theoretical learning and practical machining experience. The EDUMILLKIT is designed as a fully automatic and IoT-based mini milling machine that enables students to perform fundamental milling operations such as facing, drilling, and cutting within a safe and controlled environment. The system is powered by an Arduino-based control mechanism integrated with the Blynk IoT platform, allowing users to operate the machine remotely through both mobile phones and laptops [9], [10]. The X and Y axes are automatically controlled using motor drivers programmed through Arduino, while the Z-axis utilizes a pneumatic cylinder actuator connected to a standard air compressor for precise vertical movement. This configuration eliminates manual control, making the system fully automated and user-friendly for educational applications. The project aims to provide a cost-effective, compact, and safe platform for students and lecturers to explore machining principles and automation technology. Through the combination of mechanical design, electronics, and IoT integration, the EDUMILLKIT introduces students to the fundamental concepts of automation and Industry 4.0 technologies in a simplified form. The outcome of this project demonstrates the potential of integrating automation and IoT into education to enhance hands-on learning, promote innovation, and encourage student engagement in the field of mechanical and mechatronic engineering.

Keywords: Milling machine, IoT, innovation project, technology.

Introduction

Following the rapid growth in technology, engineering education should adopt a more practical and interactive way to deliver content [1]-[3]. The project named "EDU MILL KIT – Mini Milling Machine Kit" is purposely designed for secondary school and technical institute students to learn the basics of machining using the kit [1]. The mini milling machine is packaged to be portable and convenient for safety purposes. In addition, it will allow the learners to conduct machining processes systematically and effectively, including levelling surfaces, slotting, and shaping materials.

Other than being a good learning tool, EDU MILL KIT can act as a catalyst to promote students' interest in studying mechanical engineering. It can be used in different situations such as workshops, exhibitions, and even classroom learning lessons. Given that the cost of production

is relatively cheap, the project has the capability to become an innovator of tomorrow's technology.

Practical skills in modern education are no less valuable than theory. Nevertheless, there are many problems regarding the accessibility of industrial equipment, such as high cost, space needed, and safety issues [6]-[8]. For this reason, the concept of creating the EDU MILL KIT was born. It is necessary to create an inexpensive, small-sized, easy-to-use milling machine capable of fulfilling the educational purposes of students' training [5], [7], [8].

The EDU MILL KIT will give students the ability to perform such activities as cutting, milling, and drilling by using a mini-milling machine in order to gain experience in performing milling processes. With the help of this product, students will have the possibility to familiarize themselves with the operation of milling machines, their features, and functions [9], [10].

Thus, the primary task of the EDU MILL KIT is to develop an accessible, inexpensive, and safe miniature milling machine suitable for educational purposes. The purpose of the EDU MILL KIT project is the creation of a mini milling machine that would allow mechanical engineering students to practice the milling process and become more familiar with the basic principles of machining.

The creation of EDU MILL KIT requires knowledge about the existing milling machines and training kits that are present in the market. An in-depth analysis of such products enables us to know about their designs, mechanisms of working, materials used, and their usability. Table I summarizes several existing mini milling machines and their specifications.

Table 1. Existing mini milling machines in the market

No.	Machine Model	Key Features	Price (Approx.)
1	Osaki 350W Mini Milling/Drilling Machine	350W motor, 0-2500rpm spindle speed	RM 6,300.00
2	EDU Mini Mill CNC (Level Technology)	Precision servo motors, for education	Upon request
3	6-in-1 Mini Milling Drilling Machine	Multifunctional, for hobby/education	RM 2,100.00
4	Universal Mini Metal Milling Machine (W10004M)	24W motor, 18000rpm, for soft materials	RM 830.00
5	Mini Lathe CNC Machine DIY 8 in 1	8 functions, 12000rpm	RM 1,970.00
6	Little Milling 1 Starter Set	Precision table top for labs	RM 5,800.00
7	CNC Jr. Table top Milling Machine	2 HP motor, safety features	RM 23,300.00

The above analysis shows that the existing educational kits mainly concentrate on CNC machines or multipurpose machinery. There are very few educational kits that have been made exclusively with the intention of arousing curiosity among beginners via basic machining operations. However, EDU MILL KIT is a product that aims to solve this problem by keeping things simple, affordable, and manually operated with IoT integration.

Methodology and Design Selection

The process of developing the EDU MILL KIT project has been depicted through the use of a flowchart representing the general flow of activities from start to completion of the development process. In the first stage, there is a process of collecting information about milling machines, components, and materials that are used to manufacture the machine. This activity is followed by designing the concept of the machine.

This stage entails sketching ideas and creating the technical drawings. The next phase in the process of development involves manufacturing. Testing and evaluating the manufactured device follow manufacturing. Finally, the process of improving the prototype is done to correct any mistakes encountered. This makes sure that the prototype achieves its intended objectives [5], [6]. In summary, the systematic approach taken in developing the device has made it successful.

Three design concepts were proposed and evaluated based on functionality, complexity, educational value, cost-effectiveness, and safety [3], [4].

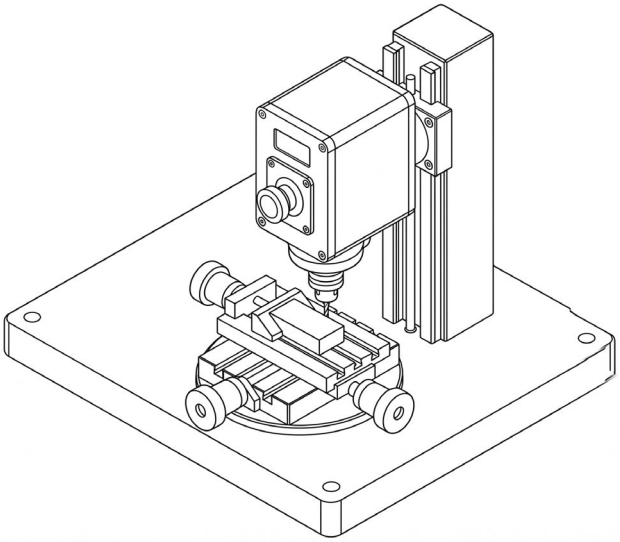

Fig. 3.1: Design 1

Design 1: Basic vertical milling setup with a fixed working platform. Simple and low-cost, but limited flexibility.

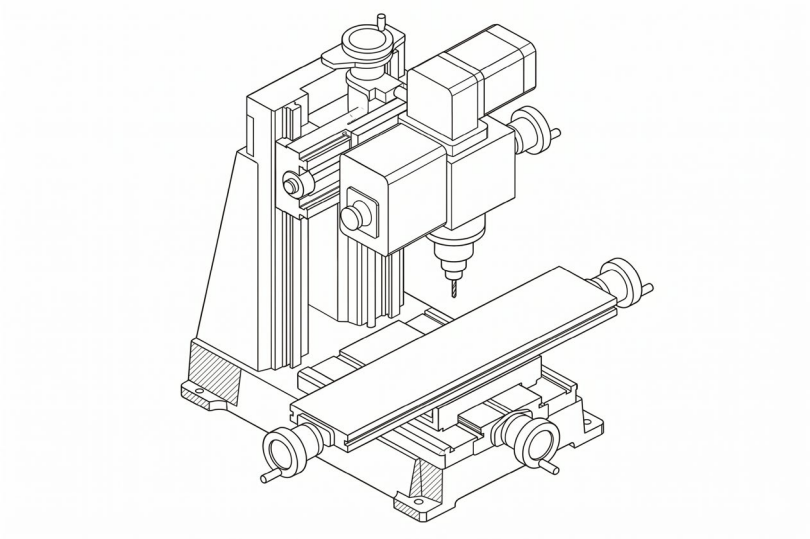

Fig. 3.2: Design 2

Design 2: Reinforced vertical column with movable worktable along X and Y axes using manual handwheels. Offers better precision and control.

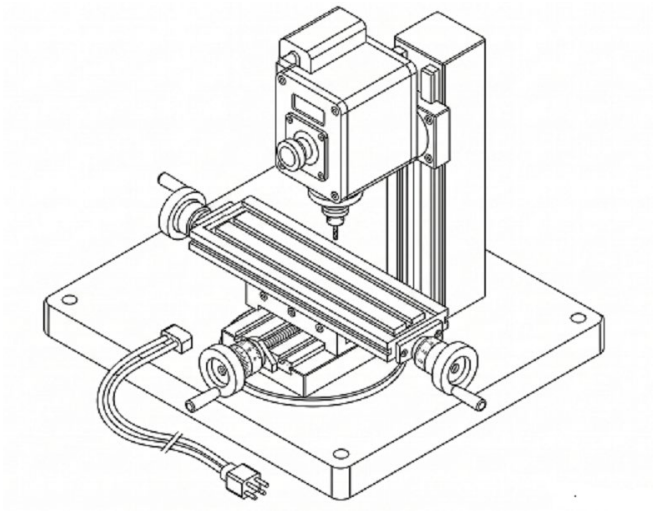

Fig. 3.3: Design 3

Design 3: Fully functional three-axis table (X, Y, and Z movements) with an integrated KY-032 Infrared Obstacle Avoidance Sensor for safety. This design was selected as it provides the best balance of educational value, safety, and functionality.

Fig. 3.4 Assembly Drawing and Bill of Materials of EDU MILL KIT

The diagram below illustrates the assembly drawing of the EDU Mill Kit along with a Bill of Materials (BOM). This diagram provides an exploded view of the whole kit and displays how the various parts are assembled. All the parts have a balloon number that corresponds with the list provided in the BOM that includes the name of the part, quantity, and part number. Some of the major parts of the EDU Mill Kit are the milling motor, X, Y, and Z axis wheels, mill table, base frame, and the spindle motor.

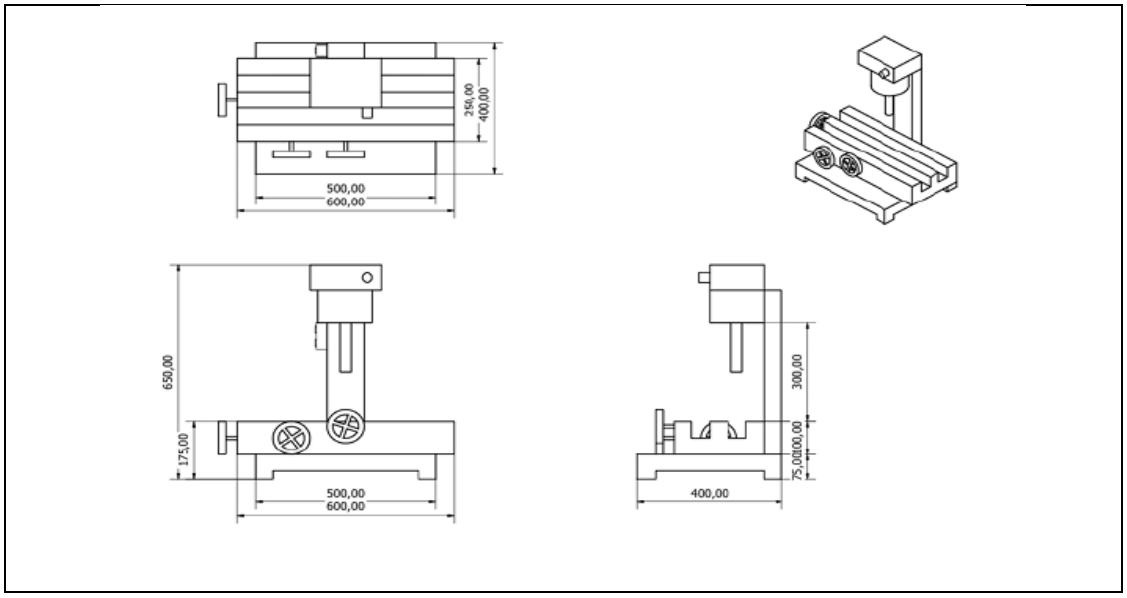

Fig. 3.5 Isometric Drawing of EDU MILL KIT

The isometric view provides a three-dimensional perspective of the EDU Mill Kit, illustrating its entire form and structure along with the placement of components. Contrary to orthographic views, it allows the user to comprehend the arrangement of the machinery easily, from the milling motor attached to the vertical stand, the X-Y table placed at the base, to the axis control wheels. Such a view proves helpful while designing as well as presenting, as it makes things clear regarding the construction of the system without any technical interpretation.

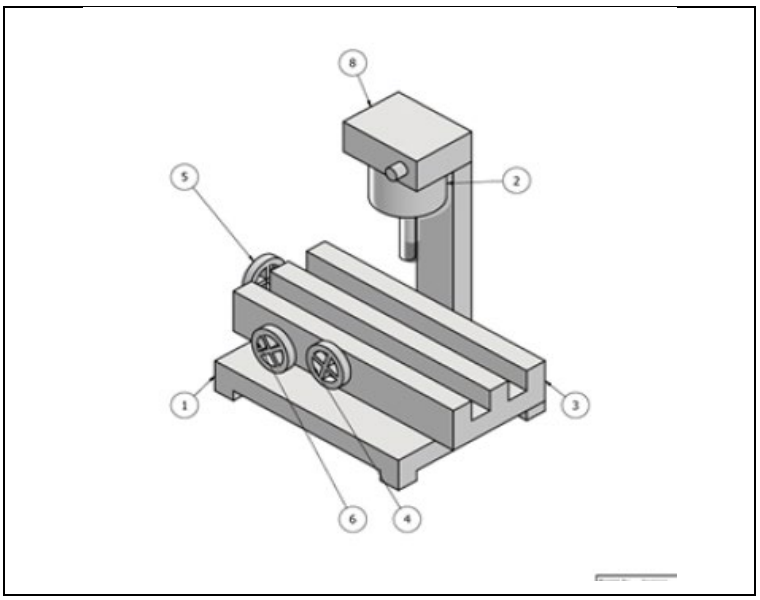

Fig. 3.7 Complete Drawing of EDU MILL KIT

As shown on the final assembly drawing below, the final assembled EDU Mill Kit is displayed, and it contains vital details that include the size of the parts, alignment, connection of the motors, working zones, among others. These are very crucial in designing the EDU Mill Kit. In the current design, progress has been made from the earlier designs in that all the axes, including the X-axis, Y-axis, and Z-axis, are included alongside the spindle motor.

Selection of Materials and Components.

Table 2. Component, Function and Price of EDU MILL KIT

Component	Function	Estimated Price (RM)
12V DC Motor (High Torque)	Drives the spindle for milling operations	RM35.00
L298N Motor Driver Module	Controls motor speed and direction	RM5.99
IR Obstacle Avoidance Sensor Module	Detects obstacles (e.g., hands) near the tool bit	RM3.80
Arduino UNO	Microcontroller for system control	RM49.00
Power Adapter 12V 5A	Supplies power to the motor and electronics	RM20.00
Limit Switches	Acts as an end stop for axis movement	RM6.00
Wiring and Connectors	Electrical connections between components	RM3.00
Spindle Chuck with ER11 Collet	Holds the milling bit securely	RM25.00
Hand Wheels (X, Y, Z Axis)	Manual control of axis movement	RM18.00
Linear Rail and Lead Screw Set	Guides and moves X, Y, and Z axes with precision	RM129.71
Mild Steel Angle	Forms the machine's base and supports the structure	RM20.00
Square Hollow Tube	Supports vertical (Z-axis) movement	RM12.00
Aluminium Sheet	Provides a lightweight, rust-proof work surface	RM18.00
Acrylic Sheet	Covers motor and moving parts for safety	RM10.00

Fabrication Process (Assembly and Setup)

The first step is the construction of a frame using aluminium profiles to provide stability to the entire setup. The worktable is positioned and levelled to reduce any vibrations. Then the linear motion system is assembled by installing linear guides, lead screws, and bearings for the X and Y axes. The installation of stepper motors (NEMA 17) and coupling them to the lead screws is done using IoT-based control [9], [10]. The spindle motor and Z-axis system, including a pneumatic actuator, are assembled in order to have a good alignment. Assembly is followed by the development of IoT control using an ESP32 microcontroller, motor drivers, and relay modules. Wiring is done in the control box for safety and efficiency purposes. The software integration will be done using Arduino IDE and the Blynk App in order to wirelessly control all axes. Calibrations and testing are done to test the movement of all axes and other functionality, like the operation of the spindle. This CNC machine can be controlled by smartphone or computer via the Blynk App.

Result and Discussion

The EDU MILL KIT is a milling machine that is operated by the pressing of buttons, unlike other milling machines where the manual control wheel is used. This machine is safe to operate and therefore makes it convenient for the novice or beginner to use. The operation of the EDU MILL KIT is by means of momentary push buttons. In all the axes, there was smooth motion when controlling the machine with good positioning at about ±1 mm, which was okay for an educational purpose.

Apart from this, the machine has a working table complete with a measuring gauge for the operator to keep tabs on the work being done. This makes it easy for people to get educated in the field of machining. The machine can be used to produce small wood and acrylic pieces. The evaluation of the EDU MILL KIT highlighted several key performance aspects

Table 3. Experimental Performance Results of EDUMILLKIT

Parameter	Observation	Result
Spindle speed	Operated consistently between 1200–1800 RPM using a 12V DC motor	Suitable for light milling tasks
Surface Accuracy	Achieved flatness within ±0.3 mm on soft materials	Acceptable for educational use
Vibration Level	Low vibration due to a stable frame and a balanced motor mount	Ensured smooth operation
Noise Level	Moderate during cutting; within safe laboratory limits	No additional insulation required
Safety	The emergency stop and on/off switch worked effectively	Meets safety requirements

From the results shown above, it can be seen that the objectives of the machine have been met. It is not capable of doing precise milling work as done by the large milling machine; however, it does accurate enough work to train students. The simplified control panel helps in learning more efficiently as no programming is involved.

Conclusion

It can be concluded from the above discussion that the EDU MILL KIT project has successfully applied a unique methodology for the field of engineering education where automation and IoT technology are combined along with practical experience [1]–[4], [9], [10]. This machine is not only small and safe, but also cost-effective and increases student engagement, as well as helps students understand machining concepts.

Abstract. This study presents the development and application of a low-cost air monitoring system for analysing Air Quality Index (AQI) and PM2.5 exposure levels in three different environments: indoor, rural, and industrial areas. The monitoring device was designed using a microcontroller-based platform integrated with particulate matter sensors, air-quality sensors, temperature and humidity modules, and a mobile data interface for real-time recording. Measurements were conducted at four time intervals (08:00–09:00, 12:00–13:00, 17:00–18:00, and 23:00–24:00) to evaluate spatial and temporal variations in air quality. Results show that rural environments consistently recorded the lowest pollution levels, with PM2.5 values below 10 µg/m³ and AQI within the "Good" category. Indoor environments exhibited moderate values, occasionally exceeding recommended limits due to limited ventilation. Industrial areas showed the highest exposure levels, with AQI exceeding 100 and PM2.5 reaching more than 30 µg/m³ during late afternoon, indicating unhealthy conditions for sensitive groups. The findings demonstrate that the proposed low-cost monitoring system is capable of providing reliable environmental exposure information and can support health-risk awareness, especially for individuals with respiratory conditions such as Chronic Obstructive Pulmonary Disease (COPD). The system also shows potential for practical deployment in environmental monitoring, smart health applications, and community-level air quality assessment.

Keywords: air quality monitoring, AQI, PM2.5, low-cost sensor, industrial environment, rural environment, indoor air quality.

Introduction

Air pollution has become a significant global concern due to its adverse effects on human health and the environment [7]. In particular, fine particulate matter (PM2.5) poses serious health risks as it can penetrate deep into the respiratory system and enter the bloodstream, leading to various respiratory and cardiovascular diseases [4], [5]. Monitoring air quality in different environments such as indoor, rural, and industrial areas is therefore essential for effective exposure assessment and environmental management [22].

Recent advancements in Internet of Things (IoT) technology have enabled the development of low-cost air monitoring systems using microcontrollers and sensors. These systems offer a practical alternative to conventional monitoring stations, which are often expensive and limited in coverage [17]. Several studies have demonstrated the feasibility of using Arduino-based platforms for real-time air quality monitoring and environmental analysis [20], [21].

However, most existing studies focus on single-environment monitoring or lack comparative analysis across multiple environments. This limitation reduces the ability

to understand variations in air quality exposure under different conditions, particularly in real-world environments where pollution sources vary significantly [22]. Therefore, this study aims to develop and apply a low-cost air monitoring system for comparative AQI and PM2.5 exposure analysis in indoor, rural, and industrial environments. The findings of this study provide practical insights into environmental exposure differences and support the development of accessible monitoring solutions.

Literature Review

Air Quality Index and PM2.5 Effects on Human Health

Air Quality Index (AQI) is widely used as a standard indicator to evaluate the level of air pollution based on the concentration of major pollutants such as PM2.5, PM10, ozone, nitrogen dioxide, sulfur dioxide, and carbon monoxide. The AQI provides a simplified representation of air quality conditions and is commonly used to assess potential health risks for the public, especially for sensitive groups including elderly people and patients with respiratory diseases [9]. Recent studies have shown that exposure to poor air quality significantly increases the risk of respiratory symptoms, hospitalisation, and mortality, particularly among individuals diagnosed with Chronic Obstructive Pulmonary Disease (COPD) [10].

Fine particulate matter (PM2.5) is considered one of the most critical pollutants due to its ability to penetrate deep into the lungs and enter the bloodstream. According to recent epidemiological studies, both short-term and long-term exposure to PM2.5 is associated with increased inflammation, oxidative stress, and deterioration of lung function, which may lead to severe complications in COPD patients [11], [12]. In addition, PM2.5 exposure has been linked to cardiovascular disease, reduced immune response, and higher risk of premature death, making continuous monitoring of particulate concentration an important requirement in environmental health research [13].

Environmental Variability of Air Pollution

Air pollution levels vary significantly depending on geographical location, human activity, and meteorological conditions. Industrial areas usually show higher pollutant concentrations because of emissions from factories, fuel combustion, and heavy traffic, whereas rural areas generally maintain lower pollution levels due to the absence of major emission sources [14]. Studies conducted in recent years have reported that pollution levels often increase during daytime and late afternoon due to higher temperature, increased traffic flow, and atmospheric conditions that limit vertical air mixing [15].

Indoor air quality is also an important factor, especially for individuals who spend most of their time inside buildings. Research has shown that indoor pollution can sometimes exceed outdoor levels when ventilation is poor or when pollutants enter from outside sources such as nearby traffic or industrial activity [16]. Therefore, analysing air quality across indoor, rural, and industrial environments is necessary to obtain a realistic understanding of human exposure in daily life.

Low-Cost Air Monitoring Systems

Conventional air quality monitoring stations provide accurate measurements but are expensive and limited in number, making them unsuitable for personal or small-scale environmental monitoring. In recent years, low-cost air monitoring systems based on microcontrollers and compact sensors have become increasingly popular for environmental measurement and health-related applications [17]. These systems

allow real-time data acquisition, portable usage, and wireless communication at a significantly lower cost compared to standard monitoring equipment.

Recent research has demonstrated that low-cost PM2.5 and air-quality sensors can provide reliable results when properly calibrated, making them suitable for community monitoring, smart city applications, and personal exposure assessment [18]. In addition, integrating multiple sensors such as PM2.5, temperature, humidity, and gas sensors into a single device enables more comprehensive environmental analysis. Such systems are particularly useful for vulnerable individuals, including COPD patients, who require immediate information about surrounding air quality in order to avoid harmful exposure.

Recent studies have highlighted the effectiveness of low-cost air quality monitoring systems based on IoT technologies. Sensor-based systems have been widely widely adopted for real-time PM2.5 monitoring in various environmental conditions due to their affordability, portability, and real-time data acquisition capabilities [17]. In addition, previous studies have emphasized the importance of multi-environment analysis to understand spatial variations in air pollution exposure [22]. It has also been reported that low-cost monitoring systems can provide reliable data when properly calibrated, making them suitable for educational and research applications [18].

Despite these advancements, comparative studies involving indoor, rural, and industrial environments remain limited. Therefore, this study addresses this gap by providing a comprehensive comparison of AQI and PM2.5 exposure across different environmental conditions. Based on these findings, the development of a portable low-cost monitoring device capable of measuring AQI and PM2.5 in different environments is important for improving environmental awareness, supporting health-risk assessment, and providing practical guidance for daily activities.

Methodology

Air Quality Monitoring System Design

In this study, a low-cost air quality monitoring system was developed to measure Air Quality Index (AQI) and fine particulate matter (PM2.5) in real time. The system was designed using a microcontroller-based platform integrated with environmental sensors, allowing portable measurement at a significantly lower cost compared to conventional monitoring stations. Low-cost monitoring systems have been widely used in recent environmental studies because they provide sufficiently accurate data for community monitoring, smart applications, and health-related research [19].

The developed system uses an Arduino Uno microcontroller as the main processing unit. A PM2.5 sensor was used to measure fine particulate concentration, while an air-quality sensor was used to estimate AQI values. In addition, temperature and humidity modules were included to monitor environmental conditions during the measurement process. The measured data were displayed on an LCD screen and recorded for further analysis. The system was powered by a Li-Po battery, allowing portable operation in different measurement locations [20].

Microcontroller-based monitoring devices combined with low-cost sensors have been reported as suitable tools for environmental monitoring, Internet of Things (IoT) applications, and personal exposure assessment due to their low cost and real-time capability [21].

Study Locations and Measurement Environments

Measurements were conducted in three different environments: indoor, rural, and industrial areas. These environments were selected to compare pollution levels under different emission conditions. The indoor environment was chosen as a closed space without the use of air filtration systems, representing typical indoor conditions. The rural environment was selected as a low-pollution area with minimal industrial activity. The industrial environment was chosen as an area with active traffic and industrial operations, which is expected to produce higher pollution levels. Comparing these environments is important to evaluate realistic exposure levels experienced in daily life [22]. Previous studies reported that industrial areas usually show higher pollutant concentrations compared to rural areas, while indoor air quality may be affected by ventilation conditions and outdoor pollution sources [23].

Measurement Time Intervals

To evaluate daily variation in air pollution levels, measurements were taken at four different time intervals: 08:00 – 09:00, 12:00 – 13:00, 17:00 – 18:00, 23:00 – 24:00 These time intervals were selected based on previous studies showing that air pollution changes throughout the day due to human activity and atmospheric conditions. Pollution levels often increase during midday and late afternoon due to traffic intensity, industrial activity, and temperature changes that influence air movement [24]. At each time interval, several readings were taken until the sensor values became stable. The average value was then calculated to represent the pollution level at that time. The averaging method was used to reduce measurement fluctuation and improve data reliability [25].

Data Collection and Processing

All measured data were recorded and processed using Microsoft Excel and MATLAB for analysis. The average values of AQI and PM2.5 for each environment and time interval were calculated and arranged in tabular form. Graphical plots were also generated to compare pollution levels between indoor, rural, and industrial areas. To ensure measurement stability, multiple readings were taken for each time interval and the average value was calculated using the following equation [26]:

$$\bar{X} = \frac{1}{n}\sum_{i=1}^{n} X_i$$

Where
$\bar{X}$ is the average value,
Xi is the i-th reading,
and n is the number of measurements.

The averaging method was applied to minimise sensor fluctuation and improve the accuracy of the measured data, as commonly used in recent air quality monitoring studies [26]. In addition to PM2.5 concentration, the Air Quality Index (AQI) was used as a main parameter to evaluate pollution level. AQI was calculated

using the standard equation applied in international air quality monitoring systems [27]:

$$AQI = \frac{I_{HI} - I_{LO}}{C_{HI} - C_{LO}}(C - C_{LO}) + I_{LO}$$

where
C is the measured pollutant concentration,
C_{HI} and C_{LO} are the concentration breakpoints,
I_{HI} and I_{LO} are the index values corresponding to the breakpoints.

This equation converts pollutant concentration into an index scale that is easier to interpret for health-risk evaluation and is widely used in modern AQI systems [27], [28]. The analysis in this study was performed using descriptive comparison to evaluate differences in pollution levels between locations and measurement times. This approach is suitable for small-scale environmental monitoring studies using low-cost sensor systems [29].

Results and Discussion

AQI Analysis in Indoor, Rural, and Industrial Environments

Table 1 shows the average Air Quality Index (AQI) values measured in indoor, rural, and industrial environments at four different time intervals, while Fig. 1 illustrates the comparison graph of AQI levels for all locations. The results indicate that the rural environment consistently recorded the lowest AQI values, remaining within the "Good" category for all time intervals. Indoor measurements also remained within the acceptable range, although slightly higher than rural values due to limited air circulation. In contrast, the industrial environment showed significantly higher AQI values, particularly during the late afternoon measurement, where the AQI exceeded 100, indicating unhealthy conditions for sensitive groups.

Table 1. Average Air Quality Index (AQI) in Indoor, Rural, and Industrial Environments

TIME (Hours)	Average Air Quality Level (AQI)		
	Indoor Area	Rural Area	Industry Area
8:00 AM - 9:00 AM	11.69	5.91	54.52
12:00 PM-1:00 PM	16.63	7.59	66.69
5:00 PM-6:00 PM	13.47	10.58	108.51
11:00 PM-12:00 AM	12.80	5.73	56.17

The highest AQI value was recorded during the 17:00–18:00 interval, which is consistent with previous studies reporting that pollution levels often increase during late afternoon due to traffic activity, industrial operation, and atmospheric conditions that trap pollutants near the ground [30]. This result confirms that time of day has a strong influence on air quality level. The comparison between the three environments clearly shows that industrial areas present the highest exposure risk,

while rural areas provide the safest conditions. Indoor environments can be considered moderate, depending on ventilation and surrounding pollution sources.

Fig. 1 shows a clear peak in the industrial environment, while rural values remain relatively stable. This pattern is consistent with previous environmental monitoring studies that reported higher AQI variability in industrial zones compared to rural locations [31].

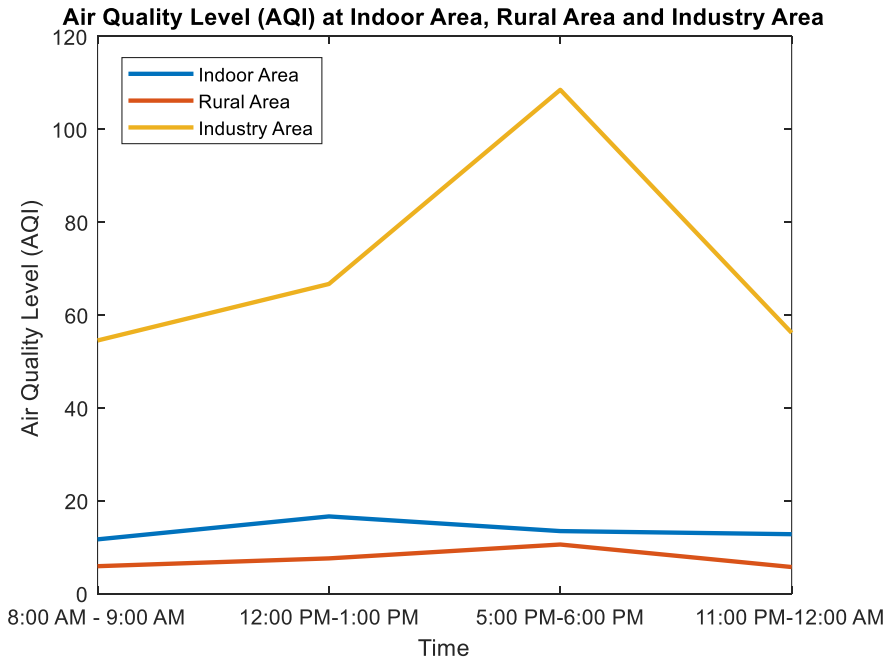

Fig. 1. Average Air Quality Index (AQI) in Indoor, Rural, and Industrial Environments

PM2.5 Concentration Analysis

Table 2 presents the average PM2.5 concentration measured at the same locations and time intervals, while Fig. 2 shows the corresponding graph for PM2.5 variation. The results show that rural areas recorded the lowest PM2.5 concentration for all time intervals, with values generally below 10 µg/m³, indicating clean air conditions. Indoor measurements were higher than rural values, especially during morning and midday, which may be influenced by indoor activities and limited ventilation. The industrial environment recorded the highest PM2.5 concentration, with the maximum value observed during the late afternoon measurement.

Table 2. Average PM2.5 Concentration in Indoor, Rural, and Industrial Environments

TIME (Hours)	Average (µg/m3)		
	Indoor Area	Rural Area	Industry Area
8:00 AM - 9:00 AM	27.81	1.01	18.18
12:00 PM-1:00 PM	29.53	9.24	25.48
5:00 PM-6:00 PM	28.06	4.23	33.22
11:00 PM-12:00 AM	15.27	4.65	23.00

The increase in PM2.5 during the afternoon is consistent with previous studies showing that particulate concentration is affected by traffic flow, industrial emissions, and meteorological conditions such as temperature and wind speed [32].

The industrial area showed a clear increase in PM2.5 between morning and evening, indicating accumulation of pollutants during working hours. Fig. 2 also shows that indoor PM2.5 values fluctuate more than rural values, suggesting that indoor air quality can be affected by external pollution sources and air circulation conditions. Similar observations have been reported in recent indoor air quality studies [33].

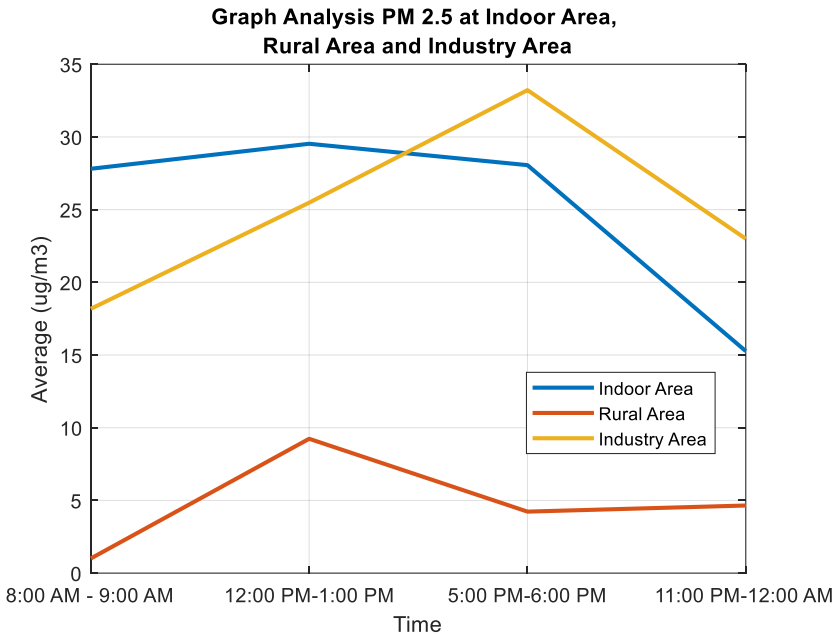

Fig. 2. PM2.5 concentration in indoor, rural, and industrial environments

Comparison of AQI and PM2.5 Measurements

The comparison between AQI and PM2.5 results shows that both parameters follow a similar trend, where rural areas consistently show the lowest pollution level, indoor environments show moderate values, and industrial areas show the highest pollution exposure. This result confirms that PM2.5 concentration strongly influences AQI values, since particulate matter is one of the main components used in AQI calculation. The increase of PM2.5 in the industrial environment directly contributes to the increase of AQI, particularly during peak activity hours [34].

From a health perspective, these findings are important for individuals with respiratory diseases such as COPD, because exposure to high PM2.5 and high AQI can trigger breathing difficulty, inflammation, and lung function deterioration. Previous medical studies have reported that COPD patients should avoid environments with high AQI and high particulate concentration, especially during peak pollution periods [35].

The results also demonstrate that the developed low-cost monitoring system is capable of detecting variations in air quality across different environments and time intervals. The system successfully provides consistent readings for both AQI and PM2.5, showing that low-cost sensors can be used for practical environmental monitoring and health-risk awareness applications.

Performance of the Low-Cost Monitoring System

The developed monitoring system was able to measure AQI and PM2.5 continuously in different environments without significant measurement instability.

The use of multiple readings and averaging method improved the reliability of the data obtained. The results confirm that the proposed system is suitable for portable air quality monitoring, especially for small-scale environmental studies and personal exposure monitoring. Similar performance has been reported in recent studies using low-cost sensors for environmental monitoring and smart health applications [36]. The ability to monitor air quality in real time makes the system useful for community awareness, health monitoring, and smart environmental applications.

Conclusion

This study also contributes to the growing body of research on low-cost IoT-based environmental monitoring systems, capable of measuring Air Quality Index (AQI) and PM2.5 concentration in three different environments: indoor, rural, and industrial areas. The results show that rural environments consistently recorded the lowest pollution levels, while industrial areas showed the highest pollution exposure, especially during the late afternoon. Indoor environments exhibited moderate pollution levels influenced by ventilation conditions and external pollution sources.

The analysis also shows that AQI and PM2.5 follow similar trends, where an increase in PM2.5 concentration leads to higher AQI values. This condition is particularly important for sensitive groups such as patients with Chronic Obstructive Pulmonary Disease (COPD), who should avoid environments with high pollution levels.

The developed low-cost monitoring system successfully provided stable and consistent measurements in different environments. The use of low-cost sensors combined with a microcontroller platform allows portable and affordable air quality monitoring compared to conventional monitoring stations. Overall, the results demonstrate that the proposed system has strong potential for community-level air quality monitoring, health-related applications, and smart environmental systems. Future work may include longer monitoring duration, additional pollutant parameters, and integration with Internet of Things (IoT) based monitoring systems. The proposed system demonstrates strong potential for scalable deployment in smart environmental monitoring and IoT-based health applications.

[b]ahmed.alduroobi@ced.nahrainuniv.edu.iq

Abstract. This paper provides a macro review of image processing, parametric design, and CAD/CAM-based research on the design of personalized cranial helmets. The incorporated studies extend over a period of fifteen years, represented by scopes of publications (2010–2025), demonstrating the gradual progression of scanning, modeling, and manufacturing technologies throughout the years. Cranial deformities are among the most common types of plagiocephaly and cranial brachycephaly that can occur in infancy and can lead to cranial asymmetry, aesthetic concerns, and, in serious cases, problems with development. A literature review of relevant studies regarding cranial devices that used 3D scanning, medical imaging, additive manufacturing, or CAD/CAM workflows was searched in several databases and collected. Data from CT scans, structured light, photogrammetry, and 3D scanning technologies were incorporated to obtain accurate cranial morphology capturing, while parametric modeling was used for helmet design tailored to the subject. This was achieved with customized helmet fabrication using additive manufacturing methods (fused deposition modeling, stereolithography, and selective laser sintering) for greater fitting accuracy, offering resultant cranial symmetry and high patient compliance. Moreover, cranial imaging, tracking, and functional analysis were used for image processing and artificial intelligence methods to enhance decision-making and exercise real-time clinical management. Results: The results show that image processing in conjunction with parametric CAD/CAM design can substantially increase the accuracy, running speed, and clinical utility of cranial remolding helmets, with far-reaching implications for early intervention and telemedicine solutions. Emerging problems include scanning technology variability, standardization of design parameters, and integration of rigorous monitoring systems to ensure reproducible results.

Keywords: Additive manufacturing, Cranial deformity, Image processing

Introduction

Orthotics is older than functional prosthetics (generally called prosthetics) and has the main objective of supporting, aligning, or improving the function associated with our bones and tissues. Archeological evidence from ancient Egypt suggested that primitive fracture braces were followed by progressive refinements introduced by world-renowned pioneers such as Hippocrates and Galen, which were then complemented with the dynamic approach of spinal device systems. The rapid evolution of materials and manufacturing techniques allowed a new, more targeted approach for orthotic prescriptions, establishing the basis for clinical biomechanics [1].

Material science, biomechanics, and digital manufacturing have heavily shaped the development of orthotics practice. Conventional processes, which were based on manual manipulation through pouring and physical identification and hand-working, are progressively being replaced by data-driven/automated strategies. The development of CAD/CAM systems was a crucial point, as this permitted an accurate and reproducible manufacturing with a broad range of options. Simultaneous improvements in 3D scanning, image processing, and parametric modelling today make accurate anatomical data collection, geometric analysis, and entirely personalized foot orthotic design possible. AM also increases freedom for design, e.g., lightweight structures and the possibility of material distribution make it possible [2].

In the first few years of life, our baby skulls expand rapidly to make room for growing brains. This developmental growth may lead, in certain cases, to different forms of the head. Early detection and proper management of cranial deformities depend on a full comprehension of normal skull development and the early signs of these anomalies. It would also seem that contemporary methods for diagnosis make ever more use of angle-based calculations extracted from images or 3D scans, aimed at providing objective data and facilitating reproducibility in the measurements [3].

Pediatric management of patients with cranial deformations. Premise: Cranial deformations are commonly observed in pediatric care, affecting as many as 25% of children born from single pregnancies and up to 50% of infants generated from multiple births at birth. Most of the time, parents notice these asymmetries in the early weeks or months, but only on rare occasions, and use denial and lack of knowledge that it happened. Pediatricians need to be alert during the initial evaluation by providing parents with information about the necessity of an early visit to a craniofacial team. In addition, a correct differential diagnosis between positional cranial deformity and craniosynostosis is crucial for timely and adequate treatment [4].

Cranial remolding helmet, or cranial remolding orthosis therapy, is commonly used in infants for positional and post-surgical cranial deformities. Treatment sooner, even at an age before 6 months old, has been proven to be more effective in terms of cranial symmetry, cephalic index, and general morphology. Accuracy of helmet design, compliance with wearing instructions, and patient-specific adaptation are important factors influencing the success rate of treatment [5-7]. Development of 3D scanning (STAR) and structured light techniques that have allowed for direct digital capture of the infant skull has helped in the development of patient-specific helmets, providing superior comfort, fit, and treatment efficacy [8, 9].

The potential for customization of cranial helmets can be improved even more with parametric design methods that provide modifiable modeling according to anatomical landmarks. Clinicians and engineers can simulate cranial growth trajectories, optimize material distribution, and make geometrical shape orthoses by using CAD/CAM tools with 3D imaging. Parametric models have been shown to minimize physical prototyping requirements, decrease production times, and improve the clinical performance, ease of fit, and use factors [10, 11].

The incorporation of additive manufacturing technologies, including fused deposition modeling, selective laser sintering, and stereolithography, has revolutionized cranial orthosis production. These techniques allow rapid fabrication of complex geometries, lightweight structures, and high-resolution patient-specific helmets, while maintaining reproducibility and clinical reliability [12, 13]. Moreover, hybrid workflows combining CAD/CAM milling and 3D printing support precision, material efficiency, and potential integration with AI-assisted monitoring, enabling scalable and standardized patient care [14].

Overall, these technological improvements involving imaging processing, parametric design, and CAD/CAM tools and additive manufacturing also serve to highlight the promising role of individually designed cranial helmets in improving clinical outcomes for infants affected by cranial deformities. This interdisciplinary cross-fertilization not only empowers accurate precision treatment and enhances patient comfort, but also allows standardized monitoring, data-driven assessment, and widespread clinical relevance, Key components of modern personalized pediatric rehabilitation.

Search Methodology

This systematic review was conducted according to the PRISMA guidelines to examine the technological evolution of cranial remolding helmets using imaging, parametric design, CAD/CAM workflows, and additive manufacturing approaches between 2010 and 2025. The review aimed to identify, classify, and synthesize studies related to cranial deformity assessment, digital image processing, patient-specific helmet design, and digital fabrication methods.

Information Sources and Search Strategy

A comprehensive literature search was conducted using major scientific databases, including Scopus, PubMed, IEEE Xplore, Google Scholar, and Springer. The search focused on studies published between 2010 and 2025. The following keywords and Boolean combinations were used:

("cranial deformity" OR "plagiocephaly" OR "brachycephaly" OR "craniosynostosis") AND ("cranial remolding helmet" OR "cranial orthosis" OR "helmet therapy") AND ("3D scanning" OR "photogrammetry" OR "medical imaging" OR "image processing" OR "CAD/CAM" OR "parametric design" OR "additive manufacturing" OR "3D printing").

Additional relevant studies were identified by screening the reference lists of selected articles to ensure that important publications were not missed during the database search.

Eligibility Criteria

Studies were included if they met the following criteria: (1) they were published between 2010 and 2025; (2) they addressed cranial deformities in infants, including plagiocephaly, brachycephaly, scaphocephaly, or craniosynostosis; (3) they investigated cranial remolding helmets, cranial orthoses, imaging-based assessment, CAD/CAM design, parametric modeling, additive manufacturing, or 3D printing; and (4) they reported relevant methodological, technological, or clinical outcomes related to cranial assessment, helmet design, fabrication, or treatment monitoring.

Studies were excluded if they were unrelated to cranial deformities or cranial remolding helmets, published outside the selected time frame, not available in full text, not peer-reviewed, or lacked sufficient methodological or technical information. Studies focusing on populations or devices unrelated to infant cranial assessment and helmet therapy were also excluded.

Study Selection

The study selection process followed four main stages: identification, screening, eligibility assessment, and final inclusion. First, records were identified through database searching. Second, titles and abstracts were screened to remove irrelevant

studies. Third, full-text articles were assessed according to the inclusion and exclusion criteria. Finally, eligible studies were included in the qualitative synthesis. The selection process is presented in the PRISMA flow diagram.

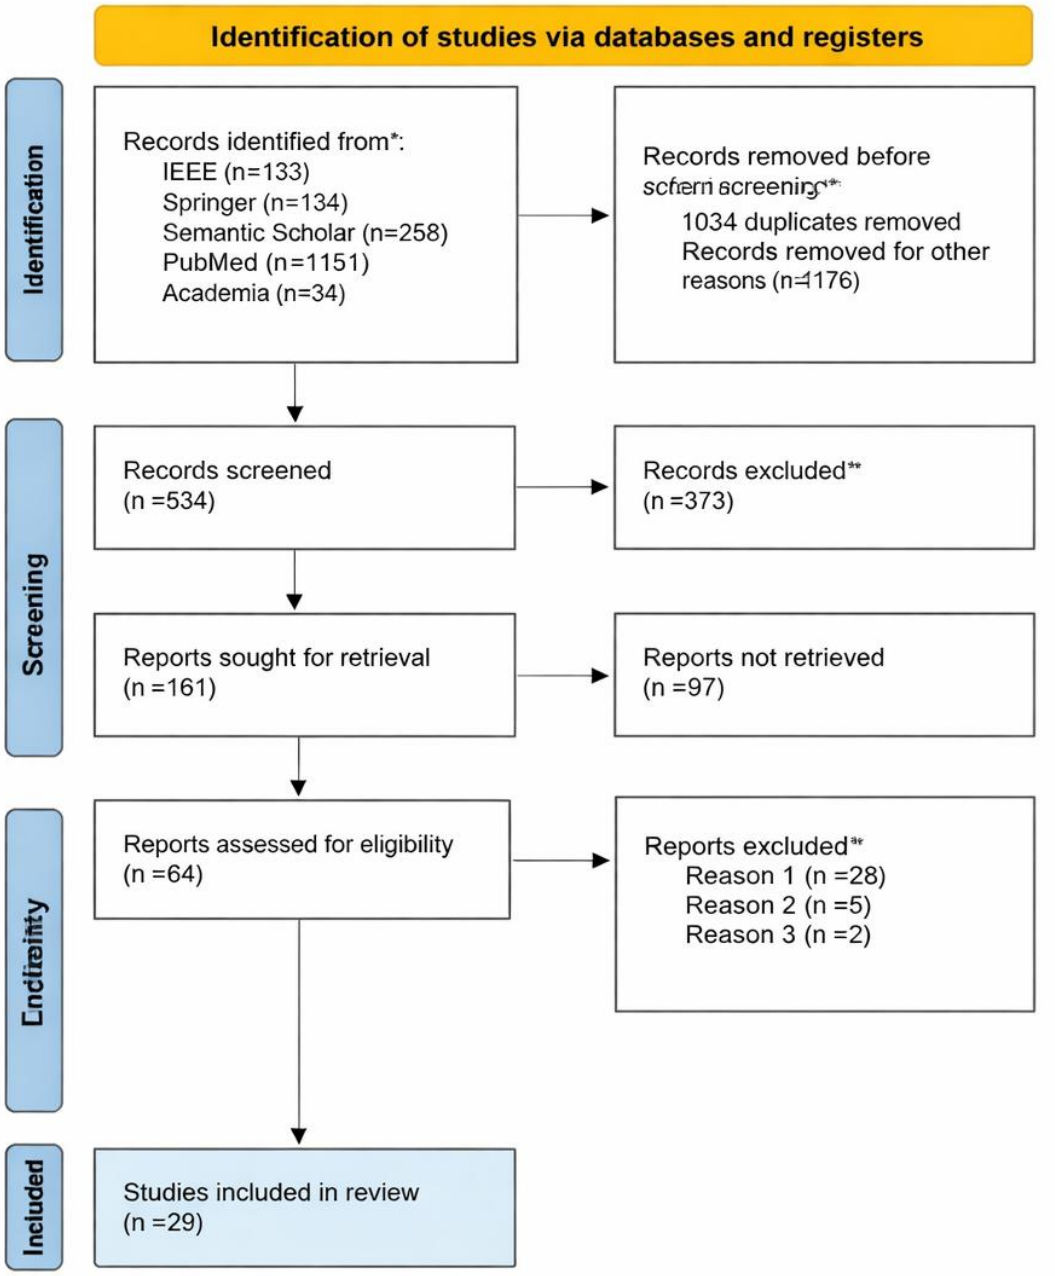

Fig. 1. PRISMA flow diagram

Data Extraction and Organization

Data were extracted using a structured form. The extracted information included author name, year of publication, study focus, imaging or scanning method, design or processing software, CAD/CAM or additive manufacturing approach, material or printer type when available, and key findings. The extracted studies were then organized into four thematic domains: cranial deformity assessment and management, medical image processing, parametric and customizable biomedical design, and CAD/CAM-based personalized healthcare products.

Data Synthesis

The included studies were synthesized qualitatively. The analysis focused on identifying technological trends, methodological patterns, clinical implications, and limitations across the reviewed literature. The extracted data were summarized in tables and figures to compare the evolution of imaging methods, image processing techniques, parametric design approaches, and CAD/CAM or additive manufacturing workflows used in cranial remolding helmet development and related biomedical applications. The overall methodological framework adopted in this review is illustrated in Fig. 2.

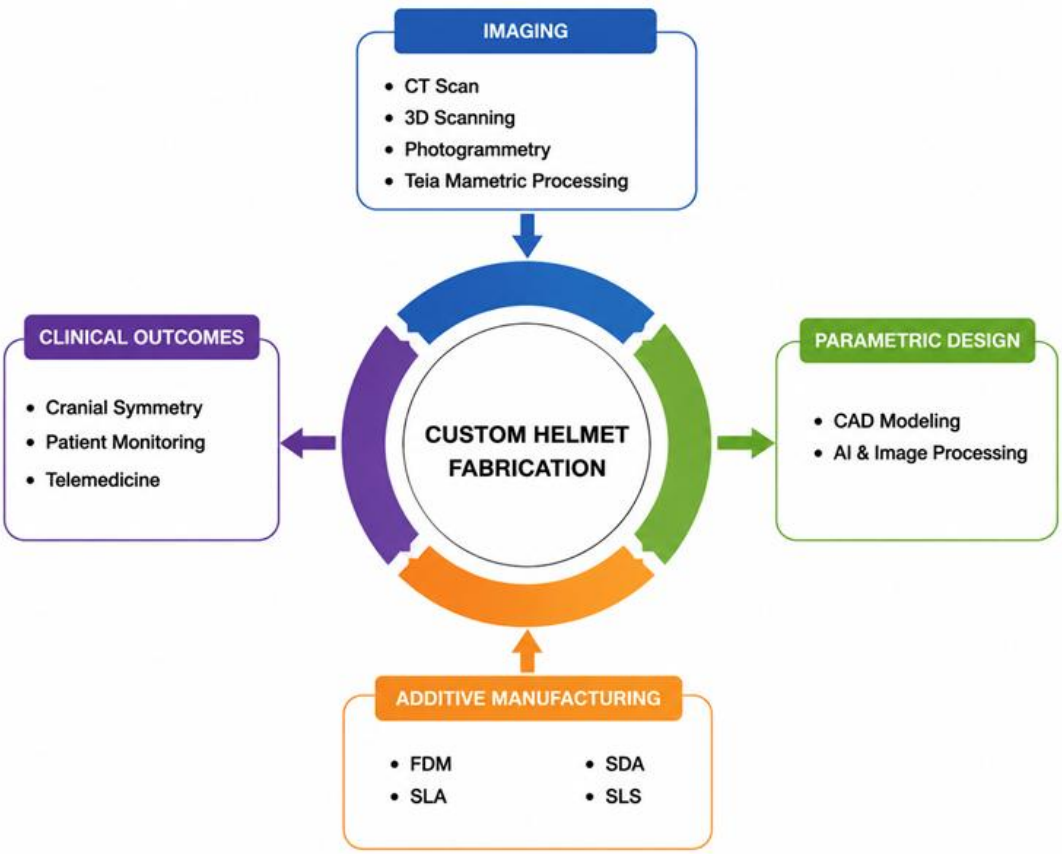

Fig. 2. Integrated methodological framework for cranial remolding helmet development using imaging, parametric design, and additive manufacturing.

Results

The extracted studies were organized into four thematic domains: cranial deformity assessment and management, medical image processing, parametric and customizable biomedical design, and CAD/CAM-based personalized healthcare products. The results are presented through tables and figures to identify the main technological trends, methodological patterns, and clinical implications related to cranial remolding helmet development.

Cranial Deformity Assessment and Management

The included studies consistently indicate that cranial remolding helmet therapy is an effective intervention for managing infant cranial deformities, particularly when treatment is initiated during the early months of life. The reported outcomes suggest greater improvement in plagiocephaly than in brachycephaly, which may be related to

differences in deformity pattern, severity, age at treatment initiation, and treatment duration. Across the reviewed studies, early diagnosis and timely intervention were repeatedly associated with improved cranial symmetry and better therapeutic outcomes.

Table 1 summarizes the main studies addressing cranial deformities in infants and their corresponding assessment or management approaches. The findings show a clear methodological transition from conventional assessment methods, such as manual head measurements and clinical observation, toward more advanced imaging-based techniques, including CT imaging, standardized photography, smartphone photogrammetry, non-contact optical scanning, and 3D scanning. Although CT scanning provides highly accurate cranial morphology, its use in infants remains limited by radiation exposure, cost, and clinical practicality. In contrast, 3D scanning and photogrammetry offer non-invasive alternatives that support patient-specific helmet design and repeated follow-up assessment.

Table 1. Cranial deformity in infants

Author's name, date	Scanning tool	Design software	AM/ material	Printer	Key finding
Cavalier et al., 2011	N/A	N/A	N/A	N/A	Deformational plagiocephaly was reduced from 31% to 13% with early postnatal environmental interventions that facilitate infant mobility.
Kim et al., 2014	CT	N/A	N/A	N/A	CT provides accurate cranial morphology, but radiation exposure limits its routine infant use; non-invasive alternatives are preferred.
Yang et al., 2019	Manual head shape measurement	N/A	N/A	N/A	Among 530 premature infants, plagiocephaly, brachycephaly, and dolichocephaly were found in 51.1%, 85.1%, and 3.0%; lower gestational age was associated with an increased severity of deformation.

Author's name, date	Scanning tool	Design software	AM/ material	Printer	Key finding
Zäh et al., 2021	Standardized photographs	Cross-sectional (survey-based) study	N/A	N/A	The public's perception also emphasized that even mild cranial asymmetries could be abnormal to the general population and justified early intervention and a cranial remolding helmet at the same time in severe manifestations.
Van Adrichem et al., 2022	Smartphone-based photogrammetry (Skully Care App)	Retrospective comparative study	N/A	N/A	Skully Care photogrammetry provided an efficient, non-invasive, and valid alternative for cranial assessment.
Cross et al., 2023	3D patient-specific cranial model (CT-based segmentation)	Finite element modeling of strip craniectomy with variable helmet durations	computational simulation only/ N/A	N/A	Extended postoperative helmet use may improve cephalic index and skull morphology, with comparable contact pressure across durations.
Taheri et al., 2023	Non-contact optical scanner	3D cranial scanning–based modeling	N/A	N/A	Cranial remolding orthosis following minimally invasive suturectomy is effective in enhancing cranial symmetry and supports its use as a postoperative aid.
Deliege et al., 2024	3D scan	CAD-based design, Patient-specific helmet modeling using the finite element method	N/A	N/A	Endoscopy-assisted strip craniectomy combined with a patient-specific helmet effectively achieved the correction of skull morphology and a better surgical outcome.
Kajita et al., 2024	VECTRA-M5 360° 3D scanner (stereophotogrammetry, contact-free)	Minimally invasive cranial orthosis design	N/A	N/A	3D scanning, including methods like VECTRA-M5 and non-contact optical scanners, offers non-invasive, high-resolution imaging, which has shown significant improvements in cranial helmet fitting.

Author's name, date	Scanning tool	Design software	AM/ material	Printer	Key finding
Graham et al., 2024	2D caliper and 3D scan	Repositioning Therapy (RT) vs Cranial Remolding Orthosis (CRO)	N/A	N/A	Cranial Re helmets led to better improvement in plagiocephaly, brachycephaly, and scaphocephaly vs repositioning.
Atallah et al., 2025	3D scanning	Customized 3D helmet design using Fusion 360 software	3D printing /PET-G filament	Creality V3 Plus printer.	The 3D-printed helmet was successful in correcting DPG with accurate direction for skull growth and good effectiveness.

The comparison of scanning methods shows that each technique has specific strengths and limitations. CT scanning provides detailed anatomical information and high geometric accuracy, but it is less suitable for routine infant monitoring because of radiation exposure. Three-dimensional scanning is fast, non-invasive, and increasingly used in personalized helmet design; however, its accuracy may be affected by scanner quality, infant movement, and environmental conditions. Smartphone-based photogrammetry is accessible and cost-effective, but it requires careful calibration and may provide lower precision than dedicated 3D scanning systems. Non-contact optical scanners provide high-resolution surface data without physical contact, although their wider clinical adoption may be limited by cost and sensitivity to lighting conditions

As shown in Fig. 3, the evolution of cranial deformity assessment and management approaches between 2011 and 2025 demonstrates a gradual transition from traditional positional management and manual assessment toward more advanced digital workflows. Traditional approaches were more dominant in earlier studies, whereas cranial remolding helmets, 3D-printed helmets, and patient-specific digital workflows became more visible in recent years. This shift reflects the growing role of digital technologies in cranial orthotic treatment, particularly through the integration of imaging, CAD/CAM design, additive manufacturing, and digital monitoring tools.

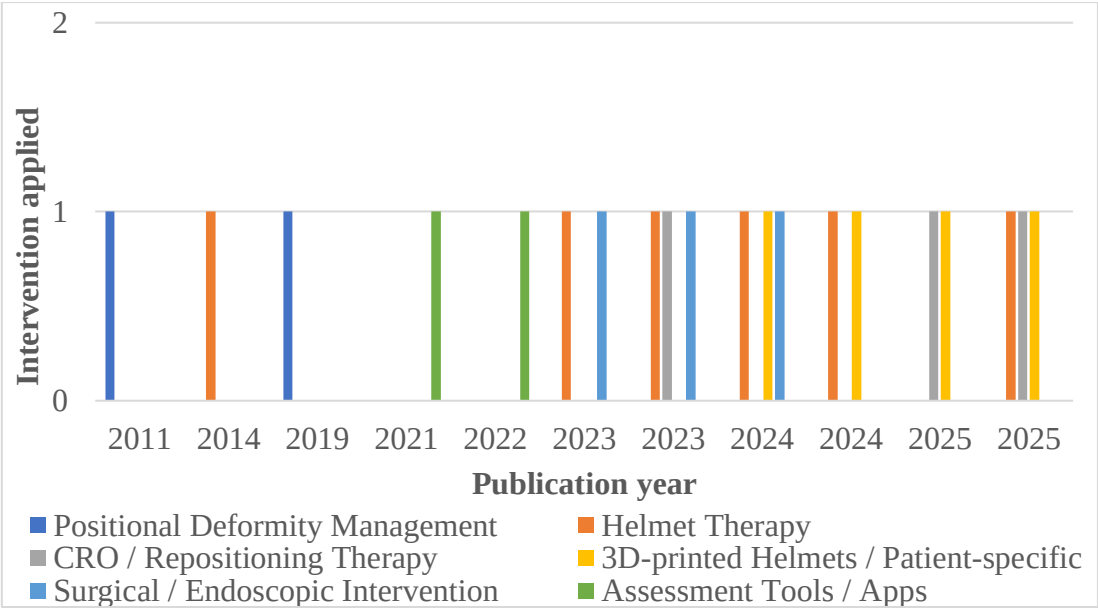

Fig. 3. Evolution of cranial deformity assessment and management approaches in infants between 2011 and 2025.

Role of Image Processing in Medical Applications

The second thematic category focuses on the role of image processing in medical applications and its relevance to cranial deformity assessment and digital helmet design. As summarized in Table 2, the reviewed studies show that medical image processing has evolved from conventional image enhancement, segmentation, and feature extraction techniques toward more advanced computational approaches, including GPU-based acceleration, machine learning, artificial intelligence, and automated quantitative analysis. These developments are important because accurate image processing supports cranial measurement, anatomical segmentation, diagnostic reliability, follow-up monitoring, and the generation of precise digital models for patient-specific cranial remolding helmets.

Table 2. Role of image processing in medical applications

Author's name, date	Scanning tool/imaging	Design/processing software	AM/material	Printer	Key finding
Scholl et al., 2011	Digital medical imaging	Scalable algorithms, parallel computing (CPU/GPU)	N/A	N/A	There were needs in terms of the management, mining, and on-the-fly processing of large digital datasets (Kilo-to-Terabyte medical datasets).

Author's name, date	Scanning tool/imaging	Design/processing software	AM/material	Printer	Key finding
Al-Tarawneh, 2012	Medical images (lung CT/X-ray)	Image enhancement (Gabor filter + Gaussian rules), segmentation	N/A	N/A	Early diagnosis of lung cancer is facilitated by image quality, segmentation, and feature extraction.

Ghoneim et al., 2018	MRI, mammograms, natural images	Noise mapping, multi-resolution regression, SVM, ELM	Cloud-edge computing	N/A	Automatic detection of image tampering attained 98% for natural images and 84.3% for medical ones.
Ahad et al., 2018	Digital cameras/image sensors	Computer vision, multimodal data integration, pattern recognition	N/A	N/A	Patient monitoring, activity recognition, and assistive technology were improved by image processing and computer vision.
Mabrouk et al., 2019	MRI, CT	Immune System Programming (ISP) + Region Growing	N/A	N/A	Increased accuracy and reliability. Anatomical structures were identified through automated segmentation.

Author's name, date	Scanning tool/imaging	Design/processing software	AM/material	Printer	Key finding
Bookland et al., 2021	Cranial images (top-down, facial)	Telehealth software with ML (Machine Learning)	N/A	N/A	Telephone-based craniosynostosis screening had an accuracy of 93.3%, a sensitivity of 92%, and a specificity was 94.3%.
Obuchowicz et al., 2024	MRI, CT, Ultrasound	AI-based segmentation, feature extraction, quantitative analysis	N/A	N/A	Accuracy and sensitivity for diagnosing, early disease detection, disease monitoring, and treatment were improved by AI.
Hidayat et al., 2025	Digital medical images	Bibliometric analysis, AI evaluation	N/A	N/A	Reported 16.24% yearly growth in AI-driven digital image processing; pointed to challenges in ethics, privacy, and explainable AI.

The findings presented in Table 2 indicate that image processing techniques contribute to improving diagnostic accuracy, reducing manual measurement errors, and supporting reproducible clinical assessment. Earlier studies emphasized image enhancement, segmentation, and computational acceleration, whereas more recent studies highlight the increasing role of artificial intelligence, machine learning, telehealth screening, and automated clinical decision support. This progression reflects a broader shift from conventional image analysis toward digitally assisted and data-driven healthcare workflows.

As shown in Fig. 4, segmentation remained a foundational technique throughout the reviewed period, while AI- and machine-learning-based methods became more prominent in recent years. The figure also shows the increasing use of 3D scanning and modeling techniques, which are particularly relevant for cranial remolding helmet design because they enable accurate digital reconstruction of cranial morphology and support patient-specific treatment planning.

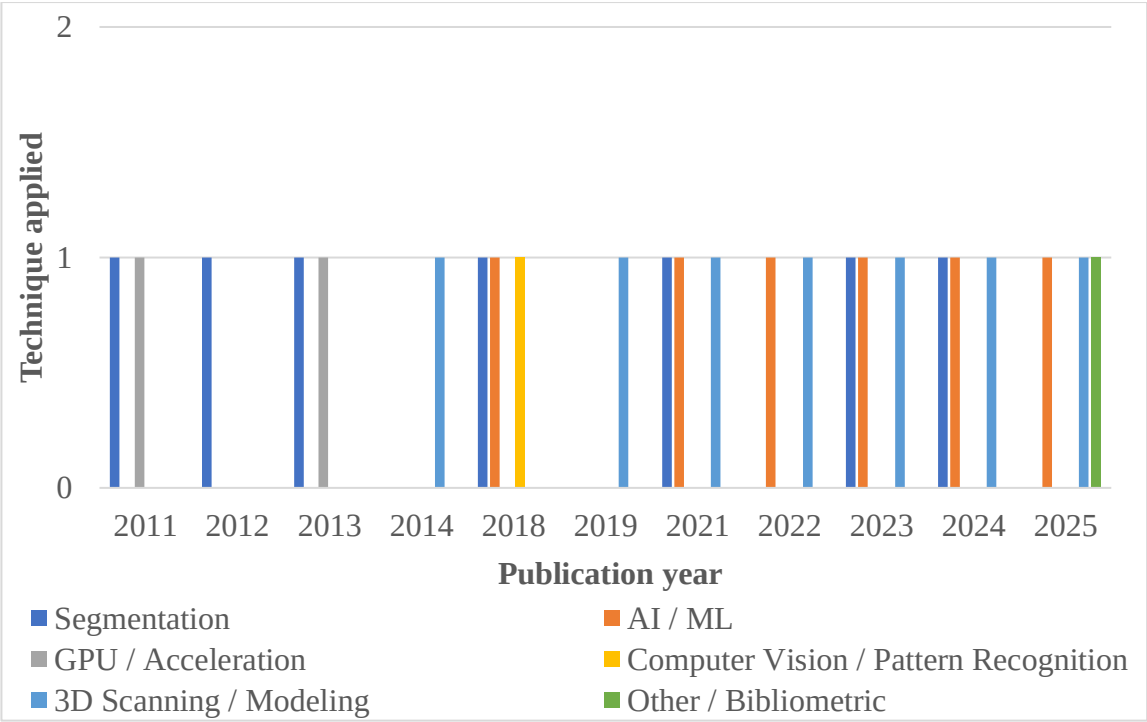

Fig. 4. Evolution of medical image processing techniques between 2011 and 2025.

Parametric and Customizable Design in Biomedical Devices

The third thematic category addresses parametric and customizable design approaches in biomedical devices. As summarized in Table 3, the reviewed studies show that parametric design has been increasingly applied to create patient-specific medical and protective devices based on anatomical data, digital modeling, and functional requirements. These approaches allow designers and clinicians to modify geometric parameters, improve anatomical fit, reduce manual design effort, and support more efficient customization. Although many of the reviewed studies are not limited to cranial remolding helmets, they provide important methodological evidence for the use of parametric modeling in customized head-related and biomedical devices

Table 3. Parametric and customizable design in biomedical devices

Author's name, date	Scanning tool/imaging	Design/processing software	AM/Material	Printer	Key finding
Colombo et al., 2010	Medical imaging / Reverse engineering	Virtual prototyping, parametric modeling	Rapid Prototyping / Epoxy resin, Polyurethane	SLA	Design Freedom enabled by parametrics reduced the development prototype times and optimized the comfort of lower limb prosthetics.

Author's name, date	Scanning tool/imaging	Design/processing software	AM/Material	Printer	Key finding
Mazzocchi et al., 2015	N/A	Parametric modeling, finite element simulation	Polymeric materials	N/A	Tuned stiffness and thickness for artificial sphincter valves to achieve a custom performance balance.
Li et al., 2020	MRI, CT	Parametric modeling of implants	N/A	N/A	Custom knee arthroplasty had better 165 anatomical fit and postoperative results than standard prostheses.
Górski et al., 2021	3D scans of pediatric upper limbs	Parametric modeling	PLA, TPE	FDM	Automatic construction of individualized pediatric transradial prosthetic sockets with less manual intervention.
Ricotta et al., 2020	Reverse engineering of the patient's arm	Parametric modeling, FEM analysis	N/A	SLS EOS FORMIGA P100 Printer	The elbow orthoses allowed interactive and flexible customization of movement that was validated.
Zurita-Gabasa et al., 2021	CT scan	Parametric framework, FEM	N/A	3D printing	Radially stiff patient-specific tracheobronchial stents; prototype design was verified with fit and reliability.

Author's name, date	Scanning tool/imaging	Design/processing software	AM/Material	Printer	Key finding
Bai et al., 2021	3D scanned head models	Parametric modeling, planimetry	N/A	3D printing	Mass-customized head and face products with adjustable anatomical factors for speedy human-specific product designs.
Park et al., 2021	3D surface scanner, 3D coordinate digitizer	Parametric modeling	N/A	N/A	Parametric head forms model captured morphological variation for customised headgear and protective wear.
Zhu et al., 2024	3D-scanned head shapes	Parametric clustering, k-medoids algorithm	N/A / ABS, EPS	N/A	Bicycle helmets mass-customized to head-shape clusters; effects of age and gender differences on the resultant helmet designs.

The findings presented in Table 3 indicate that parametric design contributes to improving personalization, anatomical conformity, functional adaptation, and design reproducibility across different biomedical applications. Earlier studies focused mainly on reverse engineering, virtual prototyping, and patient-specific prosthetic devices, whereas more recent studies expanded the application of parametric modeling to orthoses, implants, tracheobronchial stents, head and face products, and helmet-related designs. This progression suggests that parametric workflows can support cranial remolding helmet development by allowing controlled modification of helmet geometry according to cranial morphology, growth requirements, pressure-relief zones, ventilation needs, and patient-specific anatomical variation.

As shown in Fig. 5, the use of digital design and processing methods increased over the reviewed period, particularly with the growing adoption of 3D scanning, patient-specific modeling, and CAD-based workflows. This trend reflects a gradual transition from conventional measurement and manual design practices toward more flexible and reproducible digital modeling strategies. In the context of cranial remolding helmets, this shift is important because parametric design can transform cranial scan data into adjustable, patient-specific helmet geometries that improve fit, comfort, and fabrication efficiency.

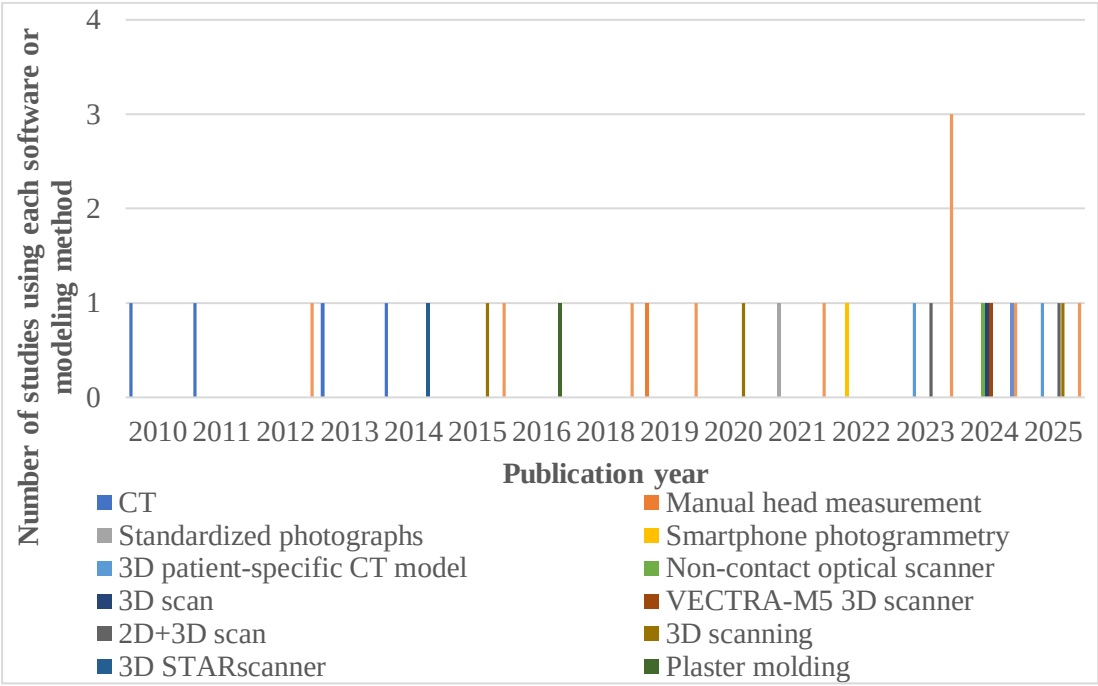

Fig. 5. Trends in design and processing software usage in cranial and biomedical device studies (2010–2025).

CAD/CAM Tools in Personalized Healthcare Products

The fourth thematic category focuses on CAD/CAM tools and additive manufacturing approaches used in personalized healthcare products. As summarized in Table 4, the reviewed studies show that digital workflows combining 3D scanning, CAD modeling, CAM procedures, and additive manufacturing have improved the production of patient-specific medical devices. These technologies support more accurate anatomical fitting, shorter fabrication time, reduced material waste, and improved reproducibility. In the context of cranial remolding helmets, CAD/CAM-based workflows are particularly important because they enable the transformation of cranial scan data into customized helmet geometries suitable for digital fabrication.

Table 4. CAD/CAM tools in personalized healthcare products

Author's name, date	Scanning tool/imaging	Design/processing software	AM / Material	Printer	Key finding
Hale et al., 2020	3D scanning	Parametric CAD	N/A	FDM	Computerized flow of work allowed for fast production of custom orthoses with good comfort, patient acceptance, and reduced clinical time.
Chua et al., 2021	CT scans	CAD	N/A	FDM	Fabricating custom cranial protection devices following craniectomy was safe, well tolerated, and accurate fitting with the ability to accurately fitted.
Scolozzi et al., 2023	N/A	CAD/CAM	N/A	N/A	The CAD/CAM-guided surgery provided accurate 3-D alignment with stable results and high patient satisfaction.

Alhallak et al., 2023	N/A	CAD/CAM	Polymers	3D printing	Digitally manufactured removable dentures presented better adaptation, retention, aesthetics, and required less clinical time.

Author's name, date	Scanning tool/imaging	Design/processing software	AM / Material	Printer	Key finding
Serrano et al., 2023	N/A	CAD/CAM	Polymers, metals, ceramics	3D printing (SLA, FDM, Binder/laser-based)	Personalized medicine, implants and prostheses, as well as microdevices with targeted drug delivery and anatomical fit, became possible by 3D printing.
Silva et al., 2024	3D scanning (photogrammetry, structured light)	CAD	N/A	3D printing	Orthosis production accuracy and patient inconvenience were reduced, as were workflow inefficiencies.
Alqutaibi et al., 2024	3D scanning	CAD	Polymers, metals, ceramics, composites	3D printing	Additive production in implant dentistry increased accuracy, dependability, and workflow efficiency.
Cioloca Holban et al., 2025	3D scanning	CAD/CAM	Zirconia, resins, Co-Cr alloys	CAD/CAM milling, SLA/SLM	Hybrid workflows improved fit, productivity, and material efficiency of fixed and removable restorations; AI-supported optimization drove quality..

The findings presented in Table 4 indicate that CAD/CAM and additive manufacturing technologies have become central components of patient-specific healthcare production. Earlier digital workflows emphasized the fabrication of customized orthoses and cranial protection devices, while more recent studies expanded toward 3D-printed biomedical devices, dental prostheses, implants, personalized medicines, and hybrid CAD/CAM–3D printing systems. This development demonstrates that digital fabrication is no longer limited to prototyping but is increasingly used for clinically applicable, patient-specific products. For cranial remolding helmets, these findings support the potential of CAD/CAM and 3D printing to improve helmet fit, reduce manual adjustment, and enable scalable customization.

As shown in Fig. 6, scanning and imaging modalities evolved from conventional CT imaging and manual measurement toward 3D scanning, smartphone photogrammetry, non-contact optical scanning, and patient-specific digital modeling. This trend confirms the increasing reliance on non-invasive and digitally reproducible techniques in biomedical design. In cranial remolding helmet development, this shift is significant because accurate scanning is the first step in generating reliable CAD models, optimizing helmet geometry, and supporting additive manufacturing-based production.

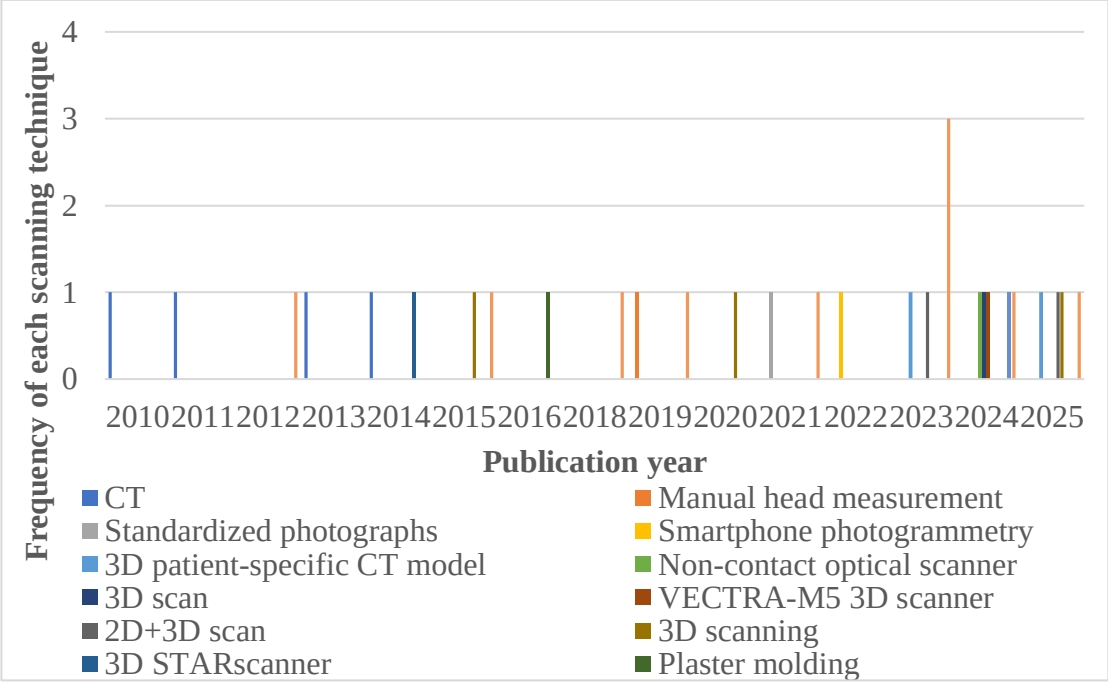

Fig. 6. Evolution of scanning and imaging modalities in biomedical design research (2010–2025).

Discussion

The findings of this systematic review indicate that the technological evolution of cranial remolding helmets has moved progressively from conventional assessment and manual fabrication methods toward integrated digital workflows based on imaging, parametric design, CAD/CAM systems, and additive manufacturing. This transition is clinically important because cranial helmet therapy depends strongly on early diagnosis, accurate cranial measurement, patient-specific design, and continuous follow-up. The reviewed studies suggest that helmet therapy is more effective when initiated during early infancy, particularly before cranial growth slows down. However, the degree of improvement varies according to deformity type, severity, treatment duration, age at intervention, and patient compliance.

One of the main findings of this review is the increasing role of non-invasive digital imaging techniques in cranial deformity assessment. CT imaging remains highly accurate for capturing cranial morphology, but its use in infants is limited by radiation exposure and clinical practicality. Therefore, 3D scanning, photogrammetry, and non-contact optical scanning have become increasingly relevant alternatives. These techniques allow repeated assessment without radiation exposure and provide digital anatomical data that can be used directly in CAD-based helmet design. Nevertheless, their accuracy may vary depending on equipment quality, calibration procedures, patient movement, and environmental conditions. This indicates that future clinical protocols should include standardized scanning procedures to ensure reproducible measurements across different settings.

Image processing also plays a central role in improving the reliability of cranial assessment and helmet design. The reviewed studies show that segmentation, feature extraction, GPU-based processing, artificial intelligence, and machine learning can improve diagnostic accuracy and support automated clinical decision-making. In cranial remolding helmet workflows, image processing can help transform raw cranial images or scans into measurable anatomical models, allowing clinicians to identify asymmetry, calculate cranial indices, and monitor changes over time. However, the integration of AI-based tools into clinical practice still requires careful validation, transparency, and attention to data privacy and algorithmic bias.

Parametric design represents another important advancement because it enables the creation of adjustable and reproducible helmet geometries based on patient-specific cranial morphology. Instead of relying entirely on manual modification, parametric models allow controlled changes in shape, thickness, ventilation, pressure-relief zones, and growth accommodation. This approach can reduce design time, improve fitting accuracy, and support more consistent clinical outcomes. However, parametric helmet design still depends on expert knowledge, reliable anatomical landmarks, and validated design rules. Without standardized parameters, different clinicians or engineers may produce inconsistent helmet designs.

CAD/CAM and additive manufacturing further strengthen the digital workflow by allowing customized helmet fabrication with improved precision and reduced production time. Additive manufacturing offers advantages such as lightweight structures, design flexibility, and the possibility of producing patient-specific geometries that are difficult to achieve using conventional fabrication methods. Despite these advantages, several challenges remain, including material selection, mechanical performance, ventilation, skin comfort, cost, production scalability, and long-term durability. More clinical studies are needed to compare 3D-printed cranial helmets with conventionally manufactured helmets in terms of correction rate, patient comfort, treatment duration, safety, and long-term outcomes.

Overall, the reviewed literature shows strong potential for integrating imaging, image processing, parametric design, CAD/CAM, and additive manufacturing into a unified cranial remolding helmet workflow. However, the evidence remains limited by methodological heterogeneity, differences in measurement techniques, variable treatment protocols, small sample sizes in some studies, and a lack of long-term follow-up. Future research should focus on standardized digital protocols, validated design parameters, comparative clinical trials, smart monitoring systems, and material optimization. Such developments would improve the reliability, accessibility, and clinical effectiveness of patient-specific cranial remolding helmets.

Conclusions

This systematic review demonstrates that cranial remolding helmet design has evolved considerably from conventional manual assessment and fabrication methods toward more advanced digital and patient-specific workflows. The reviewed studies indicate that early diagnosis and timely helmet intervention remain essential for improving cranial symmetry in infants, particularly in cases of positional plagiocephaly and brachycephaly. The effectiveness of treatment is influenced by age at intervention, deformity severity, treatment duration, wearing compliance, and the accuracy of helmet design.

The findings also show that imaging and scanning technologies play a critical role in modern cranial helmet development. While CT imaging provides high anatomical accuracy, non-invasive methods such as 3D scanning, smartphone photogrammetry, and non-contact optical scanning are increasingly preferred for infant assessment because they reduce radiation exposure and support repeated follow-up. Image processing, artificial intelligence, and machine learning further enhance cranial measurement, segmentation, monitoring, and clinical decision-making.

Parametric design and CAD/CAM-based workflows provide an important foundation for producing customized cranial helmets with improved fit, reproducibility, and fabrication efficiency. Additive manufacturing further expands these possibilities by enabling lightweight, patient-specific, and geometrically complex helmet structures. However, several limitations remain, including variability in scanning protocols, lack of standardized design parameters, limited long-term clinical evidence, material-related constraints, and differences in treatment protocols across studies.

Future research should focus on developing standardized digital workflows that integrate accurate scanning, validated image-processing methods, parametric helmet design, CAD/CAM systems, and additive manufacturing. More comparative clinical studies are needed to evaluate the long-term effectiveness, safety, comfort, durability, and cost-effectiveness of digitally designed and 3D-printed cranial remolding helmets. Overall, the integration of imaging, parametric design, and additive manufacturing represents a promising direction for improving the precision, accessibility, and clinical performance of personalized cranial remolding helmet therapy.

Abstract. Agricultural settings present unique challenges for the transmission of huge amounts of images over long-range wireless networks. It is challenging to remotely gather data for transmission over a wireless network in research areas due to a lack of basic amenities like internet connections, especially in distant agricultural areas. In this research, the Fast Fourier Transform (FFT) method was used in conjunction with the Discrete Cosine Transform (DCT) method of image compression to achieve a higher compression ratio. In order for a Wireless Sensor Network (WSN) to provide compressed image data to a wireless based station, a LoRaWAN network has been identified. Low-power LoRaWAN networks may regularly transmit compressed images from an agricultural region to a monitoring system up to 15 km away. Images of golden apple snails were collected for this study from a variety of sources. The procedure was coded in MATLAB so that it could be run with input images being judged by the created algorithm. The input images can be compressed with a range of compression ratios (CR) from 3.00 to 50.00, as shown by the simulation results. Compressed image quality is measured not only by the above-mentioned criteria, but also by Mean Square Error (MSE) and Peak Signal to Noise Ratio (PSNR). According to the numbers, the best achievable compression ratio is 49.04, with an MSE of 172.72 and a PSNR of 25.75 at its highest.

Keywords: Long-range network, Discrete Cosine Transform, Fast Fourier Transform, Compression technique, Wireless Sensor Network.

Introduction

Digital images contain large amounts of data, which require higher bandwidth for transmission. There are typically two main categories of image compression algorithms, namely lossy and lossless [1]. Lossy image compression involves the removal of certain data during the compression process, resulting in an irreversible transformation of the image. Conversely, lossless image compression produces an output image that closely resembles the original input and can be fully restored.

The transmission of large volumes of image data through Wireless Sensor Networks (WSNs) in agricultural environments presents significant challenges. Long-distance communication in rural areas, particularly in paddy fields, is often constrained by limited infrastructure and the need for periodic crop monitoring. Simultaneous transmission of large image files is therefore impractical. To effectively transmit images of paddy fields affected by invasive snails and the resulting damage to rice crops, it is necessary to reduce the image size and divide the data into multiple packets. Previous research has shown that LoRa requires approximately 498 seconds to transmit a 1 MB image due to its constrained data rate and payload limitations [2].

Background

LoRa is a communication technology and protocol developed by SimTech (Camarillo, CA, USA). LoRa demodulates signals using Frequency Shift Keying (FSK) at levels below 19.5 dB of the noise floor [3]. In contrast, most conventional communication technologies can only demodulate signals when the signal power is considerably higher than the noise floor. LoRa technology also offers continuous phase transitions among chirp symbols in the physical layer packet, providing improved synchronization accuracy in both time and frequency without requiring expensive hardware.

LoRa gateways are capable of covering wide urban and rural areas. Compared to traditional long-range communication technologies, which typically cover distances between 8 and 13 kilometers, LoRa enables wireless sensor nodes to achieve greater communication range while maintaining low power consumption. A Wireless Sensor Network (WSN) consists of remote sensing nodes responsible for monitoring and collecting data, which are then transmitted to a central sink for processing in specific applications.

Nevertheless, the transmission of multimedia data over LoRa remains challenging due to its inherent limitations in data rate, bandwidth, and payload size. The primary concern in WSNs is energy consumption, which must be minimized to support long-distance communication. Furthermore, the limited bandwidth and memory capacity of sensor networks create challenges for data transmission from sensor nodes. [4]. For instance, LoRa technology imposes a maximum duty cycle of 1%, allowing only 36 seconds of transmission per hour in each sub-band for every end device. This limitation makes the direct transmission of image data highly impractical and necessitates the implementation of efficient image compression techniques.

Literature Review

Over the past two decades, numerous image compression techniques have been developed to address the challenges associated with digital imaging. These techniques can generally be classified into two categories: lossy and lossless compression. Lossless compression techniques preserve all original image information, making them suitable for applications where data integrity is critical. However, they typically achieve lower compression ratios. Common lossless methods include Huffman Encoding and Lempel-Ziv-Welch (LZW) coding.

On the other hand, lossy compression techniques achieve significantly higher compression ratios by discarding less perceptually important information. Among the most widely used lossy techniques are the Discrete Cosine Transform (DCT), Discrete Wavelet Transform (DWT), and Fractal Compression [5]. DCT is particularly popular due to its computational simplicity and high compression efficiency, making it suitable for implementation in resource-constrained embedded systems. DWT offers superior image quality and multi-resolution analysis, although it generally requires greater computational resources.

Several studies have investigated the application of image compression in Wireless Sensor Networks and long-range communication systems. These studies have demonstrated that transform-based techniques, particularly DCT and DWT, are effective in reducing image size while maintaining acceptable visual quality. However, the use of image compression specifically for LoRa-based image transmission remains relatively limited. Given LoRa's strict duty-cycle restrictions, low data rate, and payload constraints, selecting an appropriate compression technique is crucial.

Although both lossy and lossless methods have been extensively studied, lossless techniques often fail to provide sufficient compression for practical image transmission over LoRa networks. Therefore, lossy compression methods offer a more feasible solution for agricultural image monitoring applications, where a balance between image quality and transmission efficiency is essential. This study focuses on evaluating the feasibility of lossy image compression for transmitting agricultural images over LoRa networks, particularly for monitoring paddy field conditions.

Technology for Lossy Data Compression

In order to compress images, the lossy compression approach applies a modification to the input data, turning it into what are known as produced images. Images generated using lossy compression will retain some information from the original data, despite the fact that their size and quality will be reduced as a result of the compression rate. This method consists of three algorithmic steps, the first phase is to eliminate inter-pixel redundancy to group information competently before the process called quantizer is applied to take out psychovisual redundancy to represent the compressed information using as few bits as possible in phase two. Then the quantized bits are resourcefully encoded to get extra compression from the coding redundancy [6]. Most studies agree that this is one of the most effective strategies for long-distance wireless image transfer [2, 4, 7]. This study focuses primarily on this method because the size of images can be scaled down with appropriate compression ratio.

Technology for Lossless Data Compression

This method is based on wavelet analysis, resulting in output images that closely resemble the input images. This approach is highly suitable for images containing detailed information, necessitating the preservation and analysis of every pixel's information [5]. The utilization of medical imaging in data processing is highly advantageous as it ensures little loss of information inside the images. The aforementioned method has a relatively low compression rate when compared to lossy compression techniques and is frequently employed by researchers for the purpose of medical imaging. The approach extensively employs the Discrete Wavelet Transform (DWT) [8]. This method is not suitable for the present study because the size of images is not necessarily demanding for further work.

Table 1: Summarizing the features of various data compression algorithm.

	DCT [6]	**Fractal Comp.** [5]	**Huffman End.** [9]	**LZW Coding** [5]
Compression	Lossy	Lossy	Lossless	Lossless
Quality	Output losing some information	Output losing some information	Output same as input	Output almost the same as input
Features	Large compression gains. High compression ratio.	Noise ratio is low.	The same as the original image. A low rate of compression.	Contains degradation relative to the original.
Method	Cos. functions transform	Images divided into square blocks called Parent Blocks.	Using a binary tree	Coding based on dictionary.
Image Format	JPEG, JPEG 2000	JPEG, JPEG 2000	BMP, PNG, TIFF	BMP, PNG, TIFF
Advantages	Smaller compressed file.	Image quality is mostly retained.	Retain full quality of images.	Restores compressed data.
Disadvantages	File cannot be restored.	File compression increases the probability of detectable deviations.	Size will be smaller.	Worst compression results.

The classification of image compression technique can also be understood more clearly by looking at Figure 1 as below. In general, there are 2 categories of image compression which leads to the result of different file formats, namely JPEG/JPEG 2000 and BMP/PNG/TIFF.

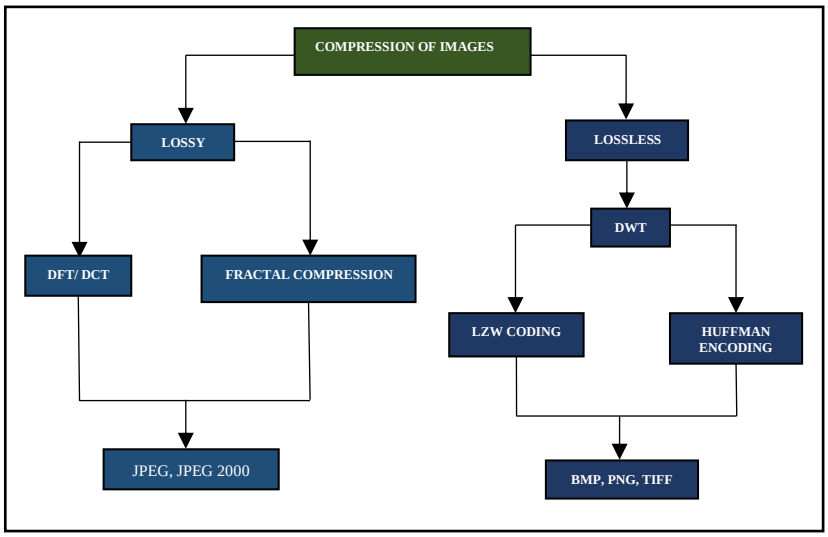

Fig. 1: Category classification of image compression methods.

Measuring the Efficiency of Image Compression

The performance of compression techniques depends on several criteria. There are 4 criteria which affect the performance metrics such as quality of image, compression ratio, speed of compression in terms of computational complexity of memory resources, and the power consumption [10].

Image Quality. There is a need to define a method that can evaluate the image quality after the reconstruction process and measure the volume distortion due to the compression process as minimal image distortion means better quality.

Mean Square Error (MSE) which is define as: -

$$MSE = \frac{1}{mn}\sum_{i=0}^{m-1}\sum_{j=0}^{n-1}[I(i,j) - K(i,j)]^2 \quad (1)$$

I(i,j) and K(i,j) are functions which define the intensity of each pixel in the sent and received images, where m and n are the number of pixels in the length and width of the image.

Peak Signal to Noise Ratio (PSNR) can be calculated as: -

$$PSNR = 10\log\frac{S^2}{MSE} \quad (2)$$

In the context of an 8-bit image, let S represent a constant value of 255. The mean square error (MSE) is a metric that quantifies the average of the squared differences between the intensity values of pixels in the original image and the corresponding pixels in the output image.

Compression Ratio. The ratio of the number of bits per pixel in the compressed version of an image to the number of bits per pixel in the original version is referred to as the compression ratio (CR). Image compression can be measured by using the formula: -

$$CR = \frac{n_2}{n_1} \quad (3)$$

Where n_1 represents the number of bits in the uncompressed original image and n_2 represents the number of bits in the compressed version of the image.

Speed of compression. Computational complexity and memory size both impact the speed at which compression may be performed. Lossy compression is a time-consuming and complicated procedure that results in additional data storage and computational needs. Thus, the primary objective is to investigate and evaluate lossy compression methods that can be used with WSN. This work also details related efforts to enhance the functionality of such methods, with the goal of minimizing computational demands with minimal power consumption while yet producing visually pleasing results. WSN calls for increased network capacity and data storage capacity [10].

Proposed Method

For optimal image compression, a Fast Fourier Transform (FFT) algorithm will be applied to the image of golden apple snails. Fast Fourier Transform is a method that was derived from the Discrete Fourier Transform (DFT) algorithm, so it can calculate the discrete value of DFT. Using the FFT-based technique, the rate of Fourier transformation calculations can be increased, whereas loop processing in DFT is time-consuming and memory-intensive.

Image Pre-Processing of Golden Apple Snail Samples

Images of golden apple snails were captured from a top view of paddy fields using a drone. Thereafter, the captured photographs will be collected for storage in a database record. Each stored image was cropped based on color differences that allow us to determine which one of the golden snails is found in the picture. For example, a sample of a picture that has been cropped from the original picture aims to reduce the pixel size of the picture and then make color recognition to detect the golden snail part in the picture. Color recognition was performed manually in which the user determines the result of the cut area to ensure that the pixel size of the picture is as desired 512 x 512 pixels.

Fig. 2: The original image of golden apple snail eggs on stem taken before crop.

Fig. 3: The cropped image of golden apple snail eggs in size 512 x 512 pixels.

In Fig. 2, the original image captured by drone has been selected to ensure the whole objects in the picture are appropriate to choose before doing the cropping process. The selected region of the cropped image is defined in Figure 3 where the size of image will be 512 x 512 pixels. The overall process of the proposed method is illustrated in Figure 4. That means, the original image will be going through image pre-processing before simulation in MATLAB software can be done.

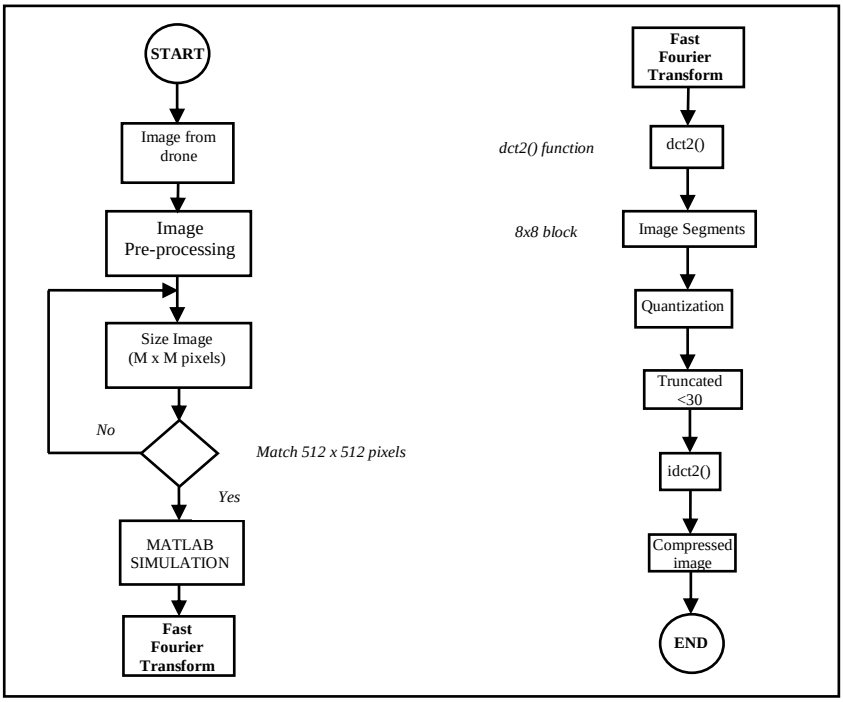

Fig. 4: Flowchart of the whole process proposed method.

Applying Fast Fourier Transform (FFT)

The Fast Fourier Transform (FFT) technique reduces the computation time required for Discrete Fourier Transform (DFT) calculations. Specifically, the iterative process involved in the DFT calculation can be significantly minimized. The Fast Fourier Transform (FFT) algorithm can be categorized into two distinct methods: Decimation in Time (DIT) and Decimation in Frequency (DIF). Both methods serve the same purpose of transforming a given signal into its basic frequency representation. Decimation refers to the process of dividing a signal into smaller segments with the objective of achieving enhanced processing speed. This entails separating the frequency components of the signal into two distinct subsets, namely the even and odd components. To begin the analysis, the initial step involves dividing the input signal x(n) in the time domain, which consists of N points, into two equal sections of N/2 points. The Fast Fourier Transform (FFT) structure is employed in order to provide efficient calculation of the Discrete Cosine Transform (DCT), making it suitable for processing large input images. The use of the dct2() function in MATLAB facilitates the accomplishment of this task. For instance, while considering Figure 5, the use of an 8 x 8 image segment enables the acquisition of DCT coefficients by the application of the dct2() function within each pixel block. Figure 6 displays the coefficients, with the DC component positioned at the top left corner. This component contains the biggest DCT coefficients, whereas the remaining components consist of smaller values compared to the top-left component. This implies that image compression can be achieved by setting the smaller coefficients to a value of zero. The technique depicted in Figure 7 is referred to as quantization.

Result & Discussion

Fast Fourier Transform (FFT) function can be employed to reduce the size of a grayscale image of 512 × 512 pixels and occupying 176 KB, as demonstrated in Table 2. The proposed approach preserves the visual appearance of the golden apple snail images, as the truncation has been configured to disregard coefficients and set them to zero. By manipulating the truncation coefficient value, one can generate output images of varied sizes using this technique. The Fast Fourier Transform (FFT) algorithm has the capability to be configured with various settings. The coefficient truncation thresholds were set to values below 10, 30, 50, 70, and 90. The most significant level of compression has been achieved with a truncation value of less than 90. The various truncation values employed are presented in Table 2.

Table 2: Multiple values for the truncation factors for an FFT-based result.

	(Coefficient truncation value) **Fast Fourier Transform (FFT)**				
	< 10	**< 30**	**< 50**	**< 70**	**< 90**
Original-image (KB)	176.0KB	176.0KB	176.0KB	176.0KB	176.0KB
Compressed-size (KB)	170.0KB	125.0KB	106.0KB	96.80KB	89.70KB
Comp.Rate (CR)	3.41	28.98	39.77	45.00	49.04
Mean.Square.Error (MSE)	14.89	68.58	110.27	143.98	172.72
Peak.Signal-to-Noise-Ratio (PSNR)	36.40	29.77	27.71	26.54	25.75
Original image					
Output image					

The results indicate that increasing compression efficiency reduces transmission payload size, which is beneficial for LoRa communication due to its limited data rate. However, higher compression levels may introduce image quality degradation, as reflected by lower PSNR values. This trade-off is important in agricultural monitoring applications where image clarity and transmission efficiency must be balanced.

Table 3 displays a comprehensive overview of the various compression approaches employed in prior research on lossy image compression. In a scholarly publication by Author et al. (2011), three distinct lossy compression techniques were introduced for the compression of a single image with dimensions of 425 x 318 pixels. In the conducted experiment, it was seen that the Discrete Cosine Transform (DCT) approach exhibited the lowest compression ratio, measuring 38.13. Additionally, the Mean Square Error (MSE) associated with this method was found to be 14.25, which was the lowest among all the other methods tested. The proposed strategy employed several threshold values in the implementation of these three strategies. The proposed method in Paper [12] introduces a technique called quantization-smoothing, which involves the utilization of two distinct images denoted as (a) and (b). The first image (a) depicts a baboon, whereas the second image (b) portrays a cameraman. The two photographs were subjected to varying levels of quantization-smoothing factor. The compressed image (a) exhibits a higher compression ratio of 34.66, while yielding a lower PSNR value of 29.12. The dimensions of the block pictures utilized in the suggested technique are 4 x 4. This study utilized pixel images of dimensions 8 x 8, with an original size of 176 KB. These images were subjected to compression using the FFT algorithm, employing five distinct values of truncation. Consequently, the truncation value (e) exhibits the most favorable compression ratio, but at the expense of a notably low peak signal-to-noise ratio (PSNR) compared to other alternatives. Despite the lower PSNR

value, the image of the golden apple snail remains visually recognizable. The proposed method of Fast Fourier Transform (FFT) suggests that increasing the truncation value leads to a larger compression ratio. In summary, the use of the value of (e) is deemed suitable for long-range wireless network transmission due to the reduction in image size to 89.7 KB, which is comparatively the smallest among the other options.

Table 3: Assessment in relation to prior efforts in the field of image compression.

Research	Approach	Mean Square Error	P.S.N.R	Comp. Rate
[11]	DWT/DCT/SVD	23.07	34.50	46.91
	DCT-SVD	18.01	35.58	44.74
	DCT	14.25	36.59	38.13
[12]	Quantization Smoothing(a)	-	29.12	34.66
	Quantization Smoothing(b)	-	31.47	21.81
This work	FFT(a)	14.89	36.40	3.41
	FFT(b)	68.58	29.77	28.98
	FFT(c)	110.27	27.71	39.77
	FFT(d)	143.98	26.54	45.00
	FFT(e)	172.72	25.75	49.04

Table 4 presents the results of compression ratio, mean square error, and peak signal-to-noise ratio measurements performed on five distinct images. An additional factor in determining the final image size was the use of a single truncation coefficient value of 90. Since the previous experiment showed that the truncation value 90 resulted in the highest compression ratio, this value was employed in the FFT method. Five images were processed using FFT, and the results showed that the best compression ratio was achieved with image Sample03, while the worst was achieved with image Sample04 (with values of 39.79 and 24.81, respectively). This means that the Table 4 findings do not reach the same level of compression as the Table 2 results. All five photos are 512 pixels on the long side, same as the last experiment. Examining the major purpose of the study—to obtain the highest compression ratio, which means the size can be decreased as much as possible—allows us to interpret the results if the truncation value 90 has been applied to all images with the same number of pixels, then the images are identical. Table 2 shows that when the truncation coefficient is 90, the largest compression achieved in this work is 49.04. Images themselves determine the compression ratio, even if all six are exactly the same size at 512 by 512 pixels and have the same truncation value of 90.

Table 4: Comparison result based on parameters by five sample images.

	Threshold Value of FFT (<90)				
	Image01	*Image02*	*Image03*	*Image04*	*Image05*
Raw image (Kilobyte)	132 KB	138 KB	141 KB	133 KB	127 KB
Compressed image size	91.5 KB	87.0 KB	84.9 KB	100.0 KB	82.5 KB
Rate of Compression	30.68	36.96	39.79	24.81	35.04
MSE Image	129.4014	128.3558	142.7150	189.9646	150.7336
Ratio of PSNR	27.0114	27.0466	26.5861	25.3441	26.3487

	Threshold Value of FFT (<90)				
	Image01	*Image02*	*Image03*	*Image04*	*Image05*
Original RGB image					
RGB cropped					
Original grayscale					
Output image					

Table 5 presents the outcomes of the compression ratio for every image employed in this study, utilizing an FFT-based technique with a truncation threshold set at a value below 90. When a truncation value less than 90 is applied to photos with the same pixel size, variations in image size and compression ratio are seen. The maximum level of compression achieved in this study is denoted as the outcome presented in Table 5, where a compression ratio of 49.04 is observed when the truncation coefficient is adjusted to a value below 90. Despite the uniform dimensions of 512 × 512 pixels and a truncation value of <90 applied to all five images; the compression ratio is contingent upon the individual characteristics of each image. Certain photos exhibit high frequency values, whereas others do not. Consequently, the compression ratios acquired exhibit variability.

Table 5: Sample image compression ratio from FFT technique.

Images	Size (KB)	Compressed (KB)	Ratio (CR)
Image01	132 KB	91.5 KB	30.7
Image02	138 KB	87.0 KB	36.9
Image 03	141 KB	84.9 KB	39.8
Image04	133 KB	100.0 KB	24.8
Image05	127 KB	82.5 KB	35.0
F.F.T	176 KB	89.7 KB	49.0

The results indicate that increasing compression efficiency reduces transmission payload size, which is beneficial for LoRa communication due to its limited data rate. However, higher compression levels may introduce image quality degradation, as reflected by lower PSNR values. This trade-off is important in agricultural monitoring applications where image clarity and transmission efficiency must be balanced.

Therefore, selecting an appropriate compression level is crucial to ensure efficient image transmission while preserving sufficient visual information for agricultural observation.

Conclusions and Future Work

This study utilizes image compression techniques on golden apple snail images to assess the appropriateness of the selected compression strategy. The compression ratio, mean squared error (MSE), and peak signal-to-noise ratio (PSNR) were achieved by implementing the lossy image compression technique on a selected image. The Fast Fourier Transform (FFT) algorithm, implemented in MATLAB, was utilized for this purpose. Nevertheless, the compressed images remain visually similar to the original images. The primary aim of this endeavor is to employ various methods in order to minimize the quantity of data required to depict a specific quantity of visual information. Further improvements can be achieved by extending the findings obtained from the current experiments. The primary objective is to efficiently transmit image data using a compact format that is compatible with the previously investigated LoRa device module. Comprehensive evaluation of all parameters is necessary in order to achieve compatibility with the LoRa Semtech module within the context of Wireless Sensor Network (WSN) applications.

[a]letchumanan@pbu.edu.my, [b]geetha@ptsb.edu.my, [c]suntheren@psp.edu.my

Abstract. This qualitative study examines how Polytechnic students conceptualise the impact of advanced artificial intelligence—specifically Artificial General Intelligence (AGI) and Artificial Superintelligence (ASI)—on future digital TVET practices. Semi-structured interviews were conducted with students from engineering and ICT programmes to explore their awareness, interpretations, and expectations of these emerging technologies within the evolving landscape of technical and vocational education. Thematic analysis indicates that students perceive AGI and ASI as having significant potential to transform TVET through enhanced personalised learning, advanced automation, and the development of higher-order digital competencies. Despite this optimism, students also voiced concerns regarding ethical implications, over-dependence on intelligent systems, and institutional readiness for such technological shifts. Overall, the findings reveal a balanced view in which students recognise both the promise and challenges of integrating AGI and ASI, underscoring the need for strategic planning, policy development, and structured support to ensure their responsible implementation in future TVET practices.

Keywords: Artificial General Intelligence (AGI), Artificial Superintelligence, Artificial Intelligence in Education, Digital Transformation, Technical and Vocational Education and Training (TVET)

Introduction

The rapid advancement of artificial intelligence (AI) technologies is transforming various sectors, including education, industry, and workforce development. Emerging forms of AI such as AGI and ASI are expected to significantly reshape learning environments, knowledge production, and professional competencies. AGI refers to highly autonomous systems capable of performing intellectual tasks at a human level across multiple domains, while ASI describes intelligence that surpasses human cognitive abilities [1, 2].

TVET plays a critical role in equipping students with practical skills, technical knowledge, and industry-relevant competencies necessary for workforce readiness. As digital transformation accelerates, the integration of advanced AI technologies has the

potential to enhance personalised learning experiences, improve training efficiency, and support the development of higher-order digital skills [3, 4]. AI-driven educational systems can support adaptive learning, automate assessment processes, and facilitate competency-based training aligned with industry needs. However, the adoption of highly autonomous intelligent systems also raises concerns related to ethical considerations, institutional readiness, and the risk of over-dependence on technology [5].

Despite growing scholarly interest in artificial intelligence in education, limited research has explored students' conceptualisation of AGI and ASI within the TVET context, particularly among Polytechnic students in technical and engineering disciplines. Understanding students' perceptions is essential, as their awareness, expectations, and concerns may influence the future adoption and implementation of advanced AI technologies in digital learning environments.

Therefore, this qualitative study examines how Polytechnic students conceptualise the impact of AGI and ASI on future digital TVET practices. Through semi-structured interviews with students from engineering and information and communication technology (ICT) programmes, the study explores their awareness, interpretations, and expectations of these emerging technologies. The findings aim to inform strategic planning, policy development, and institutional practices to ensure the responsible and effective integration of advanced AI technologies in future TVET education.

Literature Review

Artificial Intelligence in Education

Artificial intelligence (AI) has increasingly influenced educational practices by transforming teaching, learning, and assessment processes. AI technologies enable personalised learning, adaptive feedback, automated evaluation, and data-driven decision-making in educational environments [3]. These systems analyse learner behaviour and performance data to deliver tailored instructional content, thereby improving learning efficiency and student engagement.

The growing role of AI in education aligns with global efforts to promote digital transformation and future-ready competencies. Policy frameworks developed by organizations such as UNESCO emphasise the importance of integrating AI technologies to support inclusive and equitable education while ensuring ethical and responsible implementation [4]. Similarly, OECD highlights the need for governance frameworks addressing transparency, accountability, and fairness in AI adoption within education systems [5]. Despite its benefits, AI integration presents challenges including data privacy concerns, algorithmic bias, and the need for institutional readiness and digital infrastructure.

Artificial Intelligence in Technical and Vocational Education and Training (TVET)

Technical and Vocational Education and Training (TVET) plays a crucial role in developing workforce competencies and preparing students for industry demands. The integration of AI technologies in TVET has been recognised as a key driver of innovation in skills development and workforce preparation. AI-supported learning environments enhance technical training through simulation-based learning, intelligent tutoring systems, and automated performance assessment, which contribute to the development of digital competencies and problem-solving skills [4].

The adoption of AI in TVET also supports the shift towards competency-based education and lifelong learning. AI-driven systems facilitate flexible learning pathways and enable continuous skills development aligned with industry requirements. However, challenges related to technological infrastructure, digital literacy among educators, and policy development remain significant barriers to effective implementation. These challenges highlight the importance of institutional preparedness and strategic planning in integrating AI technologies within TVET environments.

Artificial General Intelligence and Artificial Superintelligence in Education

Artificial General Intelligence (AGI) represents an advanced form of AI capable of performing intellectual tasks across multiple domains with human-level cognitive abilities. Unlike narrow AI systems designed for specific tasks, AGI demonstrates generalised reasoning, learning, and problem-solving capabilities [1]. The development of AGI has significant implications for education, particularly in enabling highly personalised learning systems, intelligent tutoring, and automated curriculum design.

Beyond AGI, Artificial Superintelligence (ASI) refers to systems that surpass human cognitive performance across virtually all domains of knowledge and decision-making [2]. The potential integration of ASI in educational contexts raises important questions regarding human–machine interaction, knowledge authority, and the future role of educators. While these technologies offer opportunities to enhance learning outcomes and efficiency, they also present ethical concerns related to autonomy, control, and societal impact.

Scholars emphasise that the implementation of advanced AI technologies in education requires careful consideration of ethical principles, governance mechanisms, and regulatory frameworks to ensure responsible use and minimise unintended consequences.

Opportunities and Challenges of AI-Driven Learning

The literature identifies several benefits of AI-driven learning environments, including improved learning outcomes, enhanced student engagement, and increased efficiency in instructional delivery [3]. AI technologies support adaptive learning systems that respond to individual learner needs and facilitate the development of higher-order cognitive skills such as critical thinking and problem-solving.

However, the increasing reliance on intelligent technologies raises concerns regarding ethical implications, over-dependence on automation, and potential reductions in human interaction within learning processes. Issues such as data security, algorithmic transparency, and digital inequality require attention to ensure equitable access to AI-enhanced education [5]. These challenges highlight the need for balanced implementation strategies that integrate technological innovation with human-centred pedagogical approaches.

Problem Statement

Although existing studies have examined AI integration in education and higher learning contexts, limited research has explored students' conceptual understanding of advanced AI technologies such as AGI and ASI within TVET settings. Previous research primarily focuses on technological implementation, institutional adoption, and pedagogical innovation, while students' awareness, perceptions, and expectations remain underexplored. In particular, little empirical evidence exists regarding how Polytechnic students perceive the impact of AGI and ASI on future digital TVET practices. Addressing this gap is essential for informing policy development, institutional planning, and responsible AI integration in vocational education.

Data Analysis Framework

The qualitative data obtained from semi-structured interviews were analysed using thematic analysis, following the framework proposed by Virginia Braun and Victoria Clarke [6]. Thematic analysis is a flexible and systematic method for identifying, analysing, and reporting patterns or themes within qualitative data, making it suitable for exploring participants' perceptions and experiences regarding emerging technologies.

The analysis was conducted through six phases.

Phase 1: Familiarisation with the Data

The researcher first transcribed the interview recordings verbatim and repeatedly read the transcripts to gain a comprehensive understanding of the data. Initial observations and reflections were documented to identify meaningful patterns related to students' awareness, expectations, and concerns regarding AGI and ASI in digital TVET practices.

Phase 2: Generating Initial Codes

The transcripts were systematically coded by identifying significant statements, ideas, and recurring concepts relevant to the research objectives. Open coding was employed to label meaningful segments of data, such as perceptions of personalised learning, automation, ethical concerns, and institutional readiness.

Phase 3: Searching for Themes

Codes were then organised into broader categories to identify potential themes representing patterns across participants' responses. Related codes were grouped to form preliminary themes describing students' conceptualisations of advanced AI technologies in TVET.

Phase 4: Reviewing Themes

The identified themes were reviewed and refined to ensure consistency and relevance to the research questions. The researcher examined whether the themes accurately represented the dataset and ensured clear distinctions between themes.

Phase 5: Defining and Naming Themes

Each theme was clearly defined by identifying its core meaning and scope. The themes were labelled to reflect key aspects of students' perceptions, including perceived benefits, challenges, and expectations regarding AGI and ASI in digital TVET practices.

Phase 6: Producing the Report

The final phase involved interpreting the themes and presenting them in a coherent narrative supported by participants' responses. The analysis provided insights into Polytechnic students' perspectives on the opportunities and challenges associated with advanced AI integration in TVET.

This systematic analytical process ensured the credibility, consistency, and transparency of the qualitative findings.

Participants and Sampling

The participants consisted of Polytechnic students enrolled in engineering and information and communication technology (ICT) programmes. These students were selected because of their exposure to digital technologies and their relevance to future technology-driven workforce environments.

A purposive sampling technique was used to select participants who possessed basic knowledge or awareness of artificial intelligence concepts. The sample included students from different academic levels to obtain diverse perspectives regarding AI adoption in education. A total of (insert number) students participated in the study.

Participation was voluntary, and all participants provided informed consent prior to data collection.

Results and Discussion

The thematic analysis revealed four major themes related to Polytechnic students' conceptualisation of advanced artificial intelligence technologies—AGI and ASI—in future digital TVET practices. These themes include (1) enhanced personalised learning, (2) advanced automation and efficiency, (3) development of higher-order digital competencies, and (4) ethical and institutional concerns.

Enhanced Personalised Learning

The findings indicate that students perceived AGI and ASI as transformative technologies capable of supporting personalised learning experiences. Participants highlighted that advanced AI systems could adapt instructional content to individual learning needs, provide real-time feedback, and improve understanding of complex technical concepts. Students believed that such intelligent systems could assist them in mastering practical skills more effectively compared to traditional instructional approaches. This aligns with literature on adaptive learning and individualised instruction [3].

Advanced Automation and Learning Efficiency

Participants also perceived AGI and ASI as enabling advanced automation in educational processes, including automated assessment, intelligent tutoring, and administrative support. Students emphasised that automation could increase efficiency in learning activities, reduce workload, and improve access to educational resources. These perceptions are consistent with studies highlighting AI's ability to streamline educational processes and enhance instructional effectiveness [5]. Despite these perceived benefits, some students raised concerns about potential job displacement and the diminishing role of human instructors, underscoring the need to redefine educators' roles in AI-enhanced learning environments.

Development of Higher-Order Digital Competencies

Students believed that exposure to AGI and ASI technologies would enhance their problem-solving abilities, critical thinking, and technical skills required for future employment in technology-driven industries. This supports arguments that AI integration in TVET contributes to workforce readiness and digital skills development aligned with Industry 4.0 [4].

Ethical Concerns and Institutional Readiness

Despite recognising the benefits of AGI and ASI, participants expressed concerns regarding ethical implications, technological dependency, and institutional

preparedness. Students highlighted issues related to data privacy, algorithmic bias, and the risk of over-dependence on intelligent systems. Additionally, participants questioned whether educational institutions possess adequate infrastructure and policy frameworks to support advanced AI integration. These concerns align with policy discussions emphasising responsible AI implementation, transparency, and governance in educational settings [4, 5].

Overall Discussion

Overall, the findings reveal that Polytechnic students demonstrate a generally positive yet cautious perception of advanced artificial intelligence technologies in digital TVET practices. Students recognise the transformative potential of AGI and ASI in enhancing personalised learning, improving efficiency, and developing future-ready competencies. At the same time, concerns related to ethical implications, over-dependence, and institutional readiness highlight the need for responsible implementation. This research contributes by centring students' awareness and expectations, which play a crucial role in shaping future educational practices. Successful integration of AGI and ASI in TVET requires comprehensive policy development, institutional preparedness, and structured support systems that balance technological innovation with human-centred learning approaches.

Conclusion

This study explored Polytechnic students' conceptualisation of AGI and ASI and their perceived impact on future digital TVET practices. Using a qualitative approach and thematic analysis of semi-structured interviews, the findings revealed a generally positive yet cautious perspective towards the integration of advanced AI technologies in vocational education. Students perceived AGI and ASI as transformative technologies capable of enhancing personalised learning, improving instructional efficiency through automation, and supporting the development of higher-order digital competencies required for future workforce demands. However, concerns related to ethical implications, technological dependency, and institutional readiness emphasise the importance of responsible AI implementation, appropriate governance frameworks, and institutional preparedness to support effective integration. Future research may further investigate educators' perspectives, institutional capabilities, and the long-term impact of advanced AI technologies on vocational education and workforce development.

Abstract. The rapid growth in job application submissions has made resume screening an increasingly complex and resource-intensive task for recruiters. Manual evaluation processes are often time-consuming, inconsistent, and susceptible to human bias, while conventional keyword based filtering techniques lack the ability to accurately interpret the contextual relevance of candidates' skills and experience. This study presents the development of an AI-based resume filtering system that automatically analyzes uploaded resumes and select candidates according to specific job requirements. The systems uses Natural Language Processing (NLP) techniques, such as breaking text into meaningful units, normalizing words to their base forms, and named entity recognition, to extract important information including skills, educational background, and work experience. Resume content is represented using the Term Frequency Inverse Document Frequency (TF-IDF) model, and cosine similarity is employed to measure alignment between candidate profiles and job specifications, enabling relevance-based ranking. The system is implemented in Phyton using established libraries such as spaCy, scikit-learn, and Pyresparer. Experimental results indicate that the proposed system improves screening efficiency, enhances the accuracy of requirements matching, and reduces the need for manual intervention. The main contribution of this research lies in providing a practical and scalable AI-based solution that bridges the gap between and basic keyword matching and context-aware resume analysis, supporting more reliable and data-driven decision-making in modern recruitment processes.

Keywords: Artificial Intelligence; Natural Language Processing; Recruitment Automation; TF-IDF; Candidate Screening

Introduction

The rapid digitalization of recruitment processes has led organizations to receive a high volume of job applications for each vacancy. Traditional manual screening methods are inefficient, time-consuming, and often influenced by subjective judgment and cognitive bias [1]. Early automated systems relied on keyword-based filtering, which fails to capture the contextual meaning of candidate qualifications [2].

Recent advancements in Artificial Intelligence (AI) and Natural Language Processing (NLP) have enabled the development of intelligent recruitment systems capable of understanding semantic relationships within text data [3]. This research proposes an AI-based resume parsing system that improves candidate-job matching using NLP techniques and similarity-based ranking.

Problem Statement

Several important recruitment problems are faced by recruiters today:

i. Manual Inefficiency: Evaluation procedures are normally time-consuming and resource consuming.
ii. Subjectivity- The manual screening is subject to inconsistency and human bias.
iii. Contextual Limitations: Traditional applications of keywords do not understand the contextual applicability of candidate skills.
iv. Decision-Making Gaps: A major gap that should be addressed is scalable solutions that offer reliable decision-making during modern recruitment based on data collection.

Objectives

In order to overcome the challenges mentioned above, this study aims at the following goals:

i. To create an automated parsing system with NLP to remove the manual inefficiencies and decrease time to hire.
ii. To apply a unified design by applying TF-IDF and Cosine Similarity to reduce human bias and consistency in evaluation.
iii. To increase the matching accuracy through lemmatization and NER to comprehend the contextual relevance of professional experience.
iv. To offer a scalable decision-making instrument that would give quantitative similarity ratings to data-driven recruiting.

Literature Review

Recruitment technology has changed the manual sorting of documents into high-tech AI analytics. The paper is a literature review of Applicant Tracking Systems (ATS) and the use of NLP in the assessment of candidates, as well as the larger effect of the system optimization is taken into consideration [2, 3].

Challenges in Traditional Recruitment

Manual resume screening is associated with inefficiency, inconsistency, and bias. Studies show that recruiters spend only a few seconds reviewing each resume, increasing the likelihood of overlooking qualified candidates [4]. Additionally, human bias can negatively affect diversity and fairness in hiring decisions [5].

Limitations of Keyword-Based Systems

Traditional Applicant Tracking Systems (ATS) rely heavily on keyword matching. While efficient, these systems fail to recognize semantic relationships between terms, leading to high false rejection rates [6]. For example, synonyms or variations of skills may not be detected, reducing matching accuracy.

NLP in Recruitment Systems

NLP techniques such as tokenization, lemmatization, and Named Entity Recognition (NER) enable systems to extract structured information from unstructured resumes [7]. Research indicates that NLP-based systems significantly improve candidate evaluation accuracy and reduce bias [8].

Machine Learning and Similarity Metrics

Vector Space Models such as TF-IDF are widely used to represent textual data numerically. Cosine similarity is then applied to measure the similarity between candidate profiles and job descriptions [9]. These techniques provide a quantitative and objective approach to ranking candidates.

Recent Advances in AI Recruitment

Recent studies highlight the use of deep learning and explainable AI in recruitment systems to enhance transparency and trust [10][11]. AI-driven recruitment tools have been shown to improve efficiency while maintaining fairness in candidate evaluation.

Research Methodology

The two major software systems of this project are the web-based user interface and the backend AI processing module. The required libraries such as spaCy, scikit-learn, pdfplumber and python-docx allow extracting the text, performing the NLP analysis, and similarity scoring. The system is launched when the users upload their resumes in PDF or DOCX format. The NLP module examines the text that is extracted in these files and determines valuable information such as names, contact details, talents and work experience. At the same time, job description as entered by the user is converted into TF-IDF vectors. The job description and the resume data are compared by cosine similarity and the match rating of each applicant is generated. The interface provided by the Streamlit online interface lets users download a structured PDF report, and displays real-time results of the ranking. Since the whole system is established on the Render cloud platform, it becomes possible to connect with a remote location and streamline the interface and the processing on the backend. Figure 1.0 represents the full workflow of the system.

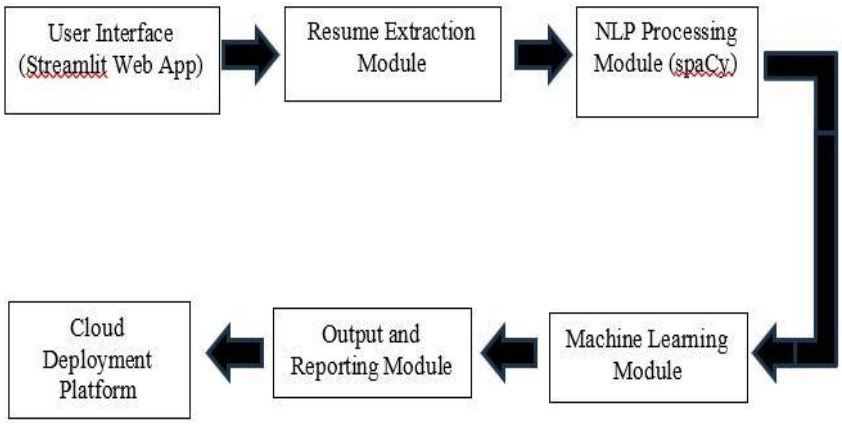

Fig 1: Block Diagram of the project

The technical setup is built on a strong Python-based foundation which includes spaCy and scikit-learn and Pyresparser.

Data Preparation and Language

Adjustment Data from PDF and DOCX formats which is not structured becomes converted into text that machines can read. The system uses:Tokenization which segments sentences into separate language parts. Lemmatization which reduces inflected words to their base form (for example, "programming" to "program").Stop-word Removal which filters out unnecessary words (such as "a" and "the") to concentrate on important technical terms.

Semantic Feature Extraction with NER

Through Named Entity Recognition (NER) the system classifies specific data into set categories which include skills and academic credentials and professional titles.

Mathematical Transformation and Ranking Resume

It content becomes transformed using the TF-IDF (Term Frequency-Inverse Document Frequency) model. The alignment between the candidate vector (V_{res}) and the job requirement vector (V_{req}) is calculated using the cosine similarity metric in Equation (1):

$$\text{Similarity Score} = \frac{V_{res} \cdot V_{req}}{\|V_{res}\| \, \|V_{req}\|} \quad (1)$$

Experimental Configuration

The system used Python 3.x on a high-performance workstation. The core libraries include spaCy for strong NLP and Pyresparser for specific extraction and Scikit-learn for vectorization and similarity calculation.

Results and Discussion

Experimental evaluations demonstrate that the proposed system drastically reduces manual intervention by providing an automated relevance-based ranking.

Table 1: Detailed Comparison of Recruitment Methodologies

Metric / Feature	**Manual Screening**	**Keyword-Based System (Traditional ATS)**	**Proposed AI-Based System**
Search Mechanism	Visual document review by HR personnel	Exact string matching against predefined keywords	TF-IDF Vector Space Modeling
Data Processing Approach	Fully manual	Rule-based automated filtering	NLP-driven automated processing

Linguistic Analysis	Subjective interpretation	None (literal keyword only)	Lemmatization, Tokenization & Named Entity Recognition (NER)
Context Awareness	High (human understanding, but inconsistent)	Poor (no semantic understanding)	High (semantic & contextual NLP modeling)
Synonym Handling	Depends on reviewer knowledge	Not supported	Supported via lexical normalization
Scalability	Low (time-consuming)	Moderate	High (parallel automated processing)
Processing Time per 100 CVs	4–6 hours	5–10 minutes	< 2 minutes
Bias Risk	High (cognitive bias)	Medium (keyword bias)	Reduced (algorithmic scoring with structured criteria)
Accuracy Consistency	Inconsistent	Moderate	High
False Rejection Rate	High (human fatigue factor)	High (missing non-exact keywords)	Low (semantic similarity matching)
Ranking Metric	Subjective preference	Binary classification (Match / No Match)	Cosine Similarity Score (0–1 scale)
Score Interpretability	Not quantifiable	Limited	Quantitative similarity percentage
Adaptability to New Roles	Requires retraining HR	Requires keyword update	Adaptive retraining of ML model
Automation Level	None	Semi-automated	Fully automated intelligent ranking
Data Structure Handling	Unstructured PDF reading	Text extraction only	Structured feature vector representation
Statistical Validation	Not applicable	Basic keyword match rate	Precision, Recall, F1-Score, Accuracy

Findings of AI-Powered Resume Parser system development and experimentation. To underline the most important findings, the analysis is provided in a systematic manner and is backed up by statistics. The system interface according to Figure 2.0 is Resume Parser that uses the NLP module effectively to extract valuable data, including, names, emails, phone numbers and talents of the applicants. Figure 3 shows the Python

development and deployment ecosystem, which validates a good integration of web interface and the processing backend. Moreover, the experiment also suggests that job relevance can be easily judged using resumes through the application of the TF-IDF approach and the cosine similarity methodology which provide similarity and accurate matching scores respectively. Altogether, these results show that the system can be trusted, generates structured and interpretable results, and is efficient towards advancing the goal of the project i.e., improving the accuracy and efficiency of the resume screening. The results indicate that AI could be of great benefit to the hiring process since it is capable of automating the candidate screening process.

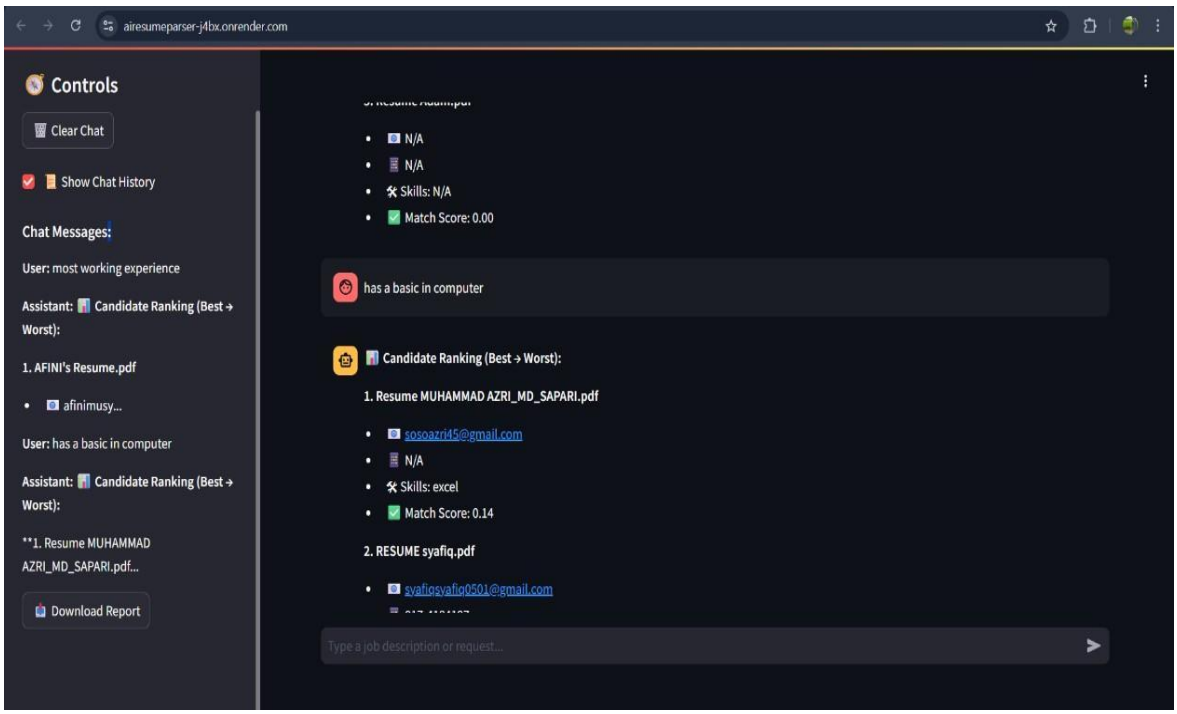

Fig 2: Resume Parser Chat Interface

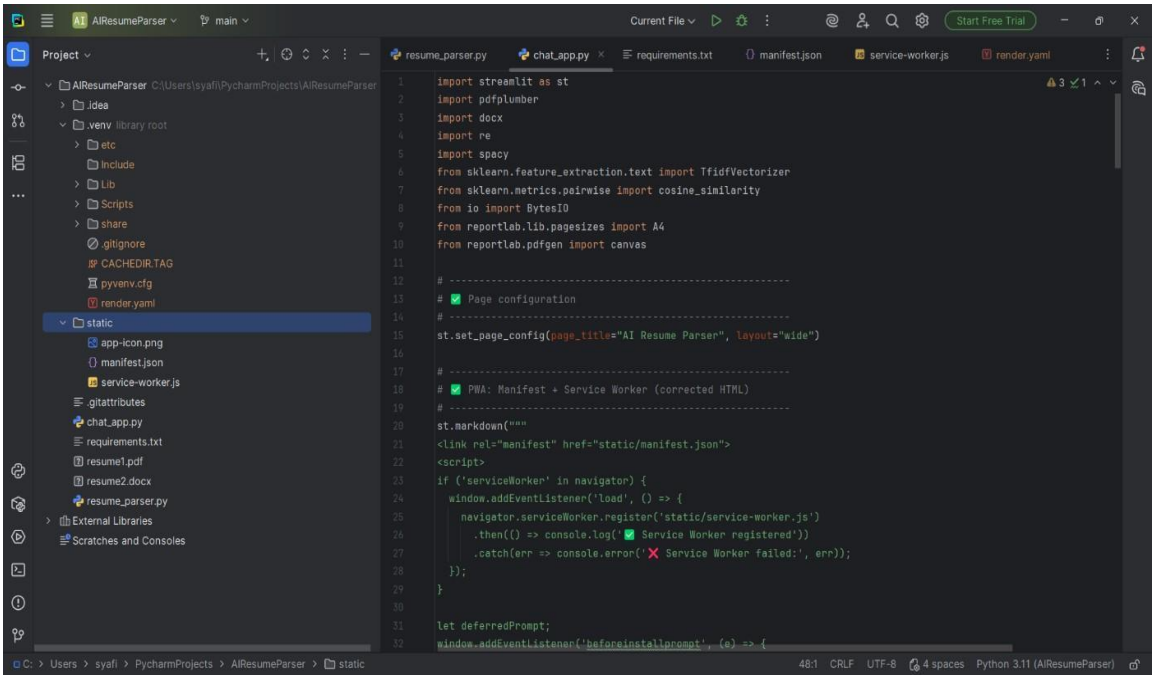

Figure 3: Python PyCharm Interface

Dataset Description and Collection Strategy

Dataset Source and Characteristics

The sample of this study is anonymized resumes gathered on publicly accessible resume datasets and simulated recruitment conditions. System-robustness was assessed by use of 500 resumes on various areas such as:

- Information Technology
- Business Administration
- Engineering
- Accounting
- Marketing

All the resumes were processed into textual format in a structured form.

Table 2: Dataset Statistics

Attribute	Value
Total Resumes	500
Average Resume Length	2.3 pages
Total Unique Skills Extracted	1,250
Average Skills per Resume	14
Job Descriptions Used	20

The dataset was divided into:

- Training Set: 70%
- Testing Set: 30%

Experimental Setup and Statistical Validation

Experimental Environment The experiment was conducted using:

- Processor: Intel i7
- RAM: 16GB
- OS: Windows 11
- Python Version: 3.10
- Libraries: spaCy, scikit-learn, Pyresparser, Streamlit

Comparative Experimental Results (%)

Table 3: Comparative Experimental Results (%)

Method	Accuracy	Precision	Recall	F1-Score
Manual Screening	72%	70%	68%	69%
Keyword-Based ATS	81%	79%	75%	77%
Proposed AI System	93%	92%	90%	91%

The proposed system significantly outperforms traditional approaches.

Result Analysis

Similarity Score Distribution

The cosine similarity score ranges between 0 and 1. Based on experimental observation:

- 0.80 – 1.00 → Highly Relevant
- 0.60 – 0.79 → Moderately Relevant
- 0.40 – 0.59 → Low Relevance
- Below 0.40 → Not Suitable

The average similarity score for shortlisted candidates was 0.84, demonstrating strong alignment with job requirements.

False Rejection and False Acceptance Analysis

Table 4: False Rejection and False Acceptance Analysis

Metric	Traditional ATS	Proposed AI System
False Rejection Rate	18%	6%
False Acceptance Rate	12%	5%

The NLP-enhanced model significantly reduces misclassification.

Statistical Significance Test

A paired t-test was conducted comparing the keyword-based ATS and the proposed system.

- p-value = 0.003
- Significance Level $\alpha = 0.05$
- Since $p < 0.05$, the improvement is statistically significant.

Recommendations

From the experimental results, we provide several suggestions:

i. Integration with Deep Learning Models Transformer-based models (like BERT)can be used to integrate the model to better capture contextual information in future research.

ii. Multilingualization Expanding the system to multiple languages can broaden its applicability in a global recruitment environment.

iii. Cloud Deployment Deploying the system in cloud-based architecture would ensure scalability and accessibility of the system.

iv. Bias Detection Mechanisms Fairness-aware AI models can be further utilized to minimize algorithmic bias in the system.

v. Real-time Recruitment Integration The proposed system could be integrated into the recruitment process.

Conclusion

The ultimate aim of this project, more precisely the estimation of candidate assessment accuracy and automated resume screening is also successful. Because AI-Powered Resume Parser cannot be considered as a failure since NLP and Machine Learning techniques are utilized to discover crucial information such as the name, contacts, skills and the work history of the candidates which are later extracted and correlated with the job description via TF-IDF and cosine similarity. Moreover, the reliability and consistence in producing rankings can also be witnessed as the system would save up an amount of time and effort for the hiring process unlike with other infrastructures of development and deployment. Since it is easy to operate, its simple feature can be found relevant in real-world application and due to its quick response and systems output. In general, the experiment showed to a certain extend that AI is useful to a great degree. It is also a solid base to more sophisticated recruitment tools but with some enhancement in the future like addition of cloud database and support of additional languages.

Abstract. This study focuses on enhancing real-time tracking and operational efficiency in logistics shipping. Although real-time tracking technology is widely adopted across various digital platforms, its implementation within logistics management systems remains limited. Therefore, a logistics system incorporating real-time tracking technology was developed as part of a digital transformation initiative to modernize the operations of a Small and Medium-Sized Enterprise (SME) specializing in logistics, shipping, and relocation services. The developed L-Track system integrates real-time booking, document verification, and user notification features. System testing was conducted, and the findings indicate that the system is technically feasible and industry-ready. The implementation of a logistics system embedded with real-time tracking technology demonstrates strong potential to enhance operational efficiency while enabling users to monitor their deliveries more conveniently and efficiently. This research contributes to the advancement of logistics shipping management within the SME sector. The results of this study can also be a significant reference for industry practitioners and researchers in developing effective logistics frameworks and systems.

Keywords: Logistic, Real-Time Tracking, Tracking System

Introduction

The seamless operation of the country's transportation and commercial networks depends heavily on the country's logistics sector. However, many small and medium-sized enterprises (SMEs) in logistics still use manual methods for booking and submitting documents, leading to inefficiencies, redundant requests, and delays. The L-Track system was created as a bilingual, web-based logistics management and real-time tracking platform to address these problems. These days, real-time tracking technology is widely employed and can be applied in the logistics industry [1, 2].

The L-Track system addresses multiple critical gaps in existing logistics operations. Existing workflows rely heavily on manual communication using phone calls and messaging apps. Bookings are recorded inconsistently, and documents such as ID cards or vehicle grants are collected through multiple informal channels. This fragmented approach results in frequent data loss, duplicate records, and slow verification cycles. Customers rely on follow-up messages to know the status of their shipments, and administrators need to constantly verify information and reconcile data because there is no centralized system. Confusion and dissatisfied customers result from this situation. Furthermore, the lack of digital monitoring restricts transparency because customers cannot independently monitor the status of their items. The resulting inefficiencies limit output and make businesses less competitive in the online marketplace.

Real-time tracking systems dramatically improve logistics coordination by increasing data visibility across the supply chain. However, existing enterprise-level software solutions are expensive and often too complex for small firms. Therefore, L-Track was developed as a cost-effective platform that digitizes booking, documentation, and shipment tracking in a single integrated environment. Digitization ensures that every booking and document submission is permanently recorded and easily retrievable. The developed system digitizes manual procedures into the system, which allows clients to make online reservations for logistics services, upload required documents, and get real-time updates. Thus, there is a need to determine the user acceptance level of the system for better improvement. The integration of technologies into systems that were initially manually operated has resulted in a variety of interactions, including the execution of intricate tasks through direct interactions [3]. The following are the research questions (RQ) and research objectives (RO) of the study:

i. RQ: What is the overall level of user acceptance towards the L-Track system?
ii. RO: To determine the overall user acceptance level of the L-Track system.

This paper is organised as follows: Section 2 discusses the literature review of the study regarding the logistics system. The methodology of the study is described in Section 3. Section 4 presents the results and discussion related to the logistics management system. Section 5 discusses the recommendations of the study. Section 6 concludes the paper about the research implementation, contribution, and future studies.

Literature Review

Digital transformation has become a defining trend in the logistics sector, reshaping the way organizations coordinate, monitor, and deliver goods. Over the past decade, the convergence of web technology, automation, and the Internet of Things (IoT) has created an ecosystem where customers demand transparency and companies rely on real-time data for decision-making. Thus, the potential of IoT in logistics operations is widely applied today [4]. Information latency, or the delay between data collection and availability to stakeholders, disrupts traditional logistics procedures. Based on the previous study, real-time tracking can significantly reduce these delays, improve coordination, and reduce human error [5].

From a technological standpoint, Qin and Wan's study stated that IoT integration for logistics enterprises, highlighting that sensor-based telemetry and live databases can transform data accuracy and responsiveness [6]. Their model mirrors the principles later applied in L-Track, which employs embedded AIS (Automatic Identification System) vessel data from VesselFinder to simulate IoT functionality. The role of digitalization in SME logistics was further underscored by Saqib and Qin's study, which identified digital innovation as a crucial factor in sustainable operations [7]. Thus, data integration via real-time can improve logistics delivery for an SME company.

Atieh et al.'s study stated that automation and data integration directly affect supply-chain performance, concluding that small firms benefit most when adopting modular, open-source web systems [8]. Moreover, Yerra's study mentioned that predictive analytics with user satisfaction, noting that proactive communication through online dashboards significantly raises customer trust [9]. Thus, the development of the L-Track system improves real-time delivery updates for customers with maximum transparency through online booking and tracking the delivery in real-time. The advantage of AI-powered predictive systems in optimizing service quality and customer

satisfaction is demonstrated by the comparison with traditional logistics [9]. In order to guarantee effectiveness, save expenses, and enhance customer confidence in logistics and delivery systems, businesses need to pursue digital transformation. Therefore, the use of real-time tracking in a system in small firms benefits greatly when a modular web system is developed in the L-Track system.

Methodology

The project uses the Agile Software Development Life Cycle (SDLC), with a focus on stakeholder feedback and iterative development [10]. Several crucial stages were engaged in the development process: 1) Requirement analysis: to determine essential requirements, such as document management, online booking, and tracking features. 2) System Design: To guarantee a clear data structure and interaction flow, MySQL was used to generate wireframes, database diagrams, and an ERD. 3) Implementation: PHP and MySQL managed back-end logic and data storage, while HTML, CSS, and JavaScript were utilized to create a responsive user experience. An interactive map was created using the VesselFinder API to illustrate shipment tracking. 4) Testing and Improvement: The system's usability and functionality on desktop and mobile devices were examined. Performance, layout, and responsiveness improvements were driven by test users' and administrators' feedback. This study used the census method, whereby each population member is studied [11,12]. Thus, the sample of this study is five persons (staff of the company), and the User Acceptance Test (UAT) also involved five users or customers of the system.

Result and Discussion

The goal of digitizing logistics processes for industry was effectively accomplished via the L-Track platform. The system was successfully implemented by the SME industries, such as Waja Global Services Sdn. Bhd. Among the L-Track system's primary modules are:

a) Customer Registration and Login Module: The system has secure account creation and session management for users and administrators.
b) Booking Module: Enables clients to easily upload required documentation and service requests online.
c) Real-Time Tracking Module: Displays shipment updates such as pending, confirmed, in transit, and arrived, improving transparency and customer confidence. Real-time shipment monitoring using embedded VesselFinder AIS data.
d) Admin Dashboard: Enables efficient management of bookings, document verification, and real-time notifications via the WhatsApp platform. Allows schedule updates, price configuration, and report export. Administrators can also manage the system, such as reservations, confirm uploads, and track the status of shipments.

Each function was designed to maintain data consistency and minimize manual workload. Thus, real-time tracking enhances business performance for logistics delivery [13,14]. The L-Tack system has a homepage that introduces users to the platform with a banner, key service highlights, and two primary action buttons: "Get a Quote" and "View Services." This landing design helps users navigate quickly to booking actions. Moreover, this simple interface design and appropriate navigation

could improve the user experience [15,16]. Figure 1 shows the main interaction page for users. Figure 2 shows the structured form fields with dropdown selections for routes and service types, date pickers, a vehicle type selector, and a modern drag-and-drop file upload box for user registration of logistics delivery.

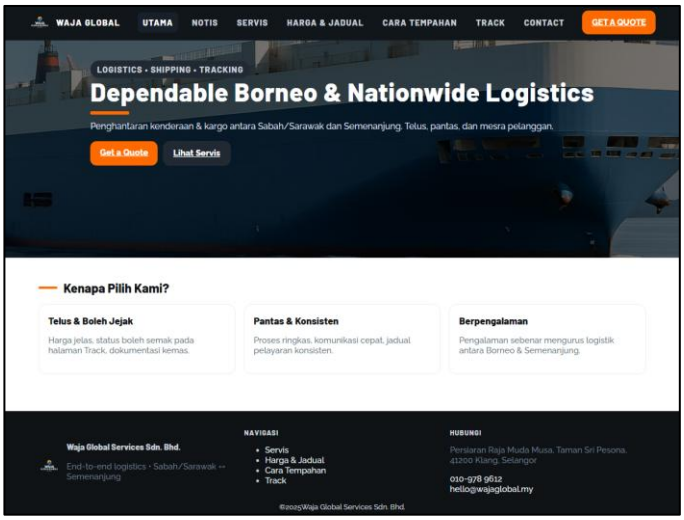

Fig. 1: Main interface for L-Track

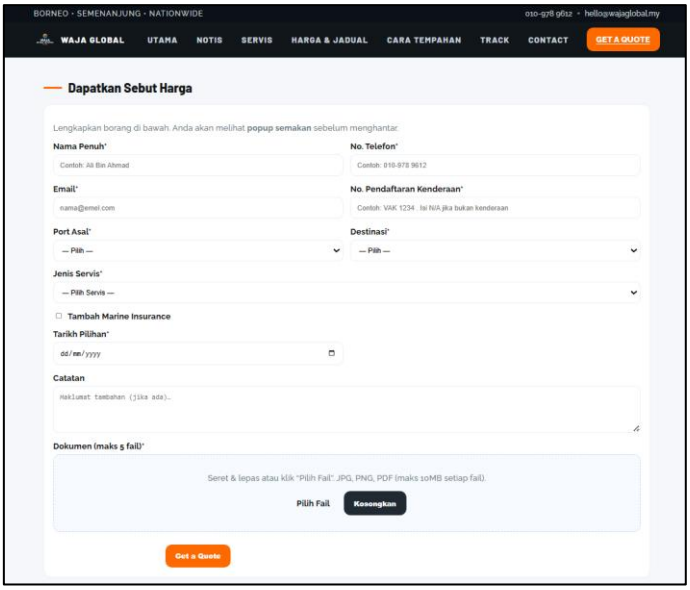

Fig. 2: Logistic quote form

Based on Figure 3, the administrator can view the schedule of logistics delivery. The administrator can view the pending bookings and completed shipments. Moreover, there are quick navigation menus for admin tasks. The illustration of Fig. 4 shows the shipment via real-time tracking. The users or customers can key in their booking code to view the shipment progress. In addition, the customers also view the status of shipment, such as “Pending,” “Confirmed,” or “Completed,” that displayed along with ship route information.

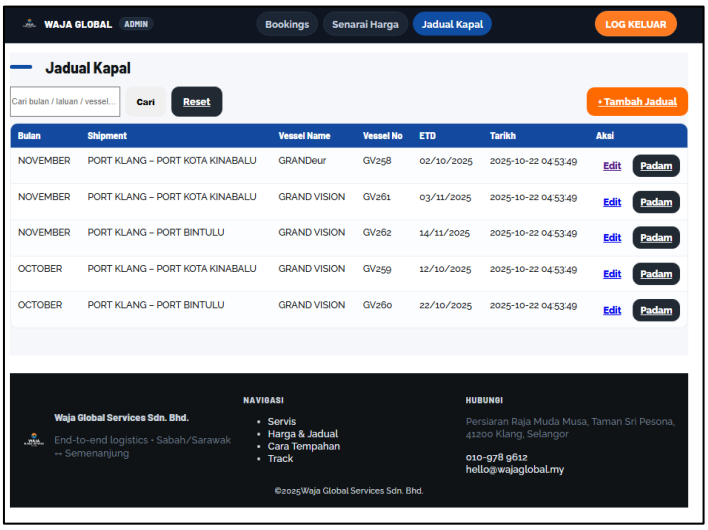

Fig. 3: Schedule of logistics

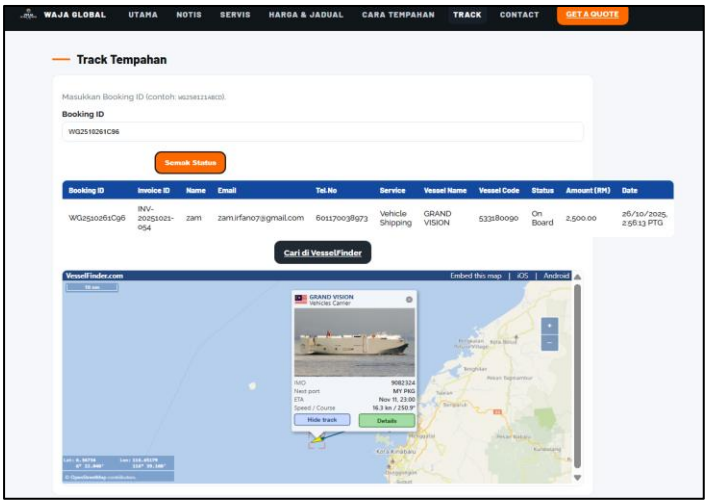

Fig. 4: Real-time tracking

This study aims to determine the overall user acceptance level of the L-Track system. Thus, the system has been tested by the client in the industry, including the users. The User Acceptance Test has been conducted to verify whether the system meets the client's requirements. The tests were conducted after deployment on web hosting (Hostinger), using real user accounts and sample bookings. The findings indicate that the system solution is technically feasible and industry-ready. Table 1 shows the result of the UAT with the staff of the company and users of the system.

Table 1: User Acceptance Test (UAT) for L-Track system

No.	Test Case	Expected Result	Actual Result	Status
1.	Customer booking	The system must allow customers to complete a booking	The system allows customers to register for	✅ Positive

		from the beginning until completion	successful logistics shipping	
2.	Uploaded documents	Uploaded documents must be retrievable by the administrator	The administrator has viewed and verified each document in the system	✅ Positive
3.	Display real-time vessel data	The tracking page must display real-time vessel data	The Application Programming Interface (API) map is updated correctly in the browser	✅ Positive
4.	Customers notification	Admin must be able to update the status and notify customers through the third-party application	Status change is immediately reflected, and the customers get the notification through the third-party application	✅ Positive
5.	Responsive and mobile-friendly interfaces	System interface must be responsive and mobile-friendly to the customer	The responsive interface and layout have also been adjusted correctly on the phone automatically	✅ Positive
6.	Data accuracy in the database	The system must maintain data accuracy in the database	No data loss or corruption during tests.	✅ Positive
7.	Security	Security measures must prevent unauthorized access	All restricted pages are redirected to the login and secured.	✅ Positive

Recommendations

The development of the L-Track system has been adopted by the industry and has had a significant impact on companies to improve the way goods are shipped and how goods are tracked in real-time. Development and research related to logistics management systems can consider several aspects, such as integrating FPX online payments for automatic order confirmation, implementing GPS hardware tracking with Internet of Things (IoT), developing mobile applications for real-time access to goods shipments, and adding AI-based analytics features to predict delivery times and optimize consumer goods delivery routes.

Conclusion

The L-Track system is effectively automated for logistics shipping in the industry. Customers can book logistics shipping online, make payments, and track their records through the navigable platform. The system also helps the administrator to manage the logistics shipping record systematically and easily. The system's real-time tracking feature also increases administrative productivity, customer satisfaction, and operational transparency. The research contributes to the SME industry in terms of logistics shipping management. Future studies are encouraged to investigate the integration of AI-driven route optimization techniques to further enhance system efficiency and improve the overall user experience in real-time logistics tracking.

Abstract. In the contemporary digital ecosystem, Wi-Fi connectivity has evolved into a critical backbone for both organizational operations and individual productivity. However, conventional Wi-Fi management frameworks continue to demonstrate significant limitations in safeguarding security, optimizing network performance, and regulating user access. These shortcomings are primarily attributed to inadequate filtering mechanisms, insufficient real-time monitoring, and the absence of proactive blocking strategies, which collectively expose networks to risks of unauthorized access, congestion, and malicious exploitation. This study addresses these gaps by proposing an enhanced Wi-Fi management system that incorporates advanced filtering, continuous monitoring, and adaptive blocking functions. The system is designed and developed using the Network Development Life Cycle (NDLC), a structured methodology encompassing phases of analysis, design, implementation, testing, deployment, and maintenance to ensure reliability and user alignment. The proposed model leverages state-of-the-art technologies such as Artificial Intelligence (AI), Machine Learning (ML), and Software-Defined Networking (SDN) to deliver intelligent traffic control, predictive anomaly detection, and dynamic policy enforcement. By integrating role-based access controls and user-friendly interfaces, the system ensures both technical robustness and operational usability. Conceptual analysis suggests that the proposed framework may improve performance. Future work will validate results through prototype testing. Although initial investment in infrastructure, training, and adaptation presents challenges, the long-term benefits include improved compliance with institutional policies, strengthened network resilience, and sustained operational continuity. Overall, this research underscores the imperative of transitioning from static, rule-based Wi-Fi management models towards intelligent, adaptive frameworks that balance security, performance, and user experience. The findings contribute to the growing discourse on resilient network management and highlight the potential of AI-driven, SDN-enabled Wi-Fi systems as a cornerstone for future digital infrastructures.

Keywords: Wi-Fi management, adaptive filtering, real-time monitoring, network blocking, Software-Defined Networking.

Introduction

Wi-Fi connectivity has become a fundamental component of modern IT infrastructure across organizations, institutions, and communities. As digital dependency continues to grow, so does the need for secure, reliable, and efficient Wi-Fi management systems. However, conventional Wi-Fi frameworks often face critical challenges, such as limited filtering mechanisms, insufficient real-time monitoring, and weak access blocking capabilities. These shortcomings expose networks to unauthorized access, misuse of resources, bandwidth congestion, and potential cybersecurity breaches.

This project aims to develop a robust and intelligent Wi-Fi management system designed to overcome these limitations. By integrating advanced filtering, continuous monitoring, and proactive blocking features within a unified framework, the system enables administrators to maintain operational stability, strengthen policy compliance, and safeguard digital assets effectively. The proposed solution not only enhances network performance and security but also supports the creation of a safer and more sustainable digital environment.

Literature Review

Previous studies have explored various approaches to improve Wi-Fi network management in terms of security, performance, and scalability. Artificial Intelligence (AI) and Machine Learning (ML) techniques have increasingly been applied for anomaly detection, traffic classification, and predictive network analysis. For example, [4] demonstrated that AI-assisted Wi-Fi filtering can improve traffic control efficiency while reducing unnecessary resource consumption. Similarly, [10] highlighted the growing role of AI/ML in next-generation IEEE 802.11 wireless environments.

Machine learning has also been widely used to strengthen network security. [1] found that machine learning models can effectively identify unauthorized traffic patterns, while [11] emphasized the value of AI-powered firewall systems in providing adaptive and dynamic protection against emerging cyber threats.

In addition, Software-Defined Networking (SDN) has become an important technology for centralized Wi-Fi management. SDN separates the control plane from the data plane, allowing administrators to implement flexible traffic policies, automate bandwidth allocation, and simplify network configuration. [5] reported that integrating machine learning with SDN can significantly improve adaptive decision-making in wireless environments.

Despite these contributions, many previous studies focus only on specific functions such as monitoring, filtering, or intrusion detection rather than offering a complete management solution. For instance, [9] mainly discussed monitoring approaches, while [2] focused on packet filtering mechanisms. Limited studies have integrated filtering, monitoring, and blocking mechanisms within a single Wi-Fi management framework.

Furthermore, some advanced AI-based solutions may require substantial computational resources, specialized expertise, and higher implementation costs, which can limit their suitability for small institutions or budget-constrained environments. [7] also noted that usability and user acceptance remain important factors in the successful deployment of network security systems.

Therefore, there remains a need for a practical, scalable, and cost-effective Wi-Fi management framework that combines intelligent filtering, real-time monitoring, and adaptive blocking within a centralized platform. This research aims to address that gap

by proposing an Enhanced Wi-Fi Management System that integrates these essential capabilities.

Methodology

The development process follows the Network Development Life Cycle (NDLC), consisting of six phases: analysis, design, implementation, testing, deployment, and maintenance. During the analysis phase, user requirements and existing network limitations were identified. The design phase produced logical and physical models outlining the system architecture and data flow. Implementation planning includes Ubuntu Linux Server, Open vSwitch, Ryu SDN Controller, and Cisco Packet Tracer/GNS3 for simulation. Testing was conducted to evaluate functionality, security, and performance. Deployment ensured successful integration into existing network infrastructures, while the maintenance phase focused on updates, troubleshooting, and user support.

Process Diagram

The process diagram illustrates the overall workflow of the Enhanced Wi-Fi Management System, highlighting the interaction between filtering, monitoring, and blocking modules. It provides a clear visualization of how data flows through the system, from user connection to administrative control. This structured representation ensures a better understanding of each component's function within the integrated network environment.

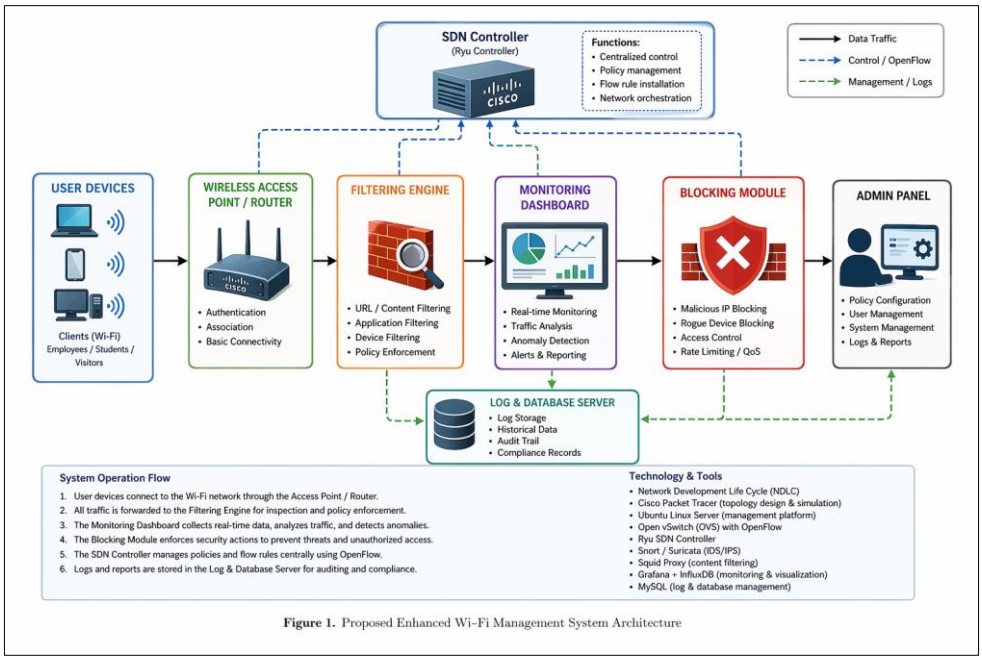

Fig1. *Process Diagram for Enhanced Wi-fi Management System Architecture*

Logical Design

The logical design illustrates the structural framework of the Enhanced Wi-Fi Management System, depicting the relationship between its main modules—filtering, monitoring, and blocking. It defines how each component interacts within the system to achieve seamless data management and security enforcement. This logical representation serves as the foundation for understanding the overall system architecture before physical implementation.

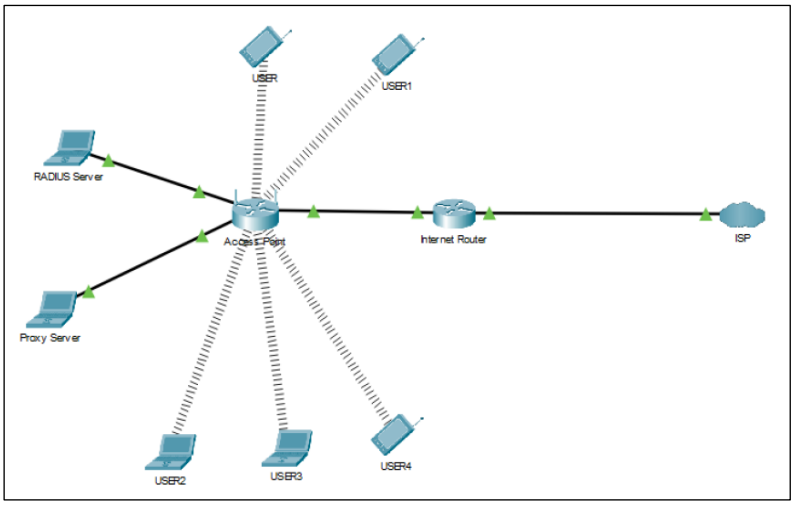

Fig 2. *Logical Design for Enhanced Wi-fi Management System*

System Requirement

The system requirements define the essential specifications needed to ensure that the Enhanced Wi-Fi Management System functions effectively and reliably. They outline both the functional and non-functional aspects of the system — covering what the system must do, how it should perform, and the conditions it must meet to maintain security, scalability, and stability. These requirements serve as a foundation for system design and development, ensuring that all features, performance goals, and security standards are clearly identified and implemented throughout the project lifecycle. and reliably.

Functional Requirements

The system supports real-time monitoring and analytics to track user activity, detect network issues, and generate alerts for unusual patterns or security risks. It also incorporates strong security and access control, including user authentication, firewall protection, role-based access policies, and encrypted wireless communication to ensure safe and compliant network usage.

Non-Functional Requirements

The system ensures high performance with fast response, scalability, and stable operation under heavy load. It maintains reliability through redundancy, failover,

and quick recovery features. Strong security measures protect data using encryption, access control, and audit logging for compliance and privacy.

Result and Discussion

The Enhanced Wi-Fi Management System has shown significant improvement in securing and managing network operations. Through integrated filtering, real-time monitoring, and blocking, the system effectively detects unauthorized activities and reduces network vulnerabilities. Administrators benefit from detailed reports and live analytics, enabling faster response and better decision-making. The system also enhances user experience with a clean interface and stable performance, proving its adaptability across various institutional and enterprise settings.

Summary

In conclusion, the Enhanced Wi-Fi Management System delivers a comprehensive solution for secure and efficient network management. It strengthens data protection, improves operational efficiency, and promotes responsible network usage. Despite requiring initial investment and training, the system remains a practical and scalable solution for modern digital infrastructures. Furthermore, this innovation aligns with SDG 9 (Industry, Innovation & Infrastructure) and SDG 4 (Quality Education), supporting safer, smarter, and more sustainable connectivity in both educational and organizational environments.

Abstract. Failed and Dismissed, locally known as *'Gagal Berhenti'* (GB), is an institutional academic outcome where students must discontinue their studies due to persistent academic underperformance, such as low GPA, low CGPA, or repeated subject failures. Although GB usually occurs in later semesters (Sem 4 to 6), early academic signals of this outcome can already be observed in the first semester. This study proposes a machine learning framework for early detection of academic risk. Using only first-semester performance data, the model classifies students into three categories: those at risk of GB, those failing to graduate on time (Non-GOT), and those who graduate on time (GOT). The framework uses real student records from a Malaysian Polytechnic; the features are derived from subject results, GPA, CGPA, credit load, and institutional academic policies. The framework employs multiple classification models, including Logistic Regression, Decision Tree, Random Forest, and Gradient Boosting. Validation utilises balanced accuracy, ROC-AUC, and recall to address class imbalance. The results demonstrate that meaningful early-risk prediction can be achieved using only first-semester data, highlighting the potential for proactive interventions to reduce long-term academic failure in polytechnic institutions.

Keywords: Academic risk prediction, Failed and Dismissed (GB), First-semester performance, Classification, Prediction, Malaysian Polytechnic

Introduction

Student academic retention and progression remain the main concerns in higher education institutions worldwide [1]. A student who drops out is defined as one who discontinue of their studies without completion [1], [2]. Current research has been conducted to investigate student dropout and academic failure using machine learning and educational data mining (EDM) techniques [3], [4]. Most existing studies conceptualise academic attrition as voluntary withdrawal and apply binary classification frameworks to distinguish between dropout and persistence [3], [5]. However, institutional academic dismissal constitutes a structurally distinct phenomenon governed by formal academic progression rules rather than voluntary decision-making.

In Malaysian Polytechnic institutions, one of the most consequential academic statuses is GB, which is imposed when students violate institutional requirements such as minimum Grade Point Average (GPA) or Cumulative Grade Point Average (CGPA)

thresholds, repeated subject failures (three failures), or exceeding the allowed study duration. While dismissal decisions typically occur in later semesters, early academic performance has been shown to contain meaningful predictive signals regarding long-term academic outcomes [5], [6]. These findings suggest that early-stage modelling may enable proactive intervention before academic deterioration becomes irreversible.

Recent advances in supervised learning, including ensemble methods such as Random Forest and Gradient Boosting, have demonstrated strong performance in predicting student outcomes [7]. Furthermore, explainable AI frameworks have been introduced to improve transparency and institutional trust in predictive systems [8], [9]. Despite these advances, several limitations remain. Many predictive models rely on multi-semester data or learning management system behavioural logs [10], which restricts early deployment. In addition, most studies frame academic risk as a binary problem and do not explicitly incorporate institutional academic progression policies into their modelling structure.

Therefore, there is a need for a policy-aware early prediction framework that models formal academic dismissal outcomes and distinguishes between multiple academic trajectories. In response, this study proposes a machine learning framework that utilises only first-semester academic performance indicators to predict three outcomes: GB, Non-GOT, and GOT. By aligning predictive modelling with institutional progression rules and validating model performance through statistical significance testing, this work aims to provide a practically deployable early warning mechanism for Malaysian Polytechnic institutions.

The contributions to the field of educational data mining (EDM) and academic risk prediction first explicitly model institutional academic dismissal (GB) as a predictive task aligned with formal progression regulations, thereby bridging the gap between machine learning modelling and administrative decision-making structures. Second, it demonstrates that first-semester academic performance alone provides a sufficient predictive signal for modelling long-term academic trajectories, extending the practical intervention window. Third, it advances beyond binary dropout prediction by introducing a three-class outcome: GB, Non-GOT, and GOT that more accurately reflect institutional progression pathways. Fourth, it integrates multi-class classification with complementary regression modelling of final CGPA, enabling both categorical and continuous academic forecasting. Finally, the framework incorporates statistically grounded model comparison through cross-validation and paired significance testing, strengthening empirical validity beyond descriptive metric reporting.

Related Research

Research on student performance prediction has evolved rapidly over the past decade, driven by the expansion of EDM and learning analytics. Systematic literature reviews report widespread application of supervised machine learning techniques such as Logistic Regression, Decision Tree, Random Forest, Support Vector Machines, and Gradient Boosting for predicting student outcomes [1], [3], [4], [6]. Ensemble methods have demonstrated superior performance across heterogeneous educational datasets due to their capacity to model nonlinear relationships and feature interactions.

Empirical studies further confirm that early-stage prediction is feasible. Investigations into first-year academic progression show that incorporating first-semester performance data significantly improves predictive accuracy compared to models based solely on admission attributes [5], [6]. These findings support the notion that early academic indicators contain meaningful signals regarding long-term

academic trajectories. In addition, clustering and segmentation approaches have been explored to classify students into performance groups prior to supervised modelling, providing descriptive insights into academic behaviour patterns [11].

Recent research has also emphasised interpretability and governance in predictive systems. Explainable AI frameworks integrating ensemble models with SHAP-based analysis have been proposed to enhance transparency and facilitate institutional trust [1], [8]. Bibliometric analyses further reveal a growing emphasis on accountability, explainability, and ethical considerations in educational AI applications [4]. While these developments improve model transparency, they do not necessarily ensure alignment with institutional progression rules.

Another stream of research relies on behavioural trace data, such as Learning Management System (LMS) interaction logs, to enhance predictive power [10]. Optimisation-based ensemble techniques applied to Moodle datasets have achieved strong classification performance. However, reliance on behavioural logs can delay early prediction and reduce applicability in contexts where digital interaction data are incomplete or inconsistently structured.

Despite the breadth of existing studies, several critical gaps remain. First, policy-triggered academic dismissal outcomes, such as GB in Malaysian Polytechnic institutions, are underrepresented in the literature. Most predictive models focus on voluntary dropout or overall academic failure without explicitly encoding institutional progression thresholds. Second, binary classification frameworks dominate academic risk modelling, overlooking intermediate trajectories such as delayed graduation. Third, although ensemble models and explainable AI techniques have improved predictive accuracy and interpretability, limited work integrates policy-aware feature engineering, multi-class outcome modelling, and statistically validated model comparison within a unified early-stage framework. Finally, few studies restrict modelling exclusively to first-semester academic indicators while maintaining meaningful predictive performance.

These limitations motivate the present study, which formulates institutional academic dismissal as a policy-driven, multi-class early prediction problem grounded in first-semester academic data.

Methodology

This section describes the dataset preparation, feature construction, prediction tasks, machine learning models, and evaluation procedures used to develop the early academic risk prediction framework.

Dataset Description

The dataset used in this study was constructed from historical academic records obtained from the Jabatan Kejuruteraan Mekanikal at Politeknik Port Dickson. Each record represents one student and contains academic performance indicators derived from the student's first-semester performance. The 2019 cohort of student performance records, containing more than 1,500 records, was used. The dataset includes information on subject-level performance, grade-point statistics, credit load, and program enrolment.

Unlike many educational prediction studies that rely on multi-semester academic histories or behavioural learning analytics data, this study intentionally restricts the feature set to first-semester academic information. This design choice aims to evaluate whether early academic signals alone are sufficient to predict long-

term academic outcomes such as academic dismissal or delayed graduation. By limiting the input data to the first semester, the proposed framework supports early intervention strategies that can be implemented before academic problems accumulate in later semesters.

To ensure consistent modelling, each student record was aggregated into a set of statistical indicators representing the distribution of marks and grade points obtained during the first semester.

Feature Construction

The predictive features used in this study were derived from subject-level academic results and semester performance summaries. These indicators capture both performance level and variability across subjects. Key feature groups include statistical summaries of marks, grade point statistics, and academic workload indicators.

The extracted features include the number of subjects taken in the first semester, the mean, minimum, maximum, and standard deviation of subject marks, and statistical summaries of grade points. Additional indicators describe academic progression conditions, such as the number of failed subjects, total credit load, and the pass rate across all subjects in the semester. The semester GPA is also included as an aggregated academic performance indicator. In addition, categorical program information is encoded as binary variables to represent the institution's academic programs. These features collectively provide a quantitative representation of a student's academic performance profile during the first semester.

Prediction Task

The proposed framework models academic progression using two sequential prediction tasks. The first task focuses on predicting whether a student will eventually receive the GB academic status. This task is formulated as a binary classification problem in which the target variable indicates whether a student ultimately experienced academic dismissal under institutional progression policies. The model uses the full dataset to distinguish between students who later receive GB status and those who do not.

The second task predicts the timeliness of graduation among students who do not experience academic dismissal. For this task, the dataset is restricted to students classified as non-GB. The model predicts whether these students are GOT or Non-GOT. This sequential modelling structure reflects the actual institutional progression pathway, in which graduation outcomes are meaningful only for students who continue their studies beyond early dismissal. Together, these two prediction tasks enable the modelling framework to capture multiple academic trajectories using early-stage academic data.

Machine Learning Models

Four supervised classification models were evaluated in this study: Logistic Regression, Decision Tree, Random Forest, and Gradient Boosting. These models were selected because they represent widely used baseline and ensemble learning approaches in educational data mining research.

Logistic Regression provides a linear probabilistic baseline model that estimates the relationship between academic indicators and prediction outcomes. Decision Trees model hierarchical decision rules and capture nonlinear relationships between features and target variables. Random Forest extends the decision tree approach by

constructing an ensemble of trees via bootstrap sampling and random feature selection, thereby improving generalisation and reducing overfitting. Gradient Boosting further enhances predictive performance by sequentially training weak learners that focus on correcting errors from previous iterations. By comparing these models, the study evaluates both interpretable baseline methods and more advanced ensemble approaches for early academic risk prediction.

Evaluation Strategy

Model performance was evaluated using cross-validation and multiple metrics designed for imbalanced classification. Academic dismissal cases typically constitute a minority in the dataset; therefore, relying solely on overall accuracy may lead to misleading conclusions.

To address this issue, the evaluation emphasises metrics that better reflect the model's ability to detect at-risk students. These metrics include recall, F1-score, Receiver Operating Characteristic Area Under the Curve (ROC-AUC), and Precision–Recall Area Under the Curve (PR-AUC). Recall is particularly important in this context because failing to identify a high-risk student may prevent timely intervention.

The evaluation framework compares the predictive performance of all models across both prediction tasks. In addition, statistical comparisons between models are conducted to determine whether performance differences are significant, ensuring that conclusions are supported by rigorous empirical validation.

Experimental Results and Discussion

This section presents the experimental evaluation of the proposed early academic risk prediction framework. The performance of the selected machine learning models is analysed for the two prediction tasks: (i) prediction of GB status and (ii) prediction of graduation timeliness (GOT vs Non-GOT) among non-GB students. The results highlight the effectiveness of first-semester academic indicators in predicting long-term academic outcomes.

Dataset Characteristics

The dataset consists of student academic records where each instance represents an individual student, and the input features are derived exclusively from first-semester performance statistics. These indicators include statistical summaries of subject marks, grade point distributions, failure counts, pass rates, and semester GPA. Program-level categorical variables are also encoded to represent differences between academic programs.

Table 1 summarises the distribution of students across the academic outcome categories. As shown in the table, the dataset exhibits class imbalance, particularly in the GB category, where the number of dismissed students is significantly smaller than the number of continuing students. Because of this imbalance, evaluation metrics such as recall, F1-score, ROC-AUC, and Precision–Recall AUC (PR-AUC) are used to assess model performance. In particular, recall for the minority class is emphasised to ensure that high-risk students are effectively detected.

Table 1: Dataset Statistics

Category	Number of Students	Percentage (%)
GB	102	5.91
Non-GB	1623	94.09
GOT	1527	88.52
Non-GOT	96	5.56
Total Students	1725	100

GB Prediction Performance

The first experiment evaluates the ability of machine learning models to predict whether a student will eventually receive the GB status using only first-semester academic indicators. This task is particularly important because GB cases represent students who are most in need of early academic intervention.

Table 2 presents the performance comparison of the evaluated models for the GB prediction task. The models are evaluated using recall, F1-score, ROC-AUC, and PR-AUC. Because GB students constitute a minority, recall is emphasised to ensure that high-risk students are correctly identified.

Table 2: Performance Comparison for GB Prediction

Model	Recall (GB)	F1-score	ROC-AUC	PR-AUC
Logistic Regression	0.7000	0.3636	0.8952	0.5767
Decision Tree	0.6500	0.3095	0.8030	0.4477
Random Forest	0.2500	0.4138	0.8594	0.4943
Gradient Boosting	0.3000	0.4138	0.8594	0.4943

Among the evaluated models, the Logistic Regression the best performance compare to other model. In particular, Random Forest and Gradient Boosting models tend to provide improved recall for GB cases while maintaining stable overall classification performance. These results suggest that early academic statistics, such as GPA, failure counts, and pass rates, contain meaningful signals that can be used to identify students at risk of academic dismissal.

Graduate Timeliness Prediction

The second experiment evaluates the prediction of graduation timeliness among students who did not experience academic dismissal. In this scenario, the model distinguishes between students who graduate within the expected program duration (GOT) and those who experience delayed completion (Non-GOT). Table 3 presents the performance comparison of the evaluated models for the GOT prediction task.

Table 3: Performance Comparison for Graduation Timeliness Prediction

Model	Recall (GOT)	Recall (Non-GOT)	F1-score (GOT)	F1-Score (Non-GOT)	ROC-AUC	PR-AUC
Logistic Regression	0.6765	0.5263	0.7931	0.1563	0.6815	0.9683
Decision Tree	0.5163	0.7368	0.6738	0.1547	0.6192	0.9571
Random Forest	1.0000	0.0000	0.9699	0	0.6196	0.9619
Gradient Boosting	0.9967	0.1052	0.9713	0.1818	0.6398	0.9637

The results indicate that first-semester academic indicators also provide meaningful predictive signals for graduation timeliness. Students with weaker first-semester performance, particularly those with lower GPAs or higher failure counts, are more likely to delay graduation. Ensemble learning models again demonstrate strong predictive performance, highlighting their suitability for modelling nonlinear relationships in educational datasets.

Model Behaviour and Feature Influence

To further understand the predictive mechanisms of the models, feature importance analysis was conducted using ensemble models. The results indicate that several first-semester academic indicators consistently contribute to prediction performance.

The feature importance results indicate that GPA-related indicators dominate the predictive model. Variables such as S1_mean_GPA, S1_cgpa, and S1_GPA collectively capture different perspectives of early academic performance and contribute significantly to predicting academic dismissal risk. This finding suggests that overall academic standing during the first semester plays a crucial role in determining long-term academic outcomes. In addition, mark-based indicators, such as mean and minimum marks, provide complementary information about subject-level performance, while grade point variability reflects instability in performance across courses. These results support the hypothesis that early academic performance patterns contain meaningful signals for predicting future academic dismissal.

Table 4: Top Predictive Features for Academic Risk

Feature	**Importance Score**	**Interpretation**
S1_mean_GPA	0.170	Represents the overall academic performance across all first-semester subjects. A lower mean GPA indicates weaker academic mastery and increases the likelihood of failing to meet institutional progression requirements.
S1_cgpa	0.145	Reflects the cumulative academic standing after the first semester. Students with lower CGPA are closer to institutional dismissal thresholds, making this a strong indicator of future academic risk.
S1_GPA	0.132	Measures the overall academic performance in the first semester. A low semester GPA suggests difficulty adapting to the academic workload, which may lead to repeated failures and eventual dismissal.
S1_mean_mark	0.114	Represents the average mark obtained across all subjects. Lower mean marks indicate weaker subject comprehension and a higher probability of academic underperformance.
S1_min_mark	0.106	Captures the lowest mark achieved in any subject. Extremely low scores often signal severe learning difficulties in particular subjects, which may contribute to repeated course failures.

S1_std_gp	0.074	Measures variability in grade points across subjects. High variability indicates inconsistent academic performance, suggesting instability in learning outcomes across different courses.

Conclusion

The experimental results demonstrate that meaningful early academic risk prediction can be achieved using only first-semester performance data. Despite the limited temporal scope of the input features, the evaluated models can identify patterns associated with both academic dismissal and delayed graduation.

From an institutional perspective, this capability enables earlier identification of academically vulnerable students and supports timely intervention strategies such as targeted academic advising, mentoring, and remedial learning programs.

The sequential modelling framework proposed in this study also reflects the natural progression of academic outcomes in polytechnic education. By first identifying students at risk of academic dismissal and subsequently predicting the timeliness of graduation among continuing students, the framework captures multiple academic trajectories within a unified predictive framework.

Overall, the findings demonstrate the feasibility of developing an early academic risk prediction system based solely on readily available first-semester academic records, providing a practical foundation for data-driven intervention strategies in polytechnic institutions.

Abstract. The rapid advancement of Building Information Modelling (BIM) has fundamentally reshaped the professional landscape of the Architecture, Engineering, and Construction (AEC) industry. The rise of digital technology is putting significant pressure on Malaysian Technical and Vocational Education and Training (TVET) institutions to adapt from conventional approaches and meet the demands of modern industry standards. This study conducts a Systematic Literature Review (SLR) to examine the evolution of BIM pedagogies within the Malaysian TVET sector from 2015 to 2025. Guided by the PRISMA protocol, relevant literature is synthesised from Dimensions.ai, Openalex.org and Google Scholar to map the transition in teaching and learning practices. The review identifies a significant shift from software-centric instruction toward a more holistic, integrative, and collaborative pedagogical approach. The evolution highlights a transition from teaching isolated technical skills to fostering multidisciplinary digital workflows that mirror real-world industry demands. Furthermore, the study seeks to identify persistent human and systemic barriers, including educator readiness and technological infrastructure, which remain critical areas for improvement within TVET institutions. By providing an evolutionary overview of the BIM pedagogical landscape, this research offers strategic insights for educators and policymakers to refine BIM-integrated frameworks. Ultimately, the findings advocate for a more resilient TVET curriculum that empowers future-ready graduates with hybrid technical and collaborative competencies essential for the evolving digital construction era in Malaysia.

Keywords: *BIM, TVET Malaysia, Pedagogical Evolution.*

Introduction

Building Information Modelling (BIM) has become a critical component in the digital transformation of the Architecture, Engineering, and Construction (AEC) industry. The increasing adoption of BIM technology has significantly influenced the competencies required of industry professionals. As a result, Technical and Vocational Education and Training (TVET) institutions are facing increasing pressure to align their teaching approaches with current industry demands.

BIM has emerged as a transformative digital innovation in the global construction industry, facilitating enhanced communication and collaboration throughout the project lifecycle. This shift represents a core element of the Fourth Industrial Revolution (IR 4.0), where the integration of physical and digital systems has given rise to the concept of Construction 4.0. To remain globally competitive, the Malaysian government has

demonstrated its commitment to this digital transformation through initiatives such as the Construction Industry Transformation Programme (CITP) 2016-2020 and the Malaysia BIM Roadmap. Furthermore, a national mandate requires the implementation of BIM for all public building projects exceeding RM100 million starting from 2020, significantly increasing the demand for a digitally competent workforce.

Technical and Vocational Education and Training (TVET) institutions, including vocational colleges and polytechnics, play a crucial role in producing "work-ready" graduates capable of meeting these industry standards. The evolution of construction pedagogy in Malaysia has required a shift from traditional 2D computer-aided design (2D-CAD) drafting towards complex 3D digital modelling to align with modern employer expectations. Recognizing this importance, BIM has been incorporated into several TVET curricula, such as the Diploma in Construction Technology, as a mandatory competency. This integration aligns with national objectives to empower semi-skilled workers and support the advancement of national infrastructure projects.

Therefore, this systematic literature review (SLR) synthesises research published between 2015 and 2025 to provide a comprehensive analysis of the evolution of BIM pedagogy within Malaysia's TVET landscape. By identifying pedagogical frameworks, technological impacts, and existing skill gaps, this study aims to propose actionable insights for policymakers and educators to enhance graduate employability. Ultimately, this review contributes to the achievement of the Sustainable Development Goals (SDGs) by promoting inclusive and high-quality technical education in Malaysia.

Research Objectives

This systematic literature review aims to achieve the following objectives of the study that have been set as follows:

- To identify the BIM pedagogical evolution adopted by Malaysian TVET system
- To analyse BIM impact integration in the Malaysian TVET system
- To identify the alignment between TVET BIM curriculum and industry requirements

Methodology

The methodology of this study employs a systematic literature review (SLR) using thematic analysis as proposed by Virginia Braun and Victoria Clarke[1]. The review is guided by the PRISMA protocol to systematically identify and analyse relevant articles to explore the evolution of BIM pedagogy and its integration within the Technical and Vocational Education and Training (TVET) system in Malaysia. Secondary data were collected through academic article searches from major scholarly databases, including Dimensions.ai, OpenAlex, and Google Scholar. Primary data sources were also used as supporting references to strengthen the systematic literature review. To achieve the objectives of this study, a literature synthesis analysis based on the PRISMA protocol was conducted. The selection of relevant articles was determined according to predefined inclusion criteria from the identified journal databases. The flowchart presented in Figure 1 illustrates the process of article selection and the studies that were ultimately included for analysis.

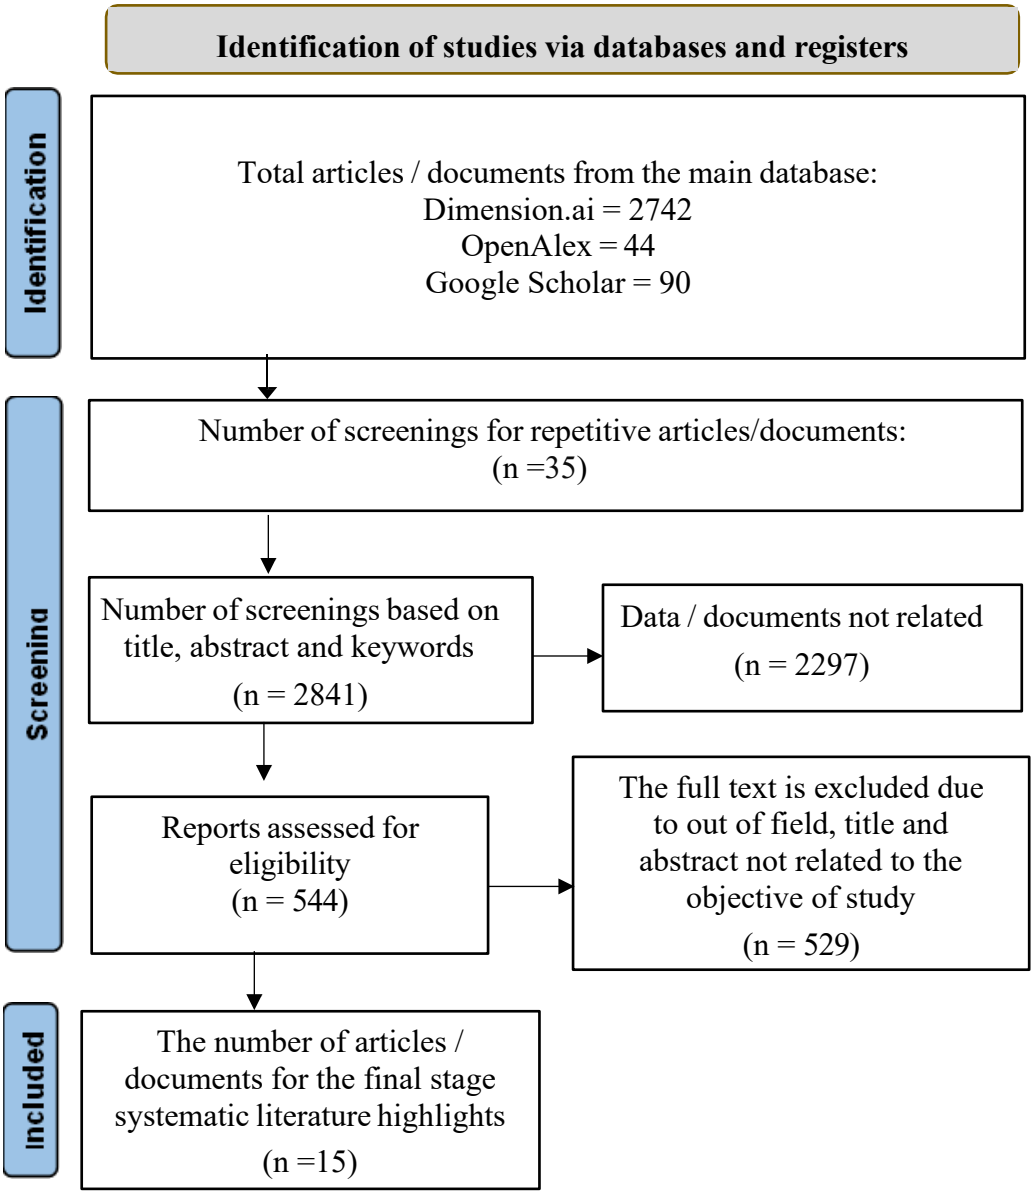

Fig 1: PRISMA flow diagram.

Identification Phase

Guided by the PRISMA guidelines, the first protocol is the identification phase. In this phase, search string strategy was used when searching the Dimensions.ai, OpenAlex, and Google Scholar databases for the process of identifying articles based on titles, abstracts and keywords. Keywords related to building information modelling, technical and vocational education as referred to Table 1.

Table 1: Search strategy for this study

Database	Search string
Dimensions.ai	("building information modelling" OR BIM) AND (TVET OR "technical vocational education" OR "vocational education") AND (teaching OR pedagogy OR learning OR education) AND (Malaysia OR Malaysian)
OpenAlex	"building information modelling" OR BIM AND TVET AND teaching
Google Scholar	"building information modelling" BIM TVET teaching Malaysia

Screening Phase

The number of articles evaluated and screened based on the abstract, title, and keywords was 2,841, after 35 articles were removed due to duplication across different databases. A total of 2,297 publications were excluded because the data or documents were not relevant to the research. The remaining 544 articles were retained, and Table 2 served as the basis for the inclusion and exclusion criteria.

Table 2: Inclusion and exclusion criteria

Inclusion	Exclusion
The study is from 2015 to 2025.	Study outside the selected year range.
Journal Articles.	Conference proceedings, books and encyclopedias.
Articles are in English language and related to BIM pedagogies related in context of Malaysian TVET.	Articles are not in English language and outside the context BIM education or pedagogies related for TVET Malaysia. .

Inclusion Phase

After undergoing the screening process, 15 articles were selected from the journal databases Dimensions.ai, OpenAlex, and Google Scholar. These articles were reviewed to ensure their validity and high quality, particularly in addressing the research problem statement in identifying the evolution of pedagogical approaches adopted by the Malaysian TVET system, the integration of BIM in education, and the alignment between the TVET BIM curriculum and industry requirements. The selected articles were read, analysed, and reviewed together with

several other fellows to obtain the research findings. Table 3 provides a summary of the selected publications for evaluation, as shown below.

Table 3: Summary of the selected articles

No.	Title & Author's Name (Year)	Research Objectives & Methodology	Outcomes	BIM Evolution (Findings in TVET Pedagogy)
1	Towards Construction 4.0: Empowering BIM Skilled Talents in Malaysia [2]	Objectives: To review initiatives for preparing BIM-skilled talents to propel Malaysia toward Construction 4.0. Methodology: Theoretical literature review gathering data from Scopus, Web of Science, and Google Scholar.	Comprehensive BIM education and on-job training (OJT) are essential. Barriers include lack of resources, high costs, and insufficient educator accreditation.	Evolution from 2D CAD conventional practices to digital Construction 4.0. BIM pedagogy is evolving from simple awareness to integration in TVET and Higher Education (HEIs) syllabi since 2007.
2	Building Information Modelling in Architecture: Implication of BIM in Education [3]	Objectives: To examine the effectiveness of BIM in Architectural Technology Certificate programs at Community Colleges. Methodology: Quantitative survey (n=30) at Bandar Darulaman and Kepala	Skills significantly influence student attitudes (48.1%). TVET proficiency drives student motivation more than initial interest.	Introduced in Community Colleges in 2016. The pedagogy evolved through a curriculum shift from "Architectural Draftsman Certificate" (2D) to "Architectural Technology Certificate"

		Batas Community Colleges.		focusing on BIM/Revit.
3	Building Information Modelling (BIM): Implementation of BIM Learning Among Quantity Surveying Students [4]	Objectives: To study the requirement for BIM software usage among Quantity Surveying students in Polytechnics. Methodology: Descriptive quantitative survey (n=111 industry respondents) in Northern Malaysia.	Early BIM exposure is highly necessary (Mean 4.20) to equip students with technical and soft skills. BIM aids in building visualization and employability.	Rationalization of the Diploma in Quantity Surveying syllabus at Polytechnics to replace manual/2D methods with BIM software like Revit and Cost-X.
4	Determinants of the Factors Affecting the Employability of Polytechnic Architecture Graduates [5]	Objectives: To determine factors affecting employability and identify current BIM skill levels (technical vs. non-technical). Methodology: Quantitative approach using simple random sampling (n=169 graduates) from six polytechnics.	Technical skills (moderate) and non-technical skills (high) significantly impact employability (R^2=0.344). Graduates are employable within 6-12 months.	Pedagogical shift toward "Competency-Based" TVET as outlined in the 11th Malaysia Plan to produce semi-skilled workers specifically for the BIM construction industry.
5	Building Information Modelling Industry	Objectives: To examine critical success factors	Five CSFs identified: Technology, Organization,	Evolution toward "Industry-Based

	Centre of Excellence (BIM ICoE) for Kolej Kemahiran Tinggi MARA (KKTM) [6]	(CSFs) for the development of the first BIM ICoE Pasir Mas. Methodology: Scoping review of 50 peer-reviewed articles published within the last 10 years.	Education/Training, Process, and Legal. Industry collaboration is vital for capacity building.	Education and Training" (IBET) through the establishment of ICoEs and "myBIM Satellite" centers in vocational institutions to centralize digital expertise.
6	An Analysis of BIM Employability Skills Among Polytechnic Architecture Graduates [7]	Objectives: To analyse BIM employability skills and determine differences based on gender. Methodology: Quantitative survey of 169 architecture diploma graduates via SPSS descriptive statistics and independent t-tests.	Non-technical skills (Teamwork, Communication) were rated higher than technical skills. Male graduates scored slightly higher in readiness (p=0.025).	Recognition of BIM as a compulsory competency in polytechnic pedagogy to meet the Construction Information Technology Plan (CITP) 2016-2020 goals.
7	The Readiness of Public Universities in Adopting Industrial Revolution 4.0 (IR 4.0) [8]	Objectives: To identify challenges in integrating IR 4.0 and recommend practices for construction management education. Methodology: Quantitative questionnaire (n=99) at UiTM Shah	Major challenges: traditional curriculum structure and lack of facilities (3D printers, VR). Industry-Academia collaboration is the top recommendation.	Pedagogical evolution driven by the "Pioneering University Framework" to introduce emerging technologies (BIM, AR, VR) as standard "Education 4.0" practices in TVET courses.

		Alam analysed via SPSS.		
8	Predictors of Commitment to Teach BIM among Vocational College Teachers [9]	Objectives: To investigate levels of preparedness, self-efficacy, and commitment among vocational college teachers to teach BIM. Methodology: Quantitative cross-sectional survey (n=92 teachers) from 12 vocational colleges in Southern Malaysia.	Commitment is high and predicted by preparedness (rs=0.766). However, technical self-efficacy is only moderate, and formal training is low (17%).	BIM has evolved to become a compulsory subject in the Diploma in Construction Technology program at vocational colleges to support Construction 4.0.
9	Bridging the Skill Gap: An Industry-Academia Training for Civil Engineering Students [10]	Objectives: To identify critical competencies and develop the PII-PM strategic framework for polytechnic curriculum alignment. Methodology: Mixed-methods design; industry survey (n=127) and qualitative content analysis of 15 polytechnic PM syllabus.	A significant theory-practice divide exists. BIM appeared in only 7% of syllabi, indicating a stark deficiency in digital tool coverage.	Proposes the PII-PM Framework pillar: "Mandatory Digital Skills Integration," advocating for BIM to move from elective/limited exposure to a core module in civil engineering pedagogy.
10	The Effect of Performance	Objectives: To examine the	Intention (ILB) acts as a full	Shift in pedagogy

	Expectancy on BIM Learning Performance [11]	effect of performance expectancy (PE) on learning performance (BLP) through intention (ILB). Methodology: Quantitative survey (n=190) analysed via multiple linear regression.	mediator. Career utility and job competitiveness are the strongest drivers for students to learn BIM.	from rote technical instruction to "Motivational Pedagogy," where educators link BIM utility to career rewards to improve student performance.
11	Integrating Emerging Technologies in Construction: Exploring Industry Awareness and Adoption [12]	Objectives: To assess the awareness and adoption of emerging technologies among construction industry players. Methodology: Quantitative research (n=75) using SPSS descriptive and frequency scales.	High awareness of BIM (Rank 2) but low awareness of Blockchain and Digital Twin. Knowledge is mostly at a basic to average level.	Pedagogy must evolve to bridge the "advanced knowledge gap," moving beyond basic BIM awareness to specialized training in integrated technologies like Drones and RFID.
12	A Study on The Readiness of Licensed Land Surveyors in The Implementation of BIM [13]	Objectives: To assess readiness among Licensed Land Surveyors (LLSs) regarding knowledge, skills, and resources. Methodology: Mixed-	LLSs show moderate-to-high readiness but face barriers like high cost (10% of budget) and lack of standardized BIM-GIS guidelines.	Evolution of surveying pedagogy toward "Scan-to-BIM" and LiDAR technology integration, facilitating the expansion of surveying into 3D digital twins.

		methods; interview with JUPEM SME and survey of 75 LLSs in the Southern Region.		
13	Factors Influencing The Teaching of Building Information Modelling (BIM) [14]	Objectives: To investigate impacts of lecturer competencies and facilities on BIM instruction in vocational colleges. Methodology: Descriptive quantitative approach; purposive sampling of 54 lecturers in Sabah.	Lecturer competency is moderate due to a lack of formal training. Hardware is often outdated, and licensed software access is limited.	Pedagogical shift toward the TPACK Framework (Technological Pedagogical Content Knowledge), emphasizing the integration of digital tools with creative TVET instruction.
14	BIM Readiness among Malaysian Polytechnic Architecture Students: A Pilot Study [15]	Objectives: To measure student readiness for BIM adoption using the Technology Acceptance Model (TAM). Methodology: Quantitative pilot study (n=30 architecture students) evaluating skills for post-graduation employment.	Readiness is heavily influenced by Perceived Ease of Use (PEU) and Perceived Usefulness (PU), positively impacting intention. BIM adoption in Malaysia grew from 17% (2016) to 55% (2021).	Foundational effort to bridge the gap between academic training and industry demand. Highlights the industry's shift and the need for institutions to modernize pedagogy to meet future mandates.
15	Construction 4.0 Readiness and Challenges	Objectives: To assess awareness of Construction	Findings reveal a significant knowledge and skill gap, coupled	Pedagogical evolution involves linking

	for Construction Skills Training Institutions in Malaysia [16]	4.0, identify key implementation challenges, and determine technology adoption readiness among Malaysian construction skills training institutes. Methodology: Literature-based assessment of the research corpus to establish strategic direction for training bodies.	with workforce fear of job loss due to 4.0 transformation. Industry 4.0 skills are now an urgent agenda for the Malaysian workforce.	concepts with digital twins, VR, and AR. It emphasizes the urgent need for national skills development strategies to upgrade TVET education to meet industry expectations.

Findings

BIM Pedagogical Evolution Adopted by Malaysian TVET System

The findings of this systematic literature review reveal a transformative pedagogical shift within the Malaysian TVET system, transitioning from traditional 2D-CAD drafting towards an integrated Construction 4.0 digital environment. This evolution is characterised by the systematic restructuring of vocational curricula to prioritise "Smart Digital Information," most notably exemplified by the transition from the Certificate in Architectural Drafting to the Certificate in Architectural Technology in community colleges. National mandates, particularly the requirement for BIM implementation in public projects exceeding RM100 million, have served as a critical external catalyst in establishing BIM as a mandatory competency within vocational syllabus [2][3]. To enhance design visualisation and collaboration, TVET institutions are increasingly integrating emerging technologies such as Augmented Reality (AR), Virtual Reality (VR), and Mixed Reality (MR). These immersive tools enable students to navigate BIM data within interactive virtual environments, facilitating deeper understanding of complex construction processes and real-time clash detection prior to physical implementation. Furthermore, the adoption of the TPACK framework (Technological Pedagogical Content Knowledge) has emerged as an important strategy for educators to effectively integrate technological tools with creative TVET teaching practices [8][14].

Despite these advancements, a persistent "Readiness Paradox" exists among TVET educators. Although teachers demonstrate high professional commitment and a strong ethical responsibility to prepare students, their technical self-efficacy remains moderate due to systemic training gaps. Evidence indicates a critical lack of professional development, as only 17% of TVET teachers have received formal BIM training, forcing the majority (83%) to rely on self-learning and informal knowledge sharing among colleagues. This competency gap is particularly evident when handling software troubleshooting and advanced BIM tasks [9][14]. From the student perspective, readiness for adoption is strongly influenced by the Technology Acceptance Model (TAM), particularly the constructs of Perceived Usefulness (PU) and Perceived Ease of Use (PEU). Studies indicate that students' readiness is largely shaped by their perception of how useful BIM will be for their future careers, which positively influences their behavioural intention to use the technology. Additionally, students' learning intention acts as a full mediator between their career-driven performance expectations and their actual academic performance [11][15].

The pedagogical impact of BIM also extends to psychological and motivational changes among students. Findings from community college studies indicate that technical skills acquired through direct instruction are a stronger predictor of students' positive attitudes (48.1% influence) compared to their initial interest in the subject. This suggests that skills-based TVET approaches effectively drive motivation, provided that the pedagogy remains practical and hands-on rather than purely theoretical. However, students still report being constrained by the lack of facilities and institutional support for digital exploration [9][14] key theme across these findings is the significant theory-practice gap and the resulting misalignment with industry requirements. While industry players prioritise practical site-based competencies such as Site Supervision, Quality Control (QLASSIC), and Scheduling Software Skills, curriculum analysis reveals that BIM coverage appears in only 7% of project management syllabi. This imbalance leads to a "practice shock" for graduates, as they often lack the practical software competencies (e.g., Revit, Cost-X) required on-site despite possessing strong non-technical skills [10].

BIM skills have been identified as a critical determinant of graduate employability, with technical and non-technical skills collectively contributing 34% of the variance in employment success. Although polytechnic graduates are generally employable within 6 to 12 months, employers still identify gaps in practical digital implementation and "work-ready" competencies. Furthermore, there is a statistically significant difference in readiness levels based on gender, with male graduates scoring slightly higher in overall BIM readiness for the construction industry [5][7]. Structural and financial barriers continue to complicate the integration of BIM within the TVET system. The high cost of BIM implementation, which can reach up to 10% of the total construction budget, poses a significant burden for training institutions and small firms. Systemic challenges such as outdated hardware, limited access to licensed software, and weak internet connectivity on campuses often hinder educators from fully adopting Education 4.0 practices. In addition, the lack of standardised BIM-GIS guidelines creates confusion in data exchange between AEC teams and spatial professionals [13][14].

To realign the TVET BIM curriculum with industry requirements, researchers have proposed strategic frameworks such as the Polytechnic Industry Integrated Project Management (PII-PM) framework. This model emphasises five pillars: modernised content, mandatory digital skills, active pedagogy, industry collaboration, and continuous feedback loops. Central to this evolution is the establishment of Industry Centres of Excellence (BIM ICoE) and myBIM Satellite centres, which function as hubs to centralise digital expertise and bridge the gap between academia and industry players [10][6]. In conclusion, although the Malaysian TVET system has successfully initiated its evolution towards digital construction, current findings highlight the urgent need for educator retraining and infrastructure upgrades. The industry is rapidly moving towards Construction 4.0, yet the technological knowledge of the workforce remains at a basic to intermediate level. Bridging this gap through targeted training, national skills development strategies, and strengthened industry and academic partnerships is essential to ensure that TVET graduates are truly equipped for the future digital construction landscape [12][16] Table 4 shows the thematic findings of BIM pedagogical evolution in Malaysian TVET.

Table 4: Thematic Analysis of BIM Pedagogical Evolution in Malaysian TVET

Theme	Key Findings	Supporting Sources
Pedagogical Evolution	Transition from 2D CAD drafting to 3D/4D/5D BIM; integration of Education 4.0 and TPACK frameworks.	[2][8][14]
Educator Readiness	High commitment to teach but moderate self-efficacy; reliance on self-learning due to 83% lacking formal training.	[9][14][16]
Student Adoption	Readiness is driven by TAM factors (PEU & PU); students favor visual learning through MR/AR/VR.	[8][11][15]
Industry Alignment	Severe theory-practice gap; Industry-Academia training (PII-PM) and ICoE centers are vital for bridging skills gaps.	[4][6][10]
Implementation Barriers	High costs (10% of budget); outdated hardware; lack of standardized BIM-GIS guidelines.	[8][13][14]
Graduate Employability	BIM skills provide a competitive edge; male graduates show slightly higher readiness; non-technical skills are highly rated.	[5][7]

BIM Impact Integration in the Malaysian TVET System

The integration of Building Information Modelling (BIM) into the Malaysian TVET system has shown significant impacts on student motivation, learning, and employability. Studies indicate that technical competence in BIM software such as Revit is a stronger predictor of positive student attitudes (48.1% influence) than

their initial interest in the subject. This demonstrates that skills-based TVET approaches can reshape students' mindsets, as learners become more motivated once they acquire practical digital skills relevant to industry needs [3]. From a cognitive perspective, BIM integration supported by technologies such as Augmented Reality (AR), Virtual Reality (VR), and Mixed Reality (MR) improves conceptual understanding through immersive visualisation. These tools enable students to explore BIM models interactively, understand complex construction processes, detect design clashes, and strengthen spatial awareness and problem-solving [8][14].

In addition, BIM competencies significantly influence graduate employability, with technical and non-technical BIM skills contributing about 34% to employability outcomes. Polytechnic architecture graduates commonly obtain employment within six to twelve months after graduation, particularly those with BIM modelling capabilities that align with the Industry 4.0 job market [5][7]. To address the theory-practice gap, TVET institutions are increasingly adopting integrated frameworks such as Technological Pedagogical Content Knowledge (TPACK) and the Polytechnic Industry Integrated Project Management (PII-PM) framework, which emphasise modern curriculum content, mandatory digital skills, active pedagogy, industry collaboration, and continuous feedback [10[14]. However, despite these advancements, a "readiness paradox" persists because only 17% of TVET educators have received formal BIM training, highlighting a critical gap in professional development [9]. The analysis of BIM Pedagogical impacts been concluded in Table 5.

Table 5: Thematic Analysis of BIM Pedagogical Impacts

Pedagogical Impact Category	**Key Finding/Effect**	**Supporting Sources**
Psychological Impact	Proficiency in BIM software (Revit) is a stronger predictor of positive student attitude (48.1%) than initial interest.	[3]
Cognitive Impact	Use of AR/VR/BIM in project-based learning enhances understanding of complex construction and real-time problem solving.	[8][14]
Employability Impact	BIM skill levels are significant predictors of recruitment success; graduates find work within 6-12 months.	[5][7]
Instructional Impact	Shift toward TPACK and PII-PM frameworks aligns TVET curricula with actual Site Operations and Industry 4.0 standards.	[10][14]
National Impact	TVET institutions act as catalysts for Construction 4.0 by providing the semi-skilled workforce required for government mandates.	[2][9][16]

BIM TVET Curriculum and Industry Requirements

The findings identify a significant misalignment between the Malaysian TVET BIM curriculum and actual industry requirements, characterised by a persistent

theory-practice gap [10]. While industry stakeholders prioritise practical site-based competencies such as site supervision, quality control (QLASSIC), and scheduling software proficiency. The TVET syllabus remains largely theoretical, with practical BIM tool coverage appearing in only 7% of core project management modules [10]. Furthermore, although architecture graduates demonstrate strong non-technical competencies, their technical BIM software proficiency is often only moderate, failing to meet the "work-ready" practical standards expected by employers in the Construction 4.0 era [5][7]. This imbalance results in a "practice shock" for new graduates and highlights the urgent need for strategic alignment between education and industry through frameworks such as the Polytechnic Industry Integrated Project Management (PII-PM) and the establishment of Industry Centres of Excellence (ICoE) to modernise digital skill acquisition [6][10].

Discussion

Based on a systematic literature synthesis from 2015 to 2025, the evolution of BIM pedagogy within the Malaysian TVET landscape requires a critical examination that goes beyond summarising key findings. Therefore, as stated in Table 6, this section discusses the impacts and trajectory of this evolution through four strategic perspectives to assess the effectiveness of digital integration in addressing the challenges of Construction 4.0. These four main dimensions include: (1) Pedagogical Quality, focusing on the shift from drafting to information management; (2) Human Capital, addressing technical competency gaps among educators; (3) Student Success, in terms of psychological drivers and employability outcomes; and (4) Sustainability, through institutional support and industry and academia synergy.

Table 6: Summary of Discussion Strategy

Discussion Angle	Key Argument
Pedagogical Quality	Shift from teaching "how to draw" (2D) to "how to manage information" (BIM/7D).
Human Capital	TVET teachers need structured upskilling, not just self-learning, to ensure instruction meets industry standards.
Student Success	Competency-based training increases employability variance by 34%; technical skills are the gateway to jobs.
Sustainability	Collaboration with anchor companies and the establishment of institutional support like ICoEs are necessary to sustain expensive digital infrastructure.

Pedagogical Quality: Transformation from Drawing to Information Management

The evolution of BIM pedagogy in Malaysia reflects a significant shift from traditional 2D drawing skills to a broader focus on integrated digital information management, spanning BIM dimensions from 3D to 7D [2][4]. TVET curriculum, such as the Certificate in Architectural Technology offered in Community Colleges, have been restructured to emphasise "Intelligent Digital Information", replacing

conventional documentation approaches used in earlier architectural drafting programmes [3]. At the same time, the incorporation of immersive technologies such as Augmented Reality (AR) and Virtual Reality (VR) has enriched the teaching process. These tools allow students to visualise design concepts more effectively and gain a deeper understanding of construction workflows, including real-time clash detection, before they encounter actual site conditions [8][14]. Consequently, the quality of BIM pedagogy is no longer measured solely by students' ability to operate software, but by their capacity to integrate interdisciplinary digital information through frameworks such as Technological Pedagogical Content Knowledge (TPACK) [14].

Human Capital: The "Self-Learning" Gap and the Need for Structured Training

Despite the strong commitment among TVET educators to teach BIM-related competencies, a critical "readiness paradox" persists in terms of human capital development. Research indicates that only 17% of TVET educators have received formal BIM training, while the remaining 83% depend largely on self-learning or informal knowledge sharing among colleagues [9][14]. While self-directed learning reflects educators' dedication, it also poses challenges because Construction 4.0 technologies and standards evolve rapidly. Without structured professional development, educators may face difficulties in addressing complex software-related issues and advanced BIM workflows [9][16]. Therefore, to sustain instructional quality, the TVET system requires structured and recognised continuous professional development programmes that can systematically strengthen educators' digital competencies [4][14].

Student Success: Technical Skills as a Gateway to Employment

Evidence shows that BIM integration in TVET has a meaningful psychological and economic impact on students. Studies reveal that practical technical proficiency is a stronger driver of positive student attitudes (48.1% influence) than their initial interest in the subject [3]. In other words, as students become more confident in using BIM tools such as Revit, their motivation and persistence in learning tend to increase. From an employability perspective, BIM-related technical and non-technical competencies collectively explain around 34% of the variation in graduate employability [5]. However, many graduates still experience a form of "practice shock" because the current curriculum provides limited exposure to digital construction tools, with BIM content appearing in only about 7% of project management modules [10]. As a result, student success depends heavily on how effectively TVET curricula can align competency-based training with the real operational needs of construction sites [7][10].

Sustainability: Industry and Academia Synergy like ICoE Support

The implementation of advanced BIM pedagogy also requires significant technological infrastructure and financial investment. In some cases, BIM

implementation costs can reach up to 10% of the total construction project budget, making it challenging for many institutions to maintain updated systems [13]. Consequently, several TVET institutions continue to operate with outdated hardware, limited licensed software, and insufficient digital resources [8][13]. To ensure long-term sustainability, stronger collaboration between academia and industry is essential. Initiatives such as the establishment of Industry Centres of Excellence (BIM ICoE) and myBIM Satellite Centres have been proposed to serve as hubs for digital expertise, training, and resource sharing [2][6]. These centres can provide accredited training opportunities and industry-relevant support at more affordable costs. Ultimately, the sustainability of Construction 4.0 initiatives within TVET will depend on consistent institutional support, industry partnerships, and the development of standardised BIM-GIS integration guidelines to strengthen digital collaboration in the built environment [6][13].

The overall findings of this systematic literature review highlight a critical transition within the Malaysian TVET system, marking a strategic shift from traditional 2D-CAD drafting toward more integrated Construction 4.0 digital information management environments. Based on the comparative analysis synthesised in the research gap in Table 7, despite the encouraging progress reflected across these studies, ranging from strengthened institutional support, emerging pedagogical frameworks, and increased integration of advanced technologies, the overall landscape of BIM pedagogy evolution remains fragmented and context dependent. Many of the existing works are constrained by limited geographical scope, small sample sizes, sector specific focus, or reliance on theoretical and self-reported data, which restricts the generalizability and practical validation of their findings. Furthermore, gaps such as the absence of longitudinal studies, insufficient large scale empirical validation, and limited integration between curriculum design and real-world implementation highlight that the current evolution is still in a transitional phase. Collectively, these limitations underscore the need for more comprehensive, data driven, and scalable research to ensure that the evolution of BIM pedagogy can be effectively sustained and translated into measurable outcomes in future educational and industry practices.

Table 7: Research Gap Analysis: Comparison of Key Sources

Research Paper	**Strengthens (Contribution)**	**Lack (Gaps & Limitations)**
[9]	Establishes a strong statistical link between institutional support and educator commitment.	Limited geographically to the Southern Region; relies on self-reported measures susceptible to bias.
[8]	Provides a detailed look at Education 4.0 pillars and digital twin/robotics integration.	Limited to UiTM Shah Alam students; findings may not reflect the broader TVET landscape.
[3]	Proves that practical software proficiency (Revit) drives student attitude more than interest.	Very small sample size (n=30); limited to two colleges in the Northern Region.
[10]	Proposes the PII-PM Framework as a strategic roadmap for industry-aligned curricula.	Analysis is restricted to Project Management syllabi and document

		reviews rather than classroom delivery.
[11]	Uses TAM and UTAUT to identify learning intention as a full mediator for student success.	Context is heavily focused on China; excludes external variables like system accessibility and social influence.
[6]	Identifies Critical Success Factors (CSFs) for institutional digital transformation.	Lacks primary empirical data from actual ICoE operations.
[4]	Highlights the necessity of 7D BIM (cost and facility management) for future graduates.	Limited to industry respondents in the Northern Region; lacks longitudinal tracking of skill acquisition.
[12]	Offers a broad mapping of technologies like Drones, RFID, and Blockchain.	Sample skewed toward the private sector (82.7%) and professionals with under 5 years of experience.
[2]	Provides an international benchmark comparing Malaysia to Singapore, Australia, and Finland.	Theoretical in nature; does not provide new field data on actual student competency levels.
[13]	Explores the specialized and often overlooked role of geospatial data in BIM workflows.	Focused solely on the surveying profession; identifies a significant lack of standardized BIM-GIS guidelines.
[5]	Quantifies that BIM skills account for 34% of the variance in recruitment success.	Cross-sectional design; findings are specific to the 2019 graduate batch.
[7]	Identifies significant gender-based differences in BIM readiness for semi-skilled workers.	Not representative of all architecture programs in Malaysia; limited to Polytechnic respondents.
[14]	Applies TPACK theory to analyze the "Training-Efficacy Disconnect" in East Malaysia.	Descriptive methodology; lacks regression analysis to determine the impact of teaching aids on student outcomes.
[16]	Focuses on the Readiness Index and national skill development strategies.	Limited existing research corpus for training institutions compared to universities.
[15]	Validates Perceived Ease of Use (PEU) as a primary driver of behavioral intention to adopt BIM.	This is a pilot study; results require large-scale validation across more diverse institutions.

Limitation of the Study

Several limitations should be acknowledged regarding the process and findings of this systematic literature review. First, the study only considered articles and documents indexed in Dimensions.ai, OpenAlex, and Google Scholar between 2015 and 2025. Although these platforms provide broad coverage, this approach may have missed

certain grey literature, internal government reports, or local journals that are not indexed in these repositories. Geographically, many of the studies analysed were concentrated in specific regions, such as Southern Malaysia or Sabah, and focused on institutions, like UiTM and selected polytechnics. As a result, the findings may not fully represent the entire TVET landscape across all Malaysian states and vocational institutions.

Methodologically, much of the evidence came from cross-sectional surveys and self-reported measures, which capture a snapshot in time and may be influenced by social desirability or overestimation of competencies rather than providing objective, long-term insights into actual skill acquisition. In addition, some assessments of curriculum alignment relied solely on official syllabus documents, which may not reflect the real nuances of classroom teaching, or the informal self-learning strategies instructors often use to bridge gaps in training. Finally, this review focused mainly on the evolution and readiness of BIM pedagogy, potentially overlooking other important external factors such as system accessibility, social influences, and institutional support structures that could also significantly affect the effectiveness of BIM teaching.

Conclusion

In conclusion, the journey of Building Information Modelling (BIM) within the Malaysian TVET landscape from 2015 to 2025 tells a story of ambitious aspirations navigating the complex realities of the digital era. We have witnessed a significant shift from simply teaching students how to draw in 2D to preparing them for an integrated digital world under Construction 4.0. While the government has provided necessary impetus through national mandates, this study reveals a notable commitment–competency gap among educators: although highly dedicated to their students' future, a striking 83% are effectively self-teaching, as formal training opportunities remain largely inaccessible. The mismatch between classroom instruction and on-site practical requirements often leads to a steep onboarding gap for graduates, who find that their theoretical knowledge does not always align with the high-tech, site-based demands of modern employers. To truly bridge this gap and cultivate a work-ready workforce, we must move beyond memorising software commands and embrace interactive frameworks such as TPACK and PII-PM, which bring construction to life through immersive tools like AR and VR. Ultimately, the potential of BIM to transform TVET is enormous, but it is a mission that requires shared responsibility. It calls for synergy between industry and academic institution such as Industry Centres of Excellence (ICoE) and ongoing government support to modernise aging infrastructure and provide structured professional development for frontline educators. Only through such collaboration can we ensure that Malaysian TVET graduates enter the workforce not merely as beginners, but as confident, capable leaders in the digital construction era.

Abstract. An operating system (OS) serves as a critical interface that facilitates communication between a user and the hardware of a digital device. Over time, OS have evolved in line with technological advancements and user demands. Today's OS landscape includes desktop and laptop systems such as Microsoft Windows and macOS, mobile platforms like Android and iOS, as well as specialized OS for embedded systems, Internet of Things (IoT) devices and cloud computing environments. This diversity reflects the increasing complexity of modern computing infrastructures. To evaluate students' awareness and understanding of computer OS, a quantitative study was conducted at Politeknik Balik Pulau involving students from the Networking System Track. The respondents, aged between 18 and 23 years old, represented a mix of male and female students. Data were collected using a structured questionnaire designed to assess students' familiarity with various OS, their perceived level of understanding and their views on future OS developments. The findings indicated that most students were familiar with widely used OS such as Microsoft Windows, Android and iOS. However, there was a noticeable lack of knowledge regarding less commonly used platforms, particularly macOS and Linux. Although many respondents rated their understanding of OS as moderate, the results highlighted a clear need for more in-depth education and practical training in this area. In terms of future developments, students expressed confidence that existing OS will be able to address upcoming technological challenges. Security enhancement was identified as a key priority, while Artificial Intelligence (AI) emerged as the most interesting area of future OS development. Overall, the study emphasizes the importance of strengthening OS education to better prepare students for the demands of modern and evolving computing environments.

Keywords: Computer Operating Systems, Student's Awareness, Future OS Development

Introduction

The digital landscape is undergoing a rapid transformation, fundamentally altering modern approaches to computing and data management [4]. From personal devices like smartphones and tablets to enterprise-level servers and data centers, operating systems (OS) have become increasingly versatile, supporting a wide range of applications. With the rise of cloud computing, virtual machines and container technology, OS platforms now play a central role in how businesses operate and scale their services [2, 6]. Trends such as artificial intelligence (AI) and machine learning are further driving the need for robust and adaptable OS, requiring substantial processing power and efficient resource management [1, 7]. This ongoing demand for innovation keeps OS developers on their toes, encouraging continuous adaptation and development. Similarly, the Internet of Things (IoT) has expanded the scope of OS, creating new challenges and opportunities as more devices become interconnected.

In this context, educational institutions like Politeknik Balik Pulau are responsible for equipping students for a future in which technology has an increasingly central role to play. The challenge is to ensure that students are aware of the latest trends in OS and understand the broader implications for technology and society [8]. This study aims to assess the level of awareness among Politeknik Balik Pulau students regarding these emerging OS trends and their impact on the modern computing landscape. By exploring global trends, the study also seeks to identify the skills and knowledge required for students to excel in this dynamic environment. This encompasses not only understanding traditional OS like Windows and Linux but also exploring newer platforms designed for cloud computing, IoT and AI. The study's results could inform curriculum development, ensuring that students acquire the relevant knowledge and practical skills needed to succeed in technology-driven careers.

Ultimately, by examining current trends and future directions, the study will shed light on how Politeknik Balik Pulau can better prepare its students to navigate the evolving world of OS and technology at large. This understanding can contribute to more effective educational programs and help ensure that graduates are ready to meet the demands of a rapidly changing technological landscape.

Current Landscape of Operating Systems

The landscape of operating systems (OS) is a diverse and dynamic ecosystem, providing the foundational software that enables computers and electronic devices to function in today's digital age [3]. OS comes in many forms, catering to a wide range of users and industries. Traditional desktop and laptop OS like Microsoft Windows, macOS and popular Linux distributions such as Ubuntu and Fedora continue to dominate the personal computing market [5, 6]. They offer extensive features, compatibility with various software applications and user-friendly interfaces. This dominance is a testament to their adaptability and ongoing evolution to meet the demands of diverse user groups.

In recent years, mobile OS have become increasingly significant. Platforms like Android and iOS power most smartphones and tablets worldwide, offering users a vast ecosystem of mobile apps and services [4]. These mobile OS are designed to optimize performance, battery life and user experience, reflecting the growing importance of mobile computing in everyday life. The influence of mobile OS extends beyond

consumer devices, impacting areas like mobile app development, mobile-first web design and the proliferation of wearable technology [2].

Beyond traditional and mobile OS, the OS landscape encompasses specialized platforms for embedded systems, the Internet of Things (IoT) and cloud computing environments [1]. Embedded OS like FreeRTOS and Embedded Linux are designed for devices like smart appliances, industrial automation systems and automotive electronics. Similarly, cloud computing platforms such as Amazon Web Services (AWS), Microsoft Azure and Google Cloud Platform rely on specialized OS to manage virtualized infrastructure and deliver cloud-based services [2]. Additionally, advancements in virtualization and containerization have given rise to specialized OS platforms optimized for virtualized environments and container orchestration, such as VMware ESXi and Docker.

OS have evolved significantly since their inception, undergoing four distinct generations of development. Initially, computers lacked dedicated OS, requiring each program to include code to interface with hardware, a cumbersome and error-prone approach. This led to the development of basic system software and, eventually, the earliest OS. The rise of mobile OS like iOS and Android further transformed personal computing, while virtualization and cloud computing necessitated specialized OS tailored for virtualized environments and large-scale data center management.

Research Objectives

This study aims to provide a comprehensive understanding of the operating systems (OS) landscape among students at Politeknik Balik Pulau. Specifically, the objectives of this research are:

i. To assess students' general awareness and level of understanding regarding various computer OS.
ii. To examine students' familiarity and usage patterns across different OS platforms, including traditional, mobile and specialized systems.
iii. To explore students' perceptions and interests regarding the future development and emerging trends of OS.

Methodology

To examine the level of awareness among Politeknik Balik Pulau students regarding computer operating systems (OS) and emerging trends, this study adopts a quantitative research design using a survey approach. Data was collected via questionnaires distributed randomly to students within the campus. While the study primarily targeted final-year students, it also included respondents from semesters 3 and 4 to provide a broader perspective of awareness within the Networking System Track. The questionnaire comprises a variety of questions aimed at gauging general knowledge of OS, current trends and future expectations, formatted using a Likert scale. This approach facilitates the collection of a large dataset for descriptive analysis using the SPSS software. Such analysis helps identify trends in student awareness and provides a descriptive overview of the respondents' demographic profile. The study sample provides a representative mix, ensuring the reliability and accuracy of the findings. Finally, the results will guide the formulation of recommendations for curriculum improvements, aiming to ensure that students are adequately prepared for future technological advancements and challenges in the computing field.

Finding and Discussion

The study investigated the level of awareness among 96 students from Politeknik Balik Pulau's Networking System Track regarding computer operating systems (OS) and their future direction. The demographic distribution among the respondents was 57% male, while 43% were female, as presented in Figure 1. In terms of age, 78% of the participants were between 18 and 20 years old and the remaining 22% were between 21 and 23 years old, as shown in Figure 2. The majority of respondents were final-year students, with the remaining balance consisting of students from the fourth and third semesters.

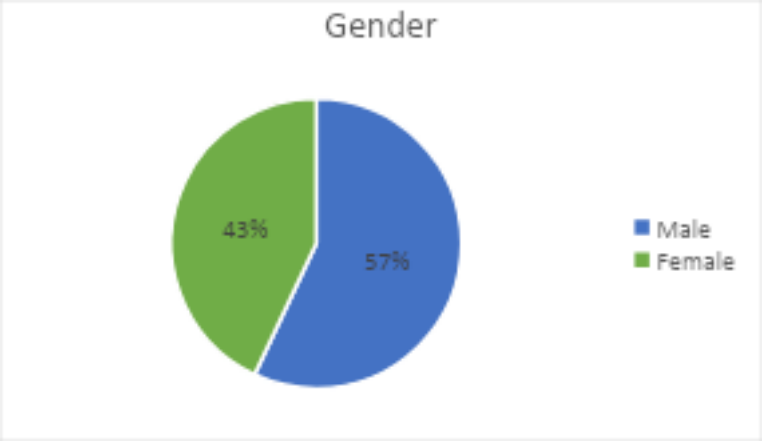

Fig 1: Gender Distribution

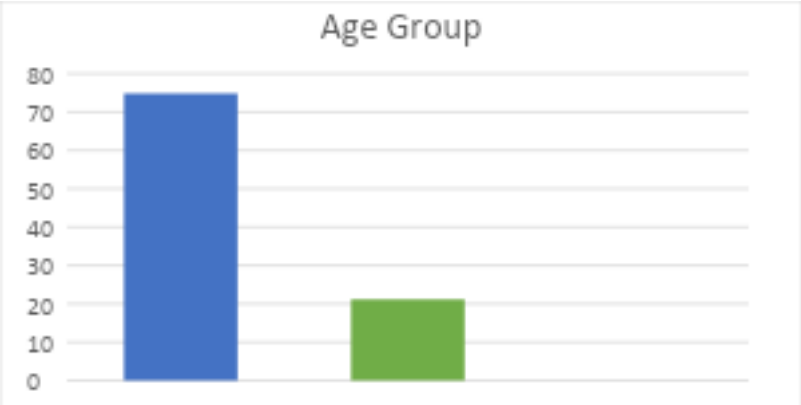

Fig 2: Age Group

Regarding the level of understanding of computer OS, the study found that 64% of respondents rated their knowledge as moderate. This suggests that while students have a foundational grasp of OS, there is room for improvement to achieve a higher level of expertise. On the other hand, findings indicated that all respondents were familiar with Windows, highlighting its dominance in personal computing, as shown in Figure 3. Beyond Windows, 93% were familiar with Android, 89% with iOS, 32% with macOS and 25% with Linux.

The high level of familiarity with Windows, Android and iOS compared to Linux suggests that students' OS knowledge is currently shaped more by personal device

usage and consumer-market exposure rather than specialized academic training. This aligns with Bazuku et al. (2023), who noted that while traditional OS dominate the personal market, a lack of exposure to Linux distributions can be a barrier in enterprise and server-side computing.

Industry data shows Android holds a 42% global market share, making it the most used OS worldwide. While this indicates students are technologically literate at a consumer level, their 'moderate' self-rating of understanding (64%) suggests they may lack the technical depth essential for professional-level administration in complex virtualized and enterprise environments. Furthermore, despite being 'Networking System' students, their low familiarity with Linux and macOS highlights a significant discrepancy between their academic background and professional requirements. Since Linux dominates the server and supercomputer landscape, this dependency on proprietary ecosystems may hinder their readiness for enterprise-level server management.

These findings point to a significant gap in knowledge, suggesting that curriculum exposure should pivot from user-level systems toward the open-source environments required for professional networking careers.

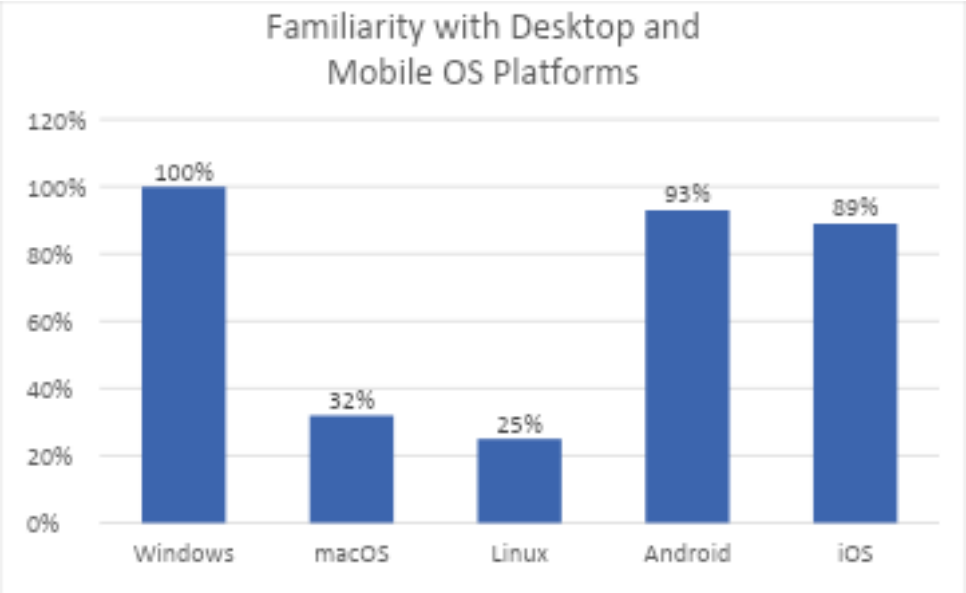

Fig 3: Students' Familiarity with Common Operating System (OS) Platforms

In terms of emerging trends, Figure 4 shows that students are most familiar with AI-powered OS (90%), followed by Cloud-based OS (87%) and IoT OS (69%). Respondents also showed awareness of Blockchain-based OS (56%), though familiarity with Virtualization remained notably low at 2%. This widespread familiarity likely contributes to the overwhelming optimism among respondents, as 100% of them (combined 76% strongly agree and 24% agree) believe that current OS are well-equipped to evolve and meet future technological challenges.

Regarding areas for enhancement, most respondents indicated that security enhancements are crucial for future operating systems. Enhanced compatibility was the second most important area, followed by improved user experience and better performance, in that order. This suggests that while there is excitement for new functionalities, data protection and system stability remain the fundamental pillars that

define the success of an OS. These essential elements must be strengthened alongside emerging technological advancements to ensure long-term reliability.

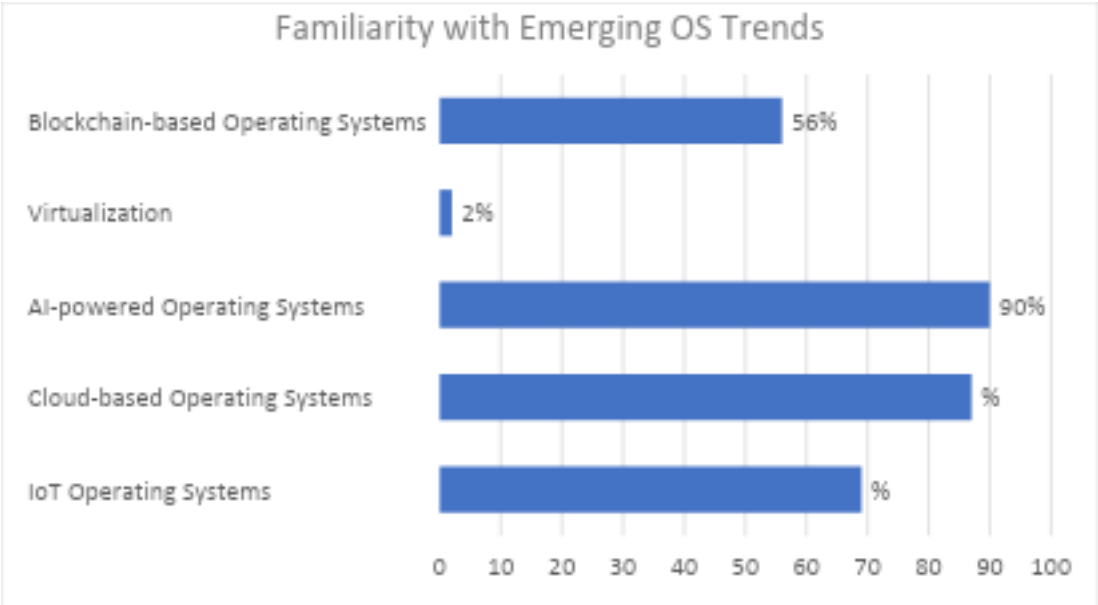

Fig 4: Students' Familiarity with Emerging Trends in Operating Systems (OS)

Lastly, the study explored the future directions in OS that most interested the respondents. As shown in Figure 5, Artificial Intelligence (AI) emerged as the primary area of interest (89%), followed by Augmented Reality (AR) and Virtual Reality (VR) at 76%, suggesting a strong enthusiasm for immersive technologies. Meanwhile, Cloud-based services and the Internet of Things (IoT) shared a 59% interest level, reflecting a broader trend towards connectivity and cloud integration. Based on this data, there is a perceived alignment between students' familiarity with modern technology and their confidence in the future of OS.

There is also a notable trend between exposure to emerging trends (AI and Cloud-based OS) and student optimism regarding the future. The 100% agreement that OS will meet future challenges suggests that high awareness of innovation (AI/Cloud) is closely linked to student confidence in the resilience of current technological infrastructures. This aligns with global industry trends where AI-powered OS are becoming foundational for optimizing business processes. This shift is further supported by Wamba-Taguimdje et al. (2020), who emphasize that AI-driven transformation has become a central pillar of organizational performance. This enthusiasm is mirrored in the literature, which notes that AI is projected to generate nearly $90 billion in profits by 2025.

However, the students' previously mentioned identification of security as the most critical area for enhancement reflects a sophisticated understanding of current industry challenges. As noted by Bazuku et al. (2023), security remains the primary hurdle for emerging OS generations, especially in IoT and Cloud environments where unauthorized access can compromise entire systems. The fact that students are optimistic indicates they perceive these advancements as tools for efficiency rather than technical hurdles.

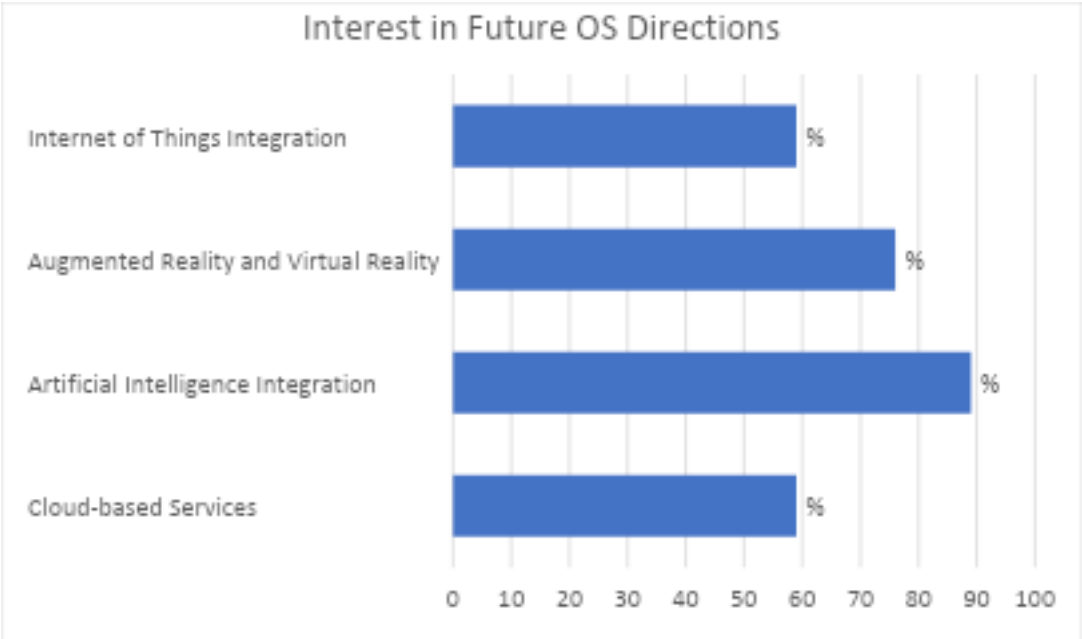

Fig 5: Students Interest in the Future Direction of Operating Systems (OS) Development

In summary, these findings indicate a comprehensive view of Politeknik Balik Pulau students' awareness of OS and their future direction. The moderate level of understanding among respondents, coupled with their optimism about the adaptability of current OS suggests a positive outlook while highlighting areas where further curriculum development could be beneficial. While students showed enthusiasm for immersive technologies like AR/VR, their identification of security as the most critical area mirrors the 'Virtualization Revolution' discussed by Arogundade & Palla (2023). They argue that as we move toward cloud scalability, security remains the fundamental challenge. This indicates that despite being 'Networking System' students, their priorities are well-aligned with current industry concerns regarding data protection. Ultimately, this integration of security, performance and emerging technologies like AI provides a clear roadmap for educational institutions to shape future-oriented learning experiences that bridge the gap between student interest and professional technical requirements.

Recommendations

The study reveals a significant knowledge gap in alternative operating systems (OS), particularly macOS (32%) and Linux (25%). To address these findings and bridge the divide between student interest and professional technical requirements, the following recommendations are proposed:

i. Professional OS Exposure: Since macOS is currently not included in the formal program structure, the institution may introduce elective short courses or technical workshops to provide students with basic exposure to the Apple ecosystem, especially for its relevance in creative and high-end networking industries.

ii. Intensified Practical Components: For Linux, which is already integrated into the syllabus through existing open-source and server management courses, it is recommended that the practical components within these courses be intensified through more rigorous, industry-simulated laboratory sessions.

iii. Industry Certification Pathways: Offering optional certification pathways, such as LPI Linux Essentials or CompTIA Linux+, as a value-added program would further enhance students' professional readiness without necessitating a full restructuring of the current academic syllabus.

iv. Security-Focused Training: Given that students identified security as the most critical area for enhancement, OS education may emphasize practical hardening and data protection to align with industry demands for secure computing environments.

v. Future Trend Alignment: To leverage the high student interest in AI (89%) and AR/VR (76%), final-year projects should be encouraged to explore how modern OS manage resources for these immersive and intelligent technologies.

Conclusions

This study on Politeknik Balik Pulau students' awareness of computer operating systems (OS) reveals a mixed level of familiarity, where a strong dominance in consumer-market platforms contrasts with a lower awareness of professional-grade systems like macOS and Linux. With 64% of respondents rating their understanding as moderate, there is a clear need for broader curriculum exposure to enhance technical expertise.

Regarding future trends, the study found a strong emphasis on security as the most critical area for improvement, followed by enhanced compatibility, user experience and performance. Respondents also expressed a high level of interest in Artificial Intelligence (89%), suggesting that AI-driven OS could be a significant focus in the future. Other areas of interest included Augmented Reality/Virtual Reality (AR/VR) (76%), as well as Internet of Things (IoT) and Cloud-based Services (both at 59%), pointing to a broader range of emerging technologies that are reshaping the OS landscape.

However, there seems to be an asynchrony between student interest in high-level trends and their underlying technical deficiencies in professional platforms. This suggests a pedagogical need to bridge the divide between 'user-level' familiarity and 'professional-level' systems administration to meet the demands of Education 4.0, which is central to Malaysia's 2030 National TVET Policy. Consequently, these findings emphasize the importance of continuous curriculum adaptation to ensure students are prepared for future career opportunities.

Furthermore, while this study identifies a descriptive link between awareness and future optimism, it is limited by the lack of inferential statistical testing. Future research should employ correlation analysis to further validate these preliminary observations with a larger sample sizes and across different institutions.

Abstract. Artificial Intelligence (AI) tools are increasingly being adopted in higher education, particularly in how programming projects are developed by students. Tools such as ChatGPT, GitHub Copilot, and Gemini are commonly used for code generation, debugging, and understanding programming concepts. This study examines patterns of AI tool usage and their relationships with four learning constructs: self-regulated learning (SRL), cognitive load, academic integrity and authenticity, and perceptions of project outcomes. A quantitative survey was conducted among 107 final-year Diploma in Information Technology (Digital Technology) students at Politeknik Seberang Perai enrolled in the DFT50114 Integrated Project course. Data were collected through a structured questionnaire and analysed using JASP with descriptive statistics and Pearson correlation. The results show that AI tools are widely used, particularly for debugging, code generation, and concept understanding. Positive relationships were identified between AI usage and all four learning constructs, with the strongest association observed for self-regulated learning. Overall, the findings suggest that AI tools can support programming project development when used appropriately. This highlights the concern for educators to support students in regulating their learning and critically evaluating AI-generated outputs to ensure ethical use.

Keywords: *Artificial intelligence tools, programming education, self-regulated learning, cognitive load, academic integrity*

Introduction

The rapid evolution of Artificial Intelligence (AI) technologies has increasingly reshaped higher education particularly in computer science and programming disciplines. AI assisted tools such as ChatGPT and GitHub Copilot are now widely integrated into programming learning activities, supporting tasks like code generation, debugging and the explanation of complex concepts. These tools provide immediate feedback and alternative solution approaches which enhance students' problem-solving efficiency and overall learning experience [1], [2].

At the same time, the growing use of AI in education has raised ongoing discussions about both its benefits and potential challenges. Previous studies suggest that AI tools can support personalised learning and improve student productivity through timely feedback [3], [4]. In Technical and Vocational Education and Training (TVET), these technologies are also seen as valuable in strengthening teaching and learning practices for both students and educators [3]. However, concerns remain regarding ethical issues

particularly the misuse of AI-generated content and its implications for academic integrity [5], [6].

Discussions on the adoption of AI technologies in higher education have gained increasing momentum as part of the broader national digital transformation agenda in Malaysia. The Ministry of Higher Education has underscored the importance of AI integration across higher education institutions including efforts to establish AI-oriented polytechnic institutions and to formulate guidelines governing AI usage in universities [7], [8]. Such initiatives signify a broader acknowledgement of AI as a strategic component in advancing the future landscape of higher education in Malaysia.

Teaching and learning practices in Malaysian polytechnic institutions are guided by the Outcome-Based Education (OBE) approach which emphasises the development of applied knowledge, problem-solving ability and higher-order thinking skills. Project-based learning is widely used to evaluate students' ability to apply theoretical knowledge in practical contexts. At Politeknik Seberang Perai, students enrolled in the DFT50114 Integrated Project course are required to develop a complete software system as part of their Final Year Project.

During the development of these programming projects, students increasingly utilise AI tools to support tasks such as requirement analysis, system design, and programming implementation. While these tools can enhance learning efficiency and support problem-solving processes, excessive reliance on AI technologies may also raise concerns related to academic integrity and reduced cognitive engagement among students [5], [6]. Therefore, it is important to examine how students utilise AI tools during programming project development and how such usage relates to students' learning strategies.

Thus, this study investigates the patterns of AI tool usage among final year Diploma in Information Technology (Digital Technology) students at Politeknik Seberang Perai. In addition, this study examines the relationships between AI usage patterns and several key learning constructs, including self-regulated learning, cognitive load, academic integrity and authenticity, and students' perceptions of project outcomes. The conceptual framework of the study is shown in Figure 1.

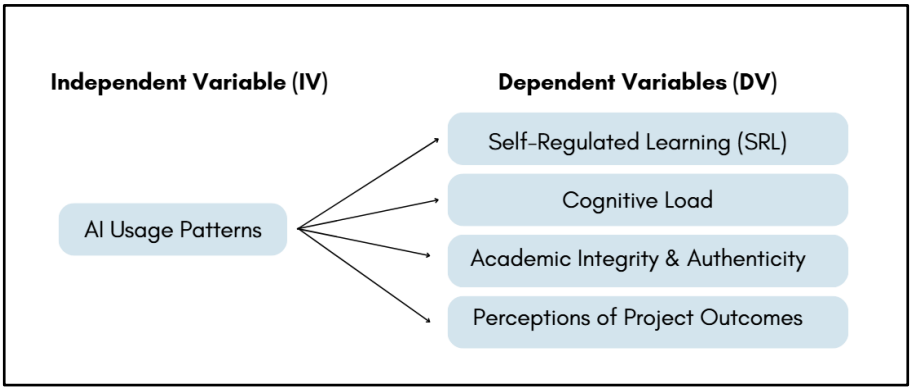

Fig 1: Conceptual framework

Problem Statement

The integration of artificial intelligence (AI) tools in programming education has introduced significant advantages, including improved efficiency and enhanced problem-solving support. However, it also raises concerns regarding students' reliance on AI tools, the level of cognitive engagement during programming tasks, and issues related to academic integrity.

At Politeknik Seberang Perai, students enrolled in the DFT50114 Integrated Project course increasingly utilise AI tools such as ChatGPT and GitHub Copilot to support their project development activities. Despite this growing adoption, there is limited empirical evidence on how AI usage patterns are associated with key learning constructs, including self-regulated learning, cognitive load, academic integrity, and students' perceptions of project outcomes.

Without a clear understanding of these relationships, educators may face challenges in designing effective instructional strategies that ensure the responsible and pedagogically sound integration of AI tools in programming education. Therefore, a systematic investigation is required to examine how AI usage patterns relate to students' learning processes and project development experiences.

Research Objectives

This study aims to:

1. Identify the patterns of artificial intelligence (AI) tool usage, including frequency of use, types of tools, purposes, and time spent, among final-year Information Technology students during programming project development.

2. Examine the relationships between AI usage patterns and key learning constructs, namely self-regulated learning, cognitive load, academic integrity and authenticity, and students' perceptions of project outcomes.

Literature Review

The integration of Artificial Intelligence (AI) in higher education has expanded rapidly particularly in computer science and programming-related fields. In recent years, generative AI technologies such as ChatGPT have changed the way students approach programming tasks. These tools can generate explanations, produce code, and assist learners in solving programming problems, which, in turn, helps students better understand programming concepts and improve their coding performance [1], [9], [10]. At the same time, studies suggest that AI-assisted tools can enhance productivity by offering alternative solutions, allowing students to explore different approaches to solving computational problems [2], [11].

Recent studies further highlight the growing influence of generative AI in programming education. AI tools can support learning by providing explanations, generating examples and delivering immediate feedback during coding activities [12], [13]. This continuous support can help students strengthen their understanding of programming logic and develop more effective problem-solving skills [14], [15]. Therefore, the use of AI tools has become increasingly common in programming-related courses within higher education institutions [4], [16].

AI tools offer clear benefits, but their widespread use also raises pedagogical and ethical concerns. While they can improve learning efficiency and access to information, overreliance may weaken independent learning and critical thinking [6], [26]. There are also growing concerns about academic integrity, especially regarding assessment authenticity in higher education [5], [17]. At the same time, in the TVET context, AI is increasingly seen as a useful tool that supports learning and skill development [3].

Self-regulated learning (SRL) plays an important role in how students use AI tools. SRL refers to the ability to plan, monitor and evaluate one's own learning [19]–[21]. Students with strong SRL tend to use AI as a support rather than depend on it fully [22]. In technology-based learning environments, SRL helps students assess AI-generated outputs more critically [23], [24]. Studies in Malaysia also suggest that students' perceptions and ethical awareness influence how AI is used in education [25], [26].

Cognitive load is another key factor in programming. Learning to program requires managing syntax, algorithms and logic at the same time. This process can be mentally demanding. For example, study explains how students often struggle, especially with object-oriented programming [27]. AI tools can help by providing explanations and coding support [28], [29]. However, excessive reliance on these tools may reduce active thinking during learning [6], [26].

Beyond cognitive challenges, AI use also raises concerns about academic integrity. Generative AI can produce code and written content, increasing the risk of plagiarism if misuse [5], [17]. Therefore, clear policies and ethical guidelines are needed to ensure responsible use [30]. In Malaysia, interest in AI in education continues to grow which aligned with broader digital transformation efforts [31], [32].

Although past studies highlight the potential of AI in programming education, empirical evidence remains limited. In particular, how students use AI during project development and how this relates to self-regulated learning, cognitive load, academic integrity, and students' perceptions of project outcomes is still not well understood. Therefore, this study investigates the patterns of AI tool usage among final year Diploma in Information Technology students and examines how these factors influence learning outcomes during programming project development.

Methodology

This study employed a quantitative research design using a survey method to examine students' perceptions of the use of artificial intelligence (AI) tools in programming project development. The study was conducted among final year students from the Department of Information and Communication Technology (Jabatan Teknologi Maklumat dan Komunikasi, JTMK) at Politeknik Seberang Perai, Malaysia during Session 1 of the 2025/2026 academic year.

The respondents consisted of 107 students enrolled in the DFT50114 Integrated Project course in the Diploma in Information Technology (Digital Technology) programme. A census sampling approach was applied, where all students registered in the course were invited to participate in the study. The respondents were selected as they were engaged in project-based learning activities supported by AI tools, including a custom GPT-based learning system designed to assist project development. The tool was designed to assist students in generating project ideas, organising report structures,

and identifying relevant references for project documentation. This context provided an authentic environment to examine how students utilise AI tools during project development.

Data were collected using a structured questionnaire comprising three sections. Section A gathered respondents' demographic information, while Section B focused on students' patterns of AI tool usage during programming project development. Section C measured four learning-related constructs associated with AI usage, namely self-regulated learning (SRL), cognitive load, academic integrity and authenticity, and perceptions of project outcomes. In this study, AI usage patterns were treated as the independent variable, whereas the four learning constructs were considered dependent variables. All perception items were measured using a five-point Likert scale, ranging from 1 (strongly disagree) to 5 (strongly agree).

The data were analysed using JASP statistical software (version 0.95.0). Both descriptive and inferential analyses were conducted to examine the patterns and relationships among the variables. Descriptive statistics, including mean, standard deviation, and percentage, were used to summarise respondents' demographic profiles and overall trends. In addition, Cronbach's alpha was employed to assess the internal consistency of the instrument, while Pearson correlation analysis was used to determine the strength and direction of relationships among the key variables. A summary of the analyses conducted is presented in Table 1.

Table 1**:** Type of analysis

No.	Type of Analysis	Description
1	Descriptive Statistics	i. Mean ii. Standard Deviation iii. Percentage
2	Construct Reliability Test	Cronbach's Alpha
3	Pearson correlation analysis	i. Relationship between AI Usage Patterns and Self-Regulated Learning ii. Relationship between AI Usage Patterns and Cognitive Load iii. Relationship between AI Usage Patterns and Academic Integrity iv. Relationship between AI Usage Patterns and Perceptions of Project Outcomes

Results and Findings

The total number of students in the study was 107, consisting of 56 females (52.3%) and 51 males (47.7%). All the students were final-year Diploma in Information Technology (Digital Technology) students from the Department of Information and Communication Technology (JTMK), Politeknik Seberang Perai. All the respondents were taking the DFT50114 Integrated Project course, in which they had to design and develop a software system as part of the Final Year Project (FYP). Therefore, they were all actively involved in the development of the programming project during the data collection phase.

This study adopted a census sampling approach, involving all students registered in the course. By including the full cohort of students working on system development projects in a real learning context, the study was able to capture a more comprehensive view of students' experiences with AI tools during project development.

Patterns of AI Tool Usage Among Students

This section describes the patterns of Artificial Intelligence (AI) tool usage among students during programming project development in the DFT50114 Integrated Project course. Descriptive statistics, such as frequency and percentage, were applied to examine key aspects of AI usage, including the proportion of users, types of tools, purposes of use, and duration of usage. The findings in Table 2 indicate that most students relied on the Final Year Project Guide in preparing their project reports.

Table 2**:** Descriptive Statistics of AI Usage Patterns Among Students

Variable	Category	Frequency (n)	Percentage (%)
Use of Final Year Project Guide	Yes	80	74.8
	No	27	25.2

The findings suggest that AI tools were widely adopted in programming project development. Most students reported frequent usage, whereas only a small proportion indicated limited use, as illustrated in Table 3.

Table 3**:** Frequency of AI Usage in Programming Project Development

Frequency of AI Usage	Frequency (n)	Percentage (%)
Never	11	10.3
Rarely	15	14.0
Sometimes	21	19.6
Often	39	36.4
Very Often	21	19.6

The results indicate that ChatGPT was the most frequently used AI tool among students, followed by GitHub Copilot and Gemini. Other tools, including Xcode AI Assistant, Tabnine, Cursor, and Amazon Q Developer, were also utilised, albeit to a lesser extent. This pattern reflects students' tendency to use multiple AI tools to support various coding-related tasks during project development, as illustrated in Table 4.

Table 4: Main AI Tools Used in Programming Projects

AI Tool	Frequency (n)	Percentage (%)
ChatGPT	72	67.3
GitHub Copilot	59	55.1
Gemini	54	50.5
Xcode AI Assistant	37	34.6

Tabnine	34	31.8
Cursor	34	31.8
Amazon Q Developer	30	28.0

Students employed the AI tools for various objectives in the development of the programming project, and the most common objective was debugging, which is the process of correcting coding errors. The other prominent objectives included the generation of code and grasping complex programming concepts. The generation of project ideas and the development of project documentation were also objectives that the students employed in the development of the programming project, as illustrated in Table 5.

Table 5**:** Main Purposes of Using AI in Programming Projects

Purpose of AI Usage	Frequency (n)	Percentage (%)
Debugging / Fixing coding errors	69	64.5
Code generation	68	63.6
Understanding difficult programming concepts	68	63.6
Generating project ideas	61	57.0
Preparing project documentation	53	49.5

The results provided in Table 6 show that students generally use a moderate amount of time in the use of AI tools in the development of programming projects. Most students reported the use of AI tools for two to five hours per week, while others reported less or more time in the use of the tools. Overall, the results show that students regularly use AI tools as a supporting resource in the completion of programming projects.

Table 6: Estimated Weekly Time Spent Using AI for Project Development

Weekly AI Usage Time	Frequency (n)	Percentage (%)
Less than 2 hours	23	21.5
2–5 hours	43	40.2
6–10 hours	27	25.2
More than 10 hours	14	13.1

Students' Perceptions of AI Usage

This part of the study focuses on exploring students' perception of using AI tools in programming project development. The items in this section were organised into five constructs, consisting of one independent construct, namely AI Usage Patterns, and four dependent constructs, namely Self-Regulated Learning, Cognitive Load, Academic Integrity and Authenticity, and Perceptions of Project Outcomes. Descriptive statistics were applied to analyze the data in this part of the study, which consisted of mean and standard deviation using a five-point scale.

Table 7 shows that Academic Integrity and Authenticity achieved the highest mean score, followed by Perceptions of Project Outcomes and Self-Regulated Learning. This suggests that students demonstrate a strong awareness of ethical issues while also acknowledging the usefulness of AI tools in enhancing project outcomes. At the same time, the positive association between AI usage and cognitive load indicates that students remain cognitively engaged when working with AI-generated outputs.

Table 7: Descriptive Statistics of Students' Perceptions on AI Usage

Construct	Item	Mean	Std. Deviation	Level
AI Usage Patterns	8–14	3.42	0.76	Moderate
Self-Regulated Learning (SRL)	15–22	3.44	0.58	High
Cognitive Load	23–27	3.40	0.62	Moderate
Academic Integrity and Authenticity	28–31	3.54	0.69	High
Perceptions of Project Outcomes	32–38	3.47	0.63	High

Instrument Reliability Test

A reliability analysis was conducted to assess the internal consistency of the measurement instrument. The results indicate a high level of reliability for the overall scale, with a Cronbach's alpha value of $\alpha = 0.911$. As this value exceeds the recommended threshold of 0.70, it suggests that the items consistently measure the constructs under investigation.

Table 8**:** Overall Reliability of the Measurement Instrument

			95% CI	
Coefficient	**Estimate**	**Std. Error**	**Lower**	**Upper**
Cronbach's α	0.911	0.016	0.879	0.942

Table 8 displays the Cronbach's alpha reliability test with the result $\alpha = 0.911$ having a 95% confidence interval ranging from 0.879 to 0.942. This implies that the instrument is reliable and can be used to measure constructs related to the application of artificial intelligence tools in the development of programming projects.

Correlation Analysis

Pearson correlation analysis was used to examine the relationships between AI usage patterns and several key learning constructs. The constructs examined were self-regulated learning (SRL), cognitive load, academic integrity, and students'

perceptions of project outcomes. Correlation strength was interpreted according to Cohen's (1988) guidelines, with the results summarised in Table 9.

Table 9: Pearson Correlation Matrix among Study Variables

Variables	*Pearson's r*	*p-value*	*Lower 95% CI*	*Upper 95% CI*
AI Usage Patterns – Self-Regulated Learning (SRL)	0.626***	< .001	0.495	0.729
AI Usage Patterns – Cognitive Load	0.537***	< .001	0.387	0.660
AI Usage Patterns – Academic Integrity	0.397***	< .001	0.224	0.545
AI Usage Patterns – Perceptions of Project Outcomes	0.558***	< .001	0.411	0.676

Table 9 shows that AI usage patterns have a strong positive relationship with self-regulated learning ($r = 0.626$, $p < .001$). This suggests that students who frequently use AI tools tend to demonstrate stronger self-regulated learning behaviours, such as planning, monitoring, and evaluating their learning strategies during programming project development. A similarly strong positive relationship was also found with cognitive load ($r = 0.537$, $p < .001$), indicating that although AI tools provide support, students remain cognitively engaged in interpreting and validating AI-generated outputs.

In addition, AI usage patterns were strongly associated with students' perceptions of project outcomes ($r = 0.558$, $p < .001$), suggesting that more frequent use of AI tools is linked to more positive perceptions of project effectiveness and productivity. In contrast, the relationship with academic integrity was moderate ($r = 0.397$, $p < .001$). While still statistically significant, this weaker association indicates that although students are aware of ethical considerations, the influence of AI usage on academic integrity is less pronounced. Overall, the findings highlight that AI usage is positively related to several key learning constructs, particularly self-regulated learning and perceptions of project outcomes.

Discussion

The findings indicate that AI usage patterns are closely linked to several learning-related constructs in programming project development. This is in line with earlier studies showing that generative AI tools, such as ChatGPT and AI coding assistants, can support programming learning by offering explanations, suggesting code, and helping students work through programming problems [1], [9], [12]. Through these functions, AI tools can make learning more efficient and, at the same time, keep students more engaged during programming tasks.

The strong positive relationship between AI usage and self-regulated learning suggests that students who use AI tools more frequently tend to manage their learning more effectively. This includes planning their approach, monitoring their progress, and evaluating their understanding throughout the development process. This observation is consistent with self-regulated learning literature, which highlights that learners with

stronger metacognitive awareness are better able to use digital tools in a purposeful and strategic way [19]–[22].

The study also found a significant relationship between AI usage and cognitive load. Although AI tools provide support, students still need to think carefully about the outputs they receive—interpreting, evaluating, and deciding whether the solutions are appropriate. This supports earlier findings that programming remains cognitively demanding, even when technological assistance is available [27], [29].

In addition, the positive relationship between AI usage and perceptions of project outcomes suggests that students generally see AI tools as helpful in completing their projects and improving their learning experience. However, the relationship with academic integrity was only moderate. This may indicate that while students are aware of ethical considerations, concerns about the potential misuse of AI-generated outputs still exist in academic settings [5], [17].

Overall, the findings suggest that AI tools can support programming project development. However, their effectiveness depends on how they are used by students. This highlights the need for educators to support students in regulating their learning and critically evaluating AI-generated outputs, ensuring that AI is used as a learning aid rather than a substitute for independent thinking.

Future Research

Future research should extend the present findings by employing longitudinal and experimental research designs to examine the causal effects of artificial intelligence (AI) usage on programming performance and learning outcomes over time. While this study identified significant relationships between AI usage patterns and key learning constructs, causal inferences cannot be established due to the cross-sectional nature of the data.

Further studies could investigate differences between high and low AI users to better understand how varying levels of engagement with AI tools influence self-regulated learning and cognitive load during programming tasks. In addition, incorporating objective performance measures, such as project grades or coding assessment scores, would provide a more comprehensive evaluation of students' academic achievement.

Future research may also explore the role of AI literacy and prompt design skills in enhancing students' ability to effectively utilise AI tools in programming activities. Expanding the study across multiple institutions or educational contexts would improve the generalizability of the findings. Finally, qualitative approaches, such as interviews or think-aloud protocols, could provide deeper insights into how students interact with AI tools during problem-solving and decision-making processes.

Summary

This study examines how final-year Diploma in Information Technology students use Artificial Intelligence (AI) tools during programming project development and how

this relates to self-regulated learning, cognitive load, academic integrity, and perceptions of project outcomes. The findings show that AI tools are widely used particularly for debugging, code generation and understanding programming concepts.

The results indicate positive relationships between AI usage and all four learning constructs. The strongest link was found with self-regulated learning, suggesting that frequent AI use is associated with better learning regulation. Positive relationships were also observed with cognitive load and perceptions of project outcomes while the relationship with academic integrity was moderate.

As a conclusion, the findings suggest that AI tools can support programming project development when used appropriately. However, their impact depends on how students engage with them. This require educators to instruct students in regulating their learning and critically evaluating AI-generated outputs to ensure responsible and meaningful use.

Abstract. Rice diseases are a significant challenge in rice cultivation and can greatly affect crop yield and food security. Early detection is crucial for effective disease management; however, many farmers face difficulties in identifying diseases due to limited access to agricultural experts and diagnostic tools. To address this issue, this study introduces RiDPA-AI (Rice Disease and Pest Analyzer with Artificial Intelligence), a mobile-based application designed to assist farmers in detecting rice diseases and accessing management information through smartphones. The system utilizes image-based analysis to identify common rice diseases, including Bacterial Blight, Brown Spot, and Leaf Blast. The study aims to develop a system capable of identifying common rice diseases, provide farmers with accessible disease management information, and support improved agricultural productivity through early detection and timely intervention. A quantitative evaluation was conducted using a questionnaire distributed to 36 rice farmers to assess usability, knowledge of smart farming technology, and user satisfaction with the application. Descriptive statistics including frequency, mean, and standard deviation were used for data analysis. The results show that the application achieved a very high usability score (M = 4.42) and very high user satisfaction (M = 4.56), while the knowledge construct recorded a high mean score (M = 3.99). These findings indicate that RiDPA-AI is a promising digital tool for supporting rice disease detection and improving decision-making in rice farming.

Keywords: Smart Farming, Rice Disease Detection, Pest Identification, Artificial Intelligence, Mobile Application

Introduction

Smart Farming Technologies (SFT) refers to the use of technologies such as IoT, cloud storage, big data and mobile devices for collection of external environment data and monitoring of crop's growth for the purpose of risk management and timely interventions that can boost the quality and quantity of agriculture produces [4].

Rice is one of the most important food crops globally, serving as a staple for over half of the world's population. However, rice diseases and pests cause significant yield losses each year, threatening global food security [17,15, 5].

Effective real-time and accurate monitoring and forecasting of these diseases and pests are crucial for their control and management.

Currently, the primary method for monitoring rice diseases and pests involves manual surveys in paddy fields. Agricultural technicians visually inspect lesions on rice leaves and stems, then determine the damage grade based on their observations [19]. This method is labor-intensive, time-consuming, and heavily reliant on the surveyors' experience,

leading to variability in accuracy and efficiency. It is inadequate for the real-time monitoring needed to effectively manage rice diseases and pests.

The rapid development of artificial intelligence (AI) has introduced new possibilities for agricultural applications, including plant growth monitoring, health analysis, and yield estimation [24,10, 13]. The YOLO (You Only Look Once) model, known for its real-time target detection capabilities with high precision, has shown promise in agricultural disease and pest detection [21,11, 12].

Researcher [16] mention that the applications of smart farming in rice production have grown rapidly including rice yield estimation, smart rice irrigation systems, monitoring rice disease and growth, and predicting rice quality and classifications. Despite advancements, automatic detection and identification methods for rice diseases and pests have not been widely adopted in field conditions due to challenges such as the need for lab-collected images, the focus on single-lesion identification, and the requirement for manual operation of image acquisition devices. To address these issues, the development of RiDPA-AI, an innovative application designed to revolutionize rice farming by leveraging AI technology for real-time, accurate identification of rice diseases through image classification.

RiDPA-AI, in collaboration with the Malaysian Agricultural Research and Development Institute (MARDI), aims to provide rice farmers with a user-friendly tool to identify and manage diseases such as Brown Spot, Hispa, and Leaf Blast directly from their smartphones. This eliminates the need for bulky printed resources like "*Perosak, Penyakit dan Rumpai Padi di Malaysia*" and enhances the accessibility and efficiency of disease management in rice farming. By addressing these challenges comprehensively, RiDPA-AI seeks to improve crop yields, promote sustainable agricultural practices, and contribute to global food security.

Problem Statement

Despite the availability of technical publications and advisory materials produced by national agricultural institutions, the use of intelligent digital tools for rice disease and pest diagnosis remains limited. There is no widely adopted mobile application that integrates artificial intelligence and image-based analysis to assist farmers in identifying rice crop health issues directly in the field. This technological gap restricts farmers' capacity to detect problems promptly and accurately, especially in situations where expert consultation is unavailable. As a result, crop management decisions are often delayed or based on uncertainty, emphasizing the need for an AI-enabled mobile diagnostic solution such as RiDPA-AI.

In current practice, disease and pest identification is frequently performed using physical reference manuals and printed guides, which are not always practical during routine field inspections. These materials may be inaccessible at critical moments, particularly when farmers require immediate guidance while observing symptoms on-site. The absence of a portable and interactive diagnostic platform limits the effectiveness of existing knowledge resources. A mobile-based system capable of delivering real-time analysis and contextual information can significantly enhance field-level decision-making by providing instant access to relevant crop health insights. Furthermore, insufficient or late identification of rice diseases and pest infestations often leads to suboptimal intervention strategies, contributing to avoidable yield reductions. Such losses directly affect farm profitability and may threaten the long-term sustainability of rice production systems. Without an efficient mechanism for early detection and informed response, farmers remain vulnerable to recurring production

challenges. Therefore, the development of RiDPA-AI is essential to strengthen diagnostic capability, support proactive crop management, and improve overall productivity in rice farming.

Objective

The aims of this project are:

- To develop a system to identify common rice diseases such as Bacterial Blight, Brown Spot, and Leaf Blast.
- To provide farmers with accessible disease management information via smartphones.
- To enhance crop yields and food security through timely disease detection and management

Scope Of the Study

This study defines the scope of the RiDPA-AI system in four key areas: user scope, system scope, administrative scope, and geographical scope to clearly identify the boundaries and intended use of the system.

The user scope includes several groups involved in rice cultivation and agricultural learning. Farmers are the main users of the system, as RiDPA-AI helps them identify rice diseases and pests quickly using a mobile application and provides guidance on disease management to support better farming decisions. Students in agriculture-related fields can also use the system as a learning tool to understand rice diseases, their symptoms, and appropriate control methods. In addition, researchers and agricultural extension officers may utilize the system as a reference and advisory tool to assist in field diagnosis and farmer consultations.

The system scope focuses on three main functions. First, the system includes an AI-based image classification feature that identifies common rice diseases such as Brown Spot, Bacterial Leaf Blight, and Leaf Blast through visual analysis. Second, the system provides a digital reference resource containing information about rice diseases, symptoms, causes, and management practices. Third, RiDPA-AI includes an agricultural input shop directory that helps users locate nearby suppliers of farming products related to pest and disease management.

The administrative scope involves system monitoring and content management. Administrators are responsible for maintaining system performance, ensuring reliability, and updating disease-related information to keep the platform accurate and useful for users.

Finally, the geographical scope of the study focuses on rice-producing areas in Malaysia. The system is designed based on local agricultural conditions and disease patterns. However, the framework is flexible and can potentially be expanded to other rice-growing regions in the future.

Literature Review

Recent advances in smart farming by [8] integrated the artificial intelligence (AI), deep learning (DL), and mobile computing to address crop health monitoring, disease identification, and pest detection. Deep learning techniques, particularly Convolutional Neural Networks (CNNs) and object detection models, have been widely applied due to their capacity to automatically extract discriminative features from crop images and

deliver high-accuracy classification outcomes. This shift from traditional manual scouting to automated AI systems is critical for enhancing food security and increasing farming efficiency worldwide.

While study done by [23] on deep learning in agricultural disease and pest detection highlights the transition from handcrafted feature methods to end-to-end AI pipelines capable of detecting and classifying disease symptoms and pest damage have become foundational in smart farming research and implementation.

Researcher by [3] developed a smartphone app using an ensemble of DenseNet-121, SE-ResNet-50, and ResNeSt-50 models to automatically detect six rice diseases, achieving an overall accuracy of 91%. Recognition occurs via a web-hosted server, facilitating field diagnosis of diseases like blast and sheath blight.

Researcher by [18] evaluated ShuffleNet, MobileNetV2, and EfficientNet-B0 for mobile-compatible disease detection. EfficientNet-B0 delivered outstanding performance with 99.8% accuracy, while being resource-efficient enough for deployment on smartphones.

Researcher [2] developed a mobile-based models using YOLOv5s and YOLOv7-tiny for offline rice disease and insect pest detection on Android devices. By integrating lightweight object detection architectures with mobile deployment, the study achieved accurate localization and classification of disease instances, demonstrating that mobile phones can host robust AI models for real-field diagnosis without continuous internet dependency.

Another study by [22] showed that mobile CNN models (e.g., MobileNetV2) achieve competitive performance in real-time rice disease classification tasks running on resource-limited mobile devices, which is necessary for applicability in rural and low-connectivity contexts.

A study implementing by [9] mention that YOLOv3 tiny and YOLOv4 tiny deployed these lightweight object detection models in the Android app "E Crop Doctor." After converting to TensorFlow Lite, the app enables offline, real time rice disease diagnoses (brown spot, leaf blast, hispa) via the device camera.

A Frontiers study by [6] introduced a GAN-MSDB-ResNet architecture that achieved 99.34% recognition accuracy, outperforming ResNet-50 and other classical models. It showed strong robustness in handling complex field backgrounds and diverse feature patterns. While [7] mention that an AI-IoT smart farming frameworks merge sensors with AI models for broader plant disease detection and precision treatment strategies, highlighting the importance of data fusion and hybrid systems to complement mobile insights.

Mobile apps combined with chatbots (e.g., E-crop doctor) extend functionality by offering real-time diagnostic guidance and farmer support, demonstrating a trend toward comprehensive smart farming apps [9].

Methodology

The development of the Rice Disease and Pest Identification (RiDPA-AI) system follows the Agile methodology as shown in Figure 1.

Fig 1: Methodology Using AGILE Method

The development of RiDPA-AI followed an iterative and user-centred approach. Initially, system requirements were identified through engagements with farmers, agricultural officers, and researchers to clarify functional needs and prioritize core features. Based on these inputs, the system architecture and user interface were designed using prototypes and iterative design refinement to ensure usability and alignment with stakeholder expectations.

Application development proceeded incrementally through planned iterations, focusing on the integration of AI-based image classification by using Convolutional Neural Networks (CNNs) model, database management, and mobile interface components. System reliability was evaluated through component-level testing, integrated system testing, and real-world user validation. Following successful validation, the application was deployed in controlled and production environments, accompanied by performance monitoring. Continuous review and stakeholder feedback were incorporated throughout the process to support system refinement and long-term improvement.

Software Requirements

The development of the system utilizes several software tools to support programming, application development, and data management. Arduino IDE is used as the main programming environment for coding, compiling, and uploading programs to Arduino microcontroller boards. It supports multiple operating systems and allows developers to write programs using simplified C/C++ syntax. The platform also provides built-in libraries that facilitate input and output operations, making it suitable for embedded system development.

Flutter is used to develop the mobile application interface. It is an open-source software development kit created by Google that enables developers to build high-performance applications for multiple platforms, including mobile, web, and desktop, using a single codebase. By using the Dart programming language, Flutter helps create responsive and consistent user interfaces while reducing development time and cost.

Firebase Realtime Database serves as the cloud-based backend system that enables real-time data communication between the application and connected

devices. It stores and synchronizes data instantly across users and devices, ensuring that information remains updated. Firebase also supports offline data storage, allowing the application to continue functioning even when the internet connection is temporarily unavailable.

Overall, these software tools work together to support efficient system development, real-time data processing, and user-friendly mobile application functionality.

Framework

Figure 2 shows the framework that represents an end-to-end mobile-based system designed to support real-time rice disease and pest identification in field conditions.

The RiDPA-AI framework illustrates a process that begins with image acquisition, where farmers capture rice plant images directly from the field using a smartphone application. These images undergo image preprocessing to enhance quality and standardize inputs before being fed into a deep learning model. To strengthen this stage, advanced AI algorithms, particularly convolutional neural networks (CNNs) model, are utilized for image processing and classification. CNNs model is ability to identify diseases at an early stage. Within the framework, CNN-based architectures operate during feature extraction, model training, and validation, enabling the system to automatically learn discriminative patterns associated with rice diseases such as Brown Spot, Bacterial Leaf Blight, and Leaf Blast.

The core of the framework involves feature extraction, model training, and validation, where convolutional neural network–based architectures learn disease-specific characteristics from the dataset. To further enhance performance, established deep learning models such as ResNet, MobileNet, or EfficientNet can be incorporated through transfer learning, allowing the system to achieve higher accuracy even with limited or variable field data. Once trained, the optimized model is saved as a model binary and deployed for inference.

During operation, users can either capture a new image or import an existing one through the mobile application. The system performs model simulation and prediction, returning the identified disease or pest along with a confidence score directly on the mobile interface. The framework also incorporates a cloud server that enables bidirectional communication when internet connectivity is available. This allows application logs to be uploaded for monitoring and analysis, while updated or improved models can be downloaded to the mobile device. Overall, RiDPA-AI integrates mobile computing, deep learning, and cloud support into a unified smart farming framework that enhances accessibility, scalability, and timely decision-making for rice crop health management.

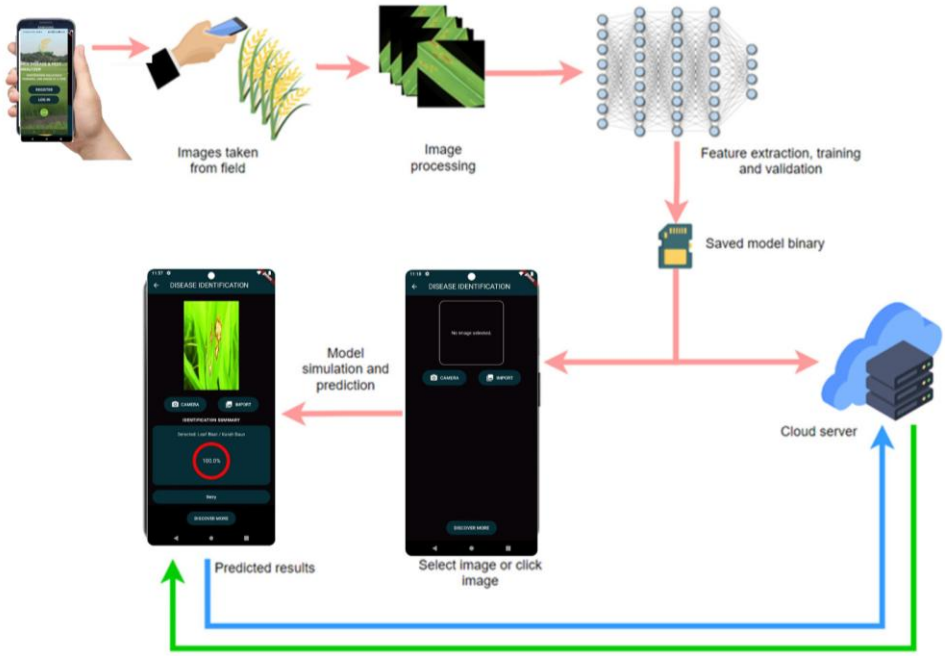

Fig 2: Framework of Rice Disease and Pest Identification(RiDPA-AI).

Flowchart

As shown in Figure 3, the RiDPA-AI flow chart outlines the operational workflow of the mobile application from user access to diagnostic output. The process begins when the RiDPA-AI application is launched, followed by a user authentication stage where the user logs in using a valid email and password. If the login attempt is unsuccessful, the system redirects the user back to the login interface until correct credentials are provided. Upon successful authentication, the user gains access to the Disease Identification module.

Within this module, the user is prompted to capture a new image or upload an existing image of the affected rice plant. The system then performs an image validation step to assess whether the uploaded image is clear and relevant for analysis. If the image is blurred or irrelevant, the application flags it as an invalid image and does not proceed with diagnosis. If the image passes validation, the system processes the image using the embedded AI model and displays the disease or pest diagnosis to the user.

After receiving the diagnostic result, the user is given the option to explore additional information related to the identified disease or pest. If the user chooses to learn more, the application opens an E-Book or knowledge resource that provides further guidance and insights. If no further information is required, the user may exit the application, thereby completing the RiDPA-AI workflow. Overall, the flow chart demonstrates a user-centric, logical, and streamlined process that supports efficient rice disease and pest identification while offering optional educational support for informed decision-making.

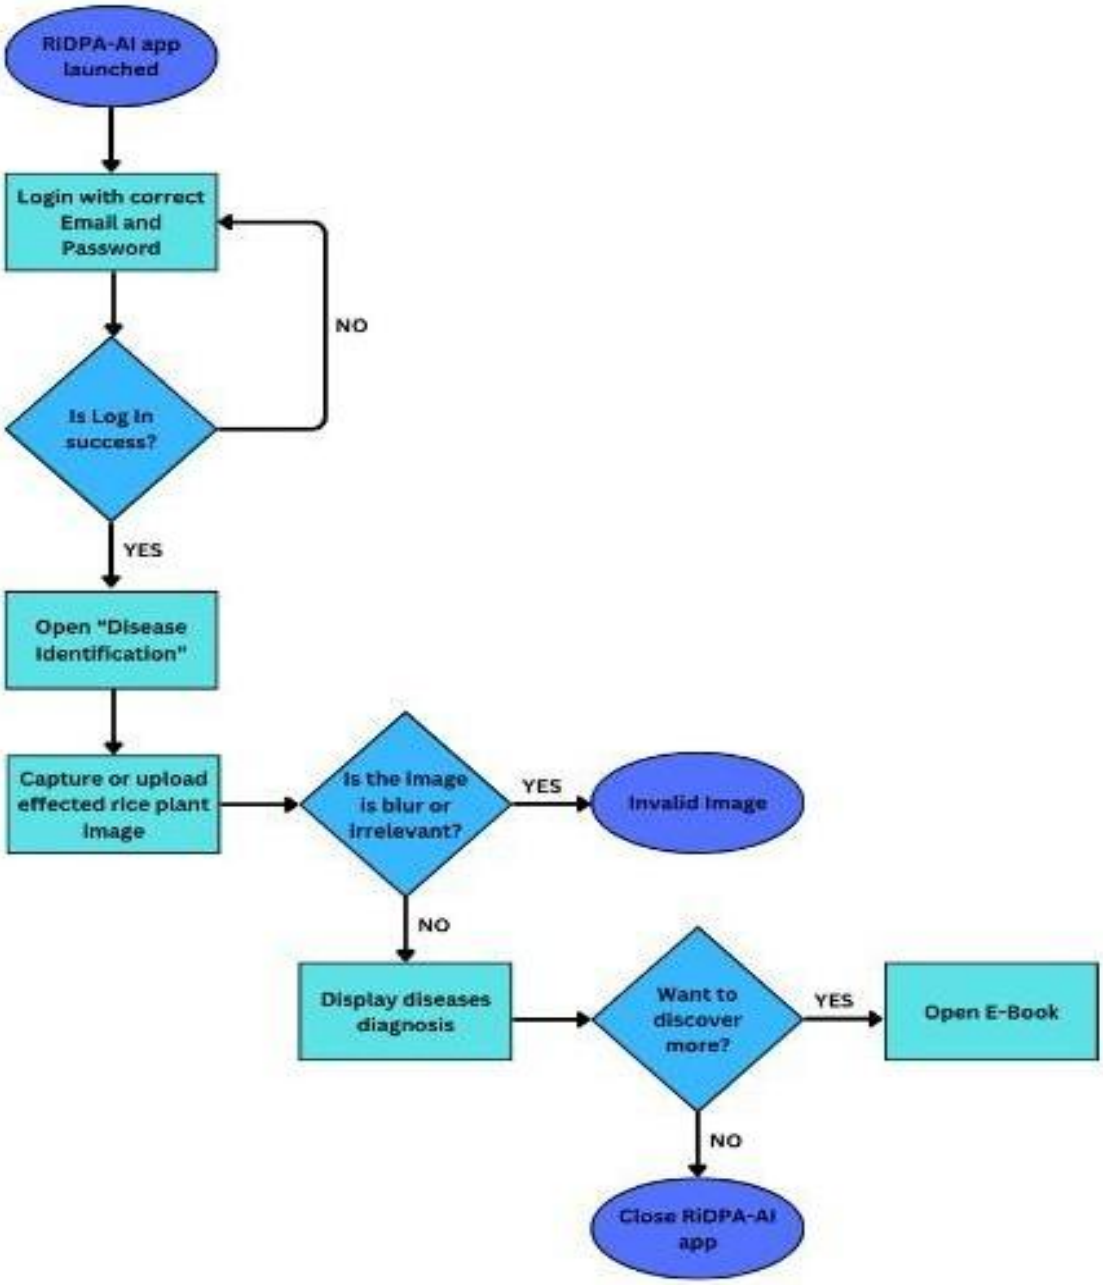

Fig 3: Flowchart of Rice Disease and Pest Identification(RiDPA-AI).

Data and Analysis of Rice Disease Classification

Dataset Distribution

Table 1: Dataset Distribution

Disease Class	Number of Images	Percentage (%)
Brown Spot	400	33.33
Bacterial Leaf Blight	400	33.33
Leaf Blast	400	33.33
Total	**1200**	**100.00**

The dataset used for training and evaluation consists of 1200 rice leaf images, categorized into three disease classes as shown in Table 1.

Model Performance Analysis

The CNN-based model was evaluated using standard performance metrics, including accuracy (overall correctness), precision (purity of positive predictions), recall (completeness of finding positives), and F1-score (harmonic balance between precision and recall). The classification results for each disease category are summarized in Table 2.

Table 2**:** Classification Performance by Disease Class

Disease Class	Precision	Recall	F1-Score
Brown Spot	0.92	0.90	0.91
Bacterial Leaf Blight	0.95	0.93	0.94
Leaf Blast	0.94	0.95	0.94
Overall Average	**0.94**	**0.93**	**0.93**

The results indicate that the CNN-based model performs consistently well across all three disease categories. Bacterial Leaf Blight achieved the highest precision (0.95), suggesting that the model is highly accurate in identifying this disease with minimal false positives. Leaf Blast recorded the highest recall (0.95), indicating strong capability in correctly detecting most of the actual cases.

Brown Spot shows slightly lower recall (0.90), which may be attributed to visual similarities with other diseases, especially in early stages where symptoms overlap. This suggests that misclassification may occur when distinguishing subtle texture and color differences.

Overall, the model achieved an average F1-score of 0.93, demonstrating a balanced performance between precision and recall. The results confirm that the CNN approach is effective for multi-class classification of rice diseases, even with a relatively small dataset.

Results and Findings

The population of this study consisted of paddy farmers at Mukim Jeram,Tunjang, Jitra Kedah. The researchers distributed the study instrument (a survey questionnaire) to 36 respondents who were randomly selected as the sample for this study.

A pilot test was conducted to check the clarity and usability of the RiDPA-AI mobile-based analyzer, evaluate farmers perceived knowledge gains related to smart farming technology, and assess user satisfaction with the application interface and information delivery. The pilot test also aimed to identify survey items that may require revision before full-scale deployment. A total of 15 respondents participated in the pilot study. The results show that the overall questionnaire achieved a Cronbach's Alpha value of 0.845, indicating high reliability. All questionnaire items were adapted from different studies [26, 27] with little modifications of words and sentences in accordance with the current study.

The mean value of this study is translated according to the following translations:

Table 3: Mean Score Interpretation

Mean Score	Interpretation
1.00 - 1.80	Very Low
1.81 – 2.60	Low
2.61 – 3.20	Medium
3.21 – 4.20	High
4.21- 5.00	Very High

(Source:adapted from Moidunny, 2009)

A total of 36 sample questionnaires were distributed to 36 paddy farmers at Mukim Jeram, Tunjang, Jitra Kedah. The respondents' self-information was analyzed using Descriptive Statistics Analysis using frequency and percentage distribution. **Table 4** refers to demographic analysis.

Table 4: Demographic Analysis

Demographic	Category	Frequency	Percent (%)
Gender	Male	36	100.00
Age	25-35	2	5.56
	36-45	2	5.56
	46-60	8	22.22
	More than 61	24	66.67
Race	Chinese	6	16.67
	Malay	30	83.33
Paddy Field Area	1-4 Acre	10	27.78
	5-8 Acre	11	30.56
	9-12 Acre	15	41.67

The results in Table 4 show that all respondents were male (100%). This finding reflects the current demographic structure of rice farming communities in many rural agricultural areas, where paddy cultivation is predominantly managed by male farmers. The absence of female respondents may indicate that male farmers are more directly involved in operational activities such as crop monitoring, pest control, and technology adoption in the field. Most participants were older adults, with 66.67% over 61 years

old, followed by 22.22% aged 46–60, and smaller proportions in the younger age groups. Regarding ethnicity, the majority of respondents were Malay (83.33%), while 16.67% were Chinese. In terms of paddy field size, the largest group of respondents cultivated 9–12 acres (41.67%), followed by 5–8 acres (30.56%), and 1–4 acres (27.78%).

Table 5: Usability Of Application

Items	Mean	Std. Deviation	Interpretation
This application is easy to use	4.14	0.9	High
I enjoy using this application	4.39	0.64	Very High
This application has clear presentation	4.50	0.70	Very High
This application is suitable for all user	4.61	0.69	Very High
This application is attractive	4.47	0.70	Very High
TOTAL	**4.42**		**Very High**

Table 5 indicates that users rate the RiDPA-AI application's overall usability as very high, with an average score of 4.42. This reflects that the application is generally seen as user-friendly, well-structured, and effective for assisting in rice disease and pest identification. Such positive perceptions suggest strong acceptance among farmers, which is crucial for continued adoption of mobile smart farming tools.Most individual items also received very high ratings. The statement "This application is suitable for all users" scored the highest (M = 4.61), highlighting that farmers believe the app can be used by individuals with varying digital skills. The clarity of the application's presentation (M = 4.50) was also highly appreciated, indicating that its outputs are easy to understand, which is vital for making timely agricultural decisions.

Additionally, respondents responded positively to the app's visual appeal and enjoyable experience ("This application is attractive," M = 4.47; "I enjoy using this application," M = 4.39). These factors enhance user engagement and increase the likelihood of repeated use and recommendations.

Table 6: Knowledge on smart farming technology (RiDPA-AI)

Items	Mean	Std. Deviation	Interpretation
I am familiar with RiDPA-AI	3.92	0.5	High
It is easy for me to learn to operate RiDPA-AI	4.00	0.41	High
I know how to use RiDPA-AI	4.00	0.41	High
I can share the information about RiDPA-AI with other farmers	4.06	0.41	High
TOTAL	**3.99**		**High**

Table 6 shows that farmers' knowledge regarding smart farming through the RiDPA-AI application is generally high, with an overall mean of 3.99. This suggests that users feel reasonably confident in their ability to understand and utilize the app for

rice disease and pest management.All items received high ratings, reflecting consistent perceptions across different knowledge aspects. The highest score was for the statement "I can share the information about RiDPA-AI with other farmers" (M = 4.06), indicating that respondents feel capable of explaining the app's functions and benefits to peers—a positive sign for promoting wider adoption.

Items related to ease of learning and operating the application ("It is easy for me to learn to operate RiDPA-AI" and "I know how to use RiDPA-AI," both M = 4.00) were also rated highly, reinforcing the idea that the app is user-friendly. The lowest-rated item, "I am familiar with RiDPA-AI" (M = 3.92), suggests that some users are still becoming accustomed to the technology, likely due to limited prior exposure.

Table 7: Satisfaction in Using the Application

Items	**Mean**	**Std. Deviation**	**Interpretation**
Design of the application is attractive	4.58	0.65	Very High
Solutions provided is easy to understand	4.64	0.59	Very High
Link are consistent	4.47	0.77	Very High
Link are easy to identify	4.56	0.65	Very High
Layout are consistent	4.56	0.65	Very High
TOTAL	**4.56**		**Very High**

Table 7 presents users' satisfaction with the RiDPA-AI application, showing an overall very high level with a mean of 4.56. This indicates that respondents were highly pleased with the app's performance in supporting rice disease and pest identification, which is important for encouraging continued use and peer recommendations in farming communities.

All aspects of the application received very high ratings. The clearest and most actionable item was "Solutions provided are easy to understand" (M = 4.64), highlighting that farmers value guidance that can be quickly applied in the field. The app's design also scored highly (M = 4.58), suggesting that visual appeal enhances user experience and engagement.

Navigation and interface consistency were also praised, with "Links are easy to identify" and "Layouts are consistent" both rated 4.56, indicating smooth and intuitive operation. The lowest-rated item, "Links are consistent" (M = 4.47), still falls in the very high category, though some users noted minor inconsistencies, pointing to opportunities for refinement.

Table 8: Overall of this application

Overall of this Application	**Frequency**	**Percent**
Poor	0	0
Fair	0	0
Satisfactory	1	2.78
Very good	12	33.3
Excellent	23	63.89
Total	**36**	**100.0**

Table 8 presents the overall evaluation of the RiDPA-AI application by 36 respondents. The majority rated the application very positively, with 33.3% indicating "Very good" and 63.9% selecting "Excellent." Only a single respondent (2.78%) considered the application "Satisfactory," while no participants rated it as "Fair" or "Poor." These results suggest that most users have a highly favorable view of the application's performance and overall quality.

Table 9: Are you going to use this application?

Are you going to use this application?	**Frequency**	**Percent**
YES	34	94.44
NO	2	5.56
Total	**36**	**100.0**

Meanwhile Table 9 shows respondents' intentions to continue using the RiDPA-AI application. Out of 36 participants, 34 (94.44%) indicated that they plan to use the application, while only 2 (5.56%) stated they would not. This demonstrates a strong willingness among users to adopt and continue utilizing the system.

Table 10: Correlation Analysis between constructs

Variables		**Usability**	**Knowledge**	**Satisfaction**
Usability	Pearson Correlstion	1	0.157	**0.606***
	Sig. (2-tailed)		0.362	0.000
Knowledge	Pearson Correlstion	0.157	1	0.320
	Sig. (2-tailed)	0.362		0.057
Satisfaction	Pearson Correlstion	**0.606***	0.320	1
	Sig. (2-tailed)	0.000	0.057	

The Pearson correlation analysis showm as Table 10 revealed that Usability and Satisfaction are strongly and significantly correlated ($r = 0.606$, $p < 0.001$), indicating that participants who perceive the RiDPA-AI application as easy to use, visually clear, and engaging report higher satisfaction. Knowledge showed a moderate positive correlation with satisfaction ($r = 0.320$, $p = 0.057$), suggesting that familiarity with the application slightly enhances satisfaction, though this relationship is marginally significant. In contrast, Usability and Knowledge were weakly correlated ($r = 0.157$, $p = 0.362$), implying that prior knowledge does not meaningfully influence perceptions of usability. These findings highlight that usability is the primary driver of user satisfaction, while knowledge contributes to a lesser extent. Designing intuitive and user-friendly interfaces is therefore critical for maximizing satisfaction, especially for older or less tech-experienced farmers.

Overall, the results demonstrate that the RiDPA-AI mobile-based analyzer is well received by paddy farmers, with very high scores in usability and satisfaction and high scores in knowledge acquisition. The findings suggest that the application is practical, easy to use, and beneficial for supporting rice disease and pest identification.

Despite the relatively older age of respondents, the high usability score indicates that the application design successfully accommodates farmers with varying levels of

technological familiarity. This highlights the importance of user-centered design in agricultural technology development. The results also suggest that improvements in usability will most effectively enhance user satisfaction and support broader adoption of smart farming technologies like RiDPA-AI. These results support the potential of RiDPA-AI as a smart farming tool that can enhance disease detection, improve decision-making, and promote digital transformation in agriculture.

Conclusion

This study presents the development of RiDPA-AI (Rice Disease and Pest Analyzer with Artificial Intelligence), a mobile-based application designed to support farmers in identifying common rice diseases and accessing relevant management information through a smartphone platform. The system focuses on the detection of major rice diseases, namely Bacterial Leaf Blight, Brown Spot, and Leaf Blast, while also providing accessible knowledge resources to facilitate informed decision-making in crop management.

From a technical perspective, the system integrates a deep learning approach based on convolutional neural networks framework to enable efficient image processing and real-time classification. The model was trained and evaluated using a dataset of 120 annotated rice leaf images, evenly distributed across the three disease classes. Performance evaluation results indicate that the model achieved an overall precision of 0.94, recall of 0.93, and F1-score of 0.93, demonstrating reliable classification capability. The confusion matrix analysis further confirms that the model performs consistently across all categories, with only minor misclassification observed between visually similar disease types.

In terms of user evaluation, the findings reveal a very high level of usability (M = 4.42) and satisfaction (M = 4.56), along with a high level of user knowledge (M = 3.99). These results suggest that the application is not only technically effective but also user-friendly and suitable for practical use in real farming environments. The strong correlation between usability and satisfaction further highlights the importance of intuitive system design in encouraging technology adoption among farmers.

Overall, the study demonstrates that RiDPA-AI has significant potential as a smart farming solution that combines technical accuracy with practical usability. The integration of AI-based classification with a mobile application platform enables early detection of rice diseases, supports timely intervention, and reduces the risk of yield loss.

In conclusion, RiDPA-AI contributes to the advancement of digital agriculture by providing an effective, accessible, and scalable tool for crop health monitoring. Future work will focus on expanding the dataset, improving model robustness under diverse field conditions, and enhancing system functionality to support a wider range of agricultural applications.

Abstract. This study presents the design and implementation of OSHA SafetyNet, a smart and integrated safety management system developed to address limitations in conventional safety practices within laboratory and workshop environments at Politeknik Seberang Perai. Traditional safety management methods often rely on fragmented documentation and manual procedures, leading to inconsistent safety monitoring and limited hazard awareness among users. To overcome these challenges, OSHA SafetyNet integrates a web-based platform for administrators and safety personnel with a mobile application designed for students. This study presents the design and implementation of OSHA SafetyNet, a smart and integrated safety management system developed to address limitations in conventional safety practices within laboratory and workshop environments. Unlike existing systems that operate in isolation, OSHA SafetyNet uniquely integrates augmented reality (AR)-based evacuation visualization, real-time hazard reporting, and a dual-platform architecture (web–mobile ecosystem) into a unified framework tailored for polytechnic environments. The system was developed using Agile methodology and evaluated quantitatively with 47 respondents. Results indicate very high usability (M = 4.72–4.87), safety awareness (M = 4.68–4.89), and user satisfaction (M = 4.70–4.91), demonstrating its effectiveness in enhancing hazard awareness and supporting proactive safety management.

Keywords: Augmented reality (AR); safety; workplace hazards; mobile application; safety management.

Introduction

Safety awareness is a fundamental component in preventing workplace accidents across educational and industrial environments. However, conventional safety practices in polytechnic laboratories remain largely manual, fragmented, and instructor-dependent, limiting both consistency and student engagement. Therefore, an effective safety management system is essential to enhance awareness, detect potential dangers, provide early warnings, and implement preventive measures to minimize incidents. With technological advancements, information technology-based safety systems, such as the Safety Awareness System (SAS), have become increasingly popular in supporting safety monitoring and accident prevention. However, existing systems still have shortcomings, particularly providing fast and interactive access to safety information for users. [1] Previous studies emphasize that effective Occupational

Safety and Health (OSH) management plays a critical role in preventing workplace accidents.

According to [3] Occupational Safety and Health (OSH) is a performance standard designed to protect employees working in both laboratory and industrial area. This act has been implemented in the academic community and essentially replaced safety education among students to develop strong safety ethics.

To address these challenges, OSHA SafetyNet has been introduced as an integrated safety system designed to enhance awareness and risk management in educational environments, specifically at Polytechnic Seberang Perai. This system provides real-time monitoring and early warning functions to detect hazards in workshops, laboratories, and workplaces and notify users and relevant authorities.

Additionally, OSHA SafetyNet is equipped with an interactive safety database that includes comprehensive safety guidelines, preventive measures, and emergency procedures. It also features safety training videos that serve as interactive guides to help users understand safety protocols, protective gear recommendations, emergency plans, and evacuation routes.

Furthermore, OSHA SafetyNet offers an Injury Tracker Module, enabling users to record and report incidents systematically. This data helps management assess the overall safety level and take necessary corrective actions to improve preventive measures. Additionally, the system provides visual safety materials, such as images and infographics, to help users recognize potential hazards more effectively. With these features, OSHA SafetyNet functions not only as a safety monitoring tool but also as an educational platform that fosters a safer, more controlled, and well-prepared learning and working environment.

Problem Statement

Safety management in polytechnic workshops and laboratories faces several critical challenges that increase the risk of accidents and unsafe practices. One major issue lies in the conventional delivery of safety briefings, which are commonly conducted verbally by instructors. This approach often results in low student engagement, inconsistent information delivery, and poor retention of essential safety instructions, limiting their effectiveness in influencing safe behavior.

Another significant problem is the reliance on manual, paper-based methods for accident and injury reporting. Such practices are inefficient, difficult to organize, and time-consuming to analyze, making it challenging to identify recurring safety issues or implement timely corrective actions. Consequently, similar incidents may continue to occur due to delayed or inadequate responses.

Additionally, negligence in the use of personal protective equipment (PPE) remains a persistent concern. Despite established safety regulations, many students fail to wear PPE correctly or consistently, largely due to insufficient guidance and lack of practical demonstration. This weakens safety discipline and exposes individuals to avoidable hazards.

These challenges highlight the need for a digital, structured, and engaging safety management approach that can improve awareness, streamline reporting, and promote consistent compliance with safety practices in workshop and laboratory environments.

Objective

The aims of this project are:

(i) To develop a digital safety briefing module with videos and galleries to help students understand and remember safety rules.

(ii) To implement a hazard reporting feature that allows users to submit safety concerns and incidents for review.

(iii) To provide videos and galleries that show the correct way to wear PPE before students enter the workshop.

Scope Of Work

The scope of this project focuses on developing OSHA SafetyNet, an integrated digital system designed to enhance safety management, compliance monitoring, and emergency preparedness in educational and training environments such as workshops and laboratories at Polytechnic Seberang Perai. The project involves two main user groups which are students and lecturers who use the mobile application, and safety officers who manage data through the web-based platform.

The mobile app enables users to view safety briefings, access AR-based escape plans, learn proper PPE usage, and report incidents in real time. Meanwhile, safety officers can update safety policies, monitor reports, generate dashboards, and analyze safety data. The system development covers modules such as digital safety briefings, AR emergency simulations, PPE management, incident and hazard reporting, emergency contacts, and analytical dashboards. The system is developed using web technologies (HTML, CSS, PHP, JavaScript, MySQL) and Unity for AR integration, hosted on a cloud platform for accessibility. Overall, the scope of OSHA SafetyNet encompasses system design, development, and testing to ensure that all users can easily access and manage safety information, thus promoting a safer and more proactive learning environment.

Literature Review

The advancement of digital solutions in workplace safety management has been widely studied, with research emphasizing the effectiveness of technology-driven approaches in reducing accidents, improving compliance, and enhancing emergency response. Various studies provide insights into key aspects of workplace safety, reinforcing the necessity of a structured and technology-integrated approach such as OSHA SafetyNet.

Recent research by [9] highlights the growing role of digital technologies in enhancing occupational safety and health (OSH) awareness, particularly through mobile applications and immersive tools. Smartphone-based solutions have been systematically reviewed, indicating that mobile apps are increasingly used to support workplace health, safety education, hazard reporting, and well-being, although evidence on their effectiveness remains limited and underexplored in academic settings.

Augmented Reality (AR) has emerged as a promising technology to enrich safety training by overlaying digital information onto real environments, providing context-aware and interactive learning experiences. A comprehensive meta-analysis of AR safety training found that AR applications significantly improve engagement and

training outcomes across multiple industries, though long-term retention is not consistently measured [4] Empirical research by [16] on AR in vocational contexts supports this trend, showing that AR systems can provide repetitive, real-time hazard warnings that help learners recognize unsafe actions more quickly and effectively.

Researcher [1] in their study mentioned that specific to laboratory environments, immersive AR training has been validated experimentally, demonstrating superior performance in knowledge acquisition, self-efficacy, and motivational impact compared with traditional video training methods. In a related study by [1], acceptance research on AR-based laboratory safety training found that users perceived such systems as useful and suitable for reducing real-world risk by enabling safe practice of hazardous procedures.

Applications combining AR and mobile interfaces have also been evaluated for their usability and motivational potential in occupational safety programmes. For example, the AR-based HazHunt application showed positive impacts on OSH training effectiveness and high usability scores, reinforcing the value of interactive digital tools [8]. Beyond training, research from public health fields by researcher [15] indicates that smartphone applications can improve worker safety knowledge and attitudes, with users of OHS apps reporting higher hazard awareness and fewer reported injuries than non-users.

Moreover, studies on digital communication for workplace safety by [5] shows that mobile and web platforms facilitate real-time safety alerts, incident reporting, and hazard detection, although barriers such as digital literacy, privacy, and cost persist, especially for small organizations. The trend toward integrated digital OHS tools aligns with research advocating digital innovations — including AI, IoT, and AR/VR — to empower workers and support proactive safety management across diverse hazardous work settings [2].

Complementary research on personal protective equipment (PPE) by [10] confirms that effective training and contextual guidance are essential to bridge gaps between PPE availability and correct usage, further underscoring the importance of engaging educational modules in safety systems.

Collectively, these studies demonstrate that mobile and immersive technologies, when incorporated into structured safety programs, can enhance hazard recognition, improve user engagement, and support proactive safety behaviors in both industrial and academic environments. However, limited research has specifically addressed integrated frameworks that combine AR, mobile reporting, and safety dashboards in polytechnic laboratory and workshop contexts, revealing a gap that OSHA SafetyNet aims to fill.

Mobile applications have been increasingly developed to support occupational health and safety (OHS) education in practical learning contexts. Researcher [12] documented a mobile app designed for vocational high school students to improve understanding of safety protocols during practicum activities in workshop environments. Their evaluation demonstrated high levels of material and media suitability, indicating that digital learning resources can effectively complement conventional lab instruction and enhance OHS awareness among learners. Similarly, a broader study by [11] examining mobile applications for OHS awareness revealed that smartphone-based platforms significantly elevate safety knowledge compared to traditional learning methods, suggesting that interactive digital tools can produce measurable improvements in user understanding and risk prevention behavior.

Recent application-level research by [6] has also evaluated AR for laboratory safety training. Ismael and colleagues developed an AR system called “SMARTLab”

to facilitate safety learning in hazardous laboratories. Participants rated the system as useful and expressed willingness to use it, demonstrating that AR can function as an effective alternative to conventional safety briefings by providing realistic simulations without exposing users to actual hazards. Another AR project by [7] focused on safety guidebooks for electrical laboratory practice, showing that AR-based instructional media can enhance students' engagement with safety procedures in technical labs.

Table 1: Comparison of Existing Studies and OSHA SafetyNet

Study	Technology Used	Key Contribution	Limitation	Gap Addressed by OSHA SafetyNet
[4] AR Meta-analysis	AR	Improve engagement	No integration with reporting	Integrates AR + reporting
[9] Mobile Apps	Mobile apps	Safety awareness	Lack of immersive features	Adds AR-based interaction
[6] SMARTLab	AR system	Lab safety training	Standalone system	Integrated ecosystem
[11] Mobile OHS App	Mobile learning	Knowledge improvement	No real-time monitoring	Real-time hazard reporting
This Study	AR + Mobile + Web	Integrated safety ecosystem	-	-

Methodology

The development of the OSHA SafetyNet system follows the Agile methodology, ensuring flexibility, iterative development, and continuous improvement throughout the project lifecycle. This approach allows for incremental progress, enabling stakeholder feedback at each stage to refine the system based on real-world safety requirements as shown in Figure 1.

The development of the OSHA SafetyNet system follows a structured and systematic process to ensure alignment with user needs and institutional safety objectives. The project begins with a planning phase that identifies key safety management challenges in workshops and laboratories, including limited safety awareness, weak emergency preparedness, and inefficient incident documentation. Based on these issues, clear objectives, scope, and development strategies are established. An Agile methodology is adopted to support flexibility, iterative improvement, and continuous stakeholder feedback.

Requirement gathering is conducted through interviews, surveys, and analysis of existing safety platforms to understand user expectations, regulatory requirements, and operational constraints. A feasibility study further evaluates the technical and operational viability of the proposed system. The outcomes are consolidated into a comprehensive system requirements specification.

Fig 1: Methodology Using AGILE Method

The design phase focuses on defining system architecture, user roles, and interface layout. Core modules such as incident reporting, emergency response, safety monitoring, and analytics dashboards are designed alongside intuitive user interfaces and structured database models.

The design of OSHA SafetyNet system includes Platform Design and System Design comprises of several interactive features as shown in Figure 2.

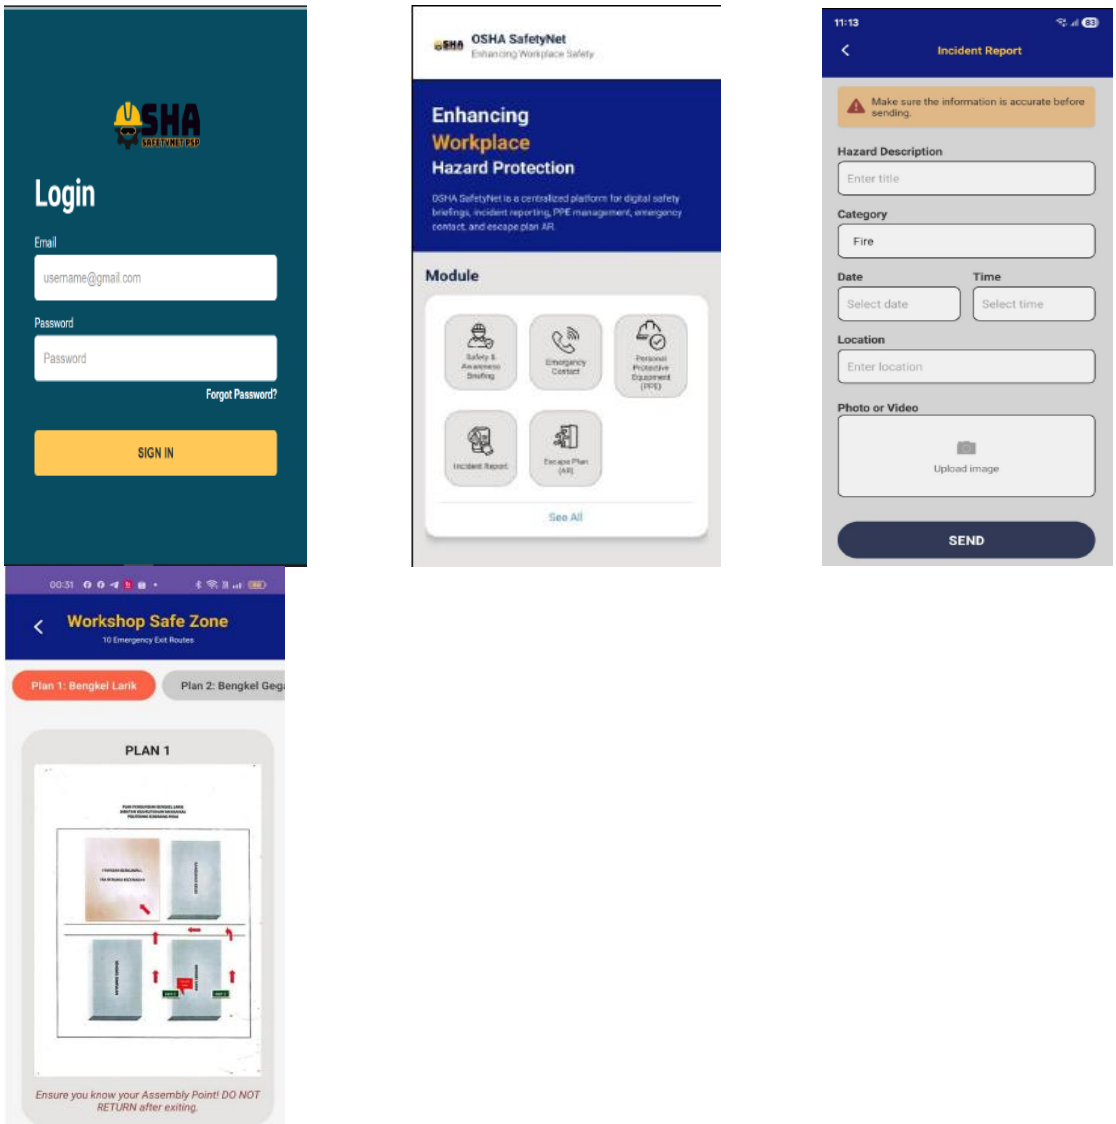

Fig 2: System Design of OSHA SafetyNet

During development, system features are implemented iteratively across multiple sprints, integrating real-time monitoring, secure access control, and data analytics. Continuous testing and refinement occur throughout development. Comprehensive testing, including unit, integration, user acceptance, security, and performance testing, ensures system reliability and readiness.

Finally, the system is deployed on a cloud platform, supported by user training, documentation, and ongoing maintenance. The Agile approach enables continuous enhancement, ensuring OSHA SafetyNet remains effective, scalable, and responsive to evolving workplace safety needs.

Results and Findings

The population of this study consisted of respondents from the Department of Mechanical at the Polytechnic Seberang Perai of Malaysia. The researchers distributed the study instrument (a survey questionnaire) to 47 respondents who were randomly selected from the programs as the sample for this study.

A pilot test was conducted to assess the reliability of the questionnaire before the actual data collection. A total of 15 respondents participated in the pilot study. The reliability of the instrument was analyzed using Cronbach's Alpha to measure internal consistency for each construct: Usability of Application, Occupational Health and Safety Awareness, and Satisfaction in Using the Application. The results show that the overall questionnaire achieved a Cronbach's Alpha value of 0.912, indicating excellent reliability. All questionnaire items were adapted from different studies [21, 22, 23] with little modifications of words and sentences in accordance with the current study.

The mean value of this study is translated according to the following translations:

Table 2: Mean Score Interpretation

Mean Score	**Interpretation**
1.00 - 1.80	Very Low
1.81 – 2.60	Low
2.61 – 3.20	Medium
3.21 – 4.20	High
4.21- 5.00	Very High

(Source:adapted from Moidunny, 2009)

A total of 47 sample questionnaires were distributed to students of the Department of Mechanincal, Polytechnic Seberang Perai. The respondents' self-information was analyzed using Descriptive Statistics Analysis using frequency and percentage distribution. Table 3 refers to respondents by demographic analysis.

Table 3: Demographic Analysis

Demographic	**Category**	**Frequency**	**Percent (%)**
Gender	Female	8	17.02
	Male	39	82.98
Age	19 till 25	45	95.74
	26 till 30	1	2.13
	Below 18	1	2.13
Department	Mechanical Engineering	47	100.00
Institute	Politeknik Seberang Perai	47	100.00

The result of the questionnaire was also found that 39 male students (83.0%) and 8 female students (17.0%) have become the respondents of this study. The majority of the respondents consist of age ranges from 19 to 25 years (95.7%). All respondents were from the Mechanical Engineering Department, which is appropriate for the study since students in this department frequently engage in laboratory and workshop activities involving occupational hazards.

The results in Table 4 as below indicate that the OSHA SafetyNet application has high usability. The statement "This application is easy to use" recorded a high mean value of 4.87, suggesting that respondents strongly agree that the application is user-friendly.

Similarly, the statement "This application is suitable for all users" also recorded a mean score of 4.87, indicating that the application design accommodates a wide range of users. The clarity of presentation also scored highly (Mean = 4.85), demonstrating that information within the application is well-organized and easy to understand.

Table 4: Usability Of Application

Items	**Mean**	**Std. Deviation**	**Interpretation**
This application is easy to use	4.87	0.34	Very High
I enjoy using this application	4.72	0.62	Very High
This application has clear presentation	4.85	0.36	Very High
This application is suitable for all user	4.87	0.34	Very High
This application is attractive	4.81	0.50	Very High
TOTAL	**4.824**		**Very High**

The mean scores for the usability items ranged from 4.72 to 4.87, which falls within the very high interpretation range (4.21–5.00). This indicates that respondents strongly agree that the OSHA SafetyNet application is easy to use, clearly presented, attractive, and suitable for all users. The relatively low standard deviation values also suggest that respondents had consistent opinions regarding the usability of the application.

Table 5: Occupational Health and Safety Awareness

Items	**Mean**	**Std. Deviation**	**Interpretation**
I am clear about my rights and responsibilities regarding workplace health and safety	4.89	0.31	Very High

I know how to perform my work in a safe manner	4.87	0.34	Very High
I became aware of a health or safety hazard at my workplace	4.83	0.38	Very High
I know the necessary precautions while doing my job	4.68	0.63	Very High
I have knowledge to respond to health and safety concerns	4.89	0.31	Very High
I know who to report incidents to at my workplace	4.89	0.31	Very High
TOTAL	**4.842**		**Very High**

The results shown in Table 5 show a high level of occupational health and safety awareness among respondents. The statements "I am clear about my rights and responsibilities regarding workplace health and safety," "I have knowledge to respond to health and safety concerns," and "I know who to report incidents to at my workplace" recorded the highest mean value of 4.89.

This indicates that the application effectively provides users with essential safety knowledge and reporting procedures. Additionally, respondents demonstrated strong awareness of how to perform work safely (Mean = 4.87).

The slightly lower mean value (4.68) for knowledge of precautions still reflects a high level of agreement, suggesting that the application successfully improves students' understanding of workplace safety practices.

The mean scores for occupational health and safety awareness ranged from 4.68 to 4.89, which also falls within the very high category. This shows that respondents have a very high level of awareness regarding workplace safety, including understanding their safety responsibilities, recognizing workplace hazards, and knowing the appropriate precautions and reporting procedures. The low standard deviation values indicate that the respondents generally shared similar perceptions regarding safety awareness.

Table 6: Satisfaction in Using the Application

Items	**Mean**	**Std. Deviation**	**Interpretation**
Design of the application is attractive	4.89	0.31	Very High
Solutions provided is easy to understand	4.81	0.40	Very High
Links are consistent	4.70	0.59	Very High
Links are easy to identify	4.89	0.31	Very High

Layout is consistent	4.91	0.28	Very High
TOTAL	**4.84**		**Very High**

The findings indicate in **Table 6** show that respondents were highly satisfied with the OSHA SafetyNet application. The statement "Layout is consistent" recorded the highest mean value of 4.91, suggesting that the structure and arrangement of the application interface are well designed.

Additionally, the design attractiveness and link identification both scored a mean of 4.89, indicating that respondents found the application visually appealing and easy to navigate.Although link consistency recorded a slightly lower mean of 4.70, the score still indicates a high level of satisfaction among users.

For the satisfaction construct, the mean scores ranged from 4.70 to 4.91, which also falls within the very high interpretation level. This suggests that respondents were highly satisfied with the OSHA SafetyNet application, particularly in terms of the application design, layout consistency, clarity of solutions provided, and ease of identifying links within the system. The low variability in responses further indicates a strong consensus among respondents regarding their satisfaction with the application.

Table 7: Overall of this application

Overall of this Application	**Frequency**	**Percent**
Poor		
Fair	0	0
Satisfactory	0	0
Very good	4	8.51
Excellent	43	91.49
Total	**47**	**100.0**

Table 7 presents the overall evaluation of the application. 91.49% of the respondents gave strongly agree that overall of this application is excellent. Only 8.51% of the respondents gave very good for the overall of this application.

Table 8: Are you going to use this application?

Are you going to use this application?	**Frequency**	**Percent**
YES	47	100
NO	0	0
Total	**47**	**100.0**

Meanwhile Table 8 shows that 100% of respondents give "yes" that they are going to use this application. All respondents indicated their intention to recommend the application to others. to others.

Table 9: Correlation Analysis between constructs

Variables		Usability	Satisfaction	OHS_Awareness
Usability	Pearson Correlstion	1	**0.7***	**0.64***
	Sig. (2-tailed)		0.000	0.000
Satisfaction	Pearson Correlstion	**0.7***	1	**0.66***
	Sig. (2-tailed)	0.000		0.000
OHS_Awareness	Pearson Correlstion	**0.64***	**0.66***	1
	Sig. (2-tailed)	0.000	0.000	

Table 9 shows the Pearson correlation analysis examined the relationships among Usability, Satisfaction, and Occupational Health and Safety (OHS) Awareness. The results indicated significant positive correlations across all constructs. The construct Usability and Satisfaction were strongly correlated ($r = 0.70$, $p < 0.001$), suggesting that participants who perceived the application as easier to use also reported higher satisfaction. While construct Usability and OHS Awareness exhibited a moderate-to-strong positive correlation ($r = 0.64$, $p < 0.001$), implying that better usability is associated with increased awareness of occupational health and safety practices. Construct Satisfaction and OHS Awareness were also positively correlated ($r = 0.66$, $p < 0.001$), indicating that participants who were more satisfied with the application tended to have greater OHS awareness. Participants who found the application easy to use and satisfying also exhibited higher awareness of occupational health and safety. These results suggest that well-designed, user-friendly applications can effectively enhance OHS knowledge.

Overall, the results demonstrate that all three constructs—Usability of Application, Occupational Health and Safety Awareness, and Satisfaction in Using the Application—achieved very high levels of agreement among respondents. This indicates that the OSHA SafetyNet application is effective, user-friendly, and well accepted by users, and it successfully supports the objective of enhancing occupational hazard awareness in polytechnic laboratory and workshop environments.

Discussion

The findings indicate that the integration of augmented reality (AR) significantly enhances safety awareness among users. This can be interpreted through the lens of experiential learning theory, whereby immersive and interactive environments enable users to visualise hazards within a contextualised setting, thereby strengthening cognitive retention and situational understanding. In contrast to conventional safety briefings, which are often passive and instructor-centred, AR facilitates active

engagement through simulated emergency scenarios, ultimately improving both attention and comprehension.

These findings are consistent with prior studies such as [4] and [6], which reported that AR-based safety training improves user engagement and learning outcomes. However, unlike previous implementations that primarily function as standalone training tools, OSHA SafetyNet extends this capability by integrating AR with real-time hazard reporting, personal protective equipment (PPE) monitoring, and digital safety management features. This integration is particularly significant, as it enables not only enhanced awareness but also the translation of knowledge into actionable safety behaviour, thereby addressing a key limitation identified in existing systems.

Furthermore, the observed strong positive correlations between usability, user satisfaction, and occupational health and safety (OHS) awareness ($r = 0.64–0.70$) suggest that system design plays a critical mediating role in safety learning effectiveness. This finding aligns with [11], which emphasised that user-centred mobile applications significantly influence both knowledge acquisition and behavioural intention within safety-related contexts. It can therefore be inferred that the effectiveness of digital safety systems is not solely dependent on technological sophistication, but also on the extent to which usability and interaction design support meaningful user engagement.

Overall, the results demonstrate that the synergistic combination of usability, interactivity, and system integration constitutes a critical success factor in the development of effective digital safety solutions. This is particularly relevant within polytechnic laboratory and workshop environments, where dynamic hazard conditions require both immediate awareness and responsive action.

Conclusion

This study presented the design and evaluation of OSHA SafetyNet, a smart application framework developed to enhance occupational hazard awareness in laboratory and workshop settings at Polytechnic Seberang Perai. The system combines a web-based platform for administrators and safety personnel with a mobile application for students, facilitating more efficient safety management and improving access to critical safety information. Its core functionalities include digital safety briefings, personal protective equipment (PPE) monitoring, incident reporting, and location-specific emergency escape guidance. The integration of augmented reality (AR) further provides interactive visualization of evacuation plans, enabling users to better understand and follow emergency procedures.

Evaluation results showed that the application achieved high levels of usability, user satisfaction, and occupational health and safety (OHS) awareness. Pearson correlation analysis revealed significant positive relationships among these constructs ($r = 0.64–0.70$, $p < 0.001$), indicating that higher usability and satisfaction were associated with greater OHS awareness. These findings suggest that an intuitive and well-designed application can effectively enhance hazard awareness and facilitate better communication between students and safety personnel. By digitizing traditional safety management processes, OSHA SafetyNet fosters a more proactive and effective safety culture within polytechnic laboratory and workshop environments.

Overall, the proposed system demonstrates strong potential as a digital safety management tool for technical education institutions. Future work may focus on

expanding functionality, integrating additional safety training modules, and deploying the application across multiple departments or institutions to further strengthen occupational safety practices in educational environments.

**Corresponding author's email: r.intan.sariah@psmza.edu.my*

Abstract. In today's digital learning environment, educators and researchers are turning to machine learning (ML) to better understand and predict how students perform academically. But with so many different classification methods being used in different studies, it becomes difficult to know which one works best. This research sets out to explore and compare the most common classification techniques used in predicting student performance. Many schools and universities now collect large amounts of student data, but there is no clear agreement on which ML algorithms give the most reliable results. Without proper guidance, educators may end up using tools that are less effective in identifying students who are struggling. This research helps to bridge that gap. We reviewed 20 peer-reviewed journal articles published between 2020 and 2024. Each study was analysed in terms of what classification algorithm was used, how accurate it was, the size and nature of the dataset, and how well the model performed overall. Among the methods reviewed were Decision Tree, Naïve Bayes, Support Vector Machine (SVM), Random Forest, K-Nearest Neighbour (KNN), and Deep Learning models like LSTM. From this review, Random Forest and Support Vector Machine stood out as the most reliable and frequently used methods. They offered a good balance between accuracy, speed, and interpretability. Deep learning methods showed strong results too, but they often require more data and technical resources. These findings aim to guide educators and researchers in choosing the best approach to help support student success.

Keywords: Student Performance, Educational Data Mining, Machine Learning, Random Forest, SVM, Prediction Models

Introduction

In recent years, predicting student academic performance has become an important focus in education, especially with the rapid growth of digital learning platforms. Schools and universities now collect a large amount of student data through systems such as online learning platforms, quizzes, attendance records, and academic databases. This has opened new opportunities for educators and researchers to use machine learning techniques to better understand student behavior and predict their academic outcomes.

Educational Data Mining (EDM) has played a major role in this area by allowing researchers to apply different classification algorithms to analyze student data. These techniques are commonly used to predict results such as grades, Grade Point Average (GPA), and even the risk of students dropping out. Some of the most

widely used algorithms include Decision Tree, Support Vector Machine (SVM), Random Forest, Naïve Bayes, K-Nearest Neighbour (KNN), and Artificial Neural Networks (ANN). More recently, advanced methods such as deep learning models, including Long Short-Term Memory (LSTM), have also been introduced to handle more complex and large-scale data.

However, even though many studies have been conducted, there is still no clear agreement on which classification technique works best. Different researchers often report different results depending on the type of dataset, the number of features used, and how the data is prepared. For example, some studies show that Random Forest performs very well because it can handle complex data and reduce errors, while others highlight the strength of SVM, especially when working with smaller or well-structured datasets. At the same time, deep learning models are gaining attention for their high accuracy, but they usually require more data and technical resources.

Because of these differences, it can be difficult for educators and researchers to decide which model to use in their own work. Without clear guidance, there is a risk of choosing a method that may not give the best results, which can affect the ability to identify students who need help at an early stage.

For this reason, it is important to carry out a structured review of existing studies to better understand which techniques are the most reliable and commonly used. This study aims to fill that gap by reviewing 20 peer-reviewed journal articles published between 2020 and 2024. The focus is on comparing the performance of different classification methods, identifying their strengths and limitations, and highlighting current trends in this research area.

Overall, this study hopes to provide useful guidance for educators and researchers in selecting suitable machine learning techniques, as well as to support future work in improving student performance prediction.

Literature References

The application of machine learning and classification algorithms in predicting student academic performance has become a central focus in educational data mining (EDM). Numerous studies have explored how predictive models can be used to identify at-risk students, improve teaching strategies, and personalize learning interventions.

1. **Classification Algorithms in EDM**
   Several classification algorithms have been widely used in prior studies, including **Decision Trees**, **Naïve Bayes**, **Support Vector Machines (SVM)**, **Random Forest (RF)**, **Artificial Neural Networks (ANN)**, and more recently, **Deep Learning models** like **CNN** and **LSTM**. For instance, [1] found that Decision Tree algorithms provided intuitive rule-based predictions, making them suitable for educational datasets. However, Random Forest was frequently identified as more robust, particularly in handling noise and overfitting [2].
2. **Performance and Accuracy Comparisons**
   Several studies have reported high predictive accuracy with ensemble methods like Random Forest and hybrid models. In a study by [3], Random

Forest achieved an accuracy of over 93% in identifying at-risk students in a Malaysian polytechnic dataset. Similarly, [4] showed that SVM yielded consistently strong performance with smaller, well-preprocessed datasets.

3. **Importance of Preprocessing**
   Data preprocessing such as feature selection, data normalization, and class balancing was noted to significantly impact model performance. Demonstrated that models trained on datasets using SMOTE (Synthetic Minority Over-sampling Technique) yielded a notable increase in classification accuracy for underrepresented student groups [5].
4. **Deep Learning and Hybrid Models**
   Recent research has shifted toward deep learning due to its capacity to handle high-dimensional data. [6] implemented an LSTM-SMOTE hybrid model that improved prediction accuracy to 95% in a longitudinal student dataset. Hybrid models combining fuzzy logic, genetic algorithms, or ensemble methods have also shown promise in improving both precision and recall [7].

Methodology

This study adopts a **systematic literature review (SLR)** approach to identify, evaluate, and compare classification techniques used in predicting student academic performance. A structured and transparent process was followed to ensure that the review is reliable, consistent, and easy to replicate.

i. Search Strategy

To collect relevant studies, a comprehensive search was conducted using several well-known academic databases, including IEEE Xplore, ScienceDirect, SpringerLink, and Google Scholar. The search focused on articles published between **2020 and 2024** to ensure that the findings reflect recent developments in the field.

A combination of keywords was used to identify relevant studies, such as:

- "student performance prediction"
- "educational data mining"
- "classification algorithm"
- "machine learning in education"

These keywords were combined using Boolean operators (AND, OR) to improve the accuracy of the search results.

ii. Screening and Selection Process

The selection of articles was carried out in several stages. First, all identified articles were reviewed based on their titles and abstracts to determine their relevance to the topic. Studies that were not related to student performance prediction or did not involve classification techniques were removed at this stage.

Next, the remaining articles were examined in full text to ensure they met the inclusion criteria. Duplicate articles and studies with incomplete information were also excluded. This step-by-step filtering process helped ensure that only the most relevant and high-quality studies were selected for the review.

iii. Inclusion and Exclusion Criteria

Inclusion Criteria:

- Articles published between 2020 and 2024
- Studies that apply classification techniques in predicting student academic performance
- Peer-reviewed journal or conference papers
- Studies that clearly report evaluation metrics such as accuracy, precision, recall, or F1-score

Exclusion Criteria:

- Articles not written in English
- Studies that do not focus on student performance prediction
- Papers that use non-classification methods (e.g., clustering only)
- Studies with unclear methodology or missing evaluation results

iv. Data Extraction and Analysis

A total of **20 studies** were selected after the screening process. From each study, important information was carefully extracted and organized into comparison tables. The extracted data includes:

- Type of classification algorithm used
- Dataset characteristics (size, features, and source)
- Tools or platforms used (e.g., Python, Weka, R)
- Evaluation metrics (accuracy, precision, recall, F1-score)
- Key findings and limitations

The collected data was then analyzed to identify patterns, similarities, and differences among the studies. This allowed for a clear comparison of the performance of different classification techniques.

v. Quality Assessment

To ensure the reliability of the selected studies, a simple quality assessment was conducted. Each article was evaluated based on:

- Clarity of methodology
- Appropriateness of the dataset used
- Use of proper evaluation metrics
- Relevance to the research objective

Only studies that met an acceptable level of quality were included in the final review. This step helps increase the credibility and trustworthiness of the findings.

Gaps and Trends

While many studies show promising results, there remains no clear consensus on a single best model. Moreover, variations in datasets, evaluation metrics, and educational context (e.g., school vs. university) make cross-study comparisons challenging. There is also a need for more real-time predictive models to enable proactive academic interventions [8].

Finding and Analysis

Table 1.0 : Comparison Table of Classification Techniques in Reviewed Research

No	Authors (Year)	Full Title (Journal/Source)	Algorithms Compared	Best Performing Algorithm(s) / Notes
1	Cortez & Silva (2008)	Using Data Mining to Predict Secondary School Student Performance (UCI Repository)	Decision Tree, Neural Network, SVM, Naïve Bayes	Random Forest slightly best
2	Alamri et al. (2020)	Predicting Student Academic Performance using Support Vector Machine and Random Forest (ICETM)	SVM, Random Forest	RF accuracy 93%
3	Alashwal et al. (2021)	Systematic Review of Machine Learning in Academic Performance Prediction (Education Sciences, MDPI)	Decision Tree, Random Forest, ANN, SVM, Naïve Bayes	RF & SVM most frequent winners
4	Sekeroglu et al. (2021)	A Systematic Review on Educational Data Mining Methods (Applied Sciences, MDPI)	Multiple ML models including Deep Learning	ANN, RF top performers
5	Adhatrao et al. (2013)	Predicting Students Performance using ID3 and C4.5 (IJDMKM)	ID3, C4.5	C4.5 slightly better
6	Bilal et al. (2022)	Analysis of Student Performance Using ML Algorithms: A Case Study (Scientific Reports, Nature)	RF, Naïve Bayes, SVM	RF accuracy ~90%
7	Mustafa Yağcı (2022)	Educational Data Mining: Prediction of Students' Academic Performance (Smart Learning Env., Springer)	KNN, SVM, LR, Naïve Bayes, RF	ANN, RF highest performance

8	Nayak et al. (2023)	Predicting Students' Academic Performance using Data Mining (Springer)	RF, SVM, Decision Tree	Random Forest outperformed
9	Baashar et al. (2022)	Role of Deep Learning in Predicting Academic Performance (IEEE Access)	Deep Neural Network vs. ML	DNN > 92% accuracy
10	Ramaswami & Bhaskaran (2018)	Student Academic Performance Analysis using Classification Techniques (IJCA)	KNN, Naïve Bayes, Decision Tree	KNN improved with pre-processing
11	Lin et al. (2023)	A Comprehensive Survey on Deep Learning for Education (Computers & Education: AI)	Deep Learning, CNN, RNN, MLP	DL methods dominant in recent research
12	Abu Amra et al. (2025)	Student Performance Prediction Using Various Classification Models (Education Systems Journal)	SVM, Naïve Bayes, KNN, J48, CART, BF-Tree	Naïve Bayes (93.6%), SVM second
13	Angioplastis et al. (2025)	LMS Data Mining for Student Prediction (Computers, MDPI)	Logistic Regression, RF, ANN, DT, KNN	KNN best F1 score
14	Aslam et al. (2022)	A Review of Classification Techniques in Educational Data Mining (VFAST Transactions)	Decision Tree, RF, SVM, KNN, NB	Comparative review—no clear winner
15	Tiered Instruction Study (2024)	RF Performance in Tiered Instruction Model for Education (arXiv Preprint)	RF, NB, SVM, Logistic Regression	RF achieved 96% accuracy
16	Somali Case Study (2023)	Dropout Prediction using Random Forest Classifier (East African J. of Education)	NB, LR, RF, SVM, KNN	RF achieved 95%
17	UTRGV (2024)	Evaluating Multiple Classifiers for Predicting Academic Risk (UTRGV Dataset)	ANN, SVM, LR, NB, KNN, RF	RF and ANN most accurate

18	Bangladesh Study (2024)	Prediction of Student Results using ML in Bangladesh High Schools (IEEE Conf. on ICT)	RF, NB, DT	RF and NB performed well
19	Fuzzy Genetic Hybrid (2020)	Fuzzy Logic and Genetic Algorithm with Decision Trees (ICETM 2020)	Fuzzy-DT, Genetic-DT, RF	RF with fuzzy logic improved explainability
20	Bagging Ensemble Study (2023)	Improving Student Performance Prediction Using Feature Selection with Bagging (Wiley Journal of Applied Intelligence)	Bagging, RF, Feature Selection	Bagging + RF combo improved generalization

Table 2.0 : Summary of Classification Techniques in Reviewed Research

Classification Technique	Frequency in Reviewed Papers	Key Characteristics	Advantages	Limitations
Decision Tree (DT)	Frequently used	Tree-structured model that splits data based on attribute values	Easy to interpret, simple to implement, useful for identifying important factors affecting student performance	May overfit when dataset is large or complex
Random Forest (RF)	Most frequently used	Ensemble method combining multiple decision trees	High accuracy, reduces overfitting, handles large datasets well	Requires more computational resources
Support Vector Machine (SVM)	Very common	Algorithm that separates data using optimal hyperplanes	Effective for high-dimensional datasets, strong predictive performance	Harder to interpret compared to simpler models

Naïve Bayes (NB)	Moderately used	Probabilistic classifier based on Bayes theorem	Fast, efficient, performs well with smaller datasets	Assumes feature independence which may not always hold
K-Nearest Neighbour (KNN)	Moderately used	Instance-based learning that classifies data based on similarity	Simple to understand and implement	Performance decreases with large datasets
Artificial Neural Network (ANN)	Increasingly used	Model inspired by human neural networks	Capable of capturing complex relationships in educational data	Requires more training data and computational power
Deep Learning Models (LSTM, CNN)	Emerging in recent studies	Advanced neural network models for complex pattern recognition	High predictive accuracy for large datasets	High computational cost and model complexity

Table 3.0 : Overall Observation from the 20 Reviewed Papers

Aspect	Summary
Most Frequently Used Technique	Random Forest
Other Common Techniques	SVM, Decision Tree
Simpler Algorithms Used	Naïve Bayes, KNN
Advanced Methods	Artificial Neural Networks, Deep Learning
Key Finding	Ensemble methods such as Random Forest often provide higher accuracy and better generalization for predicting student academic performance.

The findings from the 20 reviewed studies show that a variety of classification techniques have been applied to predict student academic performance. While the tables provide a clear summary of the methods used, a deeper analysis reveals several important patterns and differences across the studies.

One of the most noticeable findings is the frequent use of Random Forest. Many studies reported that Random Forest achieved higher accuracy compared to other methods. This is mainly because it combines multiple decision trees, which helps reduce overfitting and improves prediction stability. As a result, Random Forest performs well when dealing with complex educational datasets that include multiple factors such as attendance, assessment scores, and student background.

Similarly, Support Vector Machine (SVM) was also widely used and showed strong performance, especially in studies with smaller or well-preprocessed datasets. Unlike Random Forest, SVM focuses on finding the optimal boundary between classes, which makes it effective in handling high-dimensional data. However, several studies noted that SVM can be more difficult to interpret, which may limit its usefulness for educators who need clear explanations of the results.
In contrast, simpler models such as Decision Tree, Naïve Bayes, and K-Nearest Neighbour (KNN) were still commonly used due to their ease of implementation and lower computational cost. Decision Trees were preferred in cases where interpretability is important, as they provide clear visual rules that help explain how predictions are made. However, these models generally showed lower or less consistent accuracy compared to more advanced techniques, especially when applied to larger or more complex datasets.

Another important observation is the growing use of Artificial Neural Networks (ANN) and deep learning models such as LSTM. These models demonstrated high prediction accuracy in several studies, especially when large datasets were available. However, their performance often depends on the quality and size of the data, as well as the availability of computational resources. This makes them less practical for smaller institutions or studies with limited data.

Across the reviewed studies, it is also clear that data preprocessing plays a critical role in model performance. Techniques such as feature selection, normalization, and data balancing (e.g., SMOTE) were shown to significantly improve accuracy, regardless of the algorithm used. This suggests that the success of a model is not determined by the algorithm alone, but also by how well the data is prepared.

Overall, while Random Forest and SVM appear to be the most reliable techniques, the findings indicate that no single model is always the best choice. The performance of each algorithm depends on several factors, including dataset size, data quality, and the specific educational context. Therefore, selecting an appropriate model requires careful consideration of these factors rather than relying on accuracy alone.

Discussion

The findings of this study show that while several classification techniques are effective in predicting student academic performance, their performance is highly influenced by factors such as dataset size, data quality, preprocessing methods, and the educational context in which they are applied.

One key factor is dataset size. Models like Random Forest and Support Vector Machine (SVM) generally perform well across different studies, but their effectiveness can vary depending on the amount of available data. For example, Random Forest tends to perform better with larger datasets because it can learn from a wide range of features and reduce overfitting through its ensemble approach. On the other hand, SVM is often more suitable for smaller or well-structured datasets, as it focuses on finding optimal decision boundaries. In contrast, deep learning models such as Artificial Neural Networks (ANN) and LSTM require large datasets to achieve high accuracy, which explains why their performance is inconsistent across studies with limited data.

Another important factor is data preprocessing. The review clearly shows that techniques such as feature selection, normalization, and class balancing have a strong impact on model performance. In many cases, simpler models like Naïve Bayes or K-Nearest Neighbour (KNN) performed significantly better after proper preprocessing was applied. This suggests that the quality of the data input is just as important as the choice of algorithm. Without proper preprocessing, even advanced models may produce weak or unreliable results.

The educational setting also plays a role in determining which model performs best. For example, datasets from universities often include more complex features such as online learning behavior, course interactions, and continuous assessments. In such cases, more advanced models like Random Forest or ANN are better suited to capture these complex relationships. In contrast, datasets from schools may be smaller and simpler, making models like Decision Tree or Naïve Bayes more practical and easier to interpret for educators.

In addition, there is a trade-off between accuracy and interpretability. While models like Random Forest and deep learning approaches often achieve higher accuracy, they are more difficult to interpret. This can be a limitation in educational settings, where teachers and administrators may need clear explanations of why a student is predicted to be at risk. In such cases, simpler models like Decision Trees may still be preferred, even if their accuracy is slightly lower.

Overall, the discussion highlights that there is no single "best" classification technique for all situations. Instead, the choice of model should depend on the specific context, including the size and quality of the dataset, the availability of computational resources, and the need for interpretability. These findings emphasize the importance of selecting machine learning models carefully to ensure that predictions are both accurate and meaningful for educational decision-making.

Conclusion

This study reviewed and analyzed 20 research papers that applied machine learning classification techniques to evaluate and predict student academic performance. The objective of the study was to identify the most used classification methods and examine their effectiveness in educational data mining.

The findings revealed that several machine learning algorithms have been widely used in predicting student performance, including Decision Tree, Random Forest, Support Vector Machine (SVM), Naïve Bayes, K-Nearest Neighbour (KNN), and Artificial Neural Networks (ANN). Among these techniques, Random Forest and Support Vector Machine were the most frequently applied methods in the reviewed studies. These algorithms consistently demonstrated strong predictive performance and were able to handle complex educational datasets effectively.

Random Forest showed particularly strong results due to its ensemble learning approach, which combines multiple decision trees to improve prediction accuracy and reduce overfitting. Meanwhile, Support Vector Machine proved effective in handling classification problems with high-dimensional data. Decision Tree models were also commonly used because

they are easy to interpret and help educators understand the factors influencing student academic performance.

Overall, the review suggests that while no single classification method can be considered universally superior, ensemble-based models such as Random Forest provide a strong balance between accuracy, reliability, and scalability for student performance prediction.

Research Contribution

This research contributes to the field of Educational Data Mining (EDM) in several ways. First, it provides a comprehensive review of classification techniques used in predicting student academic performance based on recent research publications. Second, the study highlights the strengths and limitations of different classification models, which can help researchers and educators select appropriate techniques for their own predictive systems.

In addition, the comparison of 20 research papers provides valuable insights into current research trends and identifies which algorithms are most frequently used in the education domain. The findings can serve as a reference for future studies that aim to develop intelligent systems for monitoring and improving student learning outcomes.

Future Work

Although this study provides a comprehensive overview of classification techniques used in student performance prediction, several areas can be explored in future research. Future studies may consider expanding the number of reviewed papers to include a larger dataset and more diverse educational contexts. This would provide a broader understanding of how classification techniques perform across different institutions and learning environments.

In addition, future research could explore hybrid or ensemble models that combine multiple machine learning techniques to improve prediction accuracy. The integration of deep learning approaches, such as recurrent neural networks and long short-term memory (LSTM) models, may also provide more advanced predictive capabilities when larger datasets are available.

Finally, future work could focus on developing real-time student performance monitoring systems that integrate machine learning models with educational platforms. Such systems could help educators identify at-risk students earlier and implement timely interventions to support student success.

Abstract. This project aims to improve kitchen wastewater quality in the research area at Medan Selera Harmoni, Merlimau, Melaka, by using a mix of zeolite and activated charcoal as a drainage water filter. Two filters were installed at selected drainage points, and water samples were taken at three-day intervals before and after filtration installation for testing. To measure the effectiveness of this filter, total suspended and dissolved solids test were conducted to determine total solids present in wastewater, along with turbidity tests. From the results, it is shown that the usage of this filter system greatly reduced suspended solid (TSS) from 0.0354mg/L to 0.0176mg/L and dissolved solids (TDS) from 2.06mg/L to 0.28mg/L. These two reading contribute to decreasing value of total solid (TS) from 2.0954mg/L to 0.2976mg/L while the turbidity of water from 2.70 NTU to 0.90 NTU. It is concluded that this filter improves water clarity and quality at the research area. The filter was also found to be practical, strong, and easy to maintain. Overall, this project offers a simple, low-cost, and eco-friendly method for treating kitchen wastewater while protecting the environment.

Keywords: Zeolite, charcoal, filter, total solids, turbidity.

Introduction

Water quality is very important for public health and the environment. In many urban places, drainage systems often become polluted with soil, food waste, grease, and organic matter, causing high turbidity and high total suspended solids content. These can reduce water clarity, block drains, and increase flood risk. Conventional treatments work often is quite hard for communities to maintain over long periods.

Drainage water in urban areas often contains suspended solids, grease, and organic substances that deteriorate water quality and threaten aquatic ecosystems (Zhao et al., 2023). Zeolite has recently been demonstrated as an effective medium for removing suspended materials and nutrients in stormwater due to its high cation exchange and adsorption capacity (Alimohammadi et al., 2020). Likewise, activated charcoal or carbon continues to be widely applied in urban runoff treatment, where it efficiently removes turbidity, dissolved organic pollutants, and color from contaminated water (Ali et al., 2021). Sponge materials further enhance the system by acting as a physical filter that captures larger debris and oils, increasing efficiency and lifespan (Mohammad, Kutty, & Rahman, 2019). By integrating these materials, the proposed drainage filter aims to provide a sustainable, low-cost, and practical solution to reduce pollution and support better urban water management.

Treating water is a key part of civil engineering. Proper treatment protects public health, supports city growth, and preserves the environment. As the demand for clean water increases worldwide, civil engineers play an important role in designing systems that keep water safe—even when human activities affect water sources, like farming, food processing, or industrial operations.

Therefore, this project focuses on innovating a drainage filtering system designed to improve water quality at the point source, particularly in areas like food courts, where drainage pollution is common. The system will be evaluated in terms of its effectiveness in reducing turbidity and TSS, two key indicators of water quality degradation. By integrating

simple and low-cost filtration media, this innovation is expected to provide a sustainable, practical, and efficient solution to enhance water quality in urban drainage systems.

Problem Statement

Poor water quality in drainage systems is of great concern for most cities and high-population-density towns. Figure 1 shows an example of high turbidity and total suspended solids, mostly emanating from soil, food waste, grease, and organic matter that run into the drains. Zhao et al. (2023) state that these pollutants affect aquatic life and also limit the rate at which water can flow, an action that causes blockage and leads to flooding. LeFevre et al. (2023), on the other hand, explain that typical conventional methods are effective but too expensive to adopt for long-term applications at the community level, such as chemical treatment or sedimentation

Therefore, this project focuses on innovating a drainage filtering system designed to improve water quality at the point source, particularly in areas like food courts, where drainage pollution is common. Food courts, Medan Selera Harmoni, Merlimau, Melaka, as in Figure 2, were selected as these places generate substantial volumes of kitchen wastewater containing oil, grease, suspended solids, and food residues. Discharging this untreated wastewater into drainage systems can result in significant environmental and infrastructural challenges.

Fig. 1: Example of drainage that highly polluted

Fig. 2: Drainage at Medan Selera Harmoni

A prevalent issue is the clogging of drains and sump pits, which impedes water flow and may lead to localized flooding. Additionally, the decomposition of food and organic matter generates unpleasant odors, adversely affecting the comfort of workers, visitors, and residents in the vicinity.

Grease accumulation on the inner surfaces of drainage systems complicates cleaning procedures and elevates maintenance costs for local authorities. Furthermore, untreated wastewater contributes to downstream pollution of drainage channels and waterways. Currently, most food courts and small shops lack accessible and practical pre-treatment systems for kitchen wastewater. This situation underscores the need for a cost-effective, low-maintenance U-drain filter box system capable of efficiently reducing suspended solids, grease, and odors before wastewater enters the main drainage network.

Objective of the study

To innovate the zeolite charcoal drainage filtering system and test the filtering system's effectiveness by referring to turbidity, total solids (TS), total dissolved solids (TDS), and total suspended solids (TSS) parameters of water quality

Scope of study

This study evaluated the effectiveness of a drainage filtration system using sponge, zeolite, and activated carbon to improve water quality, specifically by reducing turbidity, total solids (TS), total dissolved solids (TDS), and total suspended solids (TSS). Two filters were installed in two different drainage channels at Medan Selera Harmoni, Merlimau, Melaka. Water samples were then taken from a sump located on site after filtration. The collected samples were tested at the laboratory at Merlimau Polytechnic according to standard procedures to measure TS, TDS, and TSS. Meanwhile, turbidity tests were conducted at the Biotech Melaka Laboratory. The testing period was conducted for 12 days for one sample before and 4 samples after the product was installed. The samples will be taken and tested at 3-day intervals. Therefore, the results only reflect the performance of the filtration system in terms of turbidity and reduction of TS, TDS, and TSS.

Fig. 3: Medan Selera Harmoni

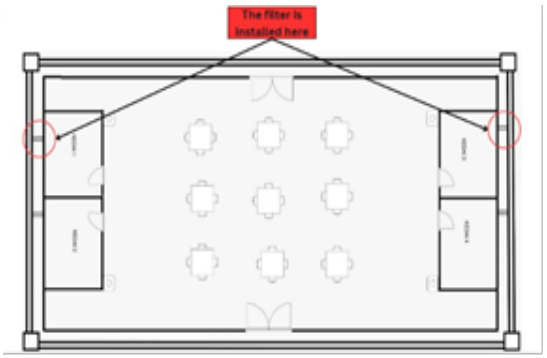

Fig. 4: Location of filter installation

Importance of the study

This project is significant as it offers a practical and low-cost solution to improve water quality in drainage systems by reducing Total Solids (TS), Total Dissolved Solids (TDS), Total Suspended Solids (TSS), and turbidity, issues commonly found in public areas such as food courts. A previous study by Titah and Nasir (2024) demonstrated that combinations of granular activated carbon and zeolite effectively remove more than 80% of Total Solids in wastewater, showcasing the strong potential of these materials for sustainable treatment. By applying a filtering system that combines sponge, zeolite, and activated carbon in drainage outlets at Medan Selera Harmoni, Merlimau, Melaka, this study demonstrates the real-world application of eco-friendly filtration technology. The findings will contribute to sustainable urban water management by providing cleaner drainage, reducing maintenance needs, and supporting healthier public environments.

Literature Review

Water pollution is a significant issue worldwide. It is caused by rapid urban growth, industrial activities, and the increasing human population. Wastewater from homes, food courts, and industries often contains solids, oil and grease, organic matter, and sometimes harmful chemicals. If this wastewater is not treated, it can damage rivers, harm aquatic life, create foul smells, and even affect human health.

Water Quality Index (WQI)

The Water Quality Index (WQI) is a scientific tool used to summarize the overall quality of water into a single numerical value that represents how clean or polluted the water is. It combines data six main parameters which is pH, dissolved oxygen (DO), biochemical oxygen demand (BOD), chemical oxygen demand (COD), total suspended solids (TSS), and ammonia (NH_3). Each of these parameters is given a specific weight or importance based on how much it affects water quality. The results are then calculated using a standard formula to produce an index number that reflects the condition of the water.

Table 1: DOE Water Quality Index Classification
(Source: National Water Quality Standards & Water Quality Index, Department of Environment)

PARAMETER	UNIT	CLASS				
		I	II	III	IV	V
Ammoniacal Nitrogen	mg/l	< 0.1	0.1 – 0.3	0.3 – 0.9	0.9 – 2.7	> 2.7

Total Coliform	count/100 ml	100	5000	5000	50000	50000	> 50000

The main purpose of the WQI is to make it easier to understand complex water test data. Instead of analyzing each parameter separately, the WQI gives an overall score that indicates whether the water is clean, slightly polluted, or heavily contaminated. This helps scientists, engineers, and environmental officers quickly evaluate the health of rivers, lakes, or drainage systems and make decisions about water treatment and protection efforts.

In general, a low WQI value means the water is of good quality, while a high WQI value indicates poor quality. Water with a WQI between 0 and 25 is considered excellent, meaning it is safe for drinking and aquatic life. A WQI between 26 and 50 indicates good water, which may need minimal treatment. A score between 51 and 75 shows moderate pollution, requiring proper treatment before use. Values from 76 to 100 are considered poor, and water above 100 is very polluted or unsafe for human use.

Table 3: Water Classes and Uses
(Source: National Water Quality Standards & Water Quality Index, Department of Environment)

CLASS	USES
Class I	Conservation of natural environment. Water Supply I – Practically no treatment necessary. Fishery I – Very sensitive aquatic species.
Class IIA	Water Supply II – Conventional treatment required. Fishery II – Sensitive aquatic species.
Class IIB	Recreational use with body contact.
Class III	Water Supply III – Extensive treatment required. Fishery III – Common, of economic value and tolerant species; livestock drinking.
Class IV	Irrigation
Class V	None of the above.

Table 4: Water Quality Classification Based on Water Quality Index
Source: National Water Quality Standards & Water Quality Index, Department of Environment)

SUB INDEX & WATER QUALITY INDEX	INDEX RANGE		
	CLEAN	SLIGHTLY POLLUTED	POLLUTED
Biochemical Oxygen Demand (BOD)	91 - 100	80 - 90	0 - 79
Ammoniacal Nitrogen (NH_3-N)	92 - 100	71 - 91	0 - 70
Suspended Solids (SS)	76 - 100	70 - 75	0 - 69
Water Quality Index (WQI)	81 - 100	60 - 80	0 - 59

Zeolite

Zeolites in Fig. 3 occur in nature typically filling fractures and pores of volcanic rocks, which limits the formation of large deposits (de Magalhães LF et al., 2022). It can be divided into natural zeolites, synthetic zeolites and modified zeolites. Natural zeolites generally have a crystalline aluminosilicate structure with the formula $M_x/n[(AlO_2)_x(SiO_2)_y]\cdot zH_2O$, where M represents cations such as Na^+, K^+, or Ca^{2+} (Li, Y et al., 2017). In this system, zeolite is placed in multiple layers, both before and after the activated carbon, to aid in ammonia adsorption, cation exchange, and fine particle filtration.

Zeolite composition in Figure 6 has a natural porous structure with tiny pores that trap suspended solids, dust, and dirt. Due to their microporous structure, zeolites present a high surface area per volume, being one of the most used materials for the adsorption of liquid and gaseous substances, achieving complete removal of contaminants in effluents, even at low concentrations (Rashed, M. N., & Palanisamy, P. N., 2018). It also has a high cation exchange capacity, allowing it to replace harmful ions like ammonium, lead, or cadmium with harmless ions such as sodium or calcium. This makes zeolite highly effective for removing heavy metals and ammonia from water. Additionally, zeolite can adsorb gases and odor-causing compounds, improving the water's smell and taste. Zeolite is also thermally stable and can be regenerated by heating or chemical washing, making it cost-effective and reusable. Its strong durability and reusability make it a sustainable and reliable material for long-term water filtration applications.

Fig. 5: Zeolite

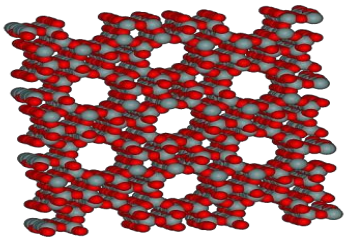

Fig. 6: Composition of zeolite

Activated charcoal or carbon

Activated carbon is one of the most frequently used adsorbent materials that has applications in various industries (Muttil N. et al., 2023). The activated carbon used in this filtration system, as in Figure 7, is a graded layer placed between two layers of zeolite. This material functions mainly to adsorb organic compounds, chlorine, and other contaminants that affect water taste, odor, and clarity. The porous structure of activated carbon obtained using the chemical activation method has attracted many researchers because of its high specific surface area (E.H. Sujiono et al., 2024), making it highly effective for filtration. Activated carbon can trap fine grease and oil particles from kitchen wastewater, helping to reduce fat buildup and prevent drain blockages. The pores create a filter to trap and remove impurities from the water as it passes through by adsorption (Aziz et al., 2024). It also removes unpleasant odors caused by decomposing organic matter and food residues.

Fig. 7: Activated charcoal or carbon

Furthermore, activated carbon adsorbs dissolved organic pollutants such as detergents, food chemicals, and sauces that contribute to water contamination. By trapping color-causing substances, it improves the clarity and appearance of the treated water, resulting in cleaner and clearer output. Because of its high efficiency and ability to work well in small systems, activated carbon is an ideal material for compact filtration setups like the drain filter used in this project.

Bio Sponge

A bio sponge (biological sponge filter) is a porous polyurethane foam material designed to perform mechanical and biological filtration in water treatment systems. It offers a high surface area owing to its porous structure (Yueshu Gao et al, 2021). It serves as a filter medium that physically removes suspended solids and provides an ideal environment for beneficial bacteria to grow and purify the water biologically. The bio sponge cleans water as a mechanical filter by trapping solids, debris, and fine particles in its pores, making the water clearer and supports biological filtration. These two processes together remove both physical and chemical contaminants from the water.

The sponge's large surface area lets many bacteria form colonies without clogging the filter, making it efficient and sustainable for long-term use. In addition, bio sponge has several advantages over traditional materials like sand, gravel, or ceramic. It is lightweight, non-toxic, chemically stable, and affordable, making it useful for many water systems such as aquariums, drainage filters, and small wastewater treatment units. It is also easy to clean and can be reused without losing effectiveness, which is better for the environment.

Methodology

Fig. 8 shows the process and procedure involved in this study. This flow chart makes the process simple to follow and ensures the filter works effectively in reducing solids, grease, and odor in kitchen wastewater.

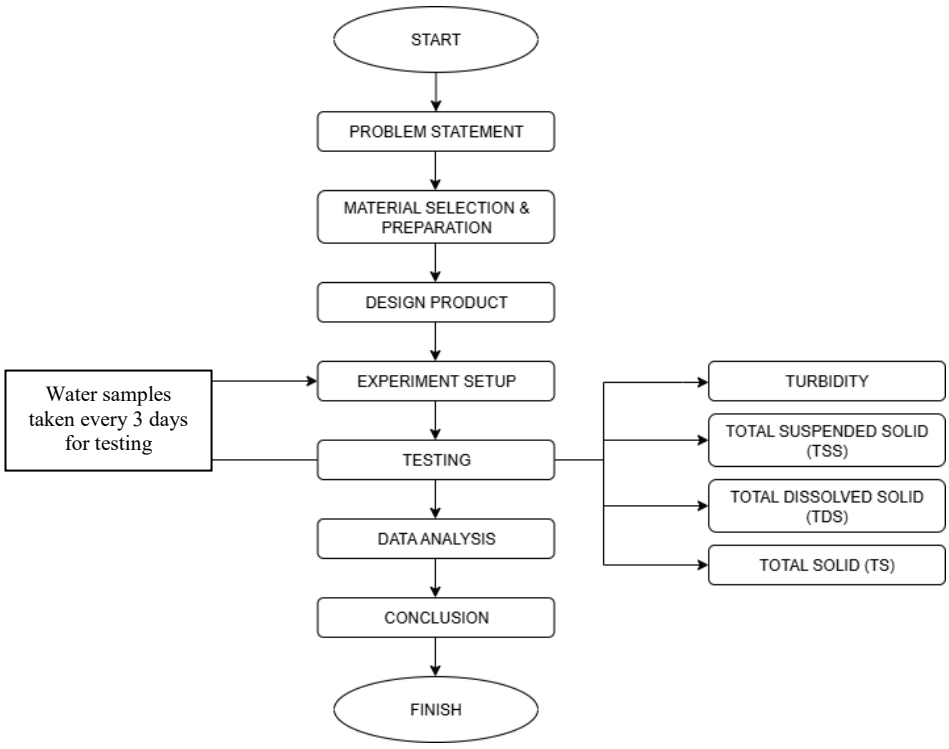

Fig. 8: Methodology flow chart

Filter Design

Product development starts with determining the main objectives, suitable materials, testing, and expected outcomes of the project. The design and experiment must meet both academic requirements and real-on site applications with accurate measurement to ensure the product would fit properly and function efficiently within the drainage system. Design of the product as shown in Figure 9 and 10 below.

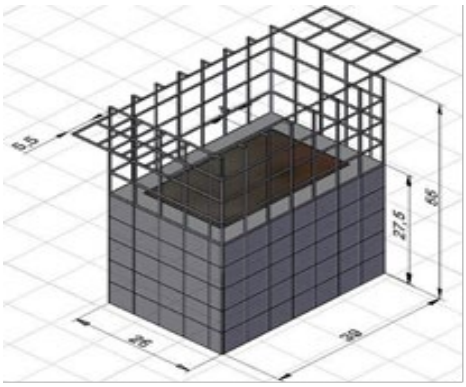

Fig. 9: 3D view of the filter

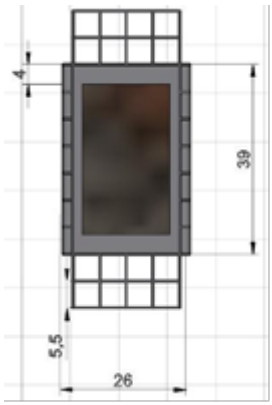

Fig. 10: Composition of zeolite

After product development, the filter was installed at the designated drainage location. Before installation, a water sample was collected from the sump to establish

baseline water quality data. The filter was then operated for three days, permitting natural water flow through the system. After this period, a subsequent water sample was collected from the same sump to assess changes in water quality following filtration.

Laboratory Testing

The sample for total dissolved solids (TDS) and total suspended solids (TSS) was conducted at the Water Quality Laboratory, Politeknik Merlimau Melaka. While turbidity tests for the same samples were run at Melaka Biotechnology Lab in Ayer Keroh, Melaka.

The turbidity test was conducted using water samples collected from the location's sump. Reading for the samples taken both before and after the installation of the drainage filtering system to evaluate its effectiveness in reducing water cloudiness caused by suspended particles. This approach ensures accurate and reliable assessment of the filtration system's performance in improving water clarity.

The total dissolved solids (TDS) test measures the amount of dissolved substances in wastewater, such as minerals, salts, and organic compounds. High TDS levels indicate the presence of pollutants that can affect water quality, taste, and suitability for discharge into the environment. In the meantime, the total suspended solids (TSS) test measures the amount of solid particles that remain suspended in wastewater, such as food waste, grease, and fine sediments. High TSS levels can clog drains, reduce water clarity, and harm aquatic life. In this project, the TSS test is used to evaluate the efficiency of the U-drain filter in removing suspended materials from kitchen wastewater. The procedure and apparatus of these two test must follow standard procedure as stated in APHA Standard Methods for the Examination of Water and Wastewater: Method 2540C and 2540D.

Fig. 11: Samples in membrane filter for TDS test

Fig. 12: Samples during TSS test

Total Solids (TS) testing is conducted to measure the amount of suspended and dissolved solids present in wastewater. It provides an overall indication of the cleanliness of the water and the efficiency of the filtration system. High TS levels typically indicate the presence of dirt, grease, organic matter, and chemical residues, which can be harmful to the environment and clog drainage systems. Lower TS values after filtration indicate that the U-drain filter effectively reduces solid materials in kitchen wastewater. The combination of sponge, zeolite, and activated carbon in the filter helps trap suspended particles and adsorb dissolved impurities, improving overall water quality and reducing pollution in the drainage system.

Data Analysis

Total Dissolved Solid (TDS) Table 1 shows the data collection of total dissolved solids (TDS) for all related samples. The TDS concentration decreased significantly from 2.06 mg/L on Day 1 to 0.28 mg/L on Day 12, indicating a substantial reduction in dissolved substances in the water after treatment. Although TDS is not a direct parameter in the WQI calculation, it is closely related to total solids and conductivity, which influence overall water quality. The observed decrease in TDS suggests an improvement in water quality conditions and supports a potential shift toward higher WQI classifications, such as Class I or Class II, which represent clean and minimally polluted water.

Table 5: TDS data analysis

Description		Weight (g)				
		Day before filtering	Day 3	Day 6	Day 9	Day 12
Weight of the porcelain evaporating dish (g)	W1	41.1077	39.2500	41.7120	41.8474	41.7126
Weight of the dish & residue (g)	W2	41.1180	39.2582	41.7180	41.8504	41.7140
Weight of residue (g)	W	0.0103	0.0082	0.0050	0.0030	0.0014
Volume of the sample (mL)	V	5	5	5	5	5
Total Dissolved Solids (mg/L)	TDS	2.06	1.64	1.20	0.6	0.28

The consistent decrease in TDS values suggests that the filter layers composed of zeolite, activated carbon, and sand played a significant role in trapping and retaining dissolved particles. Activated carbon, with its large surface area, captures dissolved organic compounds and lowers conductivity. Zeolite helps by exchanging ions and removing certain metal ions or nutrients. The decrease in TDS, as shown in Figure 13, proves that the U-drain filtration system removed dissolved impurities and improved the chemical quality of the water over time.

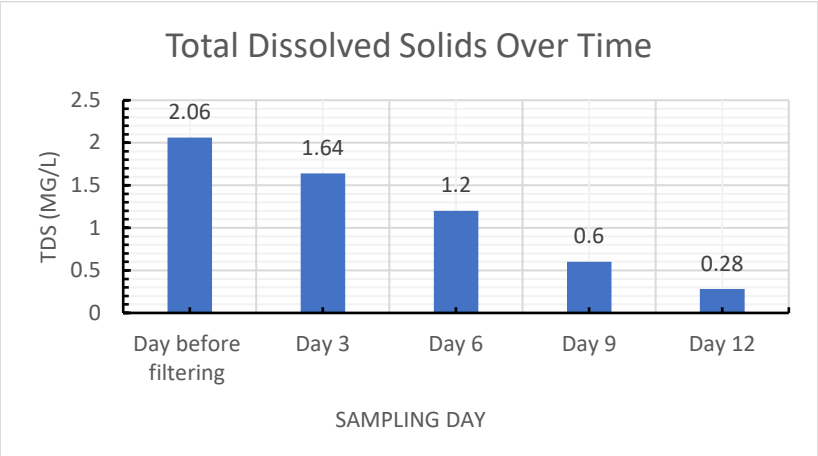

Fig. 13: TDS value over time

Total Suspended Solids (TSS). The total suspended solids (TSS) concentration decreased consistently from 0.0354 mg/L on Day 1 to 0.0176 mg/L by Day 12. This reduction indicates that the U-drain filter system effectively removed suspended particles, including fine sediments, dust, organic debris, and other insoluble materials

present in the drainage water. TSS is a direct parameter used in determining water quality classification. Lower TSS values contribute positively to the WQI score, as high levels of suspended solids can reduce light penetration, disrupt aquatic ecosystems, and indicate pollution. The observed decrease in TSS suggests a significant improvement in water clarity and overall quality, potentially supporting a classification within Class I or Class II, which represent clean to slightly polluted water conditions.

Table 6: TSS data analysis

Description		Weight (g)				
		Day before filtering	Day 3	Day 6	Day 9	Day 12
Weight of the clean filter paper(g)	W1	0.14	0.14	0.14	0.14	0.14
Weight of the filter paper & residue (g)	W2	0.1577	0.1565	0.1520	0.1500	0.1488
Weight of residue (g)	W	0.0177	0.0165	0.0120	0.0100	0.0088
Volume of the sample (mL)	V	500	500	500	500	500
Total Suspended Solids (mg/L)	TSS	0.0354	0.0330	0.024	0.0200	0.0176

The reduction in TSS can be attributed to the filtration layers of the system, typically composed of sand, gravel, or sponge, which trapped larger particles as water passed through. Consequently, these layers prevented suspended solids from reaching the outlet, resulting in clearer and cleaner filtered water. The consistent decrease in TSS further demonstrates that the filter maintained its performance and did not experience clogging during the test period. This sustained functionality is essential for the reliable operation of urban drainage systems.

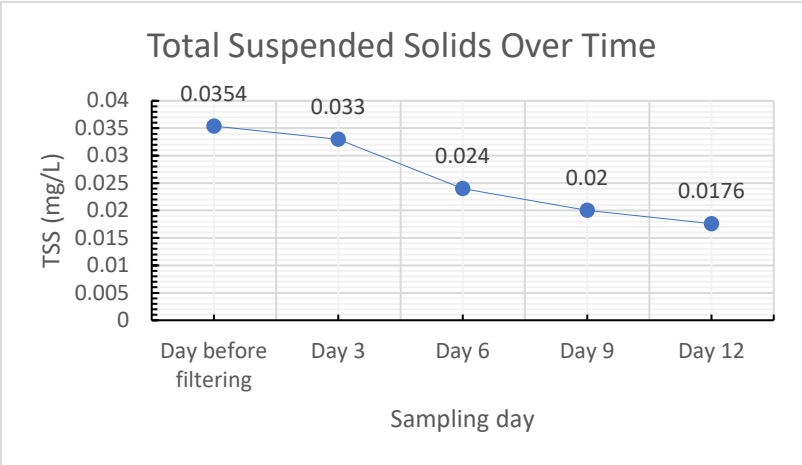

Fig. 14: TSS value over time

Total Solids Test Data. Total solids (TS) refer to the combined measurement of total dissolved solids (TDS) and total suspended solids (TSS). The TS concentration in the drain water showed a continuous decrease over the 12-day period. Initially, the TS level was 2.0954 mg/L, indicating a relatively higher presence of both dissolved and suspended materials. By Day 3, it had decreased to 1.673 mg/L, and further declined to 0.2976 mg/L by Day 12. This means that the solids were reduced by about 85 to 90 percent from the starting point. These results indicate that the filter system is working very well to purify the water.

This consistent reduction demonstrates the effectiveness of the U-drain filter system in removing both dissolved and particulate matter from the water. Although total solids (TS) are not directly included as a parameter in the Malaysian Department of Environment (DOE) Water Quality Index (WQI), they are closely related to TDS and TSS, which influence overall water quality. The decreasing TS trend therefore suggests an overall improvement in water quality and supports a better WQI classification, indicating cleaner and less polluted water conditions.

Table 7: TS data analysis

Sampling day	Day before filtering	Day 3	Day 6	Day 9	Day 12
TDS (mg/L)	2.06	1.64	1.2	0.6	0.28
TSS (mg/L)	0.0354	0.033	0.024	0.02	0.0176
TS(mg/L)	2.0954	1.673	1.224	0.62	0.2976

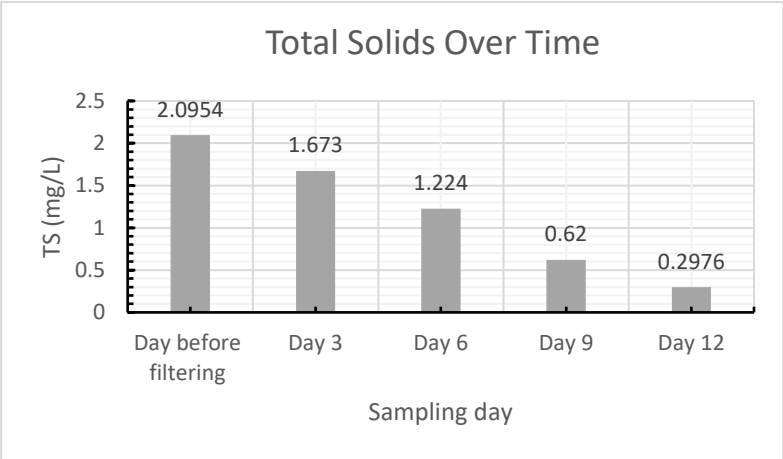

Fig. 14: TS value over time

Turbidity test data. Turbidity measurements of the drain filtration system showed a clear improvement in water clarity over the 12-day period. The initial turbidity was 2.70 NTU, indicating slightly cloudy water due to the presence of suspended particles such as soil and organic matter. Over time, turbidity decreased progressively to 2.10 NTU on Day 3, 1.60 NTU on Day 6, 1.20 NTU on Day 9, and 0.90 NTU on Day 12. This steady decline demonstrates the effectiveness of the filtration system in removing suspended solids and other impurities from the water.

Table 8: Turbidity data analysis

Test Day	Turbidity Reading (NTU)	Observation
Day before filtering	2.70	Slightly cloudy water before filtration
Day 3	2.10	Turbidity starts decreasing, system working properly
Day 6	1.60	Water clearer, fewer suspended solids
Day 9	1.20	Water quality continues improving
Day 12	0.90	Very clear water, filtration fully effective

In relation to the Malaysian Department of Environment (DOE) Water Quality Index (WQI), turbidity is closely associated with total suspended solids (TSS), which

is a direct parameter in WQI calculation. Lower turbidity values indicate improved water clarity and reduced particulate pollution, contributing positively to overall water quality. The final turbidity value of 0.90 NTU suggests that the treated water approaches high-quality conditions, potentially aligning with Class I or Class II under the WQI classification, which represent clean to slightly polluted water.

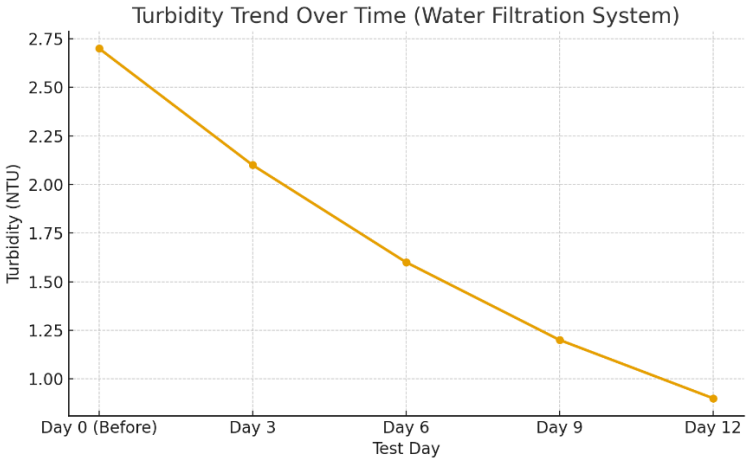

Fig. 15: Turbidity value over time

Conclusion and Recommendation

In this study, a designed and tested filter made with sponge, zeolite, and activated charcoal/ carbon was used to treat drainage water at Medan Selera Harmoni in Merlimau, Melaka. Over 12 days, a significant decrease were detect in both solid particles and water cloudiness. The filter system was able to remove both floating and dissolved particles. Overall, this Zeolite Charcoal Water Filter system offers an affordable, durable, and practical solution for treating dirty drainage water in public areas. It can help cities reduce pollution, simplify maintenance, and improve public health. Future research could focus on scaling up the system, testing it over longer periods, and finding the best combination of materials for even better water treatment.

The results of this project support several recommendations aimed at improving the performance, durability, and overall effectiveness of the Zeolite Charcoal Water Filter. Although the current design effectively reduces total dissolved solids (TDS), total suspended solids (TSS), and total solids (TS) and turbidity, further research and design enhancements are necessary to optimize long-term operation and broaden potential applications.

Future research should extend the testing duration to evaluate the filter's long-term efficiency. While the 12-day testing period produced promising results, continuous operation over several months would provide insight into the saturation level of the filter media, required maintenance frequency, and overall system lifespan. Collecting long-term data would inform replacement schedules and improve system reliability for daily use in food courts or similar facilities.

For the testing, it is suggested to incorporate other water quality parameters, such as pH, Biological Oxygen Demand (BOD), Chemical Oxygen Demand (COD), and oil and grease concentration. Evaluating these parameters would provide a more comprehensive assessment of the filter's effectiveness in removing solids and reducing organic and chemical pollutants. Furthermore, the ratio of filter media like sponge, zeolite, and activated charcoal should be optimized. Varying the proportions may affect the adsorption rate, flow rate, and material durability. Testing different layer

thicknesses or particle sizes could enhance efficiency, minimize clogging, and extend operational lifespan.

The filter box design should be improved to increase user-friendliness and simplify maintenance. Adopting a modular or cartridge-based structure would allow users to replace individual sections instead of the entire unit. This modification would reduce operational costs and encourage wider adoption, especially among small businesses and community kitchens.

Abstract. This study examines the effectiveness of Effective Microorganism Activated Solution (EMAS) in improving wastewater quality from urban drainage ditches. The study focuses on turbidity and ammonia nitrogen as key water quality indicators. Wastewater samples were collected from three drainage locations in Parit Baru, Sabak Bernam, and treated with EMAS-based mudballs over a nine-day period. Results showed significant reductions in ammonia nitrogen (92.31%–97.3%) and turbidity (24.9%–88.2%). However, the study is limited to two parameters and does not include control samples or replication, which may affect the reliability of conclusions. Nevertheless, the findings suggest that EMAS mudballs have potential as a low-cost and eco-friendly method for improving wastewater quality in drainage systems. This study also aligns with SDG 14: Life Below Water, whereby it helps protect aquatic ecosystems through the reduction of pollutants and the prevention of eutrophication that can affect aquatic life. This study aimed to explore the effectiveness of mudballs using activated solution in improving ditch water quality through turbidity parameters and to measure changes of ammonia nitrogen in water quality before and after EMAS mudball application. EMAS mudballs were applied to ditch and lake water samples for nine days to measure reductions in ammonia and turbidity. The results at Parit Baru, Sabak Bernam, showed significant improvements in water quality, with ammonia reduced by 92.31% in location 1, 95.65% in location 2, and 97.3% in location 3. Turbidity decreased in location 2 from 6.86 NTU to 4.9 NTU, with a 28.6% reduction, and for location 3, a smaller decrease was observed from 9.28 NTU to 6.97 NTU, a 24.9% reduction. In location 1, turbidity dropped significantly from 21.3 NTU to 2.52 NTU, indicating an 88.2% reduction. These results have also indirectly improved wastewater quality. Nonetheless, the study is limited to the concentration of domestic discharges and fertilizers from agricultural activities. Another limitation of this study is that it involved various uncontrolled human activities and untreated industrial waste discharged from a small and medium industries activities. However, this study offers a simple, low-cost, and eco-friendly method for improving wastewater quality, though its effectiveness depends on initial conditions, duration, and application amount.

Keywords: Effective Microorganism, Activated Solution, Turbidity, Ammonia Nitrogen

Introduction

Water pollution occurs when harmful substances mix with water in rivers, lakes, oceans and underground, making it dangerous and unusable for humans, animals and plants. Pollution can take various forms, including chemicals, pathogens, plastics and other waste materials. These pollutants can originate from natural sources and human activities, posing significant risks to aquatic ecosystems and public health. Pollution poses a major threat to marine ecosystems, including coral reefs, fish populations and seabirds. Pollutants such as oil, plastic waste and chemicals endanger marine life through ingestion, entanglement and habitat destruction. Excess nutrient runoff from agriculture and urban areas can lead to eutrophication, resulting in excessive algae growth and oxygen depletion in water bodies. Eutrophication disrupts aquatic ecosystems, causing fish deaths, habitat degradation and biodiversity loss (Earth Reminder, 2024).

One of the sources of pollution is domestic pollution, which refers to the harmful substances that are emitted or generated within residential areas. It is a significant environmental concern that affects not only the immediate living environment but also contributes to broader ecological issues. Pollution in the home can originate from various sources, including household activities, appliances, and even the building materials used in constructing homes.

Most domestic wastewater is smelly, dirty, blackish in color and full of trashes and is not well managed as people dispose of the garbage wherever possible, mostly in the drainage systems in rivers. This led to pollution that causes bad effect on our health and an increase in other living microorganism in the drain such as E-coli, Salmonella, and rotavirus. When this wastewater flows to a stagnant trench, the action of various bacteria and other microorganism make the wastewater turn black in color and bad odor smell could be detected. Organic materials within wastewater originate from plants, animals or synthetic organic compounds, and enter wastewater via a number of routes including human wastes, detergents, and industrial sources. Therefore, the application of EM mudball was used (Mazalan, Hashim & Hanapiah, 2017).

EM mudball is one of the new applications to treat the wastewater. EM mudball is made from mixture of effective microorganism, soil, bio recycle and molasses. EM mudball act as media for the bacteria to growth. After a certain time, as the bacteria growth is shown by surrounded by white pores of algae on the surface of the mudball. So that it can be used.

EM mudball has potential to reduce the sludge, reduce the smelly and improve the quality of the water of the polluted area. This is due to photosynthetic bacteria which can reduce the smelly produce by polluted water. Apart from that, it may convert polluted water source to fresh water supply source and help the meeting in increasing domestic, industrial and agricultural demand and ensure sustainability of water resource in Malaysia. As for that, EM is used to treat domestic wastewater in terms of dissolved oxygen (DO), chemical oxygen demand (COD), turbidity, suspended solid (SS), color, pH, volatile organic compound (VOC) and heavy metal and to observe the effectiveness of treating domestic wastewater using EM mud ball technology (Mazalan, Hashim & Hanapiah, 2017).

Before mudballs were used, activating EMAS is a crucial step to ensure the microorganisms inside are fully active and effective. EMAS contains beneficial microorganisms in a dormant state, and through a controlled activation process, these microorganisms are awakened and ready to work. This activation not only boosts biological activity within the mudballs but also creates a stable and safe microbial environment, free from harmful pathogens. As a result, the activated mudballs perform more efficiently when applied to rivers, lakes, or contaminated soil, supporting natural restoration processes and improving environmental health (TeraGanix, 2024).

Despite this potential, previous studies on mudball application have largely focused on its technical or environmental effectiveness rather than its relation to SDG. Most studies have examined mudball performance in relation to pollutant reduction, microbial action, or water quality improvement, but fewer have considered how such this activities influence supports SDG 6: Clean Water and Sanitation, ensuring access to clean water and effective waste water management, aligning with SDG 12: Responsible Consumption and Production and also this study contributes to SDG 14: Life Below Water, providing a positive impact in reducing pollution in rivers and drains that can cause eutrophication and harm aquatic life.

Therefore, this study addresses an important gap by examining the effectiveness of Effective Microorganism Activated Solution (EMAS) can contribute to Sustainable Development Goal 6 (Clean Water and Sanitation). By positioning mudball-based restoration as both an environmental and educational intervention, this study contributes to the growing discussion on how Mudball-based water remediation for drainage restoration can be implemented through practical, low-cost, and contextually relevant approaches in higher education institutions to enhance the knowledge of SDG 6, SDG 12 and SDG 14.

Problem Statement

Lake pollution (NextIAS, Water Pollution, 2025).

This situation can have detrimental effects on this aquatic ecosystem as pollutants not only harm aquatic life but also seep into the soil and contaminate groundwater, which can affect human health. In addition, water pollution can also lead to excessive algae growth and eutrophication due to the presence of excessive nutrients such as nitrogen and phosphorus. Uncontrolled algae growth can block sunlight from penetrating and disrupt the photosynthesis process of other aquatic organisms. When algae die and decompose, this decomposition process will consume a large amount of dissolved oxygen in the water (USGS n.d.).

As a result, this will lead to a decrease in the level of dissolved oxygen in the water body. If dissolved oxygen is low, it can cause stress to aquatic life, fish deaths and a deterioration of overall water quality. Not only that, but it also disrupts the ecological balance and affects the use of water for domestic supply as well as economic activities such as fisheries. The effects of water pollution are not easy to resolve and have also caused discomfort to the public.

In this regard, one potential method to tackle water pollution is biological treatment. Unlike conventional treatment systems, biological methods are more energy efficient, have a lower carbon footprint and can convert pollutants into less harmful substances rather than merely removing or transferring them (Benefits of Biological Wastewater Treatment, n.d).

Biological treatment methods use living microorganisms such as bacteria, fungi and other microbes to break down organic matter and pollutants through natural processes such as decomposition and oxidation. Therefore, this method is seen as a practical and sustainable solution in efforts to improve water quality and reduce the impact of water pollution on the environment and community well-being.

Objective

These objectives of this study:

1. To evaluate the effectiveness of EMAS-based mudballs in improving ditch water quality based on turbidity parameters.

2. To determine the reduction of ammonia nitrogen on water samples before and after a EMAS mudball application.

Significance Of Study

This study is important because it can assess the effectiveness of the Effective Microorganism Activated Solution (EMAS) used through Mudball in restoring water quality from pollution. This approach offers an eco-friendly, sustainable, and low-cost alternative suitable for rural areas that may lack access to modern water treatment technology.

From the results of this study, it can serve as a reference for authorities, local communities, and researchers in planning strategies to improve water quality in the future. From a sustainable development perspective, this study supports SDG 6: Clean Water and Sanitation, ensuring access to clean water and effective waste water management. At the same time, this study also uses natural materials such as molasses and water for the preparation of EMAS, making it safe for the environment and aligning with SDG 12: Responsible Consumption and Production.

Overall, this study not only contributes to the restoration of water quality but also helps to sustainably preserve the environment and raise community awareness of the importance of effective water resource management.

Methodology

Study Area and Sample Collection

Wastewater samples were collected from three different drainage locations in Parit Baru, Sabak Bernam, Selangor, Malaysia. The sampling locations were selected to represent different potential pollution sources within urban drainage systems. Location 1 was situated near a residential area where domestic wastewater such as detergents, household waste, and oil residues was discharged into the drainage ditch. Location 2 was located near an educational area surrounded by palm trees and vegetation, where organic debris and algal growth were commonly observed. Location 3 was located near a medical and construction area, where wastewater contamination may originate from construction activities and nearby facilities.

Approximately 5 litres of wastewater were collected from each location using clean sampling containers. The collected samples were transported to the laboratory for further experimental analysis and treatment.

This study was conducted under controlled laboratory batch conditions using wastewater samples collected from field locations, rather than direct in-situ field application.

Preparation of Effective Microorganism Activated Solution (EMAS)

The Effective Microorganism Activated Solution (EMAS) was prepared to activate beneficial microorganisms used in the mudball preparation process. First, 3 litres of water were heated until boiling. Then, 200 g of brown sugar was added to the hot water and stirred until fully dissolved to provide a carbon source for microbial growth. After the solution cooled to room temperature, 65 mL of cultured drink containing beneficial microorganisms was added and mixed thoroughly.

The solution was then stored in a clean container and allowed to stabilize before being used for activating the mudballs. This activation process helps stimulate microbial activity, ensuring the microorganisms are active and effective during the wastewater treatment process.

Preparation of EM Mudballs

EM mudballs were prepared using a mixture of natural materials to support microbial growth. The main components included topsoil, rice husk, bokashi, and molasses. These materials were thoroughly mixed until a uniform mixture was obtained. The prepared EMAS solution and water were gradually added to the mixture until a suitable consistency was achieved.

The mixture was then shaped into spherical mudballs approximately the size of a tennis ball. After shaping, the mudballs were placed in a shaded area and allowed to ferment for approximately 7–14 days to promote microbial development. Once the fermentation process was complete, the mudballs were further activated by soaking them in the EMAS solution for two days until visible mold growth and a sweet-sour odor indicated active microbial activity.

Experimental Procedure

The activated mudballs were used to treat the collected wastewater samples. Prior to treatment, three mudballs were weighed, each with an approximate weight of 50 g. One mudball was then placed into each 5-liter water sample collected from the respective sampling locations.

Water quality measurements were conducted before the mudball treatment and during the treatment period. Data were recorded at four different time intervals: before treatment (Day 0), Day 3, Day 6, and Day 9. This experimental design allowed the observation of changes in water quality parameters over time after the application of EM mudballs.

Water Quality Analysis

Two main water quality parameters were analysed in this study: turbidity and ammonia nitrogen concentration.

Turbidity measurements were conducted using a TL2300 Laboratory Turbidimeter. For each test, 10 mL of water sample was placed into a sample cell, and a small amount of silicone oil was applied to the cell surface to reduce friction and improve measurement accuracy. The sample cell was then inserted into the turbidity meter, and readings were recorded in Nephelometric Turbidity Units (NTU).

Ammonia nitrogen analysis was performed using the AmVer™ Diluent Reagent Test 'N Tube method with a Hach DR3900 Spectrophotometer. A blank sample was prepared using dilution water, while the test sample contained the wastewater sample. Ammonia Salicylate Reagent and Ammonia Cyanurate Reagent were added to each vial, and the solutions were shaken thoroughly to dissolve the reagents. The samples were allowed to react for 20 minutes before analysis. The spectrophotometer was first calibrated using the blank sample, followed by the measurement of the water sample to obtain ammonia nitrogen concentration values in mg/L.

Equipment and Materials

Figure 1 presented wastewater sampling locations at three drainage sites in Parit Baru, Sabak Bernam. Otherwise Figure 2 presented preparation of EM mudballs using soil, rice husk, bokashi, and molasses. study area several laboratory instruments and equipment were used to ensure accurate measurement of water quality parameters. The Hach DR3900 Spectrophotometer was used to determine ammonia nitrogen concentrations in water samples, while the TL2300 Laboratory Turbidimeter was used to measure turbidity levels. These instruments provide reliable and accurate readings for water quality analysis and are widely used in environmental monitoring studies.

Results And Discussion

Turbidity Analysis

Refer to the Table 1, the turbidity results demonstrated a noticeable reduction after the application of EM mudballs at all three sampling locations. At Location 1, turbidity decreased significantly from 21.3 NTU to 2.52 NTU after nine days, representing an 88.17% reduction. The most substantial decrease occurred by Day 6, indicating rapid microbial and sedimentation activity.

At Location 2, turbidity reduced moderately from 6.86 NTU to 4.90 NTU (28.57% reduction). The improvement was gradual, likely due to the initially low turbidity value before treatment.

Location 3 showed an initial decrease from 9.28 NTU to 6.44 NTU by Day 3, followed by a temporary increase on Day 6 (15.43 NTU), before decreasing again to 6.97 NTU on Day 9. The temporary spike may be attributed to uneven mudball decomposition or disturbance of settled particles.

All final turbidity values were below the National Water Quality Standards (NWQS) irrigation limit of 50 NTU, indicating compliance with regulatory requirements.

The turbidity reduction can be explained by two mechanisms:

1. Biological degradation – Beneficial microorganisms such as lactic acid bacteria and photosynthetic bacteria decomposed suspended organic matter.

2. Physical flocculation – Clay particles in the mudball bound suspended solids, forming larger aggregates that settled at the bottom.

These combined biological and physical processes contributed to improved water clarity and stabilization.

Table 1: Raw data for turbidity

Location	Before [NTU]	Day 3 [NTU]	Day 6 [NTU]	Day 9 [NTU]
1	21.3	12.97	1.79	2.52
2	6.86	6.31	5.2	4.9
3	9.28	6.44	15.43	6.97

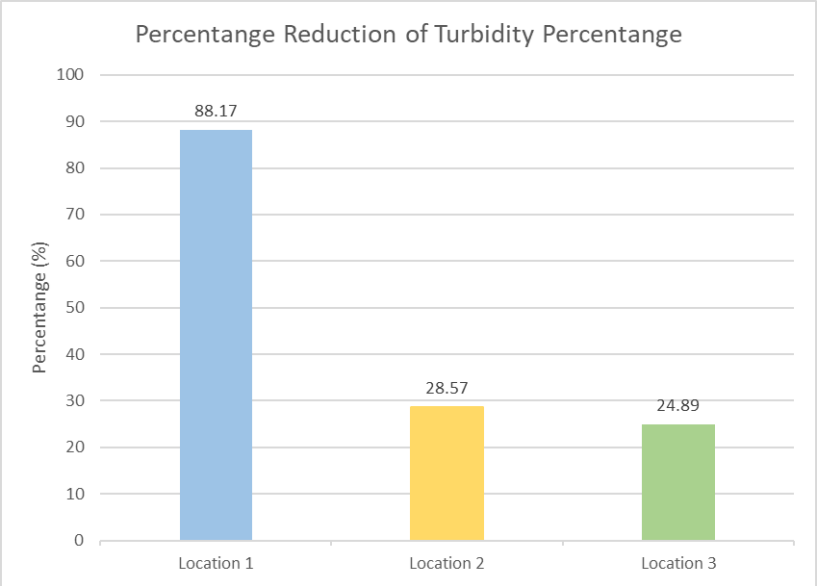

Figure 3: Percentage reduction of turbidity

Figure 3 shows the percentage reduction of Ammonia Nitrogen (NH_3-N) at three different locations. Location 3 recorded the highest reduction at 97.3%, followed by Location 2 at 95.65%, while Location 1 showed the lowest value at 92.31%. This indicates that the treatment or intervention was most effective at Location 3. The differences may be influenced by environmental factors, treatment efficiency, or the initial water quality conditions at each studied location.

Ammonia Nitrogen Analysis

Ammonia nitrogen showed significant reduction across all locations.

Table 2 presented at Location 1, ammonia decreased from 2.6 mg/L to 0.2 mg/L (92.31% reduction).
At Location 2, levels decreased from 2.3 mg/L to 0.1 mg/L (95.65% reduction).
At Location 3, the highest initial concentration (7.4 mg/L) decreased to 0.2 mg/L, achieving a 97.3% reduction.

All final values were below the NWQS Class IV irrigation limit of 0.9 mg/L.

The reduction of ammonia nitrogen is mainly attributed to:

The reduction of ammonia nitrogen may be associated with several possible mechanisms:

1. Microbial processes such as nitrification, as reported in previous studies.
2. Adsorption by clay particles, which may bind ammonium ions (NH_4^+).
3. Potential biofilm activity that may enhance microbial stability and nutrient uptake.

The consistent decrease across all sites confirms that EM mudballs function effectively as a biological remediation agent.

Table 2: Raw data for Ammonia Nitrogen , NH_3-N [mg/L]

Location	Before NH_3-N [mg/L]	Day 3, NH_3-N [mg/L]	Day 6, NH_3-N [mg/L]	Day 9, NH_3-N [mg/L]
1	2.6	2.2	0.1	0.2
2	2.3	0.7	0.1	0.1
3	7.4	5.3	0.2	0.2

Figure 4 illustrates the percentage reduction of turbidity across three different locations. Location 1 shows the highest reduction at 88.17%, indicating the most effective improvement in water clarity. In contrast, Location 2 and Location 3 recorded significantly lower reductions of 28.57% and 24.89%, respectively. This suggests that the treatment or intervention applied was considerably more effective at Location 1. The variation in turbidity reduction may be influenced by differences in environmental conditions, pollutant levels, or the efficiency of the treatment methods implemented.

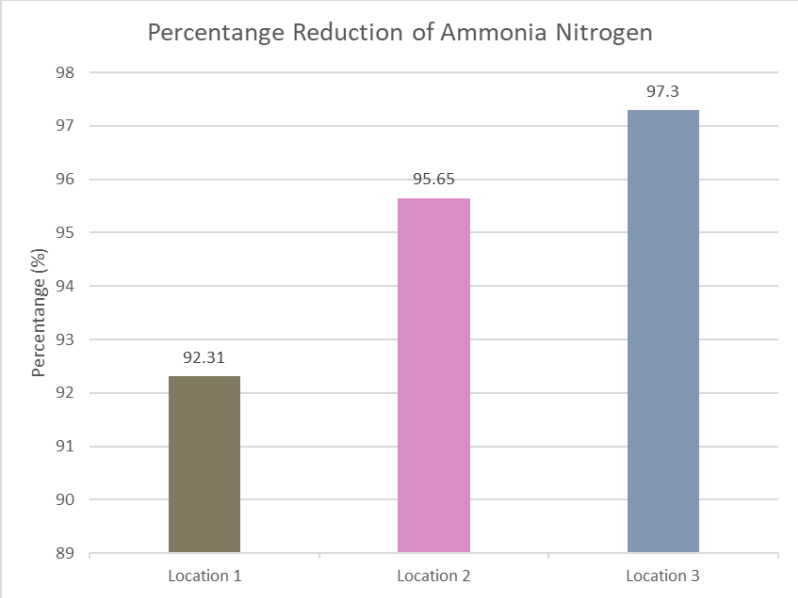

Figure 4: Percentage reduction of Ammonia Nitrogen NH_3-N

This study has several limitations. First, no untreated control samples were included, making it difficult to fully isolate the effect of EMAS mudballs from natural sedimentation processes. Second, the experiment was conducted without replication, which limits the statistical reliability of the findings. Third, only two water quality parameters (turbidity and ammonia nitrogen) were measured, which may not fully represent overall wastewater quality. Future studies should include additional parameters such as COD, DO, and pH, along with controlled experimental design and replication.

Although a control sample was not included in this study, future work should incorporate untreated control samples to distinguish between natural settling effects and treatment efficiency. Each location was treated as a single experimental unit without replication, which may affect the reproducibility of the results. Future studies should include multiple replicates to improve statistical reliability.

Summary

This study provides preliminary evidence that EMAS mudballs may contribute to SDG 6 (Clean Water and Sanitation) by improving selected water quality parameters. However, further studies with more comprehensive analysis are required to confirm its broader impact on wastewater quality. The results showed that turbidity and ammonia nitrogen levels were reduced to meet NWQS standards, suggesting that EM mudballs have potential as a natural and eco-friendly treatment method. These improvements may be associated with the activity of beneficial microorganisms, which can break down organic matter, reduce turbidity, and improve water quality. However, these mechanisms were not directly measured in this study. Furthermore, this approach may align with sustainable development goals, particularly SDG 6 and SDG 12, by promoting cleaner water and responsible use of natural resources. Based on the findings, key recommendations include optimizing the dosage of EM mudballs, integrating them with other treatment systems, conducting long-term monitoring, and evaluating safety to ensure the method remains effective and sustainable over time.

Abstract. Plant-based beverages are gaining increasing attention due to the growing demand for healthier and more sustainable food products. Spinach-based beverages are valued for their high nutritional content, including vitamins, antioxidants, and bioactive compounds. However, the development of stable spinach-based beverages remains challenging because suspended plant particles and fibers tend to settle during storage, resulting in phase separation and undesirable texture that may reduce product quality and consumer acceptance. This study investigated the effect of different concentrations of xanthan gum on the stability, physicochemical characteristics, and sensory properties of spinach-based beverages. Four beverage formulations containing xanthan gum concentrations of 0%, 0.1%, 0.3%, and 0.5% were prepared and evaluated. Physicochemical properties were analyzed using viscosity measurements and color analysis (L*, a*, and b* values), while physical stability was assessed through visual observation of sedimentation and phase separation during refrigerated storage. Sensory evaluation involving 50 untrained panelists was conducted to evaluate appearance, color, texture, taste, and overall acceptability using a hedonic scale. The results showed that formulations containing 0.3% and 0.5% xanthan gum exhibited improved physical stability with minimal phase separation compared to the control sample. Viscosity increased significantly with increasing xanthan gum concentration, ranging from 25.70 cP in the control sample to 41.43 cP in the formulation 3. Color analysis showed no significant differences among the formulations ($p > 0.05$). Sensory evaluation indicated that formulations with moderate xanthan gum concentrations achieved better overall acceptability, while higher concentrations increased beverage thickness and slightly affected taste perception. Overall, xanthan gum effectively improved the stability and texture of spinach-based beverages, with moderate concentrations (0.3%) providing the best balance between physicochemical stability and sensory acceptance.

Keywords: spinach beverage, xanthan gum, plant-based beverage, physicochemical properties, sensory evaluation, beverage stability

Introduction

The development of plant-based beverages has garnered significant attention in recent years due to increasing consumer demand for healthier and sustainable food alternatives. Among these, vegetable-based drinks such as spinach beverages are valued for their high micronutrient content, antioxidant compounds, and potential

health benefits. However, the formulation of stable and palatable plant-based beverages remains challenging because issues such as phase separation, sedimentation, and undesirable mouthfeel often affect product quality and consumer acceptance. These challenges highlight the importance of incorporating suitable stabilizers and texture modifiers to improve the physical and sensory characteristics of such beverages [1, 2, 3]. In the past, studies have primarily focused on the role of hydrocolloids as stabilizing agents in food and beverage systems. Xanthan gum, a microbial polysaccharide widely used in the food industry, has been extensively studied for its excellent rheological properties, shear-thinning behavior, and ability to form viscoelastic networks that enhance viscosity and stability. Previous research has shown that xanthan gum can improve emulsion stability, reduce particle mobility, and enhance mouthfeel in plant-based beverages [1, 4, 5]. These findings have contributed significantly to understanding the functional role of hydrocolloids in beverage formulations. However, earlier studies have also highlighted several limitations, particularly regarding optimal concentration levels, interactions with other ingredients, and potential impacts on sensory acceptance. Recent advancements in food formulation science have introduced the concept of synergistic interactions between xanthan gum and other hydrocolloids such as guar gum, locust bean gum, and gum arabic. These combinations can create weak gel-like networks with enhanced rheological properties, enabling better control of viscosity, stability, and texture in beverage systems [6, 7, 8]. Despite these developments, there remains limited research specifically examining the application of xanthan gum and hydrocolloid blends in spinach-based beverages, particularly in balancing stability, nutritional value, and sensory quality. This research aims to address these gaps by investigating the role of xanthan gum in improving the physical stability and texture of spinach-based beverages. The significance of this study lies in its potential to contribute to the development of more stable, acceptable, and nutritionally valuable plant-based drinks. Furthermore, the findings are expected to provide useful insights for food scientists and beverage manufacturers in optimizing hydrocolloid-based formulations for vegetable-based functional beverages.

Problem Statement

The formulation of plant-based beverages has gained increasing attention in recent years due to the growing demand for functional and health-oriented drinks. Vegetable-based beverages such as spinach drinks are rich in vitamins, antioxidants, and bioactive compounds that provide various health benefits. However, the development of stable vegetable-based beverages presents a significant challenge due to issues related to phase separation, sedimentation, and undesirable mouthfeel. These problems occur because plant particles and fibers tend to settle over time, resulting in physical instability and reduced consumer acceptance [1, 5, 9]. This issue is particularly important because the stability and sensory quality of beverages directly influence consumer perception and market acceptance. Poor physical stability may cause separation between liquid and solid components, while inappropriate texture can negatively affect drinking experience [1]. Hydrocolloids such as xanthan gum are widely used in the food industry as stabilizers and thickening agents due to their ability to increase viscosity and improve suspension stability in beverage systems [3, 4, 11]. Xanthan gum can form a three-dimensional viscoelastic network that helps maintain particles in suspension and enhances the overall texture of liquid food products [5, 10].

Despite the extensive application of xanthan gum in various food systems, limited studies have specifically examined its role in spinach-based beverage formulations, particularly in relation to physicochemical stability and sensory acceptance [9, 13, 14]. In addition, inconsistencies remain regarding the optimal concentration required to achieve a balance between improved stability and desirable sensory attributes, as excessive viscosity may negatively affect consumer perception [15, 16, 17].

Therefore, this study focuses on evaluating the influence of xanthan gum concentration on the physicochemical properties, physical stability, and sensory characteristics of spinach-based beverages. By systematically analyzing different formulation levels, this research aims to provide a clearer understanding of how xanthan gum contributes to beverage quality and to identify an optimal concentration that ensures both product stability and consumer acceptability.This approach directly addresses the existing research gap by offering empirical evidence on the functionality of xanthan gum within a spinach-based matrix, which remains underexplored compared to other plant-based beverages [5, 10, 12]. The findings are expected to support the development of stable and acceptable vegetable-based beverages and contribute to improved formulation strategies in functional drink applications.

Moreover, environmental factors such as pH, ionic strength, and the presence of divalent cations may influence xanthan gum hydration, molecular structure, and rheological behavior in aqueous systems [18, 19, 20]. In addition, the interaction between xanthan gum and other components in vegetable-based beverages, such as plant proteins, fibers, and phytochemicals, remains insufficiently explored. These interactions may affect not only the stability of the beverage but also the nutritional bioavailability and sensory properties of the final product [14, 21, 22]. Furthermore, emerging research highlights the importance of optimizing hydrocolloid concentration and processing techniques to enhance the functional quality of plant-based beverages [23, 24]. Therefore, it is critical to investigate the effects of different concentrations of xanthan gum on the physicochemical and sensory properties of spinach-based beverages. This research aims to address this gap by evaluating the influence of xanthan gum concentration on beverage stability, viscosity, color characteristics, and consumer sensory acceptance. By conducting physicochemical analyses and sensory evaluation, this study seeks to provide a deeper understanding of the role of xanthan gum in improving the quality of spinach-based beverages. Ultimately, the findings of this research are expected to contribute to the development of stable, nutritionally valuable, and consumer-acceptable vegetable-based beverages. In addition, this study may support the advancement of functional beverage formulation and encourage the use of hydrocolloids in plant-based beverage innovation [7, 25, 26, 27].

Research Objective

This study aims to investigate the effect of different concentrations of xanthan gum on the quality of spinach-based beverages. The objectives of this research are as follows:

i. To determine the effect of different concentrations of xanthan gum on the physical stability of spinach-based beverages.
ii. To evaluate the physicochemical properties of spinach-based beverages formulated with different concentrations of xanthan gum.
iii. To assess the sensory acceptability of spinach-based beverages with varying xanthan gum concentrations.
iv. To identify the optimal xanthan gum concentration that produces the most acceptable spinach-based beverage formulation.

Research Scope

This study focuses on evaluating the effect of different xanthan gum concentrations on the quality of spinach-based beverages. The scope of this research includes the following aspects:

i. to evaluate the stability of spinach-based beverages formulated with different concentrations of xanthan gum (0%, 0.1%, 0.3%, and 0.5%). It will involve preparing four beverage formulations and observing the occurrence of phase separation and sedimentation during refrigerated storage. The evaluation will focus on short-term storage stability under controlled laboratory conditions. This aim will allow for a better understanding of how xanthan gum concentration influences the physical stability of spinach-based beverages.
ii. to analyze the physicochemical characteristics of spinach beverages prepared with varying concentrations of xanthan gum. This will include measurements of viscosity using a Brookfield viscometer and color analysis using a MiniScan EZ spectrophotometer. The analysis will focus on parameters such as viscosity and color values (L*, a*, b*) under controlled laboratory conditions. The goal is to determine how different xanthan gum concentrations affect the physical quality and appearance of spinach-based beverages.
iii. to evaluate the sensory characteristics of the spinach beverage formulations through a sensory evaluation test. The research will specifically explore panelists' perception of appearance, color, texture, taste, and overall acceptability. The sensory analysis will involve approximately 50 panelists using a hedonic scale under controlled sensory laboratory conditions. This aim will provide insights into consumer acceptance of spinach beverages formulated with different xanthan gum concentrations.
iv. is to determine the most suitable xanthan gum concentration based on physicochemical and sensory evaluation results. The research will involve statistical analysis of collected data using SPSS to compare the performance of the four formulations. This objective focuses on identifying the formulation that provides the best balance between stability, texture, color, and sensory acceptance.

Research Questions

The research aims to answer the following key research questions:

i. How do different concentrations of xanthan gum affect the physicochemical stability and sensory acceptability of spinach-based beverages?
ii. How do different concentrations of xanthan gum influence the physical stability of spinach-based beverages, particularly in terms of phase separation and sedimentation?
iii. What are the effects of varying xanthan gum concentrations on the physicochemical properties of spinach-based beverages, including viscosity and color characteristics *(L, a*, b*)?
iv. How do different xanthan gum concentrations influence the sensory attributes of spinach-based beverages, such as appearance, color, texture, taste, and overall acceptability?
v. Which xanthan gum concentration produces the most optimal spinach-based beverage formulation in terms of stability, physicochemical quality, and consumer acceptance?

Literature Review

In recent years, plant-based beverages have received significant attention due to the increasing demand for healthier, sustainable, and functional food products. Consumers are increasingly seeking alternatives to traditional dairy beverages, leading to the rapid development of plant-derived drinks made from fruits, nuts, legumes, and leafy vegetables [1, 13, 14]. Among these, spinach-based beverages have gained interest due to their rich nutritional profile, including vitamins, minerals, antioxidants, and bioactive compounds that contribute to improved human health. Spinach is known for its high content of iron, carotenoids, and polyphenols, making it a promising ingredient for functional beverage development [2]. Despite these advantages, the formulation of vegetable-based beverages remains technically challenging. Unlike fruit juices, vegetable beverages often contain higher levels of insoluble fibers and suspended particles, which can cause physical instability such as sedimentation, phase separation, and turbidity changes during storage [5, 9]. These physical changes negatively affect product appearance, texture, and overall consumer acceptance. As a result, stabilizing agents are frequently used in beverage formulations to maintain uniform dispersion of particles and improve product stability.

Hydrocolloids play a crucial role in improving the stability and rheological properties of food systems. Xanthan gum is one of the most widely used hydrocolloids in the food industry due to its excellent thickening, stabilizing, and emulsifying properties [3, 11]. Produced through microbial fermentation by *Xanthomonas campestris*, xanthan gum forms highly viscous solutions even at low concentrations and exhibits remarkable stability across a wide range of temperatures and pH levels [7, 11]**.** These properties make xanthan gum particularly suitable for beverage applications where suspension stability and texture control are critical. Previous studies have demonstrated that xanthan gum can significantly enhance the stability of beverage systems by increasing viscosity and reducing particle

sedimentation [4, 10]. However, excessive concentrations may lead to undesirable sensory effects such as slimy mouthfeel or reduced flavor perception [15, 17]. Therefore, optimizing the concentration of xanthan gum is essential to achieve a balance between physical stability and sensory acceptability. Although xanthan gum has been widely investigated in various food systems, relatively limited studies have focused specifically on its application in spinach-based beverages. In particular, the interaction between xanthan gum and spinach components such as plant fibers, proteins, and phytochemicals has not been extensively explored [13, 14]. Understanding these interactions is important for designing stable and acceptable vegetable-based beverages.

Rheological and Stabilizing Properties of Xanthan Gum

The functionality of xanthan gum in beverage systems is closely related to its rheological properties. Rheology refers to the study of flow and deformation of materials and is a critical factor in determining the texture and stability of liquid food products [3]. Xanthan gum solutions exhibit pseudoplastic or shear-thinning behavior, meaning their viscosity decreases under shear stress. This property allows beverages to maintain high viscosity during storage while remaining easy to pour and consume [3, 11]. The molecular structure of xanthan gum consists of a cellulose-like backbone with trisaccharide side chains, which contribute to its ability to form stable three-dimensional networks in aqueous solutions [4]. These networks increase the viscosity of the continuous phase and help suspend insoluble particles, thereby reducing sedimentation in beverage systems [5]. Several studies have demonstrated the effectiveness of xanthan gum in improving the stability of plant-based beverages. For example, xanthan gum has been shown to enhance suspension stability in protein-based beverage systems and plant-derived emulsions [5, 10]. In addition, the presence of xanthan gum can reduce droplet coalescence in emulsions, leading to improved product consistency and shelf stability [6]. However, the rheological behavior of xanthan gum solutions can also be influenced by environmental factors such as pH, ionic strength, and temperature [18, 19]. In some cases, the presence of divalent cations or high pH conditions may inhibit xanthan gum hydration and reduce its thickening efficiency [7]. Therefore, understanding these environmental interactions is essential for optimizing xanthan gum functionality in beverage formulations.

Sensory Properties and Consumer Acceptance

While improving physical stability is essential for beverage quality, sensory attributes ultimately determine consumer acceptance. Texture, mouthfeel, flavor perception, and appearance are key factors influencing the success of beverage products in the market [15, 16]. Hydrocolloids such as xanthan gum can significantly influence sensory perception by modifying viscosity and mouthfeel. Increased viscosity may enhance perceived creaminess and body in beverages; however, excessive thickening can suppress flavor release and reduce overall palatability [12, 17]. Therefore, achieving an optimal viscosity level is critical for maintaining both physical stability and desirable sensory characteristics. Studies investigating sensory perception in thickened beverages have reported mixed results. Some researchers found that moderate xanthan gum concentrations improve mouthfeel and consumer acceptance, particularly in functional beverages designed for specific populations such as dysphagia patients [16, 21]. However, other studies suggest that excessive

xanthan gum concentrations may create a slimy or gummy texture that negatively affects flavor perception and overall liking [15, 17]. In addition to texture, color and visual appearance are also important sensory attributes for vegetable-based beverages. Changes in viscosity can influence light scattering and visual turbidity, which may affect the perceived freshness and quality of the beverage [8]. Therefore, evaluating both physicochemical and sensory properties is necessary for developing acceptable beverage formulations.

Development of Functional Vegetable Beverages

The growing demand for functional foods has encouraged researchers to explore the use of plant-based ingredients in beverage formulations. Functional beverages are designed to provide additional health benefits beyond basic nutrition, often through the inclusion of bioactive compounds, probiotics, or antioxidants [9]. Spinach is considered a promising ingredient for functional beverage development due to its high nutritional value and antioxidant properties [2]. However, incorporating leafy vegetables into beverages presents formulation challenges related to texture, stability, and flavor. Hydrocolloids such as xanthan gum can help address these challenges by improving suspension stability and modifying texture. Recent studies have also explored the role of xanthan gum in improving probiotic stability and encapsulation in functional beverages [9]. Additionally, advances in hydrocolloid technology have enabled the development of new beverage formulations with enhanced stability and nutritional functionality [10]. Emerging research also highlights the potential for sustainable xanthan gum production through fermentation and waste valorization [26, 27].

Research Gaps

A summary of the limitations in previous studies and the corresponding research gaps addressed in this study is presented in **Table 2.1**.

Table 2.1. Summary of research gaps in xanthan gum applications in plant-based beverages

Aspect	Previous Studies	Identified Gap	Present Study Contribution
Type of Beverage	Focus mainly on dairy-based and fruit-based beverages [5, 10, 12]	Limited studies on spinach-based beverages	Investigates xanthan gum application specifically in spinach-based beverages
Hydrocolloid Interaction	General evaluation of xanthan gum functionality in various systems [3, 11]	Limited understanding of interaction with spinach components (fibers, phytochemicals) [13, 14]	Examines physicochemical behavior within spinach matrix
Stability Analysis	Emphasis on viscosity and emulsion stability	Lack of comprehensive evaluation including	Evaluates physical stability through

Aspect	Previous Studies	Identified Gap	Present Study Contribution
	[4, 10]	sedimentation and phase separation in vegetable drinks [5, 9]	sedimentation and storage observation
Sensory Evaluation	Some studies report sensory effects of viscosity [15, 17]	Limited integration of physicochemical and sensory analysis in one framework	Combines sensory evaluation with physicochemical analysis
Optimal Concentration	General recommendations without product-specific optimization [15, 16]	Lack of precise concentration range for spinach beverages	Identifies optimal xanthan gum concentration for balance between stability and acceptability

Summary

Overall, previous studies have demonstrated that xanthan gum plays a crucial role in improving the stability, viscosity, and sensory characteristics of beverage systems. Its ability to form viscoelastic networks and exhibit shear-thinning behavior makes it particularly suitable for suspension stabilization in plant-based beverages. However, the optimal application of xanthan gum depends on several factors, including concentration, environmental conditions, and interactions with other ingredients in the beverage matrix. While xanthan gum has been widely studied in various food systems, research specifically focusing on spinach-based beverages remains limited. Therefore, this study aims to investigate the effects of different xanthan gum concentrations on the physicochemical stability and sensory properties of spinach-based beverages. The findings are expected to contribute to the development of stable and consumer-acceptable vegetable-based functional beverages.

Research Methodology

This section describes the research methodology employed in this study to evaluate the effect of xanthan gum concentration on spinach-based beverages. The methodology includes raw material preparation, formulation development, physicochemical analysis, sensory evaluation, and statistical analysis. A systematic approach was adopted to ensure the reliability and reproducibility of the experimental results. The methodology also explains the procedures used to collect and analyze data related to the physicochemical and sensory properties of the developed beverages.

Raw Materials. The raw materials used in the preparation of the spinach-based beverage included fresh spinach leaves, green apples, granulated sugar, filtered water, citric acid, and xanthan gum. Fresh spinach and green apples were obtained from a local market, while the other ingredients were food-grade materials commonly used in beverage formulations.

Formulation of Spinach Beverage. The study investigated the effects of different concentrations of xanthan gum on the stability and sensory properties of spinach-based beverages. Four beverage formulations were prepared with varying xanthan gum concentrations. The formulation details are presented in Table 3.1.

Table 3.1. Formulation of Spinach Beverage

Raw Material	Formulation 1 (%)	Formulation 2 (%)	Formulation 3 (%)	Formulation 4 (%)
Spinach	20.00	19.90	19.70	19.50
Green Apple	5.70	5.70	5.70	5.70
Water	68.00	68.00	68.00	68.00
Sugar	6.00	6.00	6.00	6.00
Citric Acid	0.10	0.10	0.10	0.10
Xanthan Gum	0.00	0.10	0.30	0.50

The concentration of xanthan gum used in the formulations were 0%, 0.1%, 0.3%, and 0.5%, respectively. These concentrations were selected to evaluate the influence of xanthan gum on beverage viscosity, stability, and sensory characteristics.

Preparation of Spinach-Based Beverage. The preparation of the spinach-based beverage involved several processing steps as illustrated in Fig. 3.1**.** Initially, all raw materials, including spinach leaves and green apples, were thoroughly washed with clean water to remove dirt and impurities. The spinach leaves and apples were then cut into smaller pieces to facilitate the blending process. Next, the spinach and green apple pieces were blended together for approximately three minutes until a homogeneous mixture was obtained. The blended mixture was subsequently filtered using muslin cloth to remove coarse fibers and obtain a smoother beverage base. The filtered mixture was then heated while continuously stirred. When the temperature reached approximately 80°C, xanthan gum and sugar were added and mixed until completely dissolved. The heating process was continued until the temperature reached 90°C**,** after which citric acid was added and the mixture was maintained for approximately 5 minutes**.** After heating, the beverage was allowed to cool to room temperature before being poured into sterilized glass bottles. The bottles were previously boiled to prevent microbial contamination. Finally, the prepared beverage samples were stored in a refrigerator (chiller) prior to further physicochemical and sensory analyses.

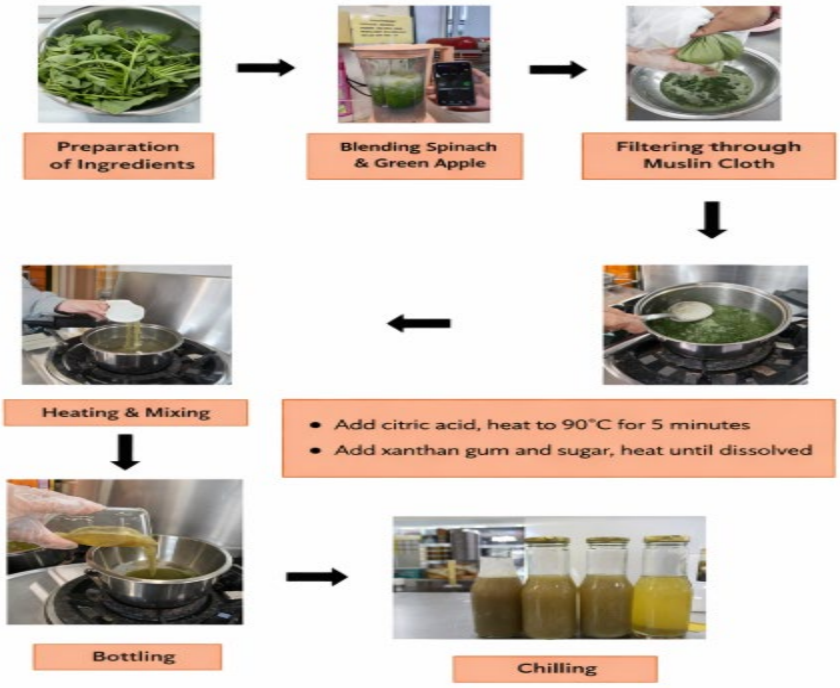

Fig. 3.1. Flowchart of Spinach-Based Beverage Production

Analytical Methods

Viscosity Analysis. Viscosity is an important parameter that describes the resistance of a fluid to flow and is commonly used to evaluate the rheological characteristics of beverage products. In this study, viscosity analysis was conducted using a Brookfield viscometer. Before analysis, beverage samples were removed from refrigeration (5°C) and allowed to equilibrate to room temperature (25 ± 2°C). Approximately 500 mL of each beverage sample was placed in a beaker for measurement. An appropriate spindle was selected and immersed into the sample, and the viscosity measurement was performed at a rotational speed of 100 rpm according to the instrument operating conditions. Each sample was measured in triplicate, and the average value was recorded to ensure accuracy and reproducibility. After each measurement, the spindle was thoroughly cleaned before the next sample was analyzed.

Color Analysis. Color analysis was performed using a HunterLab MiniScan EZ 4500L spectrophotometer**,** which measures the reflectance color of samples based on the *L, a*, and b*** color system. Prior to measurement, the instrument was calibrated using standard black and white calibration tiles to ensure accurate readings. The beverage sample was then placed in the sample port, ensuring that the surface completely covered the measurement area. The instrument recorded the color values for each sample, including L* (lightness), a* (red-green coordinate) and b* (yellow-blue coordinate).

All measurements were conducted under controlled laboratory conditions, and the average values were calculated from repeated readings.

Sensory Evaluation

Sensory evaluation was conducted to assess consumer acceptance of the spinach based beverage formulations. The sensory test involved 50 untrained panelists consisting of students and staff members who regularly consumed plant-based beverages. Four beverage samples representing different xanthan gum concentrations were prepared and coded using random three-digit numbers to minimize bias. Each panelist evaluated all samples under controlled sensory laboratory conditions. The sensory attributes evaluated included appearance, color, texture, taste, and overall acceptability. Panelists rated each attribute using a 7-point hedonic scale, where 1 represented "dislike extremely" and 7 represented "like extremely." Drinking water was provided to panelists for mouth rinsing between sample evaluations to minimize flavour carryover.

Data Analysis

The data obtained from physicochemical and sensory analyses were statistically analyzed using Statistical Package for Social Sciences (SPSS) version 28. All experiments were conducted in triplicate, and the results were expressed as mean ± standard deviation. Statistical differences among the beverage formulations were determined using One-Way Analysis of Variance (One-Way ANOVA) followed by Tukey's post hoc test at a significance level of $p < 0.05$. The statistical analysis enabled the identification of significant differences among formulations and determination of the most acceptable spinach beverage formulation.

Results and Discussion

Four formulations of spinach beverages were stored in a refrigerator at 0–4 °C for 5 h. Based on the visual observation shown in Figure 4.1, noticeable differences in sedimentation were observed among the beverage samples. Sample F1 exhibited the highest phase separation between the liquid and fiber fractions, followed by F2. In contrast, F3 and F4 did not show any visible separation between the liquid and fiber layers. These results indicate that the addition of xanthan gum at concentrations of 0.3% and 0.5% effectively prevented phase separation in the spinach beverage. However, the addition of 0.1% xanthan gum was insufficient to stabilize the beverage system. This finding is consistent with previous studies which reported that xanthan gum improves suspension stability and reduces sedimentation in beverage systems by increasing viscosity and forming a three-dimensional network that helps maintain particles in suspension [11], [12]**.** The improved stability observed in F3 and F4 may therefore be attributed to the enhanced thickening and stabilizing properties of xanthan gum within the spinach beverage matrix.

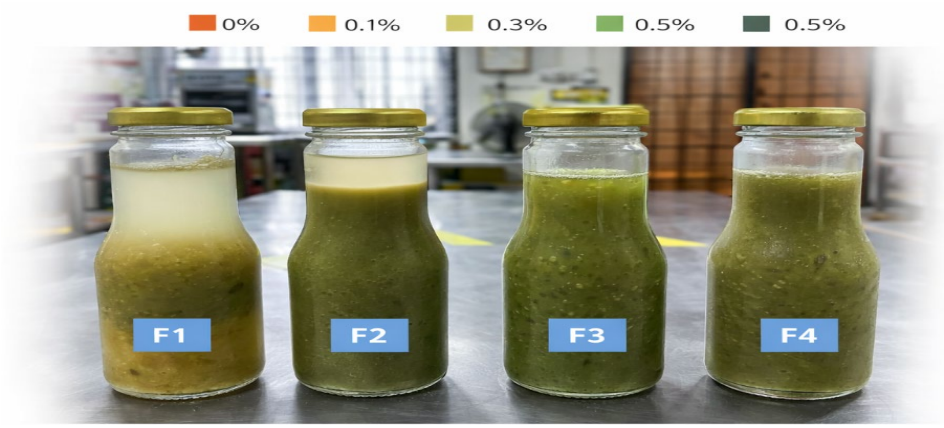

Fig. 4.1. Sedimentation observation of phase separation in spinach beverages with different xanthan gum concentrations after storage at 4 °C for 5 h

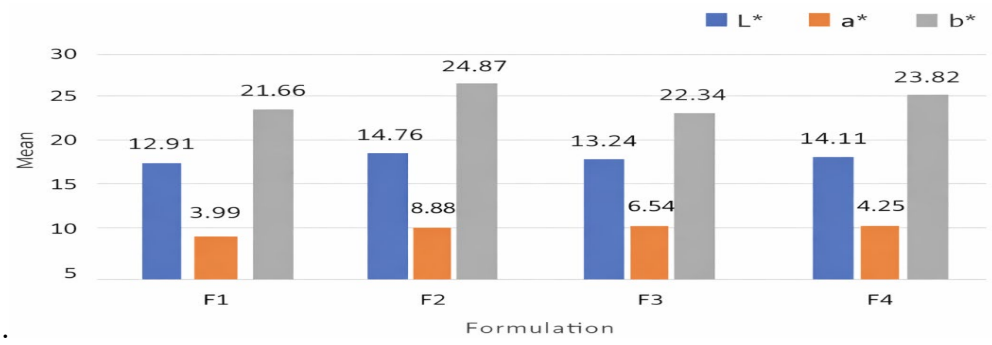
Although the sedimentation stability in this study was evaluated through visual observation, the method provided a practical preliminary assessment of phase separation behaviour among the beverage formulations. The differences observed between samples clearly demonstrated the stabilizing effect of xanthan gum at higher concentrations. Similar observations have been reported in previous studies, where xanthan gum improved suspension stability and reduced sedimentation in beverage systems due to its viscosity-enhancing and network-forming properties [11], [13], [14]. Xanthan gum is known to form a weak three-dimensional structure within aqueous systems, which helps maintain suspended particles and minimizes phase separation during storage [15], [16]. However, visual observation is considered a qualitative approach and may not fully represent the extent of sedimentation quantitatively. Therefore, future studies are recommended to incorporate quantitative stability measurements such as sedimentation index analysis, centrifugation stability testing, turbidity analysis, or particle size distribution measurements to obtain more objective numerical data regarding beverage stability.

Color Characteristics

The color characteristics of the spinach beverages were determined using a colorimeter and expressed in terms of CIELAB parameters (L*, a*, and b*), as shown in Table 4.1 and Fig. 4.2. The L* value represents the lightness of the sample. Among the formulations, F2 recorded the highest mean L* value (14.76), indicating a brighter appearance compared with the other samples, whereas F1 showed the lowest L* value (12.91). However, statistical analysis indicated that there were no significant differences ($p > 0.05$) among the samples. For the a* parameter, which represents the green–red axis, F2 also exhibited the highest mean value (8.88) compared with F1, F3, and F4. Similarly, the b* value, representing the yellow–blue axis, showed the highest mean value in F2 (24.87). Based on the obtained results, F2 showed relatively higher color intensity compared with the other formulations. This may be attributed to the presence of xanthan gum, which can influence pigment dispersion and optical properties in the beverage matrix. This finding is consistent with previous studies which reported that xanthan gum and other hydrocolloids can improve pigment suspension stability and influence the visual appearance and color characteristics of beverage systems through modifications in viscosity and light scattering

properties[17][18]**.** Overall, the combination of L*, a*, and b* values indicates that F2 produced a more visually acceptable green color compared with F1, F3, and F4



.

Fig. 4.2. Comparison of CIELAB color parameters (L*, a*, b*) of spinach beverage samples for different formulations (F1–F4).

Table 4.1. Color parameters (L, a*, b*)* of spinach beverages formulated with different xanthan gum concentrations

Parameter	F1 (0%)	F2 (0.1%)	F3 (0.3%)	F4 (0.5%)
L*	12.91 ± 1.51[a]	14.76 ± 1.31[a]	13.24 ± 3.16[a]	14.11 ± 0.95[a]
a*	3.99 ± 0.97[a]	8.88 ± 4.86[a]	6.54 ± 2.45[a]	4.25 ± 0.27[a]
b*	21.66 ± 2.29[a]	24.87 ± 1.91[a]	22.34 ± 4.86[a]	23.76 ± 1.50[a]

Viscosity Analysis

The viscosity of spinach beverage samples formulated with different concentrations of xanthan gum is presented in Table 4.2 and Fig. 4.3. The results show that viscosity increased with increasing xanthan gum concentration. Among the formulations, F4 exhibited the highest viscosity (41.43 cP), followed by F3 (35.80 cP) and F2 (29.97 cP), while F1 showed the lowest viscosity (25.70 cP). Statistical analysis indicated that samples F2, F3, and F4 were significantly different from F1 ($p < 0.05$). The increase in viscosity can be attributed to the thickening properties of xanthan gum, which enhance the resistance to flow in the beverage matrix. Similar findings have been reported in previous studies, where xanthan gum significantly increased the viscosity and rheological stability of beverage systems due to its ability to form highly viscous and pseudoplastic solutions even at low concentrations [19], [20], [21]. Xanthan gum molecules can interact to form a three-dimensional network structure that reduces particle mobility and improves suspension stability in liquid food systems [22], [23], [24]. Therefore, the results indicate that higher xanthan gum concentrations contribute to increased viscosity and improved structural stability of the spinach beverage.

Table 4.2. Viscosity of spinach beverages formulated with different xanthan gum concentrations

Formulation	Xanthan Gum (%)	Viscosity (cP)
F1	0.0	25.70 ± 3.02[a]
F2	0.1	29.97 ± 0.42[b]
F3	0.3	35.80 ± 4.10[b]
F4	0.5	41.43 ± 3.99[b]

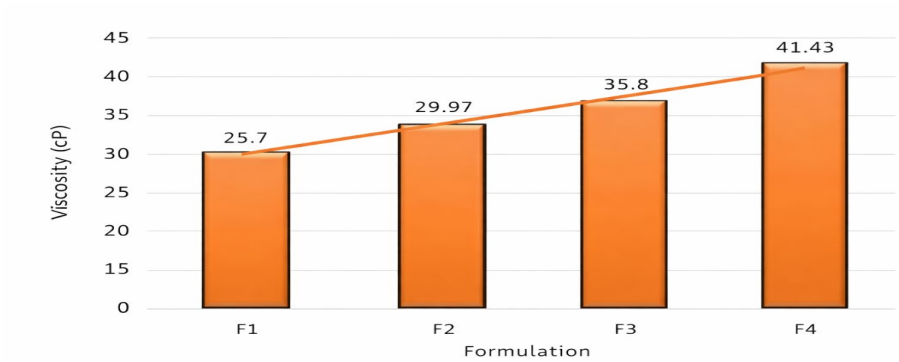


Fig. 4.3. Comparison of viscosity (cP) of spinach beverage formulations (F1–F4) with different xanthan gum concentrations

Sensory Evaluation

Hedonic Analysis

The sensory evaluation results for spinach beverages based on the hedonic scale are presented in Table 4.3 and Fig. 4.4**.** The attributes evaluated included appearance, color, texture, taste, and overall acceptability**.** The hedonic evaluation was interpreted based on the 7-point hedonic scale, where higher mean scores indicated greater consumer acceptance of the beverage samples. Mean values between 1.00–2.99 represented low acceptability (dislike), values between 3.00–4.99 indicated moderate acceptability (neither dislike nor moderately like), and values between 5.00–7.00 reflected good acceptability (like). Therefore, formulations with higher mean scores were considered more preferable among the panellists [25], [26].

Table 4.3. Hedonic sensory evaluation results of spinach beverage samples.

Attribute	F1 (0%)	F2 (0.1%)	F3 (0.3%)	F4 (0.5%)
Appearance	4.11 ± 1.51[a]	4.80 ± 1.20[ab]	4.85 ± 0.91[b]	5.37 ± 0.88[b]
Color	4.20 ± 1.30[a]	4.29 ± 1.45[a]	4.80 ± 1.18[ab]	5.14 ± 1.06[b]
Texture	4.49 ± 1.17[a]	4.57 ± 1.19[a]	4.57 ± 1.19[a]	4.77 ± 1.21[a]
Taste	4.91 ± 1.26[a]	5.00 ± 1.02[a]	4.80 ± 1.23[a]	4.97 ± 1.23[a]
Overall Acceptability	4.89 ± 1.25[a]	5.37 ± 0.97[a]	4.74 ± 1.97[a]	5.14 ± 1.21[a]

For the appearance attribute**,** sample F4 recorded the highest mean score (5.37) compared with F1, F2, and F3. Statistical analysis showed that F4 differed significantly from F1 but showed no significant difference compared with F2 and F3. This indicates that F4 was the most visually preferred sample among the panelists. For the color attribute**,** F4 also showed the highest mean score (5.14) and differed significantly from F1 and F2, but not from F3. This suggests that panelists preferred the darker green color of F4 compared with the other formulations. For texture**,** F4 recorded the highest mean score (4.77) compared with F1 (4.49), F2 (4.57), and F3 (4.57). However, no significant differences were observed among the samples. The higher texture score of F4 may be attributed to the higher xanthan gum concentration, which improved the viscosity and mouthfeel of the spinach beverage. For the taste attribute, no significant differences (**p > 0.05**) were observed among the samples. Nevertheless, F2 recorded the highest mean score (5.00**)** compared with F1, F3, and F4, indicating that the lower xanthan gum concentration in F2 produced a more acceptable taste. In terms of overall acceptability**,** no significant differences (**p > 0.05**) were observed among the formulations. However, F2 obtained the highest mean score (5.37)**,** suggesting that panelists generally preferred the formulation with a lower xanthan gum concentration [25], [26], [27].

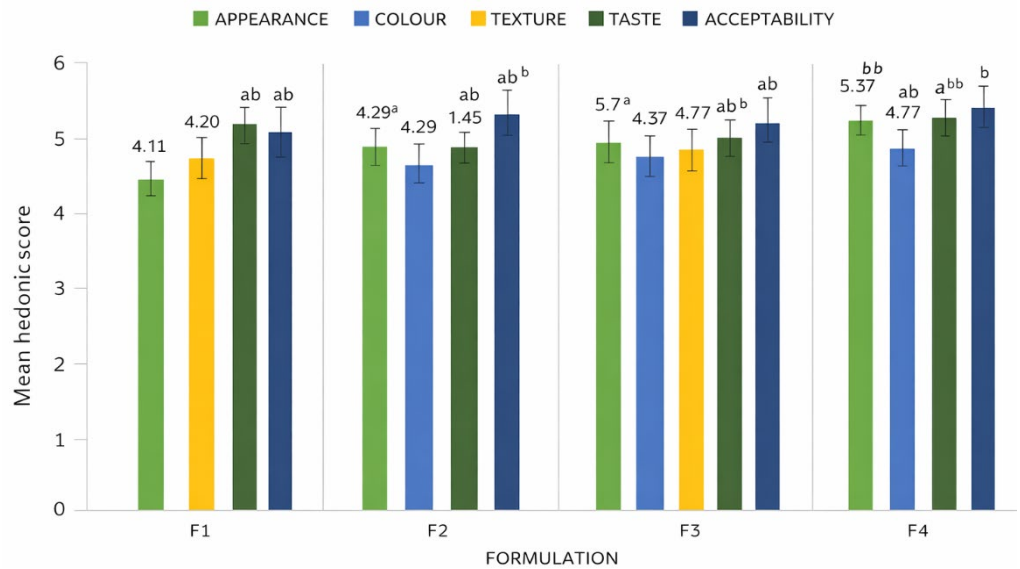

Fig. 4.4. Hedonic sensory evaluation of spinach beverage formulations (F1–F4) based on appearance, colour, texture, taste, and overall acceptability

Scoring Analysis

The results of the sensory scoring analysis for spinach beverage samples are presented in Table 4.4 and Fig. 4.5**.** The attributes evaluated included appearance, color, texture, and taste**.**

Table 4.4. Sensory scoring evaluation of spinach beverages formulated with different xanthan gum concentrations

Attribute	F1 (0%)	F2 (0.1%)	F3 (0.3%)	F4 (0.5%)
Appearance	3.21 ± 1.45[a]	3.64 ± 0.95[a]	3.94 ± 1.03[a]	3.80 ± 1.29[a]
Color	3.84 ± 1.45[ab]	3.17 ± 1.14[a]	4.12 ± 0.85[b]	3.72 ± 1.29[ab]
Texture	3.09 ± 1.45[ab]	3.09 ± 1.45[a]	3.77 ± 1.08[bc]	4.30 ± 1.22[c]
Taste	3.21 ± 1.34[a]	3.54 ± 1.04[ab]	4.10 ± 1.06[b]	3.95 ± 1.50[ab]

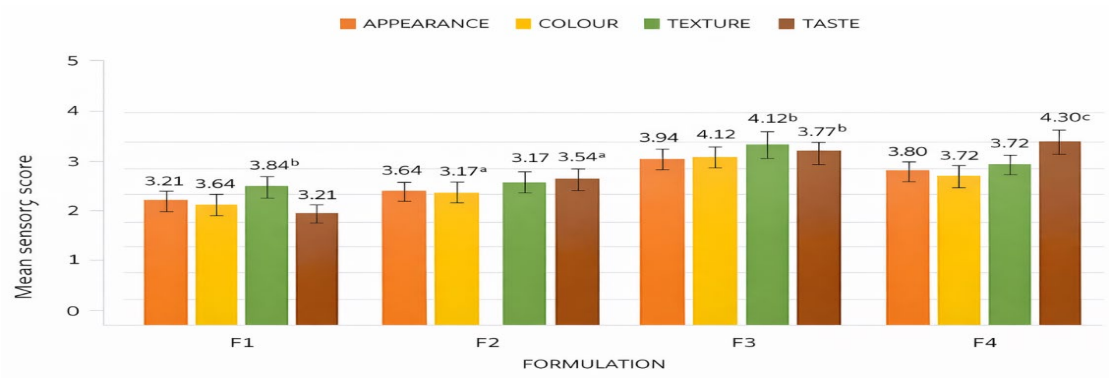

Fig. 4.5. Sensory scoring evaluation of spinach beverage samples based on appearance, colour, texture, and taste.

For the appearance attribute, sample F3 recorded the highest mean score (3.94) compared with F1, F2, and F4. However, statistical analysis showed no significant differences ($p>0.05$) among the samples, indicating that panelists rated the appearance of all formulations similarly. For the texture attribute**,** F4 showed the highest mean score (4.30) and was significantly different from F1 and F2. This suggests that the higher xanthan gum concentration in F4 contributed to a thicker and more viscous texture, which was preferred by the panelists. In terms of color**,** F3 recorded the highest mean value (4.12) compared with the other formulations, indicating that panelists preferred the darker green color of this sample. For the taste attribute**,** F3 also showed the highest mean score (4.10) compared with F1, F2, and F4. In contrast, F1 recorded the lowest score**,** suggesting that variations in xanthan gum concentration influenced the taste perception of the spinach beverage. Overall, the results indicate that different xanthan gum concentrations influenced the sensory attributes of the spinach beverage, particularly texture and color [28], [29], [30].

Based on the overall physicochemical, stability, and sensory evaluation results, formulation F3 containing 0.3% xanthan gum was considered the optimal spinach beverage formulation. The formulation demonstrated improved physical stability without visible phase separation while maintaining acceptable viscosity and favorable sensory characteristics. Although F4 (0.5%) exhibited the highest stability and viscosity, the increased thickness may have slightly affected sensory perception. In contrast, F2 (0.1%) showed good sensory acceptance but lower physical stability. Therefore, the 0.3% xanthan gum concentration provided the best balance between beverage stability, texture, and consumer acceptability [12], [31], [32].

Conclusion

This study was conducted to examine the influence of different concentrations of xanthan gum on the physicochemical properties, stability, and sensory characteristics of spinach-based beverages. The research focused on evaluating how xanthan gum affects phase separation, viscosity, color parameters, and consumer acceptance in vegetable-based beverage formulations. The experimental results demonstrated that xanthan gum plays a significant role in improving the physical stability of spinach beverages. Visual observation revealed that formulations without xanthan gum or with low concentrations showed noticeable phase separation during refrigerated storage. In contrast, samples containing higher xanthan gum concentrations exhibited better suspension stability with minimal separation between liquid and fiber components. These findings indicate that xanthan gum effectively enhances particle dispersion and stabilizes the beverage matrix.

The physicochemical analysis also showed that xanthan gum concentration significantly influenced viscosity. The viscosity values increased progressively with higher xanthan gum levels, confirming its function as an effective thickening and stabilizing agent. Increased viscosity contributed to improved structural stability of the beverage by reducing sedimentation of suspended particles. However, excessive thickening may potentially affect drinking quality, highlighting the importance of optimizing hydrocolloid concentration. Color analysis indicated that xanthan gum had minimal influence on the instrumental color parameters of spinach beverages. Although slight variations in lightness and chromaticity were observed among the formulations, no significant differences were detected statistically. This suggests that the addition of xanthan gum primarily affects the physical stability and rheological properties of the beverage rather than altering its visual appearance.

Sensory evaluation results revealed that xanthan gum concentration influenced several sensory attributes, particularly texture and overall acceptability. Formulations containing moderate xanthan gum concentrations showed favorable sensory responses, especially in terms of taste and overall acceptance. In contrast, higher concentrations tended to increase beverage thickness, which improved mouthfeel but may slightly affect flavor perception. These findings indicate that an appropriate balance between viscosity and sensory quality is necessary in beverage formulation.

Overall, the results demonstrate that xanthan gum can be effectively utilized to improve the stability and quality of spinach-based beverages. The formulation containing moderate xanthan gum concentration provided a suitable balance between physical stability, desirable texture, and consumer acceptance. This highlights the importance of selecting an optimal hydrocolloid concentration in the development of plant-based functional beverages. The findings contribute to the growing body of knowledge on hydrocolloid applications in vegetable-based beverage systems. The study provides useful insights for food researchers and beverage manufacturers interested in developing stable and consumer-acceptable plant-derived drinks. By understanding the role of xanthan gum in beverage stabilization and texture modification, more effective formulation strategies can be developed for functional beverage products.

Despite these contributions, several limitations should be acknowledged. The evaluation focused on short-term storage stability and a limited number of physicochemical parameters. In addition, sensory evaluation involved a specific group of panelists under controlled laboratory conditions. Future investigations may explore long-term storage stability, interactions between xanthan gum and other hydrocolloids, and the influence of processing conditions on beverage quality. Further studies could also examine nutritional bioavailability and consumer preference across broader populations. In conclusion, xanthan gum has demonstrated considerable potential as a stabilizing and texturizing agent in spinach-based beverage formulations. Appropriate concentration levels can enhance beverage stability while maintaining acceptable sensory characteristics. The outcomes of this research provide a useful foundation for further development of functional vegetable-based beverages with improved stability, texture, and consumer acceptance. Overall, the results demonstrate that xanthan gum can be effectively utilized to improve the stability and quality of spinach-based beverages. Among the formulations evaluated, F3 containing 0.3% xanthan gum was identified as the optimal formulation because it provided the best balance between physical stability, viscosity, and sensory acceptability. The formulation exhibited improved suspension stability without visible phase separation while maintaining acceptable texture and consumer preference. Although F4 (0.5%) showed the highest viscosity and stability, the excessive thickness may have slightly influenced sensory perception. In contrast, F2 (0.1%) demonstrated favourable sensory acceptance but lower physical stability. Therefore, the incorporation of 0.3% xanthan gum is recommended for the development of stable and consumer-acceptable spinach-based beverages. The findings of this study provide useful insights for food researchers and beverage manufacturers in optimizing hydrocolloid applications for plant-based functional beverage formulations.

Abstract. The transition from secondary education to higher education presents a significant challenge for students, particularly in mathematics. In Malaysia, students progressing from the Sijil Pelajaran Malaysia (SPM) to diploma-level Engineering Mathematics 1 often experience academic shock, different teaching approaches, and the need for higher-order thinking skills. Furthermore, the persistence of gender-based achievement gaps in mathematics warrants deeper investigation within the context of Malaysian engineering education. The purpose of this study is to investigate the academic progression of students from SPM level Mathematics to Diploma level of Engineering Mathematics 1, identify potential gender-based achievement gaps, and evaluate the efficacy of a targeted intervention workshop titled "Chill Math Workshop". Employing a quantitative methodology with a comprehensive cohort of 535 first-semester engineering diploma students, regression analyses revealed a statistically significant, moderately positive predictive relationship between secondary mathematics proficiency and tertiary academic performance. Crucially, the findings highlight a stark gender divergence in academic adaptation; female students demonstrated a statistically significant systemic improvement in mathematical attainment, whereas male students exhibited a measurable academic decline. Furthermore, the intervention workshop achieved near-universal engagement and contributed to a 61.5% cohort pass rate, proving highly effective at mitigating early academic hurdles. Taken together, the findings show that although prior academic achievement shapes tertiary outcomes, timely and targeted teaching interventions early in the semester are pivotal in helping students bridge the gap between high school mathematics and the rigorous expectations of engineering diploma programmes.

Keywords: Mathematics, Engineering Mathematics; Academic, SPM, Gender, Malaysia.

Introduction

Academic performance remains a critical measure of student success, while also providing insight into the quality and inclusivity of the educational system [1]. Mathematics plays an essential role in intellectual development and students' attitude towards academic outcomes [2], as mathematics has impact on human daily life which resulting from actual experience for a valuable human resource. The sustainability of Science, Technology, Engineering and Mathematic (STEM) pathways at the upper-secondary level, raising critical questions about student engagement and preparedness in disciplines essential to Malaysia's trajectory toward a high-income, innovation-driven economy in this 21st-century [3, 4]. Since 2017, Ministry of Education Malaysia has undertaken a pivotal curriculum reform, transitioning from Kurikulum Bersepadu Sekolah Menengah (KBSM) to Kurikulum Standard Sekolah Menengah (KSSM) to

better equip secondary level students with critical thinking and competencies, which align with the objectives of the Malaysia Education Blueprint (2013–2025) [3].

Across Malaysia's primary and secondary education system, mathematics remains a compulsory subject, underscoring its central importance in fostering cognitive and academic development. This emphasis extends into tertiary or universities education, where mathematics is thoughtfully contextualized and tailored to meet the specific demands of diverse fields of study, reinforcing its relevance across academic and professional domains [5]. Administered by the Malaysian Examinations Syndicate, the *Sijil Pelajaran Malaysia* (SPM) serves as a key national examination and a prerequisite for admission into higher education institutions [6]. Students who have sat for the SPM examination need to adapt to a more challenging level of learning when continuing their studies to the diploma or degree level.

In addition, the issue of gender-based achievement gaps are also receiving increasing attention in mathematics education studies. Several past studies have shown that there are gender differences in mathematics performance, which may be influenced by factors such as attitudes towards mathematics, learning styles, levels of self-confidence, and environmental support. However, the findings are inconsistent and require further research, particularly in the context of engineering education in Malaysia.

Accordingly, this study examines the progression of students' academic achievement through three focused objectives: (i) the relationship between workshop attendance and Test 1 performance in Engineering Mathematics I; (ii) the connection between achievement in Engineering Mathematics I and SPM Mathematics grades; and (iii) potential gender differences in performance across Engineering Mathematics I and SPM Mathematics. This study seeks to illuminate the challenges faced by polytechnic lecturers in formulating more effective teaching and learning strategies.

Literature Review

Through an integrated framework aligned with the Sustainable Development Goals (SDGs), The United Nations Educational, Scientific and Cultural Organization (UNESCO) promotes SDG 4 (Quality Education) and SDG 5 (Gender Equality) by positioning education as both a human right and a transformative force for equity [7]. Mathematics, as a foundational discipline, plays a critical role in this agenda by cultivating logical reasoning, problem-solving capacity, and data literacy competencies essential for participation in modern knowledge economies. However, persistent gender disparities in mathematics achievement and participation reflect deeper structural inequities that SDG 5 seeks to dismantle. Bridging this gap is not only a pedagogical concern but a socio-economic imperative, as equitable access to mathematical education empowers underrepresented groups, particularly women and girls, to engage in STEM fields and decision-making processes. Thus, the intersection of mathematics education with UNESCO's SDG priorities underscores a reciprocal relationship, advancing gender equality enhances mathematical inclusion, while strengthening mathematical competence accelerates progress toward sustainable and equitable development.

Patterns of achievement and progression in high school mathematics offer valuable insight into future academic outcomes, reinforcing the importance of a strong foundational skill set for success in higher education [8]. These findings highlight that proficiency in mathematics is not merely subject-specific, but instrumental in shaping students' broader academic trajectories. Students who struggle to grasp fundamental mathematical concepts often experience the subject as increasingly inaccessible, which can erode their motivation and confidence, ultimately impeding not only their progress in mathematics but also their overall academic development [9].

In Malaysia, mathematics serves as a foundational pillar for students pursuing engineering pathways at both pre-university and university levels, shaping the analytical rigor and problem-solving capacity essential for success in the discipline [10]. For engineering students especially, Engineering Mathematics 1 is compulsory subject that not only requires a deeper understanding of concepts, but also requires higher-order thinking skills, the ability to make abstractions, and the ability to solve complex problems. Thus, mathematics grade for SPM is important as it is one of the students' entry qualifications to higher education level in Malaysia [11, 5, 6] and may influence students' learning experiences and outcomes [11] especially on tertiary level mathematics.

The difference in the level of difficulty between mathematics at the SPM level and engineering mathematics is often a major challenge for students. Many students experience academic shock when faced with a denser syllabus and different teaching approaches. This situation can affect students' academic achievement and their level of confidence in mastering mathematics subjects at a higher level. Studies shows a statistical relationship signifies that students who enter the program with stronger SPM mathematics foundations are highly likely to maintain superior academic trajectories in their university mathematical modules [5, 12, 9, 13, 14]. At the same time, better SPM results also lead to better academic performance in higher education, which is significant with students' CGPA (Cumulative Grade Point Average) [6]. However, study done by [10] compile negative relationship within SPM Maths' Grade with tertiary level of mathematics.

Besides, gender-based differences in mathematics performance remain a well-documented concern in education, driven by the interaction of sociocultural expectations, pedagogical practices, and students' beliefs about their capabilities [15, 16]. A 4 years longitudinal assessment had been done in Germany and found out that mathematics gender gap appears strikingly early in formal education, emerging within the first months of Grade 1 and consistently favouring boys [17]. Further discussed in the study, boys and girls demonstrate nearly identical levels during early school entry; however, a statistically significant disparity develops after just four months of schooling. Notably, this pattern proves robust over time, recurring annually with only minimal variation across family backgrounds, classroom contexts, school types, and socioeconomic levels. These findings suggest that the roots of gender disparities in mathematics are established early and are not easily explained by differences in students' environments alone.

Meanwhile, findings on gender differences in mathematics performance vary considerably across contexts. In some cases, female students are found to outperform males, as reported in in South Africa [15], Germany [18], and Malaysia [14]. In others,

male students demonstrate higher achievement levels in mathematics performance [16, 19, 7]. Yet, a substantial body of research also points to no significant gender differences, with consistent findings across Malaysia [5, 20], India [2], South Africa [8], and Taiwan [21].

Methodology

This study was conducted using a quantitative approach. The population was Semester 1 diploma who registered for the subject of DBM10163 Engineering Mathematics 1 (535 students). The data consisted of standardized test scores held in session 1 2025/2026, in comparison with their final examination result (DBM10163), as well as their SPM Examination result in the subject of mathematics. In this study, 100% of the population engage as participants of this study.

Questionnaire was distributed to the students when they attended the "Chill Math Workshop" organised by the Mathematics, Science, and Computer Department (JMSK) of the polytechnic. The collected data were systematically analysed using the Statistical Package for the Social Sciences (SPSS) software. The use of descriptive statistics was intended to obtain mean values, percentages, frequencies, and standard deviations. While for inferential statistics, the One-Way ANOVA and regression test method was used to identify the relationship between the achievement of SPM Mathematics grades, Engineering Mathematics 1 grades, and gender differences.

Data Analysis & Discussion

Demography Data and "Chill Math Workshop"

This study comprised a total of 535 students. As shown in Table 1, participants were distributed across departments, programmes, and classes. The highest representation came from the Mechanical Engineering Department (JKM) with 225 students, followed by Civil Engineering Department (JKA) with 167 students and Electrical Engineering (JKE) with 143 students.

As an action and effort from the Mathematics, Science, and Computer Departments (JMSK) of the polytechnic, the "Chill Math Workshop" was organized in preparation for Test 1. The "Chill Math Workshop" achieved a massive 99.6% attendance rate (533 out of 535 students), indicating excellent student engagement. Since only 2 students were absent, the overwhelming participation inadvertently limited comparative statistical analysis between attendees and non-attendees. However, the overall cohort pass rate of 61.5% provides a valuable benchmark (Table 2), that the "Chill Math Workshop" successfully cultivated a proactive learning culture, effectively normalizing help-seeking behavior among the student, as a platform for foundational skill-building. Thus, "Chill Math Workshop" should be continue as one of the essential workshops for every semester.

Table 1: Number of Students of This Study.

Department	Program	Class	No. of Students
Civil Engineering Department (JKA)	DGU	DGU1A	26
		DGU1B	27
	DKA	DKA1A	28
		DKA1B	29
		DKA1C	28
		DKA1D	29
Electrical Engineering Department (JKE)	DEE	DEE1A	38
		DEE1B	37
	DEP	DEP1A	20
	DTK	DTK1A	24
		DTK1B	24
Mechanical Engineering Department (JKM)	DEM	DEM1A	24
		DEM1B	25
	DKM	DKM1A	36
		DKM1B	36
		DKM1C	36
		DKM1D	36
	DTP	DTP1A	32
Total Students			**535**

Table 2: Comparison Attendance to "Chill Math Workshop" and Passing Rate

Attendance to "Chill Maths Workshop"	FAIL Test 1	PASS Test 1	No. of Students	Passing %
Not Attended	1	1	2	50.0%
Attended	205	328	533	61.5%
Total Students	**206**	**329**	**535**	**61.5%**

Table 3: "Chill Math Workshop" Feedback Summary

Evaluation Metric	Mean	SD
Speaker/Facilitator Performance		
1. Course objectives achieved	4.69	0.68
2. Relevant content, tasks, and exercises	4.70	0.67
3. Good and effective delivery	4.71	0.68
4. Effective use of teaching aids	4.72	0.64
Course Implementation & Logistics		
5. Conducive and suitable venue	4.63	0.73
6. Smooth planning and execution	4.67	0.70
7. Appropriate time allocation per module	4.66	0.71
Overall Effectiveness & Participant Impact		
8. Increased knowledge/understanding	4.66	0.71
9. Increased confidence in applying knowledge	4.65	0.72
10. Helps improve performance in Engineering Math 1	4.68	0.71
11. Program should be continued for other courses	4.67	0.72
12. Overall, the program was successful and beneficial	4.69	0.70

Besides, survey also done towards the effectiveness of "Chill Math Workshop" (Table 3). The instrument utilised a 5-point Likert scale, where responses ranged from 1 (Strongly Disagree) to 5 (Strongly Agree). From the feedback (Table 3), the facilitators performed exceptionally well, scoring the highest overall averages among all categories. "Effective use of teaching aids" ranked highest (Mean = 4.72), and low standard deviations (0.64 - 0.68) indicate a strong consensus among the participants that the speakers were highly effective and engaging. In terms of course implementation and logistics questionnaires, the physical venue or atmosphere scored the lowest across the entire survey (Mean = 4.63, Std Dev = 0.73). While still an overwhelmingly positive score, if organizers are looking for an area of marginal improvement for future workshops, assessing the comfort or capacity of the venue would be the primary target.

The workshop successfully met its core educational mandate. Participants strongly agreed that the program was universally beneficial (Mean = 4.69). Crucially, students felt it practically supported their core academic requirements for Engineering Math 1 (Mean = 4.68). The mode and median for all questions firmly sit at 5, proving that "Strongly Agree" was the standard baseline for almost all participants. The successful implementation of the "Chill Math Workshop" likely served as a critical scaffold. By targeting notoriously difficult topics like Trigonometry and Complex Numbers early in the semester, the workshop played a key role in s7upporting students' transition from high school mathematics to the more demanding context of engineering diploma programmes.

Correlation Analysis

An analysis of the performance level transitions from SPM to Engineering Mathematics 1 reveals a distinct centralization of academic achievement, characterized by a contraction at the performance extremes and a significant expansion within the intermediate tiers (Table 4). Specifically, the Excellent cohort experienced notable attrition, declining from 38.5% to 29.5%, as approximately 39% (80 out of 206) of top-performing SPM students regressed to lower brackets in Engineering Maths 1 module.

Table 4: Summarize of Performance Level

Performance Level	SPM (%)	Math 1 (%)	Trend
Excellent (A+, A, A-)	38.5% (N = 206)	29.5% (N = 158)	**N = 206, Slight reduction** (N = 126, Maintain grade) (N = 80, Degraded to Honor/Pass)
High Honors (B+, B, B-)	26.7% (N = 143)	34.0% (N = 182)	**N = 316, Strong increase** (N = 31, Upgrade to Excellent) (N = 275, Remains Honors/Pass) (N = 10, Failed)
Honors (C+, C)	30.8% (N = 165)	28.4% (N = 152)	
Passed (C-, D+, D)	1.5% (N = 8)	6.4% (N = 34)	
Failed (E, F)	2.5% (N = 13)	1.7% (N = 9)	**N = 13, Slight reduction** (N = 12, Remains Honors/Pass) (N = 1, Failed)

Visual inspection of the grade distributions indicates that while SPM grades were heavily concentrated around the 'A+' and 'C+' categories, the Engineering Mathematics 1 outcomes demonstrated a higher frequency of 'A+' and 'B+' grades. Conversely, the data demonstrates strong upward mobility among foundational learners; a near-total majority of previously failing students (12 out of 13) successfully remediated into passing tiers. This upward pressure, combined with the downward shift of elite students, substantially swelled the middle cohorts, particularly the High Honors bracket, which grew to 34.0%. Ultimately, this structural shift indicates that while the Engineering Mathematics 1 curriculum effectively supports and elevates lower-performing students, its heightened academic rigor presents a formidable challenge for maintaining baseline elite-level excellence.

According to [22], t-value tells how large the difference is relative to the spread (variance) of the data. A low t-value (usually between -1.96 and 1.96) indicates the difference is likely just random noise. Meanwhile, p-value tells the probability that

this difference occurred by random chance, where value larger than 0.05 formally declares the result "not statistically significant." In this study, a comprehensive linear regression analysis was done, stratifying the participants of this study (N = 535) by academic department. The statistical outputs (Table 5) reveal a highly significant statistical relationship ($p < 0.001$) between SPM Mathematics proficiency and subsequent Engineering Mathematics 1 performance across all three departments, supported by strong t-values ranging from 7.389 to 8.708.

Table 5: Linear Regression Analysis Results Based on Department

Department	N	Mean (SPM Math)	Mean (Eng. Math 1)	Std. Error	t-Value	P-Value	R^2	Average GPA Change
Civil Engineering Department (JKA)	167	2.94	3.00	0.061	7.389	< 0.001	0.249	+0.06 (Slightly Improved)
Electrical Engineering Department (JKE)	143	2.77	2.89	0.063	8.119	< 0.001	0.319	+0.12 (Improved)
Mechanical Engineering Department (JKM)	225	3.10	2.90	0.062	8.708	< 0.001	0.254	-0.20 (Declined)

The Electrical Engineering Department (JKE) and Civil Engineering Department (JKA) successfully translated foundational knowledge into advanced academic gains, demonstrating positive average GPA changes of +0.12 (improving from an SPM Math Mean of 2.77 to Engineering Math 1 Mean = 2.89) and +0.06 (improving from 2.94 to 3.00), respectively. Conversely, the Mechanical Engineering Department (JKM) exhibited a notable academic regression; despite entering with the highest baseline mathematical proficiency (SPM Math Mean = 3.00), their performance declined in Engineering Math 1 results (Mean = 2.90), resulting in a negative average GPA change of -0.20. Thus, discipline-specific bridging interventions might tailored to arrest the statistically validated academic attrition within the Mechanical Engineering department.

The R^2 values range between 0.249 and 0.319, indicating that SPM Mathematics performance accounts for approximately 25% to 32% of the variance in Engineering Mathematics 1 outcomes, a moderate correlation strength (Table 7). This confirming

that SPM Mathematics serves as a robust baseline predictor for Engineering Mathematics 1 efficacy [5, 12, 9, 13, 14]. Students who performed well in their SPM Math are generally likely to perform well in Engineering Mathematics 1. The fact that 68% to 75% of the variance in tertiary grades remains unexplained (as inferred by the R^2 values) is an optimistic pedagogical indicator. It empirically justifies institutional interventions; tertiary success is not strictly deterministic based on historical performance. Moving forward, curricular designers must investigate the specific pedagogical barriers within the syllabus, department-specific scaffolding to mitigate the observed academic attrition in high-performing matriculants. Besides, study also can be done to investigate other related factors such as study habits or students' personality which likely account for the variance in student performance.

Meanwhile, gender disparities in STEM disciplines often manifest during the transition from secondary foundational curricula to tertiary programs. From Table 6, the regression analyses confirmed a statistically robust, positive strong predictive relationship between secondary and tertiary mathematical performance across both demographic groups. Both males ($r = 0.518$, $t = 11.316$, $p < 0.001$) and females ($r = 0.530$, $t = 8.436$, $p < 0.001$) demonstrated significant statistical interdependence, indicating that SPM Mathematics proficiency is a universally valid predictor of tertiary Engineering Mathematics 1 capability, independent of gender.

Table 6: Statistical Significance of Mathematics Performance by Gender

Gender	N	Mean (SPM Math)	Mean (Eng. Math 1)	Correlation (r)	Regression t-value	Regression p-value
Male	351	2.96	2.83	0.518	11.316	< 0.001
Female	184	2.96	3.11	0.530	8.436	< 0.001

The female students experienced a statistically significant systemic increase in mathematical attainment, transitioning from SPM Mathematics Mean 2.96 to an Engineering Mathematics 1 Mean 3.11. Conversely, the male students exhibited a statistically significant decline in performance, where the mean value contraction from 2.96 down to 2.83. The significant upward trajectory of the female students ($p < 0.05$) suggests that current tertiary instructional modalities, syllabus structure, and bridging interventions ("Chill Math Workshop") synergize effectively with female learning profiles or academic resilience strategies. This pattern mirrors findings from earlier studies [14, 15, 18], reinforcing the view that female students are outperform than males especially in mathematics performance. These findings compel a strategic reassessment of engineering pedagogy. Future study can be done to investigate potential variables, such as differences in study habits or other factors which can lead to gender differences, as it is important for equitable retention in engineering disciplines.

Table 7: Correlation Strength Classification Table

Correlation (r)	Strength
± 0.81 – 1.00	Very Strong
± 0.51 – 0.80	Strong
± 0.31 – 0.50	Moderate
± 0.21 – 0.30	Weak
± 0.01 – 0.20	Very Weak

Academic achievement denotes the extent to which a student successfully attains the prescribed educational standards and learning objectives throughout their academic trajectory [5]. From the analysis, it suggests that while background knowledge helps, other factors during the study of Engineering Math 1 course, likely study habits, university environment, or attendance also play a substantial role in the students' final grades. Besides, it may cause by students' limited engagement with the deeper purpose of learning, which involved cognitive processes, lack of confidence, memory, emotions, ethical awareness, tend to do careless mistakes, sensory as well as physical experiences [10, 24]. By engaging these interconnected facets, learning becomes more personally meaningful and intrinsically motivating, fostering a richer and more sustained educational experience

In summary, the data demonstrates that while foundational secondary education is highly predictive of future tertiary success (statistically related), the university curriculum actively and significantly enhances overall student capability across the cohort (statistically significant improvement). Beyond the classroom, mathematics permeates everyday life, shaping how individuals interpret, navigate, and make decisions in the world around them [2]. The findings of gender-based differences in achievement cannot be attributed to a single cause; rather, they emerge from the dynamic interaction of individual characteristics, family environments, and educational contexts such as teaching quality and resources.

Conclusion

This study emphasizes the pivotal structured of early intervention in supporting students' transition from secondary-level mathematics to the rigor of tertiary Engineering Mathematics 1. While prior SPM achievement demonstrated a statistically significant moderate correlation with tertiary performance, the observed improvement in mean grade point following the "Chill Math Workshop" intervention confirms that academic trajectories remain malleable rather than predetermined. The findings suggest that targeted, topic-focused scaffolding delivered such as "Chill Math Workshop" at the beginning of the semester can effectively reduce academic shock, strengthen foundational understanding, and elevate overall cohort performance, particularly for students entering with weaker mathematical backgrounds. Importantly, the uniform improvement across the cohort indicates that such inclusive interventions have the potential to narrow achievement disparities, including those associated with gender, by raising the baseline competency for all learners.

Based on these outcomes, it is strongly recommended that higher education institutions institutionalize structured bridging workshops or pre-university curricula as a compulsory component of first-year engineering curricula to support cognitive readiness and foster higher-order thinking skills that fits with mathematical requirement [25]. Future research is suggested to integrate qualitative measures such as student self-efficacy, motivation, and mathematics anxiety to provide a more holistic understanding of intervention effectiveness. Additionally, comparative studies across institutions and disciplines are encouraged to validate generalizability and identify optimal instructional models for scalable implementation. When teachers actively engage in constructing and adapting mathematical models to suit their students' needs, they are more likely to cultivate the confidence and sense of self-efficacy required to meaningfully integrate online platforms and digital tools, thereby enhancing student engagement [4].

Beyond Satisfaction: International Mobility as an Experiential Accelerator for TVET Entrepreneurship Learning: Evidence from the Malaysia–Indonesia GEX 2025

Norazlin binti Adan[1,a *], Rushidah binti Md Rosdi[2,b]

Abstract. Technical and Vocational Education and Training (TVET) in ASEAN seeks to develop graduates who are employable, entrepreneurial, and globally connected. However, empirical evidence on how international mobility contributes to entrepreneurship learning remains limited, particularly in short-term TVET programmes. This study evaluates the Malaysia–Indonesia Globalpreneur Exchange (GEX) 2025, involving an inbound cohort in Malaysia (n = 78) and an outbound cohort to Batam, Indonesia (n = 44). Using a six-dimensional evaluation framework covering programme management and communication, learning and entrepreneurial competence, cross-cultural and international collaboration, social values and leadership development, industry exposure and practical learning, and future intention and perceived impact, the study employed post-programme surveys for both cohorts. Likert-scale items were used for the inbound instrument, while conceptually aligned activity-specific indicators were used for the outbound instrument, which also included open-ended responses. Internal consistency was high for the Likert-type items in both cohorts, with Cronbach's alpha values above 0.95. The findings indicated consistently positive participant perceptions across the evaluated dimensions. Inbound participants reported particularly high ratings for social values and leadership development (mean = 4.68/5.00) and cross-cultural and international collaboration (mean = 4.67/5.00), while outbound participants highlighted strong perceived benefits in international networking, industry benchmarking, and readiness for future global participation. Qualitative feedback from the outbound cohort further emphasised the value of teamwork, empathy, and industry immersion, while also identifying practical areas for improvement, particularly schedule pacing and accommodation. Overall, the findings suggest that short-term mobility may provide a supportive context for participant-reported entrepreneurship learning when programme design integrates cross-cultural teamwork, industry immersion, and structured reflection. The study offers a useful reference for the continuous improvement and scaling of ASEAN-focused entrepreneurship mobility programmes, with implications for TVET policy, institutional practice, and regional workforce development.

Keywords: TVET, entrepreneurship learning, international mobility, experiential learning, ASEAN, programme evaluation

Introduction

International student mobility has expanded globally and is increasingly viewed as a strategic mechanism for learning, capability development, and institutional internationalisation rather than a purely enrichment-oriented activity [1,2]. Within ASEAN, mobility is also associated with graduate employability because it can expose learners to intercultural communication, adaptability, professional networking, and regional collaboration [3,4]. For Technical and Vocational Education and Training (TVET)

systems, this agenda is particularly relevant as current policy frameworks emphasise graduate readiness, quality assurance, stakeholder engagement, and stronger alignment between education and the future of work [5,6].

In Malaysia and the wider ASEAN context, existing mobility initiatives have reported positive educational experiences and broader internationalisation benefits [7–9]. However, evaluative approaches often remain focused on general participant experience and satisfaction, offering limited insight into how mobility supports entrepreneurship-related learning, which programme features contribute most strongly to these outcomes, and how evidence from programme evaluation can inform future programme design and scaling [8–10]. This limitation is especially important for TVET, where mobility is increasingly expected to contribute not only to exposure and networking, but also to applied competence and workforce readiness [3,6].

The Malaysia–Indonesia Globalpreneur Exchange (GEX) 2025 was developed within this context as a short-term entrepreneurship mobility programme that combines industry immersion, cross-cultural teamwork, and student showcasing across outbound and inbound components. The present study evaluates GEX 2025 across two cohorts: an outbound group travelling to Batam, Indonesia, and an inbound group hosted in Malaysia. Specifically, the study addresses three questions: (i) What outcomes do participants report across key dimensions of entrepreneurship learning and mobility experience? (ii) Which aspects of the programme appear strongest, and which areas require improvement? (iii) How can the findings inform a practical design blueprint for the continuous improvement and scaling of ASEAN-focused entrepreneurship mobility programmes?

By applying a six-dimension evaluation framework that extends beyond satisfaction alone, this study contributes to research on TVET mobility, entrepreneurship education, and experiential learning. It positions international mobility not only as a positive participant experience, but also as a potentially valuable context for entrepreneurship learning with implications for institutional practice and regional workforce development [10,13].

Literature Review and Conceptual Framework

Experiential Learning in Entrepreneurship Education

Entrepreneurship education increasingly emphasises experiential and collaborative learning because entrepreneurial capability develops most effectively when students engage in authentic tasks such as opportunity recognition, problem solving, pitching, teamwork, and reflection [24,25]. Kolb's experiential learning theory conceptualises this process as a cycle of concrete experience, reflective observation, abstract conceptualisation, and active experimentation [24]. In entrepreneurship education, these stages are often embedded in practice-based activities that allow learners to test ideas, receive feedback, and refine their thinking in realistic contexts [25]. This perspective is relevant to mobility programmes because cross-border learning environments can intensify the experiential cycle by exposing participants to unfamiliar settings, new stakeholders, and applied decision making.

International Mobility as an Experiential Context

International mobility provides a distinctive experiential context because learners must interpret unfamiliar environments, adapt socially and academically, and reframe prior knowledge through interaction and reflection [11,13]. Research on short-term study abroad suggests that meaningful outcomes are more likely when programmes include intentional structure, guided learning activities, opportunities for reflection, and close integration between host experiences and academic objectives [13,14,26]. Programme design therefore matters. Short-term mobility may be more accessible than longer placements, but its compressed format requires careful sequencing of preparation, immersion, interaction, and closure if deeper learning is to occur [10,18,26]. In TVET and entrepreneurship settings, this makes mobility particularly valuable when it is linked to authentic industry engagement and collaborative problem solving rather than passive observation alone.

Cross-Cultural Competence Development

Cross-cultural competence is an increasingly important outcome of both international education and entrepreneurship learning. Deardorff conceptualises intercultural competence as involving the attitudes, knowledge, and skills required for effective and appropriate interaction across cultures [22]. In entrepreneurship education, universities can intentionally support this development through collaborative tasks, reflective activities, and learning environments that require students to engage constructively with diverse perspectives [12,23]. Mobility research also indicates that international experiences can strengthen cultural intelligence and related capabilities, although outcomes may vary according to factors such as prior intercultural exposure and learner characteristics [15]. For TVET graduates operating in ASEAN's integrated regional environment, cross-cultural competence is therefore both a learning outcome in its own right and an important employability asset.

TVET Mobility in the Malaysian Context

In the Malaysian context, evidence from mobility-related and exchange-based initiatives suggests positive potential for student learning, exposure, and international engagement [7,9,16]. Work on student exchange in the Malaysia–Indonesia context has highlighted learning beyond the classroom and the value of cross-border interaction [7], while studies on virtual and hybrid mobility also point to the relevance of accessible exchange models in supporting student development [9,16]. Recent curriculum-focused work further suggests that mobility can shape student learning meaningfully when it is aligned with programme objectives and designed as part of the broader educational experience [17]. Nevertheless, evaluation approaches that systematically examine programme quality, learning, collaboration, leadership, practical exposure, and future-oriented intention remain limited, particularly within the Malaysia–Indonesia TVET corridor.

In the TVET entrepreneurship context, international mobility, experiential learning and entrepreneurship education intersect through practice-based exposure. International mobility provides unfamiliar social, cultural and industry environments; experiential learning explains how students transform these experiences into learning through reflection and experimentation; while entrepreneurship education provides the applied tasks through which students practise opportunity recognition, communication,

pitching, problem solving and networking. Therefore, short-term mobility can operate as an experiential accelerator when participants are not merely exposed to another country, but are required to interact, collaborate, benchmark industry practices, reflect on their learning and apply entrepreneurial ideas in authentic settings. This intersection is particularly relevant for TVET because learning outcomes are expected to be practical, work-related and transferable to future employment or entrepreneurial activity.

Conceptual Framework for This Study

Drawing on the literature above, the present study conceptualises international mobility as an experiential accelerator for TVET entrepreneurship learning. In this study, acceleration refers to the intensification and deepening of participant-reported learning when mobility is designed around three interconnected elements:

1. Cross-cultural teamwork and collaboration: mixed-nationality teams, guided interaction, and structured peer learning
2. Industry immersion and benchmarking: enterprise visits, exposure to innovation ecosystems, and contact with entrepreneurs
3. Structured reflection and showcasing: preparation activities, in-programme reflection, debriefing, and pitching or presentation opportunities

When these elements are integrated, mobility may function as more than a satisfactory experience. It may also operate as a purposeful learning intervention that supports entrepreneurial competence, cross-cultural capability, leadership development, and future-oriented intention. To assess these outcomes more holistically, the study applies a six-dimension evaluation framework informed by mobility programme guidance and international learning assessment literature [10,18,22,26]. The framework covers:

1. Programme management and communication
2. Learning and entrepreneurial competence
3. Cross-cultural and international collaboration
4. Social values and leadership development
5. Industry exposure and practical learning
6. Future intention and perceived impact

The term experiential accelerator is used conceptually in this study to describe participants' perceived intensification of learning through structured mobility experiences, rather than to imply a statistically proven causal effect. This framework enables the study to examine both programme quality and participant-reported learning outcomes, while also helping to guide programme improvement and future scaling.

Methodology

Research Design

This study employed a cross-sectional, post-programme survey design to evaluate participants' perceptions of the Malaysia–Indonesia Globalpreneur Exchange (GEX) 2025. Quantitative data were collected from both the inbound and outbound cohorts using post-programme survey items, including five-point Likert-scale items and activity-specific indicators. To complement the quantitative findings, the outbound

instrument also included open-ended questions to capture participants' suggestions for improvement and to provide contextual explanation for their responses. This design was appropriate for programme evaluation because it enabled timely feedback for programme refinement while preserving participants' perspectives on their learning experiences and overall programme quality [13,22].

Programme Context

GEX 2025 is an entrepreneurship mobility programme supported by the Jabatan Pendidikan Politeknik dan Kolej Komuniti (JPPKK) through the Bahagian Ambilan dan Pembangunan Pelajar (BAPP), and implemented in collaboration with partner institutions. The programme reflects a mobility-as-accelerator approach through structured academic, entrepreneurial, and cross-cultural activities. The programme comprised two components:

1. Outbound component involved travel to Batam, Indonesia from 18 to 22 August 2025. Activities included industry visits to Politeknik Negeri Batam and local enterprises, cross-border collaboration sessions, and entrepreneurship showcase activities.
2. Inbound component was hosted in Malaysia from 15 to 18 October 2025 at Ruang Legar KPT, Putrajaya. Activities included exhibitions and pitching sessions, networking opportunities involving Malaysian and Indonesian participants, and mentoring sessions.

The programme schedule and participation details were documented in the official invitation letters issued for the outbound and inbound cohorts [20,19].

Participants

The inbound cohort consisted of 78 respondents. Most participants were students (62.8%), followed by mentors or lecturers (26.9%), heads of entrepreneurship units (5.1%), and participants holding dual roles (5.1%). The majority were female (82.1%). In terms of nationality, 68 participants (87.2%) were from Malaysia and 10 participants (12.8%) were from Indonesia. Most respondents reported prior exposure to international programmes (75.6%), suggesting that a substantial proportion of the cohort had some previous mobility experience. The outbound cohort consisted of 44 respondents who participated in the programme visit to Batam, Indonesia. This group comprised students (n = 25, 56.8%), lecturers (n = 18, 40.9%), and one programme director (n = 1, 2.3%). Most respondents were female (n = 35, 79.5%), while male respondents accounted for n = 9 (20.5%).

Table 1: Outbound Cohort Profile (n = 44)

Characteristic	Category	n (%)
Role	Student	25 (56.8)
Role	Lecturer	18 (40.9)
Role	Programme Director	1 (2.3)
Gender	Female	35 (79.5)
Gender	Male	9 (20.5)

The analysis combined responses from students, lecturers, mentors and heads of unit because the study was designed as a programme-level evaluation rather than a role-specific impact study. However, these respondent groups may have evaluated the programme from different standpoints. Students were more likely to assess personal learning, confidence and entrepreneurial exposure, while lecturers, mentors and heads of unit may have evaluated programme management, institutional collaboration and implementation quality. Therefore, the findings are interpreted as aggregate programme perceptions and not as evidence that all respondent categories experienced the programme in the same way. Role-based differences are acknowledged as a limitation and are recommended for further analysis in future studies.

Instrument and Measures

Programme outcomes were assessed using a six-dimension framework developed in alignment with mobility evaluation practices [10,22]. The framework was constructed by adapting concepts from mobility programme guidance and intercultural learning assessment literature, and the items were then contextualised to the entrepreneurial and cross-border activities of GEX 2025. The inbound instrument contained 30 Likert-scale items, with five items representing each dimension, as well as three overall items measuring goal achievement, satisfaction, and intention to apply learning. The outbound instrument covered conceptually similar domains, although the wording and response format were adapted to specific programme activities.

Although the inbound and outbound surveys were conceptually aligned, they were not identical in format. The outbound questionnaire used more activity-specific wording and, for several indicators, categorical response options that were summarised using frequencies and percentages in the official programme evaluation. Accordingly, inbound findings are presented as dimension mean scores with standard deviations, whereas outbound findings are reported using selected indicators that map conceptually onto the same dimensions. The results are therefore interpreted descriptively within each cohort and are not treated as directly comparable numerical scores across cohorts.

For the Likert-scale items, responses were recorded on a five-point scale ranging from 1 (strongly disagree) to 5 (strongly agree). Selected outbound indicators used categorical response formats. The six dimensions were operationalised as follows:

1. Programme management and communication (Items 1 to 5)
   Clarity of information, responsiveness of organisers, and logistical coordination.
2. Learning and entrepreneurial competence (Items 6 to 10)
   Perceived gains in entrepreneurial skills, problem solving, and business knowledge.
3. Cross-cultural and international collaboration (Items 11 to 15)
   Intercultural communication, teamwork across nationalities, and networking.
4. Social values and leadership development (Items 16 to 20)
   Empathy, leadership confidence, social responsibility, and teamwork.
5. Industry exposure and practical learning (Items 21 to 25)
   Exposure to innovation, contact with industry, and relevance to future practice.
6. Future intention and perceived impact (Items 26 to 30)
   Intention to apply learning, motivation for future international engagement, and perceived longer-term benefit.

Overall, the framework reflects established programme evaluation approaches that distinguish between programme experience, immediate learning-related outcomes, and future-oriented intentions [10,22].

Instrument Development and Content Alignment

The six-dimension instrument was developed through a structured review of literature on international mobility, experiential learning, intercultural competence and entrepreneurship education. The initial dimensions were derived from recurring constructs in previous studies and mobility programme guidance, particularly programme management, learning outcomes, intercultural collaboration, leadership and social values, industry exposure and future intention. The items were then contextualised to the specific activities of GEX 2025, including pitching, showcasing, industry visits, cross-cultural interaction and entrepreneurship networking. To strengthen content relevance, the draft items were reviewed internally by the programme evaluation team and entrepreneurship education lecturers for clarity, relevance, language appropriateness and alignment with the six evaluation dimensions before the instruments were distributed.

The items were also checked against the programme objectives and activity structure before data collection to ensure alignment with the intended programme outcomes. The inbound instrument used a consistent Likert-scale format across the six dimensions, while the outbound instrument used more activity-specific indicators because it was designed around the Batam visit, PBL Expo, CSR activity and Biz Growth activities. Therefore, the two instruments were treated as conceptually aligned but not statistically equivalent. Reliability analysis was conducted for the Likert-type items, and Cronbach's alpha values indicated high internal consistency for both cohorts. This process supported content alignment for programme evaluation purposes; however, it should not be interpreted as a full psychometric validation of the instrument.

Data Collection and Procedure

Data were collected immediately after programme completion through an online survey platform, namely Google Forms. Participation was voluntary and anonymous. The survey was made available in both English and Bahasa Malaysia to accommodate participants from different backgrounds. After screening for completeness and eligibility, 78 inbound responses and 44 outbound responses were retained for analysis. The number of usable responses indicated strong participant engagement with the evaluation process.

Reliability and Data Analysis

For the quantitative component, internal consistency was assessed using Cronbach's alpha. The reliability coefficients were high for both cohorts, with $\alpha = 0.972$ for the inbound instrument and $\alpha = 0.953$ for the outbound instrument. These values indicate excellent internal consistency for the Likert-scale items included in the analysis. Descriptive statistics, including means, standard deviations, frequencies, and percentages, were calculated to summarise participant responses. Cronbach's alpha was computed only for items measured using Likert-type scales.

For the qualitative component, responses to the open-ended questions were analysed thematically using an iterative coding approach. Two researchers independently reviewed the responses, identified recurring patterns, and developed an initial coding framework. The data were then coded systematically to refine and confirm the emerging themes. The main themes included networking benefits, cross-cultural learning, leadership development, logistical challenges such as scheduling pace, accommodation, and rest time, as well as suggestions for future improvement. These qualitative findings were used to support and contextualise the quantitative results. The outbound descriptive findings reported in this paper are consistent with the official outbound evaluation report [21].

Ethical Considerations

Participation in the survey was voluntary. Respondents were informed of the purpose of the evaluation, and completion of the questionnaire was treated as implied consent. No personally identifiable information was collected, and all responses were analysed and reported in aggregate form to protect confidentiality. As the study was conducted as an anonymous post-programme evaluation for quality improvement purposes, with no collection of personally identifiable data, it was handled in accordance with internal programme evaluation procedures.

Results

Table 2 summarises the two components of GEX 2025 and the corresponding evaluation cohorts. Table 3 presents the demographic profile of the inbound cohort. Table 4 reports the inbound mean scores and standard deviations by evaluation dimension. Table 5 presents the conceptual mapping of outbound indicators to the six-dimension framework, while Table 6 summarises selected quantitative outcomes from the outbound programme evaluation [21].

Programme Overview and Sample Characteristics

Table 2: GEX 2025 Programme Components and Evaluation Cohorts

Component	Dates	Location	Evaluation Sample (n)
Outbound Cohort	18–22 August 2025	Batam, Indonesia	44
Inbound Cohort	15–18 October 2025	Ruang Legar KPT, Putrajaya, Malaysia	78

Table 3: Inbound Cohort Profile (n = 78)

Characteristic	Category	n (%)
Country	Malaysia	68 (87.2)
Country	Indonesia	10 (12.8)
Role	Student	49 (62.8)
Role	Mentor / Lecturer	21 (26.9)
Role	Head of Entrepreneurship Unit	4 (5.1)
Role	Mentor and Head of Unit	4 (5.1)
Gender	Female	64 (82.1)
Gender	Male	14 (17.9)

Prior international programme	Yes	59 (75.6)
Prior international programme	No	19 (24.4)

The inbound cohort was predominantly composed of Malaysian participants, students, and female respondents. A substantial proportion of respondents also reported previous participation in international programmes, indicating that many participants entered the programme with some prior mobility exposure.

Inbound Quantitative Findings

Table 4.: Inbound Cohort Mean and Standard Deviation by Evaluation Dimension (Five-Point Scale), n = 78

Dimension	Items	Mean	SD
Programme management and communication	1–5	4.56	0.57
Learning and entrepreneurial competence	6–10	4.65	0.52
Cross-cultural and international collaboration	11–15	4.67	0.56
Social values and leadership development	16–20	4.68	0.47
Industry exposure and practical learning	21–25	4.64	0.50
Future intention and perceived impact	26–30	4.65	0.51
Overall (Items 1–30)	1–30	4.64	0.46

The inbound findings indicate consistently positive participant perceptions across all six evaluation dimensions, with an overall mean score of 4.64 out of 5.00. The highest rated dimension was social values and leadership development (M = 4.68, SD = 0.47), followed closely by cross-cultural and international collaboration (M = 4.67, SD = 0.56). These findings suggest that participants viewed the programme as especially valuable in strengthening teamwork, empathy, leadership confidence, and intercultural communication. Positive perceptions were also evident in the three overall evaluation items. A total of 93.6% of respondents agreed or strongly agreed that the programme achieved its objectives, that they were satisfied with the overall experience, and that they were motivated to apply what they had learned.

In terms of areas for improvement, half of the respondents (50.0%) indicated that no improvement was needed. Among those who identified improvement priorities, the most frequently cited areas were accommodation and facilities (23.1%), communication among organisers (19.2%), time coordination for meals and travel (16.7%), schedule density (12.8%), and short break time (11.5%). These responses suggest that while the overall experience was rated highly, participants still identified several logistical aspects that could be strengthened in future programme delivery.

Outbound Quantitative Findings

Because the outbound evaluation employed activity-specific indicators and partly categorical response formats, a conceptual mapping was developed to show how selected outbound indicators correspond to the six-dimension evaluation framework. This mapping was used only for descriptive interpretation and was not intended to claim statistical equivalence between the inbound and outbound cohorts.

Table 5: Conceptual Mapping of Outbound Evaluation Indicators to the Six-Dimension Evaluation Framework

Six-Dimension Framework	Outbound Indicator Used	Rationale for Mapping
Programme management and communication	Clarity of visit information, passport/visa information, committee preparation	Reflects preparation, communication and logistical readiness.
Learning and entrepreneurial competence	PBL Expo confidence, communication skills, business and innovation exposure	Reflects perceived entrepreneurial skills and applied learning.
Cross-cultural and international collaboration	International cooperation opportunities, networking with students and industry	Reflects cross-border networking and collaboration.
Social values and leadership development	CSR activity, teamwork, community-based entrepreneurship	Reflects empathy, social responsibility and collaborative values.
Industry exposure and practical learning	BTP/ITEBA visits, Biz Growth, IKS exposure	Reflects industry benchmarking and practical business learning.
Future intention and perceived impact	Intention to join future overseas competitions, readiness for future activities	Reflects motivation and future-oriented impact.

Based on this mapping, selected outbound outcomes are presented descriptively in Table 6. The findings are interpreted within the outbound cohort and are not directly compared with the inbound mean scores.

Table 6: Outbound Cohort Selected Outcomes from the Programme Evaluation (n = 44)

Domain	Indicator	Key result
Networking and collaboration	Opportunity for international cooperation	100% reported large or very large opportunities
Networking and collaboration	Expanded networks with students and industry	97.7% agreed or strongly agreed
Industry exposure and benchmarking	Exposure to innovation ideas and technology	100% agreed or strongly agreed
Overall programme value	Programme objectives achieved	93.2% rated achieved or highly achieved
Future intention	Intention to join future overseas competitions	100% agreed or strongly agreed
Overall satisfaction	Satisfaction with overall experience	100% satisfied or highly satisfied
Continuous improvement	Logistics requiring improvement	18.2% indicated improvement needed

The outbound findings similarly reflect very positive participant perceptions. Reported benefits were particularly strong in relation to international networking,

benchmarking, exposure to innovation and best practices, and willingness to participate again in future international programmes. Overall satisfaction was reported by all respondents. At the same time, a minority of participants identified logistical areas requiring improvement. As noted in the official outbound evaluation, these issues were mainly related to schedule pacing and accommodation readiness [21].

Qualitative Findings from the Outbound Cohort

Thematic analysis of the outbound open-ended responses provided further context for the quantitative findings. The most frequently reported suggestions for improvement were the need to rebalance the activity schedule to reduce fatigue (n = 7), improve accommodation facilities such as laundry access and basic amenities (n = 5), increase rest time between activities (n = 4), improve coordination of travel and meal timing (n = 3), provide financial support for lecturer chaperones (n = 1), and broaden participation opportunities in future programmes (n = 6) [21]. The qualitative data also highlighted several perceived strengths of the programme.

Cross-Cultural Learning and Networking

Participants described the programme as expanding their perspectives on entrepreneurship through interaction with peers from different backgrounds. One participant noted that meeting Indonesian participants opened new ways of thinking about entrepreneurship and provided fresh ideas for approaching business. Another respondent emphasised the value of networking opportunities with both industry mentors and fellow students who shared similar entrepreneurial interests.

Leadership and Social Values

Several responses reflected perceived growth in confidence, teamwork, and interpersonal sensitivity. Participants reported that the programme helped them communicate more effectively in group settings, respect differing viewpoints, and develop greater empathy when working with individuals from diverse backgrounds.

Industry Exposure and Practical Learning

Participants also highlighted the practical value of company visits and pitching activities. Responses suggested that these experiences helped them connect classroom learning with real-world entrepreneurial practice, while also strengthening their confidence in presenting business ideas in a more structured and convincing way.

Logistics and Schedule Management

Despite the positive overall experience, respondents also pointed to several logistical concerns. These included a densely packed schedule, limited rest time, accommodation arrangements, and the coordination of meals and transportation. Participants indicated that improvements in these areas could enhance comfort and allow greater focus on learning activities. Overall, the qualitative findings complement the quantitative results by illustrating how participants perceived the programme's contributions to learning, networking, leadership development, and practical exposure, while also identifying clear areas for operational refinement in future iterations.

Discussion

The findings should be interpreted with caution because they are based on self-reported data collected through a short-term, post-programme design. Within these limitations, the results suggest that short-term international mobility may serve as a valuable experiential context for entrepreneurship learning in TVET when the programme design integrates authentic entrepreneurial tasks, cross-cultural collaboration, and industry exposure. In the inbound cohort, the highest ratings were observed for social values and leadership development (M = 4.68) and cross-cultural and international collaboration (M = 4.67). These patterns are consistent with previous studies indicating that intercultural learning is strengthened when participants engage in collaborative activities and are required to adapt socially and professionally during mobility experiences [11,15].

From the perspective of entrepreneurship education, the consistently positive findings for learning and entrepreneurial competence (M = 4.65), industry exposure and practical learning (M = 4.64), and future intention and perceived impact (M = 4.65) suggest that participants viewed the programme as contributing to learning in ways that extended beyond general satisfaction or enjoyment. This interpretation is consistent with experiential learning theory, which proposes that skill development is strengthened when learners move through cycles of concrete experience, reflection, and active experimentation [24,25]. In the context of GEX 2025, the pitching and showcasing components may be understood as forms of performance-based experimentation, while the industry visits and cross-border interactions provided opportunities for concrete experience and situated learning.

At the same time, participant feedback drew attention to several practical constraints that may influence the quality of the learning experience. Comments relating to schedule pacing, rest intervals, and accommodation suggest that learner wellbeing and cognitive capacity are important conditions for meaningful engagement. This observation is consistent with findings from short-term mobility research showing that overly intensive schedules may reduce opportunities for reflection and limit deeper forms of learning [13,26]. Programme management also emerged as an area for ongoing refinement. Although all dimensions were rated positively, programme management and communication received a slightly lower mean score than the other domains. This suggests that logistical organisation and communication processes remain important determinants of participant experience. Previous mobility programme guidance also suggests that management quality can shape learning efficiency and overall participant experience [10,18]. In this study, participants' suggestions, particularly in relation to schedule rebalancing, accommodation improvements, and better coordination of meals and transport, provide practical guidance for strengthening future programme implementation.

Based on the evaluation findings, three programme design principles can be proposed. First, short-term entrepreneurship mobility appears to benefit from structured experiential sequencing that connects industry immersion, collaborative teamwork, and entrepreneurial outputs. Second, it is important to include intentional facilitation of intercultural collaboration so that interaction extends beyond surface-level contact and supports meaningful exchange. Third, programme sustainability depends not only on academic and entrepreneurial content, but also on operational arrangements that protect participant wellbeing, including realistic scheduling and adequate facilities. These principles are broadly aligned with recommendations in the literature on entrepreneurship education and international mobility [10,13].

The findings suggest that the learning value of GEX 2025 may be explained through three interconnected mechanisms. First, cross-cultural interaction created a boundary-crossing experience in which participants had to communicate, negotiate meaning and work with peers from a different national and institutional context. Second, industry visits, pitching and showcasing activities provided concrete entrepreneurial experiences that allowed participants to observe business practices, compare institutional approaches and relate classroom learning to real-world settings. Third, reflection through feedback, participant evaluation and open-ended responses enabled participants to make sense of their experiences and identify areas for future application. These mechanisms help explain why the highest scores were observed in social values, leadership development and cross-cultural collaboration, rather than satisfaction alone.

Conclusion

This study suggests that short-term international mobility may provide a supportive context for participant-reported entrepreneurship learning in TVET when it is designed around cross-cultural collaboration, industry immersion and structured opportunities for reflection. The findings indicate positive perceived outcomes in leadership, intercultural competence, entrepreneurial readiness and future international engagement. However, because the study relied on self-reported post-programme data without a pre-test, control group or long-term follow-up, the findings should be interpreted as perceived short-term outcomes rather than causal evidence of learning gains. Despite these limitations, the six-dimensional evaluation framework offers a practical basis for improving future ASEAN-focused TVET mobility programmes. Future implementation should strengthen reflective activities, improve logistics and accommodation arrangements, and develop longitudinal tracking to examine whether perceived learning is translated into entrepreneurial action, sustained collaboration or career-related outcomes. Therefore, the notion of international mobility as an experiential accelerator should be understood as a programme evaluation interpretation based on participant-reported outcomes, not as causal proof of measurable learning gains.

Limitations and Future Research

Several limitations should be considered when interpreting the findings of this study. First, the evaluation relied on self-reported outcomes, which reflect participants' perceptions rather than objectively measured learning gains or behavioural change. Second, the absence of a pre-test and control or comparison group limits the ability to draw causal conclusions about programme effects. Third, because data were collected immediately after programme completion, the study captures short-term perceptions rather than longer-term changes in entrepreneurial behaviour, collaboration, or professional development.

In addition, the inbound sample was predominantly female, and a large proportion of participants reported prior international programme exposure. These characteristics may affect the extent to which the findings can be generalised to other participant groups. The qualitative component also presents a limitation, as open-ended responses were collected only from the outbound cohort. As a result, qualitative insights from the inbound participants were not available to enrich interpretation across both programme components. Furthermore, the sample included participants with different institutional

roles, including students, lecturers, mentors, and heads of unit, which may have introduced variation in how programme outcomes were perceived and evaluated.

Future research could strengthen the evidence base in several ways. First, researchers could employ pre- and post-programme designs with control or comparison groups to assess learning gains more rigorously. Second, follow-up studies at three, six, and twelve months could examine whether participants translate their reported learning into entrepreneurial actions, new ventures, or sustained international collaboration. Third, comparative studies across different ASEAN mobility routes could help distinguish context-specific features from more generalisable programme design principles. Fourth, future analyses could explore differences by participant characteristics such as role, prior mobility exposure, gender, and discipline in order to better understand for whom such programmes are most beneficial. Finally, longitudinal indicators could be developed to examine how mobility participation relates to career development, international engagement, and broader regional economic contribution over time. Taken together, these directions would support the development of a more cumulative and robust evidence base for international mobility as a strategic intervention in TVET, particularly in relation to entrepreneurship development, graduate employability, and regional integration in ASEAN.

Acknowledgements

The authors would like to acknowledge the support of JPPKK through BAPP, Kolej Komuniti Kuala Langat, Keusahawanan PolyCC Zon Selangor dan Wilayah Persekutuan Kuala Lumpur, and Politeknik Negeri Batam in the implementation of GEX 2025. The authors also extend their sincere appreciation to all participants for their valuable engagement and feedback, which contributed significantly to this evaluation.

Abstract: The rapid proliferation of Generative Artificial Intelligence (GenAI) has fundamentally disrupted the landscape of entrepreneurship education, precipitating a shift from the era of "Cyberpreneurship" to "AI-Preneurship." While previous models identified ICT self-efficacy as a primary driver for digital business creation, the emergence of GenAI introduces complex cognitive dimensions that require a re-evaluation of student readiness within the Malaysian context. This paper proposes a conceptual framework to examine the impact of GenAI adoption on the development of the entrepreneurial mindset. By synthesizing the Digital Entrepreneurship Process, Extended Theory of Planned Behaviour Model and Social Cognitive Theory with the aspirations of the National Entrepreneurship Policy 2030 (*Dasar Keusahawanan Negara*, DKN 2030) and MyDigital; the framework argues that GenAI must be positioned as a mechanism for cognitive empowerment rather than technological dependency. Validated by recent findings on student usage patterns, this study outlines how targeted digital literacy and ethical awareness serve as critical mediators in transforming passive users into resilient, tech-empowered entrepreneurs.

Keywords: Entrepreneurial Mindset, Malaysian Education, Generative Artificial Intelligence

Introduction

The Malaysian higher education landscape is experiencing a major shift due to national policies of digitalization and blistering development of artificial intelligence technologies. The Malaysia Digital Economy Blueprint (MyDIGITAL) and the Twelfth Malaysia Plan (12MP) are strategic national plans that aim to transform Malaysia into a digitally-driven, high-income country by focusing on innovation, development of digital talents, and entrepreneurship in higher education institutions [1, 2]. At the core of this national transformation is the development of agile, competent and future-ready digital talent that can navigate the complexity of the Fourth Industrial Revolution and become part of the digital economy ecosystem. In this respect, it is anticipated that higher education institutions (HEIs) are shifting towards a new approach to pedagogy, which would enable entrepreneurship education based on innovation to replace the old one, incorporating new digital technologies and Artificial Intelligence (AI) into the learning models [3, 4].

The introduction of Generative Artificial Intelligence (GenAI) has enhanced this change even more, essentially transforming the ways in which entrepreneurship is taught, learned, and practiced within the academic setting. Recent research reports that GenAI is not only a technological solution but a disruptive technology that is transforming the way knowledge is created, decisions are made, and innovation processes are undertaken in entrepreneurial ecosystems [3, 5]. GenAI is being applied in higher education to generate ideas, develop business models, analyze markets, and plan, indicating a shift in traditional Cyberpreneurship that emphasised simple digital and Information, Communication and Technology (ICT) skills; to a more sophisticated paradigm of AI-preneurship; where cognitive governance, strategic thinking, and adaptive decision-making are the new skills required by students and future entrepreneurs [4, 6]. The change is indicative of the increasing role of artificial intelligence in entrepreneurship education as a technical competency but as a cognitive and strategic facilitator of innovation and venture formation.

Although access to GenAI tools in HEIs is increasing, there has developed a critical pedagogical paradox. Although students are becoming more efficient in using digital tools and AI technologies, there is evidence that excessive dependence on automation may decrease critical thinking, creativity, and ability to solve problems independently unless it is accompanied by relevant pedagogical frameworks [4, 5]. Students in most instances have a technician-based approach whereby they are more concerned with the use of operational tools as opposed to the strategic thinking of an entrepreneur, which subsequently traps them into relying on the automated systems and reduces their capability of coming up with sustainable and innovative business enterprises [3]. This phenomenon brings up the issue of whether digital talent may be commoditized whereby graduates are reduced to operational users of technology as opposed to strategic innovators who can spearhead entrepreneurial activities in the digital economy.

The root cause is not, however, the lack of technical capability, but the absence of entrepreneurial agency and self-efficacy, which are the key factors of entrepreneurial behavior and venture creation. The Social Cognitive Theory (SCT) argues that what people believe about themselves in terms of their ability is what affects their motivation, persistence, decision making and capacity to act on what they learn [7]. Empirical studies in entrepreneurship also support that entrepreneurial self-efficacy is an important factor in opportunity recognition, innovation and venture success, and it is a key element of entrepreneurship education at higher education institutions [6, 8]. Nevertheless, the existing entrepreneurship programs tend to focus more on software skills and technical performance than on cognitive growth in strategy planning and unintentionally, they reinforce the idea of passive use of technology instead of making students become leaders and innovators in applying digital tools [3].

To counter this barrier, GenAI needs to be re-framed as a productivity tool to a cognitive empowerment mechanism, which will allow students to improve their strategic thinking, entrepreneurial decision-making, and innovation skills. This necessitates a pedagogical transformation to cognitive augmentation in which artificial intelligence serves as an instrument in which it enhances the development of entrepreneurial mindset in lieu of substituting human creativity and agency [4, 5]. This

kind of transformation is in line with the National Entrepreneurship Policy 2030 (*Dasar Keusahawanan Negara*, DKN 2030) of Malaysia that focuses on producing innovative, resilient, and competitive entrepreneurs who can help in the sustainable economic growth and national development [12].

Based on SCT and Digital Entrepreneurship Process Model (DEP), and the national entrepreneurship agenda of Malaysia, this paper presents a conceptual framework, the Cognitive Augmentation Model of Entrepreneurial Mindset (CAM-EM) that can be used to convert passive users of GenAI into resilient, tech-empowered local young entrepreneurs. The CAM-EM model places GenAI in the role of a cognitive facilitator that strengthens entrepreneurial self-efficacy, strategic thinking, and innovation potential and facilitates the creation of sustainable AI-based enterprises in Malaysian higher education. Combining national policy goals with current research in the field of entrepreneurship and artificial intelligence, the research will introduce new insights to the existing body of literature on AI-preneurship and will offer a systematic pedagogical model to educate entrepreneurs in the digital economy of the future.

Review of the Literature

The fast adoption of GenAI into the Malaysian higher education has dramatically changed the outlook of the digital entrepreneurship, and the conceptualization of the entrepreneurial mindset development in the Malaysian context needs reconsideration. The literature on digital entrepreneurship that has been published so far highlights that digital technologies are not just tools of operation, but of strategic facilitation that has an impact on the processes of opportunity recognition, venture creation, and innovation [9].

DEP model describes the role of digital technologies in the process of transitioning opportunity identification to venture development, improving access to information, market analysis, and business model innovation. In this context, technology is an enabler that lowers entry barriers and speeds up decision making in entrepreneurship enabling students to participate more in digital business development.

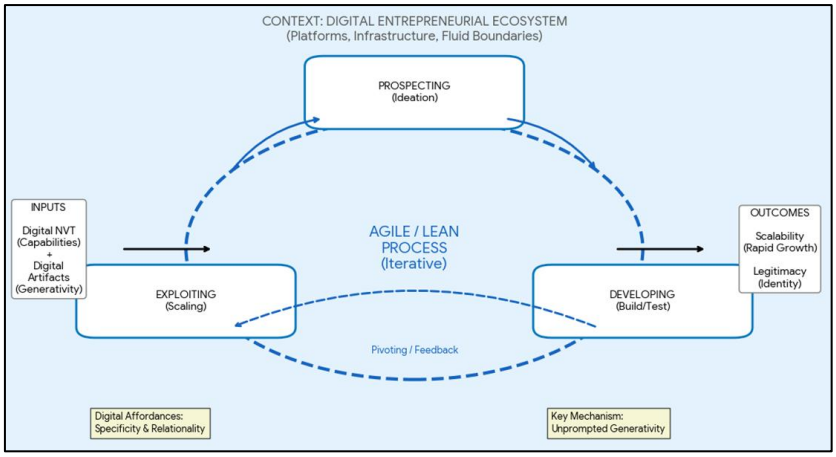

Figure 1: Digital Entrepreneurship Process Model as synthesized from the article [9]

With the advent of GenAI, this process has moved past the conventional domain of digital entrepreneurship, with cognitive augmentation features that boost strategic thinking and decision-making. Recent research indicates that the adoption of artificial intelligence in entrepreneurship teaching enhances the capacity of students to derive business ideas, simulation of market conditions, and optimization of business models using data-driven information [10]. It implies that GenAI is a digital enabler and a cognitive tool that facilitates entrepreneurial learning and innovation.

Nevertheless, the efficiency of GenAI implementation is influenced by how well students are digitally literate and ethically conscious to utilize such tools in a strategic way, as opposed to a passive manner. In the absence of guided instructions, students can overly depend on automated outputs, which restricts their capacity to acquire autonomous entrepreneurial thinking and decision-making skills.

To describe this behavioral aspect, the Extended Theory of Planned Behaviour (ETPB) is a valuable framework in explaining how attitudes, perceived behavioral control and technological competence can affect entrepreneurial intentions in digital settings [11]. The interconnection of artificial intelligence skills into this model proves that the desire of students to become entrepreneurs depends on their trust in working with digital technologies, perceived utility of AI, and social support in the learning environment.

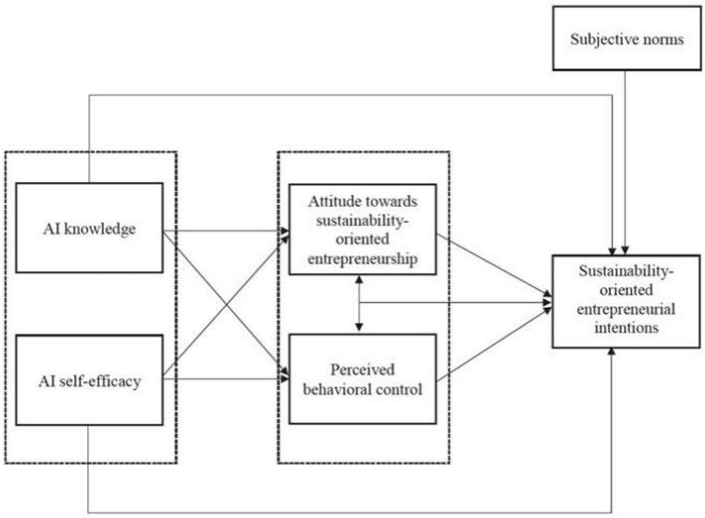

Figure 2: Extended Theory of Planned Behaviour Model [11]

This underscores the need to have effective digital literacy programs and policy support like MyDIGITAL and the DKN 2030, which focus on the creation of digitally competent and innovative entrepreneurs who can help a country grow its economy [2, 12].

Although the DEP model and the Theory of Planned Behaviour (TPB) can be used to describe the technological and behavioural drivers, they are incomplete in explaining the psychological processes that influence the development of the entrepreneurial mindset. SCT is an elaborate explanation that focuses on the interplay between the environment, individual beliefs, and behavior in influencing the outcome of an individual [7]. This theory suggests that self-efficacy can shape the development of entrepreneurial mindset as it dictates how people approach challenges, deal with uncertainty, and make strategic choices. When applied to GenAI use, students with greater entrepreneurial self-efficacy will tend to engage AI as a strategic innovation

partner, and less entrepreneurial self-efficacy students will be more inclined to rely on automated tools and fail to take entrepreneurial risks.

The idea of human-AI symbiosis also justifies placing GenAI as a cognitive empowerment tool instead of a tool that will substitute human decision-making. AI tools must be used in a Human-in-the-Loop system, whereby it handles complex data processing, but leaves strategic judgment and decision-making power to humans [13]. Such interaction allows people to use AI to provide analytical effectiveness without losing the ability to think critically and develop an entrepreneurial approach. In entrepreneurship education, such a methodology can be used to make sure that GenAI can maximize opportunity recognition and innovation capacity without compromising the cognitive autonomy of students.

The notion of GenAI literacy as a set of multidimensional constructs encompassing technical competence, ethical awareness, and critical evaluation skills has also been introduced in recent literature [14]. GenAI literacy helps students to comprehend the restrictions, dangers, and ethical consequences of AI, such as the problems of data integrity, bias, and intellectual property. Ethical awareness is particularly important in entrepreneurship education, as it ensures responsible decision-making and sustainable business practices. Through incorporating GenAI literacy in the digital entrepreneurship process, students will be able to create a balanced solution that is both technologically efficient and ethically responsible and strategic in its approach.

Moreover, the digital transformation literature points out that behavioral and innovative characteristics are instrumental in the competitiveness of an entrepreneur and the sustainability of a business in a technologically-oriented setting [15]. Proactive innovation orientation, adaptability, and strategic thinking are more likely to enable students to use GenAI to explore opportunities and create ventures. This is consistent with the notion of entrepreneurial mindset that involves alertness to opportunities, innovation orientation and readiness to deal with uncertainty as psychological dimensions of entrepreneurship [16]. These dimensions will play a critical role in equipping students to operate within the fast-changing digital economy, as well as to convert technological capabilities into viable business enterprises.

Entrepreneurial self-efficacy is a key mediator in this process as it determines the way students translate GenAI literacy into entrepreneurial action. The studies indicate that entrepreneurial self-efficacy is a major determinant of opportunity recognition, risk-taking behaviour and venture creation, and thus it plays a significant role in entrepreneurial success [8]. Interventions in education, aimed at experiencing learning, learning digital skills, and cognitive training, can reinforce self-efficacy and promote a proactive entrepreneurial approach among students. This underscores the importance of higher education institutions to come up with curriculum that incorporates the adoption of GenAI with cognitive and psychological growth as opposed to technical training.

Overall, the literature indicates that the three factors (GenAI adoption, digital entrepreneurship processes, and social cognitive mechanisms) are interdependent and affect the development of entrepreneurial mindset in higher education. DEP Model describes the technological pathway, Theory of Planned Behavior describes the

behavioral intention and SCT describes psychological transformation through self-efficacy and cognitive empowerment.

Nevertheless, the current literature is still disjointed and does not have a coherent framework that links GenAI literacy, ethical awareness, entrepreneurial self-efficacy, and digital opportunity processes within the Malaysian policy framework. Thus, this paper will combine these theoretical interpretations into a conceptual framework to describe how the introduction of GenAI can open up the entrepreneurial potential and build resilient and tech-empowered entrepreneurs in accordance with DKN 2030 and MyDIGITAL.

The Proposed Conceptual Framework

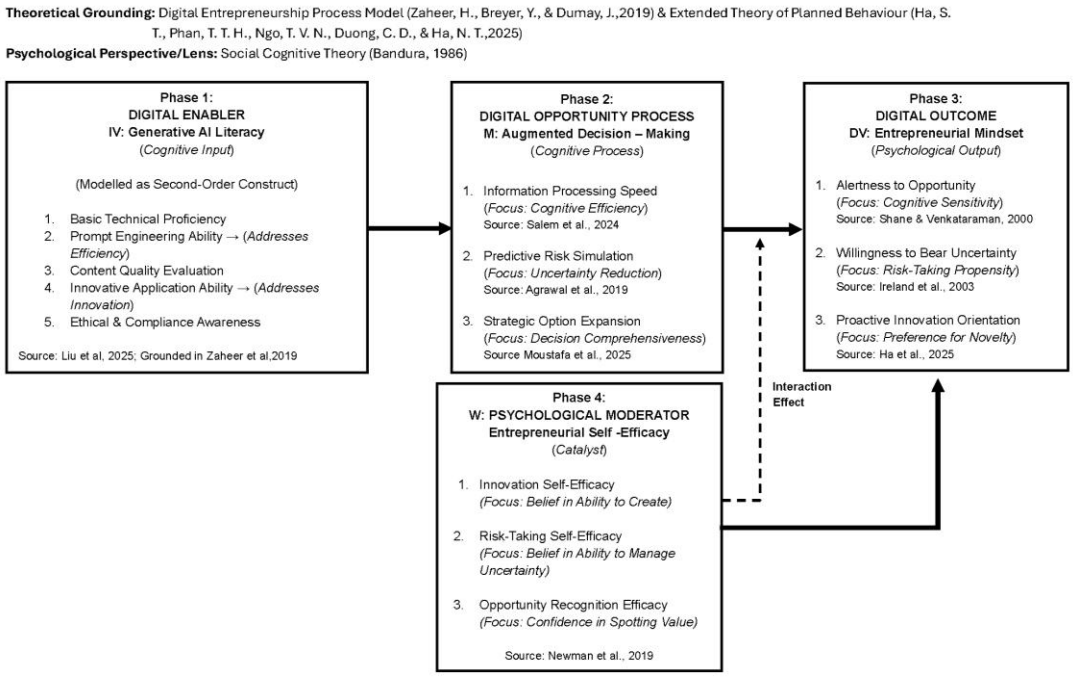

Figure 3: The Cognitive Augmentation Model of Entrepreneurial Mindset (CAM-EM)

The conceptual framework proposed justifies the way in which the implementation of GenAI can affect the growth of entrepreneurial culture in higher education students by framing artificial intelligence as the source of cognitive empowerment, not technological addiction. The framework combines the DEP Model and SCT with the national aspirations of MyDIGITAL and DKN 2030 to have a systematic explanation of how students can be transformed into tech-empowered resilient entrepreneurs instead of passive consumers of technology [2, 7, 9, 12].

The framework is based on the premise that the GenAI adoption does not necessarily result in the development of entrepreneurial mindset because technological adoption should be accompanied by cognitive and psychological processes that precondition the development of entrepreneurial behavior [13, 14]. In the DEP Model, digital technologies serve as facilitators that help in recognizing opportunities, creating businesses, and innovating business but their success is determined by how the users interpret and use the technological outputs in a strategic manner [9]. SCT also describes

that the interaction of the environmental factors, personal beliefs, and cognitive processes affect behavior, and self-efficacy and knowledge play a major role in determining entrepreneurial results [7, 8]. Thus, the framework suggested here makes digital literacy and ethical awareness mediating variables, whereas entrepreneurial self-efficacy serves as a psychological mediating variable between GenAI adoption and the development of entrepreneurial mindset.

Phase 1: GenAI Adoption as Digital Enabler

The initial element of the framework conceptualizes GenAI adoption as a digital enabler that helps students to be more able to access information, develop business ideas, and discover entrepreneurial opportunities. The literature of digital entrepreneurship emphasizes that digital technologies lower the barriers of entry and accelerate the innovation process by means of real-time access to data, market insights, and business intelligence tools [9]. Predictive analytics, automated market analysis, and large language models are tools in the context of GenAI that can be used to facilitate entrepreneurial learning through enhancing idea generation and strategic planning [10].

Nevertheless, digital literacy and ethical awareness are the cognitive inputs in the framework as they determine the success of GenAI adoption. GenAI literacy can be described as the capacity to comprehend, analyze, and strategically apply artificial intelligence and remain conscious of the ethical and compliance concerns like data reliability, intellectual property, and responsible use of AI [14]. Ethical awareness will make sure that students are able to scrutinize the outputs of AI and not over-depend on automation, which is the key to sustainable entrepreneurship in the digital environment [13]. This stage is in line with MyDIGITAL and DKN 2030 that focuses on producing digitally competent and responsible entrepreneurs who can play a role in developing the digital economy in Malaysia [2, 12].

Phase 2: Digital Opportunity Process through Cognitive Empowerment

The second phase is the stage of cognitive empowerment, during which students will be actively engaged with GenAI to improve decision-making and opportunity recognition of entrepreneurship. According to the DEP Model, innovation can be supported by digital technologies, which enhance information processing and allow evaluating opportunities faster [9]. This process is more developed in GenAI-driven settings where artificial intelligence contributes to predictive analysis, business simulation, and strategic planning, enabling students to optimize their entrepreneurial ideas and minimize uncertainty [10].

This phase is also supported by Human-AI symbiosis theory which states that artificial intelligence must work within a Human-in-the-Loop system where AI will do analytical work and human beings will have strategic control and judgment [13]. This interaction allows students to engage with GenAI as a cognitive collaborator that stimulates their analytical abilities without taking away their autonomy in decision-making. Besides, the digital transformation studies reveal that adaptability and proactive thinking are innovative and behavioral characteristics that greatly enhance the competitive advantage in technologically oriented settings [15]. GenAI empowers

cognition and boosts the formation of entrepreneurial opportunities through predictive risk analysis, strategic option expansion, and improved information processing.

Phase 3: Entrepreneurial Mindset as Digital Outcome

The third phase of the framework conceptualizes entrepreneurial mind as the main product of GenAI adoption and cognitive empowerment. Entrepreneurial mindset is the mental disposition that allows people to see opportunities, be innovative and deal with uncertainty in a dynamic business environment [16]. It is defined by the alertness to opportunities, orientation to innovations, and readiness to take calculated risks which are the keys to successful entrepreneurship in digital economies.

The study of digital entrepreneurship suggests that the application of artificial intelligence and digital tools increases opportunity recognition and business model innovation, which results in increased entrepreneurial intentions and venture formation [10]. SCT describes how people can attain entrepreneurial mindset as a result of constant interplay between cognitive processes, environmental factors, and personal beliefs, which support proactive behavior and strategic thinking [7]. Consequently, GenAI adoption, with facilitation by digital literacy and ethical awareness, helps to build robust and innovative entrepreneurs who are capable of working in technology-driven settings.

Phase 4: Entrepreneurial Self-Efficacy as Psychological Moderator

The psychological moderator that defines the magnitude of the relationship between GenAI adoption and entrepreneurial mindset development is entrepreneurial self-efficacy. SCT explains that self-efficacy determines the confidence that people have in their potential, their ability to persevere in difficult circumstances, and their readiness to take risks in entrepreneurship [17]. Empirical research has proven that entrepreneurial self-efficacy has a major influence on opportunity recognition, innovation behavior, and venture creation, which are major determinants of entrepreneurial success [8].

High entrepreneurial self-efficacy students tend to apply GenAI strategically to search business opportunities and create innovative solutions whereas low entrepreneurial self-efficacy students can overuse automated outputs and not take entrepreneurial decisions [10]. This underscores the need to have educational interventions to instill confidence, experience, and strategic thinking to make sure that the use of GenAI results in cognitive empowerment, and not technological dependence.

Integrated Conceptual Framework

The conceptual framework integrates GenAI adoption (digital enabler), digital literacy and ethical awareness (mediators), cognitive empowerment (opportunity process), entrepreneurial mindset (outcome) and entrepreneurial self-efficacy (moderator) into a single framework. This framework builds on top of Digital Entrepreneurship Process (DEP), Extended Theory of Planned Behaviour Model

(ETPB) and Social Cognitive Theory (SCT) by adding GenAI literacy and national digital policy alignment, which explains the comprehensive nature of how the adoption of artificial intelligence can unlock entrepreneurial potential in Malaysian higher education.

The framework aligns with MyDIGITAL and DKN 2030 by focusing on creating young tech-savvy entrepreneurs capable of using GenAI in a responsible and strategic way to become contributors to the Malaysian digital economy. This theoretical framework offers a systematic guide that teachers and policy-makers can use to develop entrepreneurship curricula that foster cognitive empowerment, ethical adoption of GenAI, and sustainable development of entrepreneurial mindset.

Future Empirical Validation and Research Recommendations

This paper provides a solid conceptual framework via the Cognitive Augmentation Model of Entrepreneurial Mindset (CAM-EM), but the next step is to move from the conceptual level to the empirical level in developing educational models. Therefore, the next critical step to this research is to be recommended as a quantitative validation of the proposed model to check its applicability in the Malaysian Higher Education context. The future research should utilize cross-sectional survey methodology for gathering primary data from diverse students at Malaysian universities, due to the findings that suggest the use of students' pattern have significant impacts on digital readiness. The data should be analyzed by the Partial Least Squares Structural Equation Modeling (PLS-SEM) that is suitable to test complex structural relationship and multi-dimensional construct in entrepreneurship research. This empirical strategy will enable the multiple testing of the specific structural paths included in the model, which will include the mediating effects of GenAI literacy and ethical awareness, in addition to the moderating role of entrepreneurial self-efficacy on the development of the entrepreneurial mindset. This future validation will help to make the framework more concrete and practical which in line with the vision of DKN 2030 and MyDIGITAL; for policymakers and Malaysian educators.

Conclusion

This paper is a conceptual discussion of how Generative Artificial Intelligence (GenAI) can be used to reinforce the development of entrepreneurial mindset in higher education students through the combination of Digital Entrepreneurship Process Model, Extended theory of Planned Behavior and Social Cognitive Theory into a single framework. It claims that although GenAI is becoming more and more available in the educational and entrepreneurial settings, its usefulness hinges on the cognitive, ethical, and psychological abilities of students to employ it strategically and not passively. The research is aligned with the Malaysian digital transformation agenda, specifically MyDIGITAL and the National Entrepreneurship Policy 2030 (Dasar Keusahawanan Negara, DKN 2030), which focus on innovation and digital literacy and entrepreneurial resilience in higher education.

According to the literature, opportunity recognition, innovation, and decision-making in the field of entrepreneurship are improved through digital technologies such as GenAI. Nevertheless, the current researches mostly focus on technological adoption and performance results, whereas little attention is paid to the development of entrepreneurial mind and cognitive empowerment of students. The review also emphasizes the presence of digital literacy and ethical awareness as a means of responsible GenAI usage, as well as the entrepreneurial self-efficacy as an important factor of confidence in using digital tools to create opportunities.

The proposed framework places GenAI adoption as a digital enabler, digital literacy, and ethical awareness as mediating variables, and entrepreneurial self-efficacy as a moderator that affects the development of entrepreneurial mindset. It theorizes GenAI as facilitating cognitive empowerment, like opportunity recognition and strategic decision-making, as part of a Human-in-the-Loop model, in which human judgment is central. The end result is an entrepreneurial mentality that is innovative, opportunity sensitive, and risk takers.

In general, the research is an addition to a coherent conceptual framework between GenAI, cognitive empowerment, and the development of entrepreneurial mindset in the context of higher education. It offers both theoretical and practical implications of curriculum design including GenAI literacy, ethics, and self-efficacy development. But, the framework is conceptual and needs to be empirically validated. The proposed model needs to be tested with the help of the data of Malaysian higher education students in the future to determine its applicability and its relevance to a particular context.

PMKL Students' Perceptions Towards Business Ethics Practices in Retail Industry on CSR Programme

Nor Fadhilah Mohd Rashid[1, a] *, Surianie Mohd Som[2, b] and Hamidah Nur Ahmad Hamidi[3,c]

[1, 2, 3,] Politeknik METrO Kuala Lumpur, Malaysia

[a]fadhilah@pmkl.edu.my, [b]surianie@pmkl.edu.my, [c]hamidahnur@pmkl.edu.my

Abstract. This study aims to assess the perceptions of students at Politeknik METrO Kuala Lumpur (PMKL) regarding business ethics practices in the implementation of the CSR program Retail Cares – Sentuhan Komuniti, a collaboration with AEON Mall AU2 Setiawangsa, as well as to identify the level of students' awareness of social and moral responsibility values through participation in community activities. This case study involved 30 Diploma in Retail Operations Management students enrolled in the Business Ethics course, selected using purposive sampling. Data were collected through a five-point Likert scale questionnaire and analyzed descriptively using SPSS version 29.0. The findings revealed a high overall mean score (M = 4.5433, SD = 0.64737), indicating that students' perceptions of business ethics practices were very positive, while the instrument's reliability value was excellent ($\alpha = 0.980$). The results demonstrate that direct involvement in industry-based CSR programs can enhance the appreciation of ethical values such as honesty, integrity, fairness, and social responsibility among students, in line with Kolb's Experiential Learning Theory. Based on these findings, the study recommends that community-based CSR activities be incorporated as structured learning components in the Business Ethics course at polytechnics through strategic collaboration with the retail industry. This approach not only strengthens theoretical learning but also supports the achievement of Polytechnic KPI 4 by empowering industry- and community-based learning, while contributing to the development of ethical, competitive, and socially responsible TVET graduates.

Keywords: Business Ethics, CSR, Students' Perception

Introduction

In the era of globalization and increasing awareness of environmental sustainability, Corporate Social Responsibility (CSR) has become an essential component of modern organizational strategies. CSR is not merely a form of charitable activity but also reflects an organization's commitment to values such as integrity, fairness, and social concern (Thomas, 2022). In the educational context, the integration of CSR elements is crucial in shaping students who are not only technically competent but also possess strong moral and ethical awareness (Kim, 2024). For students in the Retail Management field, exposure to CSR activities provides opportunities to bridge theory with real-world practice while enhancing their understanding of business ethics within an industrial context. In this regard, Politeknik METrO Kuala Lumpur (PMKL), in collaboration with AEON Mall AU2 Setiawangsa, organised a community-based environmental programmed titled "Retail Cares: Sentuhan Komuniti." This programmed was implemented as part of the course requirement for DPB40113 Business Ethics, which emphasizes the inculcation of social responsibility and ethical awareness among students. The programmed theme, "Caring Community, Preserved Earth," reflects a strong commitment to social responsibility and environmental sustainability. The

programmed not only fosters social responsibility values within the community but also provides PMKL students with practical exposure to applying business ethics, corporate communication, and event management skills. Through this experience, students are able to understand how business ethics and CSR are interconnected in building an ethical and socially responsible organizational reputation. As highlighted by Licandro et al. (2024) CSR education at the higher education level has the potential to enhance students' moral awareness and long-term sustainability perspectives. Therefore, programmed such as Retail Cares not only benefit the local community but also serve as an experiential learning platform that strengthens ethics education within the Malaysian TVET context.

Problem Statement Although Corporate Social Responsibility (CSR) programmes are widely implemented in both education and retail sectors, empirical evidence on their effectiveness as an experiential learning platform for developing business ethics awareness among Technical and Vocational Education and Training (TVET) students remains limited. Previous studies have shown that CSR initiatives in higher education are often evaluated based on organisational benefits such as reputation and stakeholder engagement rather than student learning outcomes (Chan, Huam & Sade, 2021; Licandro et al., 2024). In addition, research by the Ministry of Higher Education Malaysia (MOHE, 2023) reported that while more than 80% of higher education institutions in Malaysia have integrated ethics-related content into their curricula, only a moderate level of ethical application is observed among students when learning is purely theory-based without experiential exposure. Furthermore, studies indicate that students involved in experiential learning activities demonstrate significantly higher ethical sensitivity compared to those exposed only to classroom instruction (Abdullah & Ahmad, 2021; Azmi & Ahmad, 2021). However, within the Malaysian TVET context, particularly in retail-related programmes, systematic evaluation of CSR participation as a mechanism for developing ethical values such as integrity, honesty, fairness, and social responsibility remains scarce. In the case of Politeknik METrO Kuala Lumpur, although students actively participate in industry-based CSR programmes such as Retail Cares – Sentuhan Komuniti in collaboration with AEON Mall AU2 Setiawangsa, their perceptions have not been comprehensively assessed. Therefore, this study is conducted to address this gap, and the findings, which indicate a high level of positive perception (M = 4.5433), further support CSR as an effective experiential learning platform for strengthening business ethics education among TVET students.

Objectives of this study aims to evaluate students' perceptions of business ethics practices in the implementation of the Retail Cares CSR programmed and to identify their levels of awareness and understanding of social responsibility and moral values embedded within the programmed. Significance of this study contributes in two main aspects: Academic contribution – providing empirical data on students' perceptions of CSR and business ethics within the context of Malaysian polytechnic education. Practical contribution – offering guidance to educational institutions and industry partners in designing more meaningful, socially impactful, and ethically grounded CSR programmed. Scope of this study involves 30 students from the Diploma in Retail Operations Management (DRO) programmed at Politeknik METrO Kuala Lumpur who were directly involved in the implementation of the Retail Cares – Sentuhan Komuniti programmed at AEON Mall AU2 Setiawangsa. The study focuses on analyzing

students' perceptions of business ethics values and social responsibility embedded through the activities conducted.

Literature References

This section discusses relevant theories, concepts, and findings from previous studies related to business ethics practices, Corporate Social Responsibility (CSR), and students' perceptions of CSR programmed implementation within the educational context. The discussion aims to establish a strong theoretical foundation for understanding the relationship between ethics education, CSR implementation, and the development of social awareness among students in Technical and Vocational Education and Training (TVET). This literature review is also essential in supporting the study's conceptual framework and strengthening the justification for implementing CSR programmed as an experiential learning medium in Malaysian educational institutions.

Business ethics refers to the moral principles, values, and norms that guide individuals and organizations in making decisions and conducting business activities responsibly and with integrity (Rahim & Anuar, 2022). In an increasingly complex global business environment, ethical practices have become a critical factor in building stakeholder trust and sustaining organizational reputation and long-term viability (Thomas, 2022; Kim, 2024). Organizations that consistently practice business ethics are not only able to enhance long-term performance but also reduce the risk of misconduct and conflicts of interest. In the Malaysian context, ethical values such as honesty, integrity, fairness, and social responsibility align with the nation's sustainable development aspirations and good governance principles outlined in the Malaysian Education Blueprint and national ESG policies. Studies by Azmi and Ahmad (2021) supported by reports from the Ministry of Higher Education (2023) indicate that students exposed to ethics-based learning are better prepared to face moral dilemmas and professional challenges in the workplace. Therefore, integrating business ethics into the TVET curriculum not only enhances students' moral awareness but also contributes to the development of an ethical and competitive workforce.

Corporate Social Responsibility (CSR) is defined as an organization's ongoing commitment to operate ethically while contributing to economic, social, and environmental development for the well-being of society (Kim, 2024). CSR is now viewed as an integral part of business strategy that supports sustainability principles and Environmental, Social, and Governance (ESG) values. In the retail sector, CSR initiatives are commonly implemented through community welfare activities, environmental sustainability efforts, and human capital development. In Malaysia, CSR implementation has received increasing emphasis, particularly through strategic collaborations between industry and educational institutions. Studies by Syed and Jamaludin (2021) and reports from the Ministry of Education Malaysia (2023). demonstrate that CSR programmers involving local communities and students can enhance social awareness, empathy, and humanitarian values. Moreover, CSR initiatives that are genuinely and ethically implemented provide tangible benefits to communities rather than merely serving corporate promotional purposes. CSR programmers such as Retail Cares – Sentuhan Komuniti, implemented through industry–education collaboration, reflect an experiential learning approach. Through this approach, students not only understand CSR concepts theoretically but also

internalize social responsibility values through direct involvement in community activities.

Experiential Learning Theory is employed in this study, emphasizing that learning occurs actively through real experiences, reflection, and application in practical situations (Kolb, 1984). In this model, the learning process involves four interconnected stages: concrete experience, reflective observation, abstract conceptualization, and active experimentation, which collectively generate meaningful knowledge (Rahmi, 2024). This theory has been widely applied in higher education and professional training, including project-based learning, community service, and industrial experiences, as it integrates theoretical knowledge with practice while developing soft skills such as creativity, reflective thinking, and problem-solving abilities (Suhaimi et al., 2025). The experiential learning approach is also consistent with the views of progressive education scholars such as John Dewey, who emphasized that direct experience forms the foundation of genuine learning by connecting theory with real-life contexts (Miettinen, 2000, as cited in The European Journal of Social and Behavioral Sciences, 2025). Therefore, experiential learning theory provides an appropriate framework for explaining how students participating in the Retail Cares programmed process and internalize business ethics values through their CSR experiences. Overall, the literature review indicates that business ethics and CSR play a crucial role in shaping students' moral values, professionalism, and social awareness. Although numerous previous studies have demonstrated the effectiveness of CSR as a medium for ethics learning, empirical research focusing on TVET students' perceptions of experiential CSR programmers in Malaysia remains limited. Therefore, this study aims to address this gap by examining PMKL students' perceptions of business ethics practices and social responsibility through the implementation of the Retail Cares – Sentuhan Komuniti programmed.

Students' perceptions of CSR and business ethics refer to their level of understanding, attitudes, and evaluations of ethical values and social responsibility practices implemented within organizations or programmed they participate in. An international study by Licandro et al. (2024) found that students' perceptions of CSR are influenced by educational exposure, cultural background, and practical experience. Students who are directly involved in CSR activities demonstrate higher levels of ethical awareness and social responsibility compared to those who receive only theoretical instruction. In Malaysia, Chan, Huam, and Sade (2021) as well as Rahim and Anuar (2022) reported that student involvement in university and industry social programmed enhances integrity, empathy, and awareness of the importance of ethics in business. Real-world experiences gained through CSR activities also help students develop soft skills such as communication, teamwork, and leadership, which are essential in the retail and service sectors. Accordingly, PMKL students' involvement in the Retail Cares – Sentuhan Komuniti programmed is expected to foster positive perceptions of business ethics practices and strengthen their understanding of the role of CSR in community and industry development.

Research Methodology in this study, a case study research design was adopted as it allows the researcher to gain an in-depth understanding of the phenomenon within its real-life context and to develop a holistic view of students' perceptions of business ethics practices in the CSR programmed Retail Cares – Sentuhan Komuniti. The selected research design is consistent with the methodological guidelines outlined by

Ghazali Darusalam and Sufean Hussin (2021) in Metodologi Penyelidikan dalam Pendidikan: Amalan dan Analisis Kajian, which emphasize the case study approach as an appropriate strategy for addressing research questions and objectives in educational and social science research. This methodology encompasses the population and sample, research instruments, data collection procedures, and data analysis methods. It was designed to ensure that the research process was conducted systematically, validly, and reliably in assessing students' perceptions of business ethics practices through the implementation of the Retail Cares – Sentuhan Komuniti CSR programmed, a collaboration between PMKL and AEON Mall AU2 Setiawangsa. A questionnaire was employed as the main research instrument to obtain descriptive and quantitative data that could be easily analyzed using statistical software.

Population and Sample The population of this study comprised 200 students enrolled in the Diploma in Retail Operations Management at Politeknik METrO Kuala Lumpur. According to Creswell (2014) a population refers to the entire group of individuals who share specific characteristics of interest to the researcher. In the context of this study, 30 students who were taking the Business Ethics course and had directly participated in the Retail Cares – Sentuhan Komuniti programme were selected as the study sample. A sample represents a subset of the population chosen to reflect the overall group (Mohd Majid Konting, 2005). Purposive sampling was employed, as only students with direct experience in the CSR programmed were able to provide feedback that was relevant to the study objectives. Patton (2002) noted that purposive sampling enables researchers to select respondents who are most capable of providing meaningful data based on their experiences.

Research Instrument the questionnaire used in this study was adapted from Singh (2023), which examined students' perceptions of ethical responsibility in the implementation of CSR programmed. Several modifications were made to suit the context of this study, namely the Retail Cares – Sentuhan Komuniti programmed conducted by PMKL in collaboration with AEON Mall AU2 Setiawangsa. A reliability test was conducted using SPSS software, and the results indicated a Cronbach's Alpha value of 0.980, reflecting a very high level of reliability. This result confirms that all items in the questionnaire demonstrate strong internal consistency and are highly reliable. The questionnaire consisted of 10 items measured using a five-point Likert scale: 1 = Strongly Disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, and 5 = Strongly Agree. Each item assessed students' perceptions of ethical values such as social responsibility, honesty, fairness, and sustainability in the implementation of the CSR programmed.

Data Collection Procedure was carried out after students had participated in the Retail Cares – Sentuhan Komuniti programmed. The questionnaire was distributed online via Google Form to facilitate quick and convenient responses from the participants. All data were collected confidentially and used solely for academic purposes. According to Singh (2023) transparent CSR implementation grounded in ethical principles can enhance students' awareness of integrity, social responsibility, and the importance of business ethics.

Data Analysis Method The data were analyzed using the Statistical Package for the Social Sciences (SPSS) software, version 29.0. Descriptive analysis was employed to obtain the mean and standard deviation for each item. The overall mean score was used

to determine the level of students' perceptions toward business ethics practices in the CSR program. In addition, reliability analysis was conducted to verify the internal consistency of the questionnaire items. The Cronbach's Alpha coefficient was used as the basis for interpreting the reliability level of the instrument. Descriptive analysis, which includes mean and standard deviation was used because it is suitable for explaining the distribution and tendencies of data in quantitative studies (Chua, 2012; Pallant, 2020). This method is also consistent with the recommendations of Creswell and Creswell (2018) who emphasize the role of descriptive statistics in summarizing data clearly and systematically.

The interpretation of mean scores refers to Wisma (1995) as shown in Table 1.

Table 1: Descriptive Analysis – Mean Score Level (Wisma, 1995)

Mean Range	Level
1.00 – 2.40	Low
2.41 – 3.80	Moderate
3.81 – 5.00	High

The interpretation of reliability values refers to Chua Yan Piaw (2012), as shown in Table 2.

Table 2: Reliability Interpretation (Chua Yan Piaw, 2012)

Cronbach's Alpha (r)	Reliability Level
.96 – 1.00	Very High
.80 – .95	High and Satisfactory
.65 – .79	Satisfactory
.50 – .64	Low
Below .50	Very Low

This part outlined the research methodology applied in the study, covering the research design, population and sample, research instrument, data collection procedures, and data analysis methods. The chosen approach ensured that the findings derived from this study are valid, reliable, and contribute meaningfully to the understanding of how CSR programs can serve as an effective platform for instilling ethical values among retail students.

Findings And Analysis Of The Study this part presents the findings of the study based on the data obtained from questionnaires answered by 30 Diploma in Retail Management students from Politeknik METrO Kuala Lumpur. The data were analyzed using descriptive statistical methods mean score and standard deviation, to identify students' perceptions of business ethics practices in the implementation of the CSR program Retail Cares – Sentuhan Komuniti PMKL x AEON Mall AU2 Setiawangsa. In addition, the reliability of the research instrument was assessed using the Cronbach's Alpha coefficient to determine the internal consistency of the questionnaire.

Reliability Analysis of the Instrument to ensure that the research instrument had a high level of reliability, a reliability test was conducted on all questionnaire items using SPSS version 29.0. The results are presented in the table below.

Table 3: Reliability Value of the Research Instrument (Reliability Analysis)

Variable	No. of Items	Cronbach's Alpha	Reliability Level
Students' Perception of Business Ethics Practices	10	0.980	Very High

Based on Table 3, the Cronbach's Alpha value of 0.980 indicates a very high level of reliability. This shows that the items in the questionnaire demonstrate strong internal consistency and are suitable for use in this study.

Descriptive Statistical Analysis was conducted to identify the level of students' perceptions of business ethics practices in the implementation of the Retail Cares – Sentuhan Komuniti CSR program.

Table 4: Descriptive Statistics of Students' Perceptions Q1-Q10

Variable	N	Minimum	Maximum	Mean	Std. Deviaton
Q1	30	3.00	5.00	4.5000	.73108
Q2	30	3.00	5.00	4.5000	.73108
Q3	30	3.00	5.00	4.4667	.81931
Q4	30	3.00	5.00	4.6000	.67466
Q5	30	3.00	5.00	4.5667	.67891
Q6	30	3.00	5.00	4.5333	.68145
Q7	30	3.00	5.00	4.6000	.67466
Q8	30	3.00	5.00	4.5667	.67891
Q9	30	3.00	5.00	4.5667	. 67891
Q10	30	3.00	5.00	4.5333	.68145

Table 5: Descriptive Statistics of Students' Perceptions

Variable	N	Minimum	Maximum	Mean	Std. Deviaton
Mean_persepsi	30	3.00	5.00	4.5433	.64737

Based on Table 4, the descriptive analysis indicates that all questionnaire items (Q1–Q10) recorded high mean values, ranging from 4.4667 to 4.6000, clearly demonstrating that students' perceptions of business ethics practices in the implementation of the Retail Cares – Sentuhan Komuniti CSR programme are highly positive. Items Q1 and Q2 each recorded a mean score of 4.50 (SD = 0.73108), indicating that students consistently agreed that the programme was implemented in a transparent and honest manner and that it successfully enhanced their awareness of the importance of business ethics in the retail sector. These findings are consistent with studies by Rahim and Anuar (2022) and Azmi and Ahmad (2021) which reported that students' exposure to ethics-based learning through practical activities enhances their understanding of integrity and honesty in professional contexts. Item Q3 recorded a mean value of 4.4667 (SD = 0.81931), which represents the highest standard deviation among all items, suggesting slight variations in students' views regarding the fairness of the programme's implementation towards all stakeholders. Nevertheless, the relatively high mean score indicates that, overall, students still perceived the programme as fair and ethical. This finding is consistent with Chan, Huam, and Sade (2021) who noted that minor differences in students' perceptions are common in community-based programmes that involve diverse roles and responsibilities.

For Items Q4 and Q7, both recorded the highest mean score of 4.6000, accompanied by a low standard deviation (SD = 0.67466), indicating a very high and consistent level of agreement among respondents. These items relate to the emphasis on social

responsibility values and the tangible benefits of the CSR programme to the community. These findings support the second research objective, which is to identify students' levels of awareness regarding social responsibility and moral values through community-based activities. In line with studies by Licandro et al. (2024) and Syed and Jamaludin (2021) direct student involvement in community-based CSR activities was found to enhance empathy, social awareness, and concern for societal well-being. Items Q5, Q8, and Q9 each recorded a mean score of 4.5667 (SD = 0.67891), indicating that students perceived the programme as effective in fostering trust, integrity, and appreciation of the role of business ethics within organisations. These findings reinforce the argument that CSR programmes not only generate social impact but also contribute to the development of students' professional attitudes. Similarly, Singh (2023) reported that students who actively participate in CSR programmes demonstrate higher levels of ethical awareness and social responsibility compared to those who receive ethics education solely through theoretical instruction.

Furthermore, Items Q6 and Q10 each recorded a mean score of 4.5333 (SD = 0.68145), reflecting a high level of student satisfaction with the programme's alignment with ethical principles and societal norms, as well as with the overall ethical implementation of the CSR activities. The relatively low standard deviations indicate stable and consistent perceptions among students. These findings align with the perspectives of Kim (2024) and Thomas (2022) who emphasised that ethically grounded CSR implementation fosters positive perceptions and trust among stakeholders, including students. Overall, Table 5 shows that the overall mean score of students' perceptions was 4.5433, with a standard deviation of 0.64737, which falls within the high category based on the mean interpretation proposed by Wisma (1995). The low standard deviation suggests that the majority of students provided consistent and positive responses across all items. These findings directly address the first research objective, which is to assess students' perceptions of business ethics practices in the CSR programme, as well as the second objective, which is to identify students' levels of awareness regarding social responsibility and moral values. In conclusion, the findings support Kolb's Experiential Learning Theory (1984) which posits that learning through real-life experiences, such as participation in CSR programmes, enhances students' understanding, values, and attitudes more effectively than conventional learning approaches.

Summary

This study demonstrates that the implementation of the Retail Cares – Sentuhan Komuniti CSR programme has a significant impact on students, the institution, industry partners, and the local community. The high overall mean score (M = 4.5433, SD = 0.64737) indicates that PMKL students successfully developed awareness of business ethics, integrity, fairness, and social responsibility through direct involvement in community-based activities. From the perspective of Politeknik METrO Kuala Lumpur (PMKL), the programme strengthens values-based curriculum implementation and supports the achievement of KPI 4 through strategic industry collaboration. For AEON Mall AU2 Setiawangsa, the programme enhances corporate image as an ethical and socially responsible retail organisation. Meanwhile, the local community benefits from tangible social and environmental outcomes while serving as a learning partner in nurturing students' moral awareness and empathy. Overall, this study confirms that experience-based CSR programmes are effective platforms for ethical learning in the

TVET context and play an important role in producing socially responsible and ethically grounded graduates.

Recommendations Based on the findings, which indicate a high level of positive student perception towards business ethics practices in CSR programs (M = 4.5433), it is recommended that CSR activities be formally integrated as structured experiential learning components within Business Ethics courses in TVET institutions, supported by clear learning outcomes, reflective activities, and assessment rubrics. In addition, stronger and continuous collaboration between educational institutions and industry partners should be established to provide meaningful real-world learning experiences that enhance students' ethical awareness and professional readiness. For future research, it is suggested that studies be expanded to include larger and more diverse samples across multiple institutions, while also adopting longitudinal and mixed-method approaches to examine the sustainability of ethical values and to gain deeper insights into students' ethical development through CSR participation.

Abstract. The purpose of this study is to examine the effect of demographic factors and emotional intelligence. This study was conducted at Polytechnic Mersing Johor (PMJ) which involved diploma students from Commerce Department. Previous studies suggested demographic factors influence the respondent's emotional intelligence. A total of 350 questionnaires were distributed to the selected respondents. Out of the number, a total of 125 responses were received. Several hypotheses were developed and tested with *t*-test and Pearson correlation analyses. The results indicated that gender did not have significant difference between gender and emotional intelligence of diploma students. Meanwhile other demographic factors, age and ethnic group, indicated a significant relationship with emotional intelligence. Finally, several recommendations were proposed for future research.

Keywords: Emotional intelligence, Demographic factors, and Polytechnic students

Background of the Study

In 2018, the Kementerian Pendidikan Malaysia (KPM) expressed its aspiration to develop a national education system of world-class standard that can foster critical thinking skills among students, as required to face future challenges (Maszlee, 2018). In addition, as outlined in the Pelan Pembangunan Pendidikan Malaysia 2013–2025, the ministry has also emphasized the importance of emotional intelligence as part of the student aspiration domain (KPM, 2012). In facing increasingly demanding challenges today, the importance of emotional intelligence has become even more significant (Suzyliana, 2016).

Apart from the characteristics mentioned above, students are also expected to possess leadership skills, and one of the key elements of these skills is the ability to understand, cooperate with, and effectively influence others. More importantly, individuals who possess a high level of emotional intelligence can control their own emotions (Windayani & Khairil, 2017). However, the emotional intelligence emphasized in the education blueprint is not clearly and comprehensively explained. Therefore, the recommendation made by the ministry presents a new challenge to the implementing agencies.

In general, the higher education sector in Malaysia is offered by 20 public universities, 36 polytechnics, 102 community colleges, 48 private universities, and 19 private university colleges (KPM, 2020). In addition, the higher education sector in the country is also supported by various foreign higher education institutions that collaborate with local colleges and universities through the offering of dual-degree programmes and programmes conducted

entirely in Malaysia. Based on available statistics, enrolment in both the public and private higher education sectors has reached nearly 1.2 million students (KPM, 2020).

In addition, there are also 181 international schools (which adopt the British, United States, and Australian education systems) as well as 17 expatriate schools that offer education from preschool to the secondary level in the country (KPM, 2020). The development of this education sector provides more options for students and their parents in shaping the educational future of the younger generation.

As part of future planning, as outlined by KPM, the government is strongly committed to developing the country's education sector as one of the education hubs in the region that attracts international students (Raduan, 2019). This initiative is considered highly strategic because the increase in international student enrolment in the country has a significant impact not only on the education system but also on the growth of the national economy (Simrit Kaur, 2005). Statistics show that international student enrolment has reached approximately 170,900 students, contributing about RM19 billion to the national economy (Saiful, 2015). Based on the pattern of international student enrolment in the country, their intake is expected to continue increasing over time.

This significant future potential must be optimally utilized, and the higher education sector must strive to remain competitive in fulfilling its responsibility to provide quality higher education to students (Simrit Kaur, 2005). Strong support services must also be provided to support this sector in line with the government's aspirations. Indeed, the importance of these behind-the-scenes services, namely support services, should not be overlooked. Weaknesses in the services provided may affect the ability of the country's education sector to deliver quality higher education comparable to other countries not only in the region but also on a broader international stage.

The increasing competition and challenges within this sector, such as rising education costs, competition to attract highly skilled and capable students and academic staff, as well as exposure to new techniques and approaches in modern teaching and learning, have become increasingly pressing (Shawyun, 2003). This situation has been further exacerbated by the spread of the COVID-19 pandemic, which demands that quality higher education be delivered in a safe and student-friendly environment (Mohd Bakri, 2020).

The challenges faced within the higher education sector are also experienced by all stakeholders, especially those directly involved in the sector (Saiful, 2015). University management, academic staff, administrators, and students must continuously face and wisely manage the demands and challenges of the current environment. Apart from intellectual capability and financial capacity, students must also possess the ability to manage their emotions effectively, especially when dealing with present-day challenges that are far more demanding compared to the learning environment of several decades ago.

The Kementerian Kesihatan Malaysia (KKM, 2016) reported that approximately 450 million individuals worldwide have a high tendency to experience mental health problems. In general, there is no fixed definition of mental health. The meaning of mental health is influenced by various factors because it is subject to relatively subjective assessments, cultural differences within societies, and the professional theories used to examine this issue. Mental health forms the foundation of individual well-being and the capacity of society, where an

individual is aware of their potential, can cope with life stresses, can produce productive outcomes, and continues to contribute meaningfully to society.

In terms of gender, statistics show that the number of individuals experiencing mental health problems is relatively balanced between females and males, with females accounting for 51.85 percent and male's 48.15 percent. In terms of age, mental health problems involve individuals between 16 and 34 years old, accounting for 58.12 percent. Of this figure, more than half involve those under the age of 25 (1.2 million cases) (KKM, 2016). On average, individuals within this age group include students currently studying in higher education institutions throughout the country.

Following the discussion above, it can be concluded that one possible approach to at least reduce mental health problems among this group, especially students to provide exposure and skills related to emotional intelligence so that they are better able to manage their emotions in a more structured manner. Therefore, this study aims to evaluate the level of emotional intelligence and examine the demographic factors that influence emotional intelligence among diploma students at Polytechnic Mersing Johor (PMJ).

Problem Statement

Reports indicate that the rate of mental health problems among citizens aged 16 to 25 is relatively high and alarming, involving approximately 1.2 million people in the country (KKM, 2016). The figure has most likely increased in recent years, especially during the pandemic. Mental health problems that are taken lightly and not given serious attention in terms of treatment may lead to more severe effects such as depression, anxiety, bipolar disorder, schizophrenia, and others (Hazli, 2020). This situation becomes worse when individuals are unaware of their emotional state and fail to manage their emotions effectively. Findings from several previous studies also support that emotional intelligence is related to several symptoms arising from mental health problems, such as stress, depression, and others.

Although previous studies have identified various factors that influence emotional intelligence, many research findings indicate that demographic factors are among the important factors affecting an individual's emotional intelligence. For this study, demographic factors consisting of age, gender, and ethnicity will be used as variables and tested together with emotional intelligence. In terms of research context, many previous studies have been conducted in sectors such as manufacturing, industry, hospitality, healthcare, and education. Nevertheless, most studies conducted in the education sector tend to focus mainly on staff (administrative and academic), and very few studies in this field focus on diploma students who are currently pursuing their studies at Public Higher Education Institutions (IPTA). Therefore, the objective of this study is to examine the relationship between demographic factors and emotional intelligence among diploma students who are currently studying at Polytechnic Mersing Johor (PMJ).

Research Questions. This research develops several questions;

i. What is the level of emotional intelligence among diploma students from Commerce Department at PMJ?
ii. Is there a difference between gender and emotional intelligence among diploma students from Commerce Department at PMJ?
iii. Is there a relationship between age and emotional intelligence among diploma students from Commerce Department at PMJ?
iv. Is there a relationship between ethnic groups and emotional intelligence among diploma students from Commerce Department at PMJ?

Research Objectives. This research embarks on the following objectives;

i. To examine the level of emotional intelligence among diploma students from Commerce Department at PMJ.
ii. To examine whether there is a difference between gender and emotional intelligence among diploma students from Commerce Department at PMJ.
iii. To examine whether there is a relationship between age and emotional intelligence among diploma students from Commerce Department at PMJ.
iv. To examine the relationship between ethnic groups and emotional intelligence among diploma students from Commerce Department at PMJ.

Literature Review

Emotional intelligence (EI). The factor of emotional intelligence is believed to require proper attention because it has increasingly become a focus among researchers as well as the public. What is unique about this factor is that emotional intelligence can be learned by anyone who is interested in it, unlike cognitive intelligence (IQ). An individual who possesses a high level of emotional intelligence can control and manage various matters more systematically, and their life tends to be more meaningful even if their IQ is only at a moderate level. This chapter discusses previous studies on emotional intelligence conducted both locally and internationally.

The concept of emotional intelligence was first introduced by Howard Gardner, Peter Salovey, and John Mayer in the 1970s and 1980s. The concept continued to develop and gained greater attention when scholars such as Goleman as well as Mayer and Salovey began to raise public awareness about the potential that could be utilized through an individual's emotional intelligence. Since then, this concept has continued to develop and has attracted particular attention among academics.

Although various models have been developed to explain the concept of emotional intelligence, the concept continues to be debated. Most researchers tend to agree that emotional intelligence is not an inborn trait rather, it can be developed through training. According to Mayer and Salovey (1997), emotional intelligence generally refers to an individual's ability to identify, manage, and regulate their own emotions as well as the emotions of others. They also believe that there is a strong relationship between social intelligence and emotional intelligence (Mayer & Salovey, 1993).

Mayer and Salovey (1997) define emotional intelligence as the ability to regulate one's own emotions and those of others, the capacity to differentiate among these emotions, and the ability to use such knowledge to guide one's thinking and actions. They believe that this skill can enhance an individual's creativity as well as problem-solving ability. Corrie (2009) argues that emotional intelligence is one method for understanding and shaping how individuals think, feel, and behave. According to him, personality is formed through an individual's emotional, physical, and mental elements, making it a unique combination.

According to Goleman (2006), emotional intelligence is a unique characteristic that determines an individual's success in an organization. This characteristic relates to an individual's values and influences their performance. He also argues that emotional intelligence is more important than cognitive intelligence. Meanwhile, Bar-On (1997) defines emotional intelligence as a set of non-cognitive abilities, competencies, and skills that influence an individual's ability to cope with environmental demands and pressures. Similarly, Richard Boyatzis, Daniel Goleman, and Annie McKee (2002) explain that the concept of emotional intelligence encompasses a collection of emotions, social knowledge, and abilities that guide and direct individuals in responding to environmental factors and pressures. This leads to improved performance in four areas which are self-awareness, social awareness, relationship management, and self-management.

Carmlie (2003) states that emotional intelligence is one of the elements that shape and influence behaviour and contribute to the creation of positive organizations. This statement is supported by Dulewicz and Higgs (2000), who argued that emotional intelligence is a predictor of managerial career success. Meanwhile, Chan (2007) associates emotional intelligence with leadership, suggesting that both are equally important. In line with this view, emotional intelligence can be summarized either as part of personality characteristics (Schutte, 1998) or as a form of ability (Mayer & Salovey, 1997).

In discussing the various models used to explain emotional intelligence, Weinberger (2009) concluded that there are two main models of emotional intelligence, the ability model and the mixed model. In general, the ability model proposed by Mayer and Salovey emphasizes the relationship between feelings and intelligence. Meanwhile, the mixed model emphasizes mental abilities. In other words, the approach introduced by Mayer and Salovey focuses on a group of distinct abilities, while the mixed models proposed by Bar-On (the emotional-social intelligence model) and Goleman (the emotional competence model) tend to focus on personality characteristics in explaining the concept of emotional intelligence.

There are four components in the ability model proposed by Mayer and Salovey (1997), namely emotional perception, emotional facilitation (application), emotional understanding, and emotional management. Although several other models have been debated by scholars, this ability model is one of the emotional intelligence models that has received considerable attention in explaining the concept of emotional intelligence (Fernandez, Berrocal & Extremera, 2006; Groves, McEnrue & Shen, 2008; Kerr, Garvin, Heaton & Boyle, 2006).

For this study, the dependent variable, emotional intelligence, will be linked to the ability model proposed by Mayer and Salovey and later adapted by Wong and Law (2002). This ability model is considered more suitable and closely aligned with the research environment because it is more oriented toward respondents from Asia (Wong & Law, 2007). Through adaptation from the original model, Wong and Law (2002) outlined four components of emotional intelligence: self-emotion appraisal, others' emotion appraisal, use of emotion, and regulation

of emotion. In addition, they strongly recommended the emotional intelligence scale they developed for use in the fields of management and leadership.

Based on the definitions discussed above, scholars generally define emotional intelligence as a form of social response that involves the perception, analysis, and construction of specific behaviours to regulate emotions. In general, individuals who possess a high level of emotional intelligence tend to be more sensitive to their own emotional states and can control and express them appropriately. This also indicates that individuals with higher emotional intelligence are more capable of developing positive relationships with others (Lomas, Stough, Hansen & Downey, 2012). Conversely, they tend to be less interested in forming negative relationships with others.

Emotional intelligence also refers to the ability to understand others, possess emotional awareness and sensitivity as a source of strength, recognize and manage one's own emotions, build positive interactions, and maintain self-motivation (Goleman, 1998). In addition, Mayer and Salovey (1999) believe that an individual's emotional intelligence enables them to think more creatively when facing life's problems. It also contributes to better problem-solving abilities and has a strong relationship with social intelligence.

In conclusion, two models are widely used in emotional intelligence research the ability model and the mixed model. Emotional intelligence refers to an individual's ability and capability to understand, control, regulate, and utilize both their own emotions and the emotions of others within the same environment. In other words, this ability can be seen as a skill that encourages individuals to develop positive behaviour, which can be directly utilized to enhance productivity within an organization.

Demographic. In general, demography refers to the study of populations based on factors such as gender, age, and race. Demographic data refer to socio-economic information such as gender, age, property ownership, occupation, education, income, marital status, birth rate, death rate, and others (Investopedia, 2019). In addition, demographic factors also include individuals' hobbies and lifestyle preferences. Suttle (2019) stated that demographic factors consist of various traits that influence consumers' preferences and behaviour.

In other words, these demographic characteristics can affect businesses. Variables such as age, gender, education level, geographical factors, occupation and income, and lifestyle are important in the field of business management. Smith (2002) also considers race as part of demographic characteristics. In this context, race can also be referred to as being related to ethnic characteristics. Meanwhile, Dewi, Halim, and Derksen (2017) view ethnic factors as one of the characteristics within demographic variables.

Previous studies have shown that various factors influence an individual's emotional intelligence. Hamid (2004) outlined that factors such as intelligence level, socio-economic status, gender, social relationships, physical condition, personality traits, and family factors can influence an individual's emotional intelligence. Meanwhile, Pooja and Kumar (2016) explained that the level of emotional intelligence is influenced by biological, psychological, and social factors. A study conducted by Marembo and Chinyamurindi (2018) found that gender, age, and work experience influence the level of emotional intelligence among academic staff.

All the findings mentioned earlier are consistent with several studies conducted by previous researchers such as Karaman, Lerma, Vela, and Watson (2017); Mamatova and Wile (2019); as well as Bryan and Malone (2015). In addition, experience is also categorized as one of the demographic characteristics (Jinalle & Amit, 2017; Soomro, Abdelwahed, & Faisal, 2019). Furthermore, family status is also considered part of these demographic characteristics (Corporate Finance Institute, 2020). Jinalle and Amit (2017) focused on the factors of age and work experience.

In summary, demographic factors refer to gender, age, race and ethnicity, property ownership, occupation, education, income, geographical factors, marital status, birth and death rates, as well as individuals' hobbies and lifestyles. Most of these characteristics are found to have an impact on the field of business management. However, for the purpose of this study, only several demographic characteristics considered suitable for the scope and respondents of the study, and supported by references from previous research, will be used. These characteristics are gender, age, and ethnic group (Dewi et al., 2017; Hamid, 2004; Marembo & Chinyamurindi, 2018; Pooja & Kumar, 2016; Mamatova & Wile, 2019). Among these three characteristics, ethnicity appears to be a demographic characteristic that has received relatively less attention in previous studies.

Relation Between Demographic and Emotional Intelligence. According to John D. Mayer and Peter Salovey (1997), an individual's ability to manage emotions greatly helps in fostering positive outcomes while avoiding negative effects and managing personal stress. The findings of a study by Farooq (2003) explain that students who possess higher emotional intelligence tend to achieve better academic performance compared to students who demonstrate lower emotional intelligence scores. Several previous studies have found that factors such as age, gender, and ethnicity influence an individual's emotional intelligence (Dewi et al., 2017; Hamid, 2004; Pooja & Kumar, 2016).

Previous studies suggest that levels of emotional intelligence may differ according to gender (Bryan & Malone, 2015; Frank, Baron-Cohen, & Ganzel, 2015; Pooja & Kumar, 2016; Sala, 2002; Samir & Ravi, 2013; Shukla & Srivastava, 2016). Frank et al. (2015) found no difference in brain activity between genders. In other words, they suggested that gender is associated with certain emotional intelligence characteristics such as cognitive empathy and affective empathy. Sergio, Dungcan, and Ormita (2015), in their study involving respondents from various countries, found clear differences in emotional intelligence between men and women. They also agreed that gender is one of the factors influencing individual emotional intelligence, although other factors such as civil status, nationality status, and work schedules also influence emotional intelligence.

A study conducted by Rivera (2003) in Puerto Rico involving Puerto Rican men and women who were working full-time or part-time, as well as those pursuing part-time college studies, showed a clear difference in emotional intelligence levels among respondents. The findings indicated that female respondents obtained lower scores compared to male respondents. However, the findings of a study by Reuven Bar-On (2000) showed that there was no clear difference between male and female staff regarding overall emotional aspects. In the theory proposed by Bar-On, women were found to demonstrate greater empathy, show greater concern regarding emotional issues, be more willing to establish better interpersonal relationships, and pay greater attention to social relationships compared to male respondents. In contrast, male respondents were found to pay greater attention to self-presentation, be more

capable of controlling emotions, demonstrate stronger problem-solving abilities, be more independent, possess higher tolerance levels, and remain optimistic.

Research findings by Nor Abidah (2006) showed that female students possessed higher emotional intelligence levels compared to male students. Generally, students who demonstrate higher emotional intelligence levels have greater potential to achieve excellent academic performance. Similarly, the findings by Hafzan, Norida, and Tajuddin (2006) confirmed the existence of clear differences between emotional intelligence levels and gender among students. Saemah Rahman, Zuria Mahmud, and Ruslin Amir (2008) found that female students showed better emotional intelligence compared to male students. The same pattern was also found in the study by Katyal and Awasthi (2005), which supported the view that female students generally possess better emotional intelligence than male students.

The study by Farooq (2003) showed that there was no significant difference between genders in terms of academic achievement. Maliha and Rehana (2010), in their study exploring emotional intelligence among students at the International Islamic University Islamabad with factors such as age, gender, and academic achievement, found a clear relationship between emotional intelligence and academic achievement among respondents. There was no difference in the mean scores of the emotional quotient inventory (EQi) between male and female students except in the stress management scale, where male students showed higher scores than female students.

A study by Shukla and Srivastava (2016) involving employees in the retail sector found that gender had a significant influence on emotional intelligence. Similarly, the findings of Pooja and Kumar (2016) revealed that gender influences employees' emotional intelligence. Likewise, the study by Bryan and Malone (2015) supported earlier findings that gender influences students' stress levels at universities. A study conducted by Iskandar, Rohaty Mohd Majzub, and Zuria Mahmud (2009) involving 265 university lecturers in Indonesia showed no significant difference between genders in terms of emotional intelligence. These findings were reinforced by the study of Syed Sofian and Rohani Ahmad Tarmizi (2010), which suggested that gender does not have an interaction effect or difference on emotional intelligence. This finding is also supported by Foster, Fethney, Kozlowski, Fois, Reza, and McCloughen (2018), who found no significant relationship between gender and emotional intelligence.

These findings differ from the study by Marc Brackett, John D. Mayer, and Rebecca Warner (2004), which found that women demonstrated higher emotional intelligence levels than men. On the other hand, the study by Panda (2008) found no difference in emotional intelligence levels between men and women, although Bryan and Malone (2015) argued that women are generally more capable of processing and managing their emotions effectively.

Most researchers' findings indicate that gender influences an individual's emotional intelligence. In certain aspects, men's emotional intelligence may be more dominant than women's. However, in some places or countries, gender does not have any influence on emotional intelligence levels. Only some findings support the existence of differences between male and female students in terms of emotional intelligence. In terms of gender, male and female students do not show differences in emotional intelligence characteristics except in the appraisal of others' emotions and the use of emotions.

Apart from the gender factor discussed above, age has also been found to influence an individual's emotional intelligence, as highlighted in previous studies (Bryan & Malone, 2015; Goleman, 2007; Pooja & Kumar, 2016; Shukla & Srivastava, 2016; Van Rooy, Alonso, & Viswesvaran, 2005). These findings are consistent with the suggestion that increasing emotional maturity enables individuals to master learning processes, which in turn enhances their life experiences (Boyatzis & Sala, 2004).

Bryan and Malone (2015) found that besides gender, age also influences students' emotional intelligence. Their respondents consisted of students studying at a College of Business in the Rocky Mountain region. The study by Van Rooy, Alonso, and Viswesvaran (2005) also found that age was related to the emotional intelligence levels of undergraduate students studying at Southeastern University. However, some studies suggest otherwise. A study conducted by Foster et al. (2018) involving master's degree nursing students at a university in Australia found no significant relationship between age and emotional intelligence.

The findings of Shukla and Srivastava (2016) also found that age had a significant influence on emotional intelligence. More specifically, their findings showed that age had a significant relationship with all tested dimensions of emotional intelligence. Similarly, the study by Pooja and Kumar (2016) involving Indian public service employees found that, in addition to gender, age also influenced their emotional intelligence. Sala (2002) explained that increasing age may lead to changes and development in emotional intelligence.

According to Goleman (2007), an individual's emotional intelligence increases as they grow older because they become more mature and have faced various life challenges. Noriah (2005) as well as Samir and Ravi (2013) also explained that age plays an important role in influencing emotional intelligence. A study by Bissessar (2011) found that not only gender but also age had a positive relationship with emotional intelligence. This online study involved 80 respondents from Bermuda and 88 respondents from Trinidad. The researcher also emphasized the importance of incorporating emotional intelligence training into the curriculum.

Similarly, the findings of Cabello, Sorrell, Fernandez-Pinto, Extremera, and Fernández-Berrocal (2016) suggested that age influences emotional intelligence. The findings of Gautam and Khurana (2019) also supported that age influences an individual's emotional intelligence. However, the study by Llego, Abdelhafiz, Alshammari, and Al-Shaqri (2019) found that age had no relationship with emotional intelligence. Similarly, the findings by Marembo and Chinyamurindi (2018) found that age did not show differences in emotional intelligence levels.

Apart from gender and age, Dewi, Halim, and Derksen (2017) found that ethnic factors also had a significant relationship with emotional intelligence. They found that Javanese, Batak, and Minangkabau ethnic groups showed different levels of emotional intelligence. However, similarities were also found among these ethnic groups in certain characteristics tested, such as interpersonal relationships and social responsibility. The study by Mamatova and Wile (2019) found differences between students from Kyrgyzstan and the United States in terms of historical experiences and emotional intelligence.

Nevertheless, their findings showed that the differences were not very large. Similarly, the findings obtained by McNulty, Mackay, Lane, and White (2016) found differences between students from Asia and Western countries. These respondents consisted of students from Australia, Ireland, the United Kingdom, and Hong Kong. Likewise, the study conducted by

Sergio, Dungcan, and Ormita (2015) involving respondents of various nationalities (including those from the Middle East, Iran, Pakistan, Russia, India, and the Philippines) working in Dubai found that nationality influenced individuals' emotional intelligence. Their respondents consisted of call centre representatives.

However, the findings of the study conducted by Khraisat, Rahim, and Yusuf (2015) found that there was no relationship between ethnicity and emotional intelligence. This finding also supports earlier research conducted by Pau, Rowland, Naidoo, Abdul Kadir, Makrynika, Moraru, and Croucher (2007), which found a weak and insignificant relationship in a study conducted on dental students from Australia compared with those from Europe, America, Asia, and Africa.

Based on the discussion above, which refers to findings from previous studies on the relationship between demographic factors such as gender, age, and ethnic group and emotional intelligence, it can be concluded that most researchers acknowledge the existence of a relationship between these variables. However, a smaller number of researchers have found no relationship between these variables (Bar-On, 2000; Frank et al., 2015; Iskandar et al., 2009; Khraisat, Rahim & Yusuf, 2015; Maliha & Rehana, 2010; Marembo & Chinyamurindi, 2018; Pau et al., 2007).

In addition, the literature review also indicates that there are relatively few previous studies that examine the three demographic dimensions and emotional intelligence within a single research model. Likewise, although some studies have used students as respondents, only a limited number focus on students who are pursuing diploma studies. Most studies involving ethnic factors as independent variables tend to focus on nationality, race, tribe, or regional differences. However, this study focuses on ethnic factors involving the three major ethnic groups in Malaysia, namely Malays, Chinese, and Indians.

The Proposed Theoretical Framework

Emotional Intelligence Theory as the Underpinning Theory. Basically, this research framework is developed based on the Emotional Intelligence Theory proposed by Mayer and Salovey (1997).

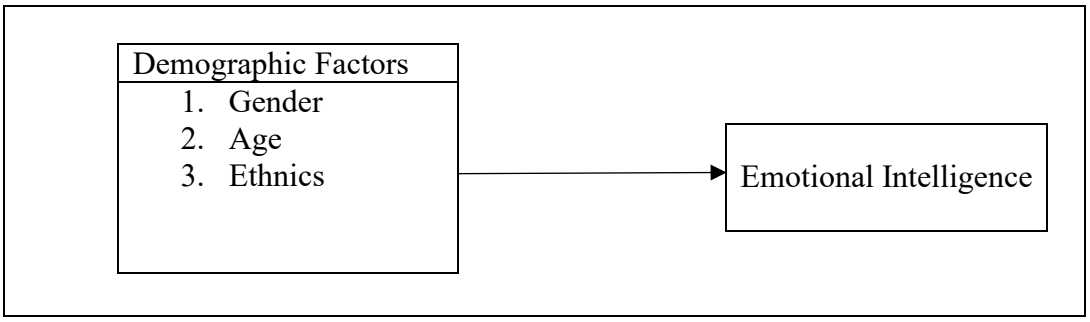

Fig. 3.1: Proposed Theoretical Framework

Based on the research framework model above, the selected demographic factors, namely gender, age, and ethnic group, are the independent variables, while emotional intelligence is the dependent variable. The relationship between all variables, namely gender, age, ethnic group, and emotional intelligence, will be tested using Pearson correlation analysis.

As discussed earlier, the development of the research framework is based on the Emotional Intelligence Theory to explain the relationship and how the factors of gender, age, and ethnic group influence the emotional intelligence of diploma students from Commerce Department at PMJ. Mayer and Salovey (1997) view emotional intelligence as the ability to regulate one's own emotions as well as the emotions of others, involving the capability to distinguish between these emotions and subsequently use them to shape patterns of thinking that produce self-directed actions.

Noriah (2005) describes this element (emotional intelligence) as a set of skills based on one's own emotions that enables an individual to manage their life effectively. She further explains that emotional intelligence involves the ability to: i)understand one's own emotions, ii) apply this ability to achieve certain goals, iii) be aware of the feelings, needs, desires, problems, or concerns of other individuals, iv) recognize the importance of religious values as guidance in life, and v) utilize life experiences, either one's own or those of others, as guidance in solving problems. Therefore, an individual's demographic characteristics are related to their emotional intelligence.

Materials and Methodology

Instrument. This study used a questionnaire as the procedure for data collection. This is consistent with McMillan and Schumacher (1993), who suggested that using a questionnaire as a research instrument can provide background information, opinions, reactions, and attitudes of respondents. The questionnaire developed consisted of 16 items, excluding the demographic information of the respondents. The emotional intelligence component comprised 16 questions adapted from Law, Wong, and Song (2004).

The questionnaire was divided into two sections, Section A and Section B. Section A contained 16 items representing the components of emotional intelligence, namely knowing one's emotions, managing emotions, self-motivation, recognizing others' emotions, and handling relationships. Meanwhile, Section B consisted of 3 items aimed at obtaining the demographic information of the respondents.

Data Collection Procedure

Population and Sampling. The population size for this study is 481 diploma students from the Commerce Department at PMJ. This group of students consists of various programmes. Among the programmes offered at Commerce Department are Diploma in Business Study (DPM) and Diploma in Secretarial Science (DSK). The sample size for this study is determined based on the table developed by Krejcie and Morgan (as cited in Sekaran & Bougie, 2013), which is 214 respondents. The sample selection will be conducted using the convenience sampling method.

Pilot study. A pilot study refers to a small-scale test conducted on the instrument that will be used to determine which questions need to be revised, modified, or retained. The pilot study is also important to test respondents' understanding of the structure of the statements and the details in the instrument to be used, as well as to identify any potential problems that may arise before the actual study is conducted on a larger scale. For validity, this instrument was referred to two lecturers with PhD qualifications from Universiti Utara Malaysia (UUM) to obtain their feedback.

Meanwhile, to test reliability, a total of 30 diploma students who are currently pursuing their studies at PMJ were selected using the convenience sampling technique to participate in this pilot study. The value of Cronbach's Alpha was examined to determine the reliability of the instrument. The results of the analysis show that the Cronbach's Alpha coefficient value for the pilot test is as presented in Table 3.2 below.

Table 3.1
Alpha Cronbach

Cronbach's Alpha	Cronbach's Alpha berasaskan item standard	Bilangan item
.885	.887	16

Data collection procedure

The researcher distributed all questionnaires to respondents, with the assistance of colleagues, and online. The questionnaire was used as the most effective approach for collecting primary data. The questionnaire was translated into Malay from the original English instrument. The researcher distributed the questionnaires to respondents between 15 January and 15 February 2026. Overall, a total of 350 questionnaire sets were distributed, and by the end of the collection period, 125 completed sets were successfully returned (including some that were received slightly late).

Data Analysis

The data obtained were analysed using Statistical Package for Social Sciences (SPSS) version 27 for Windows with both descriptive and inferential statistical techniques. Descriptive statistics were used to examine the distribution of respondents' demographics. This descriptive analysis helps to describe the profile of respondents, such as age, gender, and ethnic group. For inferential techniques, only t-tests and Pearson correlation tests were conducted to test the research hypotheses in accordance with the objectives of this study.

Result and Discussion

Result of variables gender, age and ethnic. In terms of gender, the analysis shows that 22 (17.5%) respondents were male students, while the majority, 103 (82.5%), were female students. This situation indicates that the number of female students at Commerce Department, PMJ is higher than that of male students. This is because student intake into higher education institutions is based on academic achievement rather than gender. Table 4.1 shows the number and percentage of students who participated in this study.

Table 4.1
Number of Respondents According to Gender

Gender	Number	Percentage (%)
Male	22	17.5
Female	103	82.5
Total	125	100

In terms of age, 70 (56.0%) respondents were 19 years old, 19 (15.2%) respondents were 18 years old, 17 (13.6%) respondents were 20 years old, and the remaining 19 (15.2%)

respondents were aged 21 years and above. Table 4.1 shows the number and percentage of students according to their age.

Table 4.2
Number of Respondents According to Age

Age group	Number	Percentage (%)
Kumpulan 1 (19)	70	56.0
Kumpulan 2 (18)	19	15.2
Kumpulan 3 (20)	17	13.6
Kumpulan 4 (21 and above)	19	15.2
Total	125	100

The composition by ethnic group shows that Malays constituted 85 (68%) respondents, followed by Chinese with 15 (12%), Indians with 22 (17.6%), and others with 3 (2.4%) respondents.

Table 4.3
Number of Respondents According Ethnic

Ethnic	Number	Percentage (%)
Malay	85	68.0
Chinese	15	12.0
Indians	22	17.6
Others	3	2.4
Total	125	100

The Cronbach's Alpha coefficient test was conducted to determine the level of consistency of the scale used. Reliability analysis is the first analysis carried out after data collection is completed. The findings show that the emotional intelligence scale recorded a Cronbach's Alpha coefficient value of .93. In general, a scale with a Cronbach's Alpha value exceeding .80 indicates good and acceptable internal consistency reliability (Sekaran & Bougie, 2013).

The normality test was conducted to examine and estimate the normal distribution of the data before proceeding with further analysis. The normality test is one of the fundamental assumptions in statistical procedures, and its results determine the appropriate statistical methods for subsequent analyses. The findings indicate that the data are normally distributed.

Descriptive analysis was conducted to provide an overview of the collected data. The results show that the mean values for the dependent variable, emotional intelligence, range from 3.53 to 4.14. These findings confirm that the respondents have a relatively high level of emotional intelligence. At the same time, the standard deviation values range from .78 to .99. Sekaran and Bougie (2013) suggest that a standard deviation value of less than 1 indicates a good data distribution.

The t-test was conducted to determine whether there is a difference between male and female students in terms of emotional intelligence. The findings show that there is no significant difference between gender and emotional intelligence. Male students recorded a mean (μ) of 3.78, standard deviation (SD) of .77, t-value of −.08, and p-value of .94. Meanwhile, female students recorded a mean (μ) of 3.80, standard deviation (SD) of .57, t-value of −.07, and p-value of .95. The scores for male and female students are almost similar, except for a slight difference in standard deviation.

Next, Pearson correlation analysis was conducted to examine the direction (whether positive or negative) and the strength of the relationship between all selected variables. A correlation coefficient of +1 indicates a perfect positive relationship, while −1 indicates a perfect negative relationship (Pallant, 2005). The findings show that all tested demographic factors, namely age and ethnicity, have a significant relationship with the dependent variable, emotional intelligence. It should also be noted that this analysis does not aim to determine causality. The results indicate that both variables age and ethnic group have a significant relationship with emotional intelligence. The relationship between respondents' age and emotional intelligence is positive and significant ($r = .860$, $p < .01$). Meanwhile, the relationship between ethnic group and emotional intelligence is significant but negative ($r = -.449$, $p < .01$).

Results of Pearson Correlation Test Between Variables

	Age	Ethnic	EI
Age	1		
Ethnic	-.448**	1	
EI	.860**	-.449**	1

** Correlation significant at .01

Discussion

The main purpose of this study is to empirically examine whether there is a difference between gender and the emotional intelligence of diploma students from Commerce Department at PMJ. This study also aims to determine whether there is a relationship between age and ethnic group factors and their emotional intelligence. In line with the research objectives, the first part of the discussion focuses on the level of emotional intelligence among diploma student at Commerce Department. Meanwhile, the second part of the discussion focuses on the differences and relationships between the variables identified in this study.

Level of Emotional Intelligence. The first research question aims to examine the level of emotional intelligence among PMJ diploma students from Commerce Department. The mean values of emotional intelligence range from 3.53 to 4.14. These values indicate that diploma students from Commerce Department at PMJ possess a relatively good level of emotional intelligence. Descriptive statistical analysis shows that three items recorded a mean value of at least 4. These items are: *I always know whether I am happy or otherwise* ($\mu = 4.14$), *I always strive to do my best* ($\mu = 4.03$), and *I understand my own feelings well* ($\mu = 4.00$).

Meanwhile, the mean values for the remaining 13 items range from 3.53 to 3.98. These items include: *I understand my own feelings most of the time* ($\mu = 3.98$), *I always set goals and strive to achieve them* ($\mu = 3.94$), *I truly understand what I feel* ($\mu = 3.90$), *I am sensitive to others' feelings and emotions* ($\mu = 3.77$), *I understand the people around me* ($\mu = 3.76$), *I am always confident in my own abilities* ($\mu = 3.72$), *I am a motivated person* ($\mu = 3.71$), *I am able to control my emotions well* ($\mu = 3.70$), *I can regulate my emotions* ($\mu = 3.68$), *I can manage anger and difficulties rationally* ($\mu = 3.64$), *I can always recognize my friends'*

emotions through their behavior (μ = 3.60), *I understand others' feelings very well* (μ = 3.56), and *I can easily control my anger* (μ = 3.53).

Based on the mean values obtained, respondents (regardless of gender, age, and ethnic group) demonstrate a relatively good level of emotional intelligence. These findings are consistent with several previous studies that used students as respondents (Bryan & Malone, 2015; Farooq, 2003; Foster et al., 2018; Maliha & Rehana, 2010; McNulty et al., 2016; Pooja & Kumar, 2016; Shukla & Srivastava, 2016; Van Rooy et al., 2005).

These findings may be attributed to the fact that the respondents are relatively well-educated and more mature (Goleman, 2007). In addition, respondents may have been exposed to soft skills during their diploma studies. Therefore, it can be said that they have been nurtured with positive values such as patience, empathy, tolerance, and others, which are closely related to emotional intelligence.

Relationship Between Demographic Factors and Emotional Intelligence. A substantial number of studies have examined the differences and relationships between demographic factors and emotional intelligence. Most previous studies indicate that there is no difference between gender and emotional intelligence, but there is a relationship between age and ethnic group (Bryan & Malone, 2015; Dewi et al., 2017; Foster et al., 2018; Gautam & Khurana, 2019; Sergio et al., 2015; Herbst & Maree, 2008; Kerr et al., 2005; Mandell & Pherwani, 2003; Sivanathan & Fekken, 2002; Sosik & Megerian, 1999).

However, the literature review shows that only a limited number of studies have examined these variables among diploma students in Malaysia. In line with the research objectives, several hypotheses were developed to predict the relationships between these variables among PMJ diploma students from Commerce Department.

The t-test results indicate that there is no difference between male and female students in terms of their emotional intelligence. These findings are consistent with several previous studies (Bar-On, 2000; Foster et al., 2018; Iskandar et al., 2009; Maliha & Rehana, 2010; Syed Sofian & Rohani, 2010). However, these findings contradict some earlier studies that found gender differences in emotional intelligence (Bryan & Malone, 2015; Pooja & Kumar, 2016; Samir & Ravi, 2013; Sergio et al., 2015; Shukla & Srivastava, 2016). This discrepancy may be due to the smaller number of male respondents (22) compared to female respondents (103), indicating an imbalance in gender distribution among the participants.
Pearson correlation analysis was conducted to examine the relationship between age and ethnic group with emotional intelligence. The results confirm that there is a significant positive/negative relationship between these demographic factors and emotional intelligence. Specifically, age shows a positive and significant relationship with emotional intelligence. This finding is consistent with previous studies (Bryan & Malone, 2015; Cabello et al., 2016; Pooja & Kumar, 2016; Shukla & Srivastava, 2016; Van Rooy et al., 2005). This may be due to the increasing level of maturity as individuals grow older.

However, this finding is inconsistent with other studies (Foster et al., 2018; Llego et al., 2019; Maremboo & Chinyamurindi, 2018), which found no relationship between age and emotional intelligence. The findings also indicate that ethnic group has a significant negative relationship with emotional intelligence. This result is consistent with previous studies (Dewi et al., 2017; Mamatova & Wile, 2019; McNulty et al., 2016), which found that ethnic group is related to emotional intelligence. This may be because cultural differences influence how

individuals behave and respond to their environment. However, some previous studies found that ethnic group does not have a significant relationship with emotional intelligence (Khraisat et al., 2015; Pau et al., 2007).

Conclusion

The analysis of the study indicates that there is no significant difference between gender and the respondents' emotional intelligence. In addition, the findings confirm that there are relationships between age and ethnic group and the respondents' emotional intelligence. These findings verify that demographic factors, namely age and ethnic group, have an effect on and are related to the respondents' emotional intelligence.

The results of the descriptive analysis show that the respondents have a relatively good level of emotional intelligence. In other words, they can manage themselves and interact effectively with others. This will help respondents regulate their emotions better and manage stress more effectively. Furthermore, the findings also indicate that demographic factors have a significant effect and influence on an individual's emotional intelligence. An individual's level of maturity tends to increase with age. In addition, Goleman (1998) and Mayer et al. (2004) suggest that emotional intelligence is a form of knowledge that can be learned. If the components of emotional intelligence are incorporated into courses involving diploma students, they may be better equipped to manage stress during their studies.

As previous research findings have been inconsistent, it is hoped that this study contributes to the advancement of knowledge by providing findings that support earlier studies, while also differing from some previous results. Moreover, the findings of this study can be utilized, particularly in understanding the relationship between demographic factors and emotional intelligence among diploma students. Such understanding will enable administrators to consider these factors when designing appropriate programs for diploma students.

Although many studies have been conducted on these variables namely age, gender, and ethnic group in relation to emotional intelligence, very few studies have examined all these variables as a unified framework model among diploma students. Therefore, this study was conducted to test and subsequently discuss the relationships among all these variables.

From Home to Classroom: Examining the Impact of Parental Involvement on Students' Self-Efficacy and Academic Performance

Ying-Leh Ling[1, a *] and Shailendran Raman[2,b]

[1]Department of Mathematics, Science and Computer, Polytechnic Kuching Sarawak, Malaysia

[2]School of Education, Humanities and Social Sciences, Wawasan Open University, Penang, Malaysia

[a]sal77sas@yahoo.com, [b]drlingyingleh@gmail.com

Abstract. Parental involvement is widely recognised as a crucial factor influencing students' self-efficacy and academic performance; however, empirical evidence examining this relationship at the secondary school level in Malaysia remains limited. This study investigates the influence of parental involvement and support on students' self-efficacy for learning and academic performance among Form 6 students in a Malaysian secondary school. Employing a quantitative cross-sectional design, data were collected from 76 Form 6 students using a structured self-administered questionnaire adapted from validated instruments. Parental involvement was measured across four dimensions—psychological support, educational support, play support, and life support—while students' self-efficacy for learning and academic performance was assessed using adapted items from the Motivated Strategies for Learning Questionnaire (MSLQ). Data were analysed using descriptive statistics and multiple regression analysis in SPSS. The findings revealed that the overall regression model was statistically significant, explaining 26.6% of the variance in students' self-efficacy for learning and academic performance. Among the four dimensions of parental involvement, life support emerged as the only significant predictor, highlighting the critical role of parents' provision of basic needs, a conducive learning environment, and emotional security. Psychological, educational, and play support were not found to be significant predictors. These results underscore that parental involvement extends beyond academic assistance to encompass foundational life support that strengthens students' confidence and engagement in learning. The study contributes to the existing literature by providing empirical evidence from the Malaysian secondary school context and offers practical implications for parents, educators, and policymakers in strengthening family–school partnerships to enhance students' self-efficacy and academic outcomes.

Keywords: Parental involvement, self-efficacy for learning, academic performance, life support, secondary school students

Introduction

Parental involvement is widely acknowledged as a key factor influencing students' academic success and self-efficacy. However, in many educational contexts, including Malaysian secondary schools, parental engagement remains inconsistent. This inconsistency is often shaped by parental attitudes, socioeconomic challenges, and uncertainty about how to support learning at home. Many parents remain unaware that their daily actions and attitudes significantly shape their children's academic self-perceptions and confidence. Goodall and Montgomery (2023) emphasized that true parental engagement goes beyond participation in school activities; it involves fostering

trust, shared responsibility, and continuous two-way communication between home and school.

Although schools actively encourage family involvement, these efforts are frequently undermined by a lack of sustained communication, mutual trust, and shared ownership of students' learning. Research by Yulianti, Denessen, Droop, and Veerman (2022) and Goodall and Montgomery (2023) highlights the need to shift from passive forms of parental involvement to active, meaningful engagement. Yet, systemic barriers such as limited time, language differences, and feelings of exclusion continue to hinder family participation, particularly in culturally diverse or lower-income settings (Kelty & Wakabayashi, 2020). Notably, as students' progress to higher levels of schooling, parental engagement tends to decline—often due to assumptions about student independence or parents' reduced confidence in their ability to support more advanced subjects. This decline may negatively affect students' motivation and belief in their academic capabilities.

In Malaysia and similar settings, parental involvement typically decreases during the secondary school years, partly due to perceptions that older students learn independently or that parents are less prepared to contribute academically (Burns, Crisp, & Burns, 2020). Such disengagement can adversely affect students' motivation and sense of competence, given that self-efficacy and academic motivation are closely linked to achievement and shaped by the social support systems surrounding students (Zheng, Chang, Lin, & Zhang, 2021).

Despite growing recognition of these issues, limited empirical research in Malaysia has examined how parental support directly influences students' self-efficacy and academic outcomes. Addressing this gap, the present study aims to examine the significant influence of parental involvement and support on students' self-efficacy for learning and their academic performance in Malaysian secondary schools. Understanding these relationships is essential for designing effective school-based strategies that strengthen student confidence, enhance learning outcomes, and promote meaningful family–school partnerships.

Relationship between Parental Involvement, Self-Efficacy for Learning, and Academic Performance

Parental involvement, students' self-efficacy for learning, and their academic performance are closely interrelated, with research consistently demonstrating that supportive home environments contribute significantly to students' confidence and achievement. Grounded in Bandura's (1997) Social Cognitive Theory, self-efficacy—defined as a student's belief in their ability to accomplish learning tasks—is influenced by environmental factors including parental behaviours, emotional support, and communication. These elements shape how students perceive their capabilities, which in turn affects motivation, engagement, and academic outcomes.

A substantial body of literature highlights the positive impact of parental involvement on both self-efficacy and academic performance. Bradley, Ferguson, and Zimmer-Fembeck (2021) found that strong parental support predicts emotional engagement and academic achievement, while Herman, Reinke, and Frey (2020) reported that improved parent–school collaboration strengthens student motivation. Affuso et al. (2023) further demonstrated that parental monitoring and emotional support predict higher levels of self-efficacy, which mediates academic performance. Similar findings were reported by Wu, Li, Zheng, and Guo (2020), who showed that self-efficacy serves as a central pathway through which parental involvement

influences learning outcomes. In addition, Cobo-Rendón et al. (2020) highlighted that positive parent–child relationships contribute to psychological well-being, which supports stronger self-efficacy and improved GPA. Studies such as Ugwuanyi, Okeke, and Ageda (2020) also reinforced the importance of self-efficacy and motivation as predictors of academic success within supportive environments.

Across the literature, several dimensions of parental involvement emerge as influential. Parenting practices and communication are consistently associated with positive emotional stability and stronger confidence in learning. Support for learning at home, including assistance with schoolwork and the establishment of conducive routines, also contributes to higher motivation and engagement. However, involvement in decision-making produces mixed effects. While collaborative decision-making can empower students, directive or controlling approaches may create pressure or reduce autonomy, as noted by Herman et al. (2020). This aligns with findings from Elkhaira, Engkizar, Arifin, Asril, Syafril, and Mathew (2020), who cautioned that parental encouragement may be neutral or even counterproductive when it conflicts with students' interests or independence.

The literature also emphasizes the heightened importance of parental involvement during online learning contexts, particularly during the COVID-19 pandemic. Fiddiyasari and Pustika (2021) found that students whose parents remained actively supportive during virtual schooling demonstrated greater intrinsic motivation and academic resilience. Overall, research consistently shows that parental involvement and support directly and indirectly enhance students' self-efficacy and academic performance. Students who perceive strong emotional and academic support tend to develop better self-regulated learning habits, stronger motivation, and a greater sense of competence. Nevertheless, the benefits of parental involvement depend on the balance between support and autonomy, with overly controlling behaviours potentially undermining self-confidence and independent learning.

In summary, previous studies strongly suggest that parental involvement plays a critical role in shaping students' self-belief and academic outcomes. However, the impact varies across dimensions of involvement and cultural contexts. These findings underscore the importance of further examining how parental involvement and support influence students' self-efficacy for learning and academic performance, particularly within Malaysian secondary schools where empirical evidence remains limited.

Research Methodology

Research Design

This study adopts a quantitative research approach to examine the relationship between parental involvement and support, self-efficacy for learning, and academic performance among Form 6 students. Quantitative methods allow the researcher to collect numerical data and analyse it statistically, providing objective and measurable insights into how these variables interact (Pawar, 2020). A cross-sectional research design is employed, with data collected at a single point in time to capture a snapshot of students' perceptions and experiences (Hunziker & Blankenagel, 2024). To obtain primary data, a physical questionnaire is administered within the school environment, ensuring controlled distribution and minimising data loss; the Head of the Form 6 Unit coordinates this process, assisting with both distribution and collection. In addition, an exploratory component is incorporated to investigate potential patterns and relationships in a context that remains understudied, as recommended by Botngård, Eide, Mosqueda, and

Malmedal (2020), who emphasise the value of exploratory cross-sectional designs in identifying multiple influencing factors within a single study. The collected data is analysed using SPSS, allowing for rigorous statistical examination of the relationships between parental involvement, self-efficacy for learning, and academic performance.

Population and Sampling

The population of this study consists of all 110 Form 6 students at the selected secondary school, representing three classes, as the goal is to generalize the findings to this entire group. Sampling was conducted using purposive sampling, a non-probability method in which participants are selected based on characteristics that align with the study objectives, ensuring that only students who are currently experiencing parental involvement and support in their learning are included. This approach is appropriate because it targets respondents who can provide meaningful and relevant data (Kharuddin et al., 2020; Chaokromthong & Sintao, 2021). Guided by the Krejcie and Morgan (1970) sampling table, a minimum sample size of approximately 86–90 students is recommended for a population of 110; therefore, this study selected 90 students in consultation with the Head of the Form 6 Unit to ensure eligibility and availability for data collection. The selected sample is considered sufficiently representative of the overall Form 6 population and supports the reliability of the study's findings.

Research Instrument

The research instrument for this study consists of a self-administered questionnaire adapted from previously validated instruments, with modifications made to ensure suitability for the Form 6 secondary school context in Malaysia. These adaptations were carefully implemented to enhance the clarity, relevance, and cultural appropriateness of the items, allowing students to provide accurate and meaningful responses. All constructs—parental involvement and support, students' self-efficacy for learning, and academic performance—were measured using a five-point Likert scale ranging from 1 ("Strongly Disagree") to 5 ("Strongly Agree"), which enables the collection of quantifiable data suitable for statistical analysis. The questionnaire comprises three sections: Section A captures demographic information such as gender and living status; Section B measures parental involvement and support across four dimensions—psychological support (6 items), educational support (4 items), play support (5 items), and life support (4 items)—adapted from Yue et al. (2022); and Section C consists of eight items assessing students' self-efficacy for learning and academic performance, adapted from Pintrich and De Groot (1991) Motivated Strategies for Learning Questionnaire (MSLQ). Minor wording adjustments were applied across all sections to align the content with the educational level and experiences of Form 6 students, ensuring both comprehensibility and contextual relevance.

Pilot Study

A pilot study was conducted to evaluate the feasibility, clarity, and effectiveness of the research instrument before the main study, involving 30 Form 6 students who were not part of the actual sample. The purpose was to ensure the questionnaire items were clear, understandable, and appropriate for the target respondents, while identifying potential issues to improve accuracy and efficiency (Aziz & Khan, 2020; Muasya & Mulwa, 2023). Reliability was assessed using Cronbach's Alpha,

with values above .70 considered acceptable (George & Mallery, 2003). Results indicated excellent overall reliability for the 26-item questionnaire (α = .962), with Parental Involvement (α = .957) and Self-Efficacy (α = .941) showing excellent internal consistency, while subscales such as Psychological Support (.833), Educational Support (.876), Life Support (.839), and Play Support (.938) ranged from good to excellent. Validity was established through expert review, confirming the content's relevance, clarity, and suitability for secondary school students (Teresi, Yu, Stewart, & Hays, 2022; Gani, Imtiaz, & Krishnasamy, 2020). These findings indicate that the questionnaire is highly reliable and valid, requiring minimal adjustments, and is therefore appropriate for large-scale data collection in the actual study.

Data collection for this study will be conducted physically at the selected secondary school, beginning with obtaining approval from the school administrator and permission from the Head of the Form 6 Unit, who will coordinate and assist in identifying the selected students. Before the main survey, a pilot study with 30 students outside the final sample will be conducted to ensure the clarity and reliability of the questionnaire. For the full-scale study, the researcher will personally distribute the physical questionnaires to the selected Form 6 students during allocated class sessions, with guidance from the Head of the Form 6 Unit, ensuring completion within the stipulated time. Participants will be briefed on the study's purpose, confidentiality, anonymity, and voluntary participation, with the option to withdraw at any time. Completed questionnaires will be collected immediately, coded, and entered into SPSS for statistical analysis.

Research Findings and Discussion

Respondent Profile

A total of 76 respondents participated in this study, with demographic profiles analysed based on gender, parent status, and semester. Of these, 25 respondents (32.9%) were male, and 51 respondents (67.1%) were female, indicating a higher female representation in the sample. Regarding parent status, 72 respondents (94.7%) reported being parents, while 4 respondents (5.3%) were guardians, highlighting that most participants carried parental responsibilities alongside their studies. The respondents were STPM students from the 2024/2025 and 2025/2026 cohorts, with 43 students (56.6%) in their first semester and 33 students (43.4%) in their third semester, providing a balanced representation across different stages of study.

Inferential Findings

Prior to interpreting the multiple regression results, the assumptions were carefully examined and found to be adequately met. Linearity was supported by significant correlations between the dependent variable, Parental Involvement and Support (SELnAP), and the predictors (SELnAP dimensions). Multicollinearity was addressed by excluding the predictor PInS due to perfect collinearity (tolerance = .000); the remaining predictors—Psychological Support (PsyS), Educational Support (EducS), Play Support (PlayS), and Life Support (LifeS)—showed acceptable Variance Inflation Factor values ranging from 1.534 to 2.893. The independence of errors was confirmed with a Durbin–Watson statistic of 1.769, while the normality and homoscedasticity assumptions were satisfied, with residuals closely approximating a normal distribution (M = .000, SD = .555) and a

standard error of the estimate of .57069. Collectively, these results indicate that the data met the necessary assumptions for multiple regression analysis.

Table 1: Model summary for regression analysis

Model	R	R^2	Adjusted R^2	Durbin-Watson	F-value	Sig.	Coefficients for predictors		
							Predictor	β	Sig.
1	.515	.266	.224	1.769	6.417	.000	Psychological Support	–.035	.827
							Educational Support	.214	.219
							Play Support	.013	.933
							Life Support	.372*	.004

Note: *p<.05*

Refer to Table 1, the multiple regression model was statistically significant, F(4, 71) = 6.417, $p < .001$, explaining 26.6% of the variance in parental involvement and support ($R^2 = .266$, Adjusted $R^2 = .224$), reflecting a moderate effect size. Analysis of variance indicated that the predictors collectively contributed significantly to the model, with the regression mean square (2.090) substantially higher than the residual mean square (.326). Among the four predictors, only Life Support significantly predicted SELnAP ($\beta = .372$, $t = 2.950$, $p = .004$), whereas Psychological Support ($\beta = –.035$, $p = .827$), Educational Support ($\beta = .214$, $p = .219$), and Play Support ($\beta = .013$, $p = .933$) were not significant. These findings suggest that Life Support plays a crucial role in enhancing parental involvement and support, which in turn can positively influence students' self-efficacy for learning and academic performance.

The analysis underscores that parental support plays a crucial role in strengthening students' academic confidence and overall learning outcomes. When parents are actively involved in their children's education, they enhance students' motivation, sense of competence, and engagement in learning. This pattern is consistent with previous research showing that students develop stronger self-belief and greater academic resilience when they receive emotional encouragement, educational guidance, and a supportive home environment (Engin, 2020; Schmid & Garrels, 2021). Such life support from parents creates a foundation that nurtures both motivation and confidence, ultimately fostering positive attitudes toward learning.

Furthermore, the study highlights the multidimensional nature of parental influence, where emotional, educational, and behavioral support work together to enhance students' self-efficacy and academic development. This aligns with earlier scholarly perspectives suggesting that parental monitoring, care, and encouragement shape the long-term trajectory of students' confidence and performance (Cobo-Rendón, Pérez-Villalobos, Páez-Rovira, & Gracia-Leiva, 2020; Affuso et al., 2023). Within the research framework, self-efficacy emerges as a key mechanism through which parental involvement contributes to improved learning outcomes. This reinforces the view that parental support, combined with motivational and environmental factors, plays a vital role in elevating students' learning efficacy and academic success (Usán Supervía & Quílez Robres, 2021).

Research Implications and Conclusion

From a practical standpoint, the study emphasizes that life support is not limited to economic provision but forms the foundational layer of learning confidence. Parents, educators, and policymakers should recognize that consistent care—such as providing nutritious meals, a conducive study environment, and emotional reassurance—directly enhances students' concentration and belief in their abilities. Schools can strengthen this understanding by organizing family engagement initiatives that guide parents in nurturing supportive home routines. Likewise, teachers can strengthen home–school partnerships through regular communication, ensuring that students feel safe, valued, and supported across environments.

At the institutional level, educational leaders are encouraged to integrate family support components into school welfare initiatives. This may include parental guidance workshops, material aid for disadvantaged students, or structured parent–teacher collaboration models that promote educational equity and motivation. Such approaches reflect the insights of Schmid and Garrels (2021), who highlighted that strong home–school synergy promotes better engagement and academic outcomes.

From a policy perspective, the findings suggest that educational reforms should prioritize family well-being as a core element of student success. National and community-level initiatives—such as mentoring programs, welfare schemes, nutritional support, or subsidies for school-related expenses—can help mitigate socioeconomic barriers that limit parental involvement. As Yang, Chen, Wang, Li, Zhang, and Huang (2023) argue, parental engagement becomes most impactful when supported by broader systemic efforts that address structural inequalities. Strengthening life support at the community and policy levels can therefore create a more equitable learning environment where all students can thrive.

Overall, the study reinforces that parental support—encompassing emotional, material, and environmental care—is a critical contributor to students' self-efficacy and academic performance. When supported by schools and larger social systems, parental involvement becomes a powerful mechanism for fostering students' confidence, resilience, and motivation to learn. The findings affirm the theoretical perspective that self-efficacy mediates the influence of parental care on academic outcomes, highlighting its central role in shaping learners' trajectories. By promoting comprehensive life support within families, educational institutions and policymakers can cultivate inclusive learning environments that enable all learners, regardless of background, to develop strong self-belief and achieve academic success.

Abstract. Ethno-pedagogy and Traditional Ecological Knowledge (TEK) represent culturally embedded forms of knowledge that can function as critical cultural resources for culturally responsive education. This study proposes an ethno-pedagogical framework for integrating TEK into teacher education through the development of culturally responsive learning materials for pre-service teachers in East Java, Indonesia. Using a qualitative case study approach, data were collected through semi-structured interviews, reflective journals, teaching materials, and field observations of local cultural practices and rituals, including *bersih desa* and *nyadran*. Thematic analysis reveals that pre-service teachers perceive ethno-pedagogy as a pedagogical bridge between scientific knowledge and locally embedded ecological practices, enabling the integration of cognitive (knowledge synthesis), affective (cultural transmission), and behavioral (transformative competence) dimensions of learning. Engagement with TEK as a cultural resource enhances teachers' cultural sensitivity, ecological literacy, and capacity to design contextually meaningful educational materials. The findings highlight the role of ethno-pedagogy in strengthening culturally responsive education by embedding local knowledge systems within formal learning contexts. The study suggests that teacher education programs should position ethno-pedagogy as a core pedagogical competency for mediating between formal curricula and indigenous knowledge, thereby reinforcing the social, cultural, and ethical foundations of education.

Keywords: ethno-pedagogy; traditional ecological knowledge; culturally responsive education; Javanese cultural practices; teacher education

Introduction

Learning ecological wisdom or *traditional ecological knowledge* (TEK) has increasingly become a critical component of environmental education across many countries (Choi, Choi, & Lee, 2007; Kim & Lee, 2016; Nam, Lee, & Lee, 2014; Selasih & Sudarsana, 2018). TEK encompasses the cumulative body of knowledge, practices, and beliefs developed by indigenous and local communities through their interactions with the natural environment. As global education systems search for more holistic and sustainable paradigms, integrating TEK into formal curricula is seen as an essential step toward enhancing ecological literacy and promoting cultural continuity (McCarter &

Gavin, 2011; Yashmita-Ulman & Singh, 2024). This pedagogical shift not only deepens students' understanding of ecological systems but also repositions cultural identity and traditional wisdom as vital resources for sustainable living.

In Indonesia—a nation rich in biodiversity and cultural plurality—local wisdom (*kearifan lokal*) plays a strategic role in environmental management and community well-being. Many indigenous and rural communities continue to practice ecological traditions that sustain both livelihoods and environmental balance. These practices are rooted in collective rituals, symbolic exchanges, and seasonal knowledge systems that reflect deeply relational worldviews. Preserving such local wisdom as a living source of innovation and social prosperity is therefore crucial. Within this context, education serves as a powerful tool for transmitting cultural values while simultaneously reinforcing ecological responsibility among the younger generation.

The integration of TEK in school education has shown significant potential for strengthening *environmental literacy*, *cultural preservation*, and *transformative learning* (Li & Shein, 2023; Feinstein, 2004). TEK-based learning encourages students to contextualize abstract ecological concepts through their lived experiences, often connecting scientific understanding with local practices. This form of learning also fosters a "sense of place," identity formation, and emotional attachment to nature—key dimensions of sustainable education. However, integrating TEK into formal education also faces notable challenges, such as epistemological differences between indigenous and scientific systems, limited teacher training, and the risk of cultural misappropriation when traditional knowledge is superficially adopted (Kim, Asghar, & Jordan, 2017; Lange et al., 2025; Bredal-Tomren, 2025).

Recent studies across diverse regions demonstrate both opportunities and constraints of such integration. For instance, an undergraduate course on Hawaiian environmental knowledge produced transformative learning outcomes by immersing students in indigenous ecological practices (Feinstein, 2004). In Norway, the inclusion of Sámi traditional knowledge into national science curricula revealed the importance of collaboration with local communities to ensure authenticity and respect for indigenous epistemologies (Lange et al., 2025; Bredal-Tomren, 2025). Similarly, on Malekula Island in Vanuatu, educators recognized the potential of TEK for enhancing school curricula but highlighted institutional and epistemological barriers that must be addressed for successful implementation (McCarter & Gavin, 2011). These cases collectively affirm that effective integration requires interdisciplinary strategies, teacher training, and culturally sensitive pedagogy grounded in collaboration with local communities (Ortiz et al., 2025; Dei et al., 2025).

In Indonesia, one promising framework for bridging local knowledge and formal education is *ethno-pedagogy*. This approach refers to a pedagogical orientation that values the integration of local cultural practices, indigenous wisdom, and ecological understanding within the learning process (Mag, 2011; Klara, 2015; Rexhepi & Bajrami, 2025). *Ethno-pedagogy* is closely related to biocultural diversity, ethnobotany, ethnography, and folklore studies—fields that emphasize the inseparability of cultural and ecological systems. In regions such as Ponorogo, East Java, traditional rituals involving the use of natural resources can serve as culturally embedded learning contexts. Through *ethno-pedagogy*, teachers and students can jointly explore how such traditions embody ecological principles, social ethics, and intergenerational sustainability.

From an educational perspective, *ethno-pedagogy* also plays a transformative role in teacher preparation. Pre-service teachers trained under this approach are encouraged to explore students' socio-cultural backgrounds, bridging the often-wide gap between

academic instruction and community life. By engaging with local ecological knowledge, teachers develop *ethno-pedagogical competence*—a core element of professional culture that aligns educational practices with current socio-cultural realities. Such competence enables teachers to not only transmit knowledge but also cultivate ecological awareness and cultural empathy in their students.

Given these considerations, this study aims to examine how pre-service teachers perceive and apply ethno-pedagogical principles in constructing locally grounded educational resources grounded in Traditional Ecological Knowledge. By situating this inquiry within Indonesia's diverse educational and cultural landscape, the study contributes to the global discourse on the integration of TEK and ethno-pedagogy as transformative pathways toward biocultural sustainability. Specifically, it seeks to understand the urgency of implementing ethno-pedagogy in developing teaching materials that focus on biodiversity conservation.

Methodology

This study employed a qualitative case study design to explore how pre-service teachers perceive and apply ethno-pedagogical principles in developing culturally responsive learning materials grounded in Traditional Ecological Knowledge (TEK). Twenty-five pre-service teachers enrolled in a teacher education program in East Java, Indonesia, were selected through purposive sampling, informed by pretest results assessing baseline knowledge as well as their exposure to local ecological practices and cultural rituals, including bersih desa and nyadran. The study followed systematic procedures across participant selection, data collection, and analysis to ensure methodological transparency.

Data were collected over three months using multiple qualitative sources, including semi-structured interviews, reflective journals, analysis of teaching materials, and field observations of local cultural practices. Semi-structured interviews were conducted using a guided protocol to elicit participants' understanding and application of ethno-pedagogical concepts, while reflective journals and teaching artifacts captured their ongoing learning processes and instructional design practices. Field observations were used to contextualize participants' engagement with local cultural knowledge systems.

Data were analyzed using thematic analysis following Braun and Clarke (2006). The coding process involved three iterative stages: initial open coding to identify meaningful units of data, categorization to group similar codes, and thematic development to construct overarching themes. These themes were continuously refined through comparison across data sources and iterative review. Both deductive (framework-driven) and inductive (data-driven) approaches were employed to ensure that analysis captured both theoretical constructs and emergent patterns.

To enhance credibility, methodological triangulation was applied across interviews, journals, artifacts, and observations. In addition, member checking was conducted by inviting participants to review and confirm preliminary interpretations. Ethical approval was obtained from the affiliated university, informed consent was secured from all participants, and the study adhered to strict ethical considerations, particularly in relation to cultural sensitivity and the respectful engagement of indigenous knowledge.

Literature Review and Conceptual Framework

Traditional Ecological Knowledge (TEK) as a Pedagogical Resource

The growing body of research on *Traditional Ecological Knowledge* (TEK) underscores its pedagogical value in advancing environmental literacy and sustainable learning (McCarter & Gavin, 2011; Kim, Asghar, & Jordan, 2017). TEK represents a complex system of understanding that integrates ecological observation, moral cosmology, and adaptive practices passed through generations. Unlike scientific environmental education, which often abstracts human–nature relations into quantifiable models, TEK is inherently relational and performative—it is learned through ritual, storytelling, and lived experience within ecological contexts (Li & Shein, 2023; Ortiz et al., 2025).

Integrating TEK into school education transforms the learning process into a culturally embedded practice. Students not only acquire knowledge about biodiversity and ecological cycles but also learn the ethics of care, reciprocity, and spiritual responsibility toward the environment. Such integration encourages "ecological identity formation" (Feinstein, 2004), where students understand themselves as part of an interdependent ecological system. This aligns with recent frameworks of biocultural diversity education, which view education as a mediating process between cultural continuity and ecological resilience (Dei et al., 2025).

However, scholars also caution that TEK cannot simply be incorporated into curricula as "content." Instead, it must be approached through epistemological pluralism that respects indigenous worldviews and avoids tokenistic appropriation (Bredal-Tomren, 2025; Lange et al., 2025). As noted by Kim et al. (2017), the epistemic foundation of TEK—its narrative form, symbolism, and oral transmission—differs from the empirical structure of Western scientific education. Therefore, successful integration demands transformative pedagogical frameworks that foster dialogue between knowledge systems rather than assimilation into one dominant paradigm.

Ethno-Pedagogy and Biocultural Learning

Ethno-pedagogy emerges as a relevant pedagogical approach to bridge the epistemological gap between TEK and formal education (Mag, 2011; Klara, 2015). Rooted in anthropological and educational theories, *ethno-pedagogy* promotes teaching methods that draw from local cultural systems, values, and ecological practices. It aligns with the broader educational turn toward *place-based* and *community-based learning* models that situate education within the socio-ecological realities of learners (Rexhepi & Bajrami, 2025).

Within the Southeast Asian context, *ethno-pedagogy* is particularly significant because traditional education systems historically evolved through oral traditions, apprenticeship, and communal rituals. These pedagogies were not only cognitive but experiential—teaching through doing, observing, and participating in social–ecological interactions. The application of ethno-*pedagogy* in modern education seeks to recover these immersive learning forms by integrating local rituals, ecological practices, and social cooperation into structured curricula.

Empirical research shows that *ethno-pedagogical* strategies can enhance teachers' cultural awareness and students' engagement with sustainability issues (Selasih & Sudarsana, 2018). For instance, pre-service teachers trained under *ethno-pedagogical* frameworks demonstrate higher competencies in developing culturally grounded teaching materials and in connecting scientific content with local

ecological contexts. Such approaches also align with *transformative learning theory*, which posits that learners reconstruct their worldview through critical reflection on lived experiences and cultural narratives.

The Indonesian Context: Local Wisdom and Biodiversity Conservation

Indonesia's ecological and cultural landscapes provide fertile ground for the development of *ethno-pedagogy*. The country's 17,000 islands host over 300 ethnic groups, each possessing distinct ecological knowledge systems embedded in rituals, cosmologies, and livelihood practices. From the *subak* irrigation system in Bali to the *sasi* marine conservation rituals in Maluku, these traditions represent sophisticated ecological governance mechanisms. However, modernization and standardized education systems have marginalized such knowledge, treating it as folklore rather than living ecological science.

Recent policy initiatives, including the *Merdeka Belajar* (Freedom to Learn) framework, open opportunities to re-contextualize local knowledge within education. Incorporating TEK and *ethno-pedagogy* can strengthen environmental education while promoting cultural identity formation among students. For example, in Ponorogo (East Java), local rituals such as *bersih desa* and *nyadran* utilize natural resources as symbols of gratitude and ecological balance. These practices—often involving collective action, sharing of food, and the cleaning of public spaces—reflect sustainable community ethics that can be used as case studies in classroom learning.

Through *ethno-pedagogy*, teachers can transform these traditions into pedagogical materials, linking ritual practices to concepts such as biodiversity, circular economy, and environmental ethics. By doing so, education becomes a site of *biocultural revitalization*, connecting local cosmology with modern sustainability discourse.

Barriers and Opportunities in TEK Integration

Despite its promise, the integration of TEK and *ethno-pedagogy* faces structural and epistemic challenges. Studies in different regions indicate that teachers often lack adequate training and conceptual frameworks to meaningfully incorporate indigenous knowledge into lessons (McCarter & Gavin, 2011; Lange et al., 2025). Moreover, educational institutions frequently privilege written, scientific knowledge over oral and symbolic forms, leading to epistemological exclusion. This structural bias not only marginalizes local wisdom but also limits students' exposure to plural ways of knowing.

Another barrier lies in cultural sensitivity. As Ortiz et al. (2025) warn, educators must "listen deeply" to indigenous voices to prevent the misappropriation of cultural practices. Effective integration therefore requires collaboration with community elders, cultural leaders, and local ecological experts. The success of the Sámi integration model in Norway demonstrates that co-designing curricula with indigenous communities ensures authenticity and reciprocal learning. Similarly, participatory learning approaches (Barraza & Bodenhorn, 2012) foster critical thinking and mutual respect across epistemic boundaries.

However, the growing body of literature also highlights opportunities. Ethno-pedagogical approaches can act as *bridging epistemologies*—frameworks that enable dialogue between scientific and traditional worldviews without subordination. When supported by teacher training and institutional policy, they can

transform schools into “ecocultural learning spaces” where students engage both cognitive and affective dimensions of sustainability (Dei et al., 2025).

Table 1: Barriers and Opportunities in Integrating Traditional Ecological Knowledge (TEK) and Ethno-Pedagogy in Education

Aspect	Description	Examples / Evidence	References
Barriers: Structural & Epistemic	Teachers lack training and frameworks to integrate TEK; institutions favor written/scientific knowledge, marginalizing oral/symbolic forms	Limited teacher preparedness; exclusion of local wisdom from curriculum	McCarter & Gavin, 2011; Lange et al., 2025
Barriers: Cultural Sensitivity	Risk of misappropriation of indigenous knowledge; lack of engagement with local communities	Need to "listen deeply" to indigenous voices; co-design curricula with Sámi communities in Norway	Ortiz et al., 2025; Barraza & Bodenhorn, 2012
Opportunities: Bridging Epistemologies	Ethno-pedagogical approaches mediate between scientific and traditional knowledge	Creation of ecocultural learning spaces; integration of cognitive and affective dimensions of sustainability	Dei et al., 2025
Opportunities: Transformative Learning	Teacher training + policy support enable effective TEK integration	Teachers and students develop competencies in ecological stewardship and community engagement	Dei et al., 2025

Results and Discussion

Pre-service Teachers’ Understanding of Ethno-Pedagogy

The analysis revealed that most pre-service teachers demonstrated a growing awareness of the pedagogical significance of local culture in environmental education. Participants acknowledged that traditional ecological practices within their communities—such as *bersih desa*, *nyadran*, and communal planting rituals—offer rich material for classroom instruction. These findings align with Klara (2015)

and Mag (2011), who emphasized that ethno-pedagogy serves as a contextualized mode of learning grounded in biocultural diversity. The teachers recognized that integrating local wisdom does not merely add cultural content to lessons but reshapes their pedagogical orientation toward more community-based and relational learning.

One participant noted that local rituals provide a meaningful entry point for learning environmental values: *"When we talk about bersih desa or nyadran, students immediately understand why nature matters, because these rituals are already part of their lives, not just school content"* (PT7).

Pre-service teachers also perceived ethno-pedagogy as a bridge connecting academic theory with the lived realities of rural learners. Similar to Selasih and Sudarsana (2018), their reflections suggested that local traditions provide opportunities for experiential and participatory learning that fosters environmental empathy. This awareness signals a pedagogical shift from rote instruction to critical engagement with local ecological contexts. Moreover, it encourages teachers to reinterpret indigenous knowledge as part of environmental ethics rather than as peripheral folklore.

Application of Ethno-Pedagogical Principles in Teaching Materials

When tasked with designing teaching materials, participants used natural and cultural resources from their surroundings as learning media. Examples included using local plants for biodiversity identification, traditional farming techniques to explain ecosystem balance, and ritual symbols to illustrate ecological interdependence. This practical engagement reflects the cognitive dimension of the conceptual framework, where teachers synthesize scientific and traditional ecological knowledge.

Reflective journals revealed that integrating local practices reshaped how participants designed learning activities: *"Using traditional farming practices made ecological concepts easier to explain, because students could connect science lessons with what their families do every day"* (PT12).

Following Mag (2011), such integration of knowledge transforms abstract ecological theory into concrete, place-based learning. Teachers' lesson designs displayed varying levels of ethno-pedagogical competence, with some incorporating local narratives and others employing community-based projects. The most effective designs were those that positioned students as co-researchers—documenting and analyzing traditional ecological practices in their villages. This participatory approach aligns with the affective and behavioral dimensions of the framework, where learning fosters emotional connection and actionable responsibility toward biodiversity.

Ethno-Pedagogical Competence as Professional Development

Ethno-pedagogical competence emerged as a transformative component of teacher professionalism. Teachers who engaged deeply with local wisdom developed stronger cultural sensitivity and ecological understanding. Engagement with community elders also prompted participants to reconsider their professional identity:

"I realized that being a teacher is not only about delivering the curriculum, but about helping students respect and continue the knowledge of their community" (PT19). As suggested by Kim, Asghar, and Jordan (2017), this competence is essential in overcoming epistemological boundaries between scientific and indigenous systems of knowledge. The teachers' reflective journals indicated that working with elders,

community leaders, and local farmers allowed them to reinterpret their role—not merely as transmitters of knowledge but as facilitators of cultural continuity.

This process is consistent with Dei et al. (2025), who argue that education rooted in cultural epistemologies can serve as a foundation for sustainable learning. By situating pedagogy within biocultural contexts, teachers not only enrich their instructional strategies but also contribute to the preservation of ecological wisdom. The findings thus reinforce the argument that teacher education programs should integrate ethno-pedagogy as a foundational competency, preparing educators to mediate between formal science and local ecological traditions.

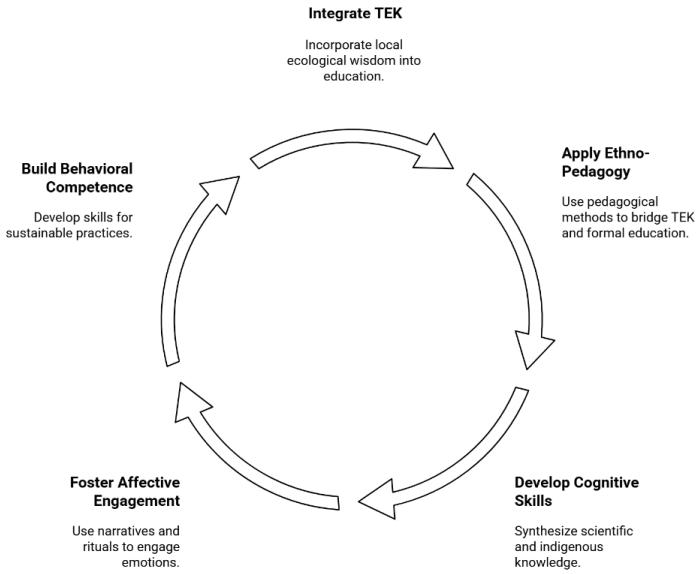

Fig. 1: Cyclical Relationship between Traditional Ecological Knowledge (TEK) and Ethno-Pedagogy in Culturally Responsive Teacher Education

This process illustrates a cycle of sustainability education in which Traditional Ecological Knowledge (TEK) serves as the foundational resource, derived from local rituals, myths, and ecological practices. Ethno-Pedagogy (EP) functions as the pedagogical bridge, translating TEK into structured learning experiences within formal education. Through this bridge, teachers are able to operationalize TEK across three interrelated dimensions:

1. Cognitive Dimension (Knowledge Integration) – Pre-service teachers synthesize scientific knowledge with local ecological insights, co-creating teaching materials that are contextually meaningful and academically rigorous.
2. Affective Dimension (Cultural Transmission) – Learning activities embed cultural narratives, rituals, and place-based experiences, nurturing students' emotional attachment to their environment and reinforcing the value of local wisdom.
3. Behavioral Dimension (Transformative Competence) – Teachers and students cultivate competencies for sustainable action, including conservation practices, community engagement, and stewardship of natural resources.

Through this multidimensional approach, EP enables students not only to acquire knowledge but also to internalize ecological ethics and a sense of belonging to their biocultural environment. By situating pedagogy within these contexts, teachers enrich their instructional strategies while actively contributing to the preservation of ecological wisdom. This cycle emphasizes that teacher education programs must integrate ethno-pedagogy as a core competency, equipping educators to mediate effectively between formal science curricula and the lived ecological knowledge of local communities.

In essence, the framework represents a continuous and reinforcing loop: TEK informs EP, which shapes teacher competence, leading to effective Biodiversity Conservation Education (BC), which in turn sustains and reinforces the relevance and practice of TEK in the community. This cyclical process ensures that education becomes both a medium for cultural preservation and a driver for ecological sustainability, fully aligned with the arguments presented by Dei et al. (2025).

Implications for Biodiversity Conservation Education

The implementation of ethno-pedagogy in teacher training has far-reaching implications for biodiversity conservation. As seen in Ponorogo and other regions of Indonesia, traditional rituals already embed principles of sustainability, reciprocity, and communal care. Transforming these traditions into structured educational content can promote conservation awareness among students while revitalizing community participation.

McCarter and Gavin (2011) and Feinstein (2004) have demonstrated similar outcomes in other cultural contexts, where integrating indigenous ecological knowledge strengthened learners' environmental literacy. In the Indonesian case, this approach also reinforces cultural resilience—protecting both natural ecosystems and cultural heritage. The study thus positions ethno-pedagogy not only as a pedagogical innovation but as a socio-ecological strategy for sustaining biodiversity through education.

Conclusion

This study highlights the urgency of implementing ethno-pedagogy in teacher education programs as a pathway to develop teaching materials focused on biodiversity conservation. By engaging pre-service teachers in contextualized learning processes grounded in local ecological knowledge, the study suggests that ethno-pedagogy has potential to connect traditional wisdom with modern environmental education, at least within the East Javanese teacher education context examined here.

Three key insights emerge. First, ethno-pedagogy functions as a mediating framework that integrates cognitive, affective, and behavioral dimensions of learning—linking scientific and indigenous knowledge systems. Second, teacher competence in ethno-pedagogy enhances professional and ecological literacy, enabling educators to design lessons that are culturally relevant and ecologically meaningful. Third, ethno-pedagogy contributes to biodiversity conservation by transforming cultural practices into active learning resources that promote sustainability ethics among students.

Within the context of this study, sustainable education appears deeply intertwined with local cultural roots, suggesting that culturally embedded pedagogies merit greater attention in teacher education programs. For the East Javanese context studied, and potentially for other culturally diverse regions in Indonesia, ethno-pedagogy offers a promising decolonial and locally grounded approach to ecological learning—one that values the wisdom of communities as integral to environmental stewardship. However,

broader applicability of these findings would require further empirical validation across different cultural and institutional settings. Future research should expand this framework through longitudinal studies assessing how ethno-pedagogical integration influences students' ecological attitudes and community engagement over time.

Acknowledgments.

The Influence of Personality Traits on Student Engagement and Collaboration in Polytechnic Education

Nur Aisyah Najian Binti Azmannuddin[1, a *], Nur Syahida Binti Mohd Yusoff[2,b]

Abstract. Student engagement and collaboration are essential for effective learning in polytechnic education where practical and group-based activities are integral. Personality traits significantly influence how students interact, participate and contribute within collaborative learning environments. This study examines how different personality traits, particularly introversion and extroversion, affect student engagement and teamwork in polytechnic settings. A mixed-method approach was employed, combining surveys and semi-structured interviews with polytechnic students across multiple programs. Quantitative data measured engagement levels, participation frequency and collaboration effectiveness while qualitative interviews explored students' experiences, perceptions and challenges during group-based activities. Preliminary findings indicate that extroverted students typically participate more actively in discussions and presentations whereas introverted students contribute more subtly yet effectively in planning and task execution. Challenges for introverted students include public speaking anxiety and hesitation to voice opinions while extroverted students occasionally dominate group interactions, affecting the balance of collaboration. The study underscores the importance of understanding student personality to design effective group activities and learning strategies that maximize engagement and teamwork. Findings suggest that instructors should adopt differentiated teaching approaches, assign structured roles within group tasks and foster inclusive environments that encourage contributions from all personality types. In conclusion, integrating personality considerations into pedagogy can enhance student engagement, promote equitable collaboration and support overall learning outcomes in polytechnic education. These insights provide practical guidance for instructional design and pedagogical strategies in TVET institutions, ensuring that diverse personality traits are accommodated to optimize collaborative learning.

Keywords: Personality Traits, Student Engagement, Collaboration, Polytechnic Education, Group Dynamics

Introduction

Polytechnic education is based on an approach to competency and practice-based paradigm with the emphasis on experience-based learning, technical practice, and group problem-solving as the core of teaching. Polytechnic institutions anticipate laboratory work, project-based assessment and simulation and industry-oriented collaboration unlike the conventional post-secondary education model where the lecture takes precedence. Students therefore are not incidental but central to the effectiveness of learning [1].

Student engagement refers to the level of learner attentiveness, curiosity, engagement and dedication that can be observed during the learning process. It includes behavioral engagement (i. e. participation in activities), emotional engagement (interest and motivation), and cognitive engagement (investment in understanding complex concepts). In Polytech settings, these dimensions are often realized in terms of group work, workshops and technical demonstrations, and peer-to-peer troubleshooting assignments [2].

Nevertheless, involvement and cooperation between people is heterogeneous. Personal diversity, especially personality types, determines how learners interact, communicate and contribute to group work. Among others, introversion and extroversion have received a lot of academic interest in the field of educational psychology. Extroverts are generally defined as people who largely prefer contemplation, organized socialization and as those with reduced social stimulation thresholds [2, 3].

In cooperation-/ability-based learning settings, e.g. polytechnics, these personality disparities can influence a participation trend on surface and a contributing pattern on underline. Though the issue of teamwork and its rising significance in Technical and Vocational Education and Training (TVET) is gaining more and more popularity, there is lacking empirical research that could assess the role of personality variables in the engagement and teamwork in this particular field. The given study thus aims to explain the connection of personality variables and student engagement in polytechnic education with the specific focus on the aspects of group dynamics and pedagogical significance [3].

Problem Statement

The predominant instructional strategy that has come into the picture in poly-techniques institutions as a result of its congruency to the industry practices is group-based learning. Employers always emphasize the importance of teamwork, communication skills and collaboration in problem solving as the key qualities that the graduates need. However, in reality, group dynamics will often follow unequal patterns of participation; some students will take up too much space in discussions, and will take up the roles of group leaders, whereas others will be rather inactive and will not contribute much during verbal interactions [4].

Such differences do not always imply competence and motivation differences. Instead, they can be as a result of personality-based forms of communication and comfort of social interaction situations. Even with strong analytical or technical skills, introverted students might feel uneasy about voicing ideas or speaking in front of their classmates without having a written or written list of points. On the other hand, extroverted students might easily take the leadership or presentation positions, which may unwillingly overshadow the quieter students [4, 5].

Research Objectives

This study aims at assessing the role played by personality traits in enhancing student engagement and collaboration in the field of polytechnic education, specifically towards the students enrolled in the IT and Commerce departments. The research objectives of the study include:

1. Examine the relationship between personality traits (introversion and extroversion) and student engagement in polytechnic education.
2. Investigate how personality traits influence collaboration and group dynamics.
3. Identify challenges faced by different personality types in group-based learning activities.

Research Questions

The following research questions were formulated to guide the study:

R_1: How do introversion and extroversion influence student engagement levels in polytechnic classrooms?

R_2: In what ways do personality traits affect collaboration within group-based activities?

R_3: What challenges do introvert and extroverted students face during teamwork?

R_4: How can instructional strategies be adapted to accommodate diverse personality traits?

Hypotheses

H_1: There is a significant relationship between extroversion and higher levels of verbal classroom participation.

H_2: There is a significant relationship between introversion and structured task-oriented contribution in group activities.

H_3: Personality traits significantly influence perceived collaboration effectiveness.

H_4: There is a statistically significant difference in engagement levels between introverted and extroverted students.

Literature Review

Polytechnic education engages students, which implies the effort that students apply to hands-on learning tasks. At some locations such as engineering workshops and digital media labs, interaction is based on the way the personality of a student fits within the learning environment. Extroverted students tend to perform well within these types of social environments, having much visible participation, expressing ideas fast, and naturally directing group work. They also process information through chatting, which

enables them to keep projects on track. Instead, introverted students work in silence and think profoundly and concentrate when working alone. Although they appear to be less active during fast classroom discussions, they demonstrate their involvement in the attention paid to the quality of their work and in the thoughts of their mind [6].

Although collaborative learning has obvious advantages, the issue of diversity of personalities may create challenges that damage equity in learning. Group work, where extroverts have an advantage because of their quick speech, may be extremely exhausting to introverts; this extrovert ideal may also force more quiet learners to the background even when they may be better suited to complete the task. Extroverted students, in their turn, can easily take over the discussion and lead to groupthink and suppress other, more in-depth opinions. These issues demonstrate that teaching design requires attention [6, 7].

In order to address the mentioned shortcomings, teachers should use teaching methods that promote equal and inclusive engagement. One of these measures includes the distribution of formal group roles, i.e., Technical Lead, Documentation Officer or Client Liaison and thus, allowing the students to exploit their natural strengths and favored types of engagement. Moreover, using digital platforms and the mentioned think-pair-share tasks that are planned deliberately provide introverted learners with the space to solidify their ideas before putting them into words. It has been acknowledged that the differences in personalities relate to the accomplishments of collaborative efficacy in the real world, and therefore, teachers can design lessons that can utilize the strengths of each student regardless of their stand on the introvert-extrovert spectrum [7].

Methodology

The research approach used in this paper is a Sequential Explanatory Mixed-Method Design. This method enables a general quantitative perspective of patterns of engagement which is then followed by more qualitative inquiry of the reasons and means behind the behaviors of students.

Research Design

- Phase 1 (Quantitative): Cross-sectional survey on the determination of personality traits and correlating them with self-reported levels of engagement and collaboration.
- Phase 2 (Qualitative): Semi structured interviews to record firsthand experiences of the students when they are on group projects and on practical lab sessions.

Participants and Sampling

Population: It consists of students in the Department of Information and Communication Technology (ICT), as well as the Department of Commerce in Seberang Perai Polytechnic.

Sampling Technique:

- Quantitative: Stratified random sampling (N is equal to 100) to guarantee that there would be representation across the varying years of study.
- Qualitative: Purposive sampling of 10-15 students according to their results in the survey (extreme extroverts vs. extreme introverts) in order to compare opposite experiences.

Instrumentation

Personality Assessment: This is a short version of the Big Five Inventory (BFI) that considers the Extraversion -Introversion dimension.

Student Engagement Scale: This scale is pegged on the National Survey of Student Engagement (NSSE) and includes behavioral, emotional and cognitive engagement.

Interview Guide: Open-ended questions: Concentrating on:
- Comfort levels in group brainstorms.
- Certain issues encountered in technical practical.
- Perceptions on what leadership and what execution in tasks.

Table 1: Personality Traits Measures (Extraversion & Introversion)

Statements	Measure Element	Trait Focus
I feel energized and motivated when interacting with large groups	Social Energy	Extraversion
I am usually the first person to initiate a discussion in a team meeting.	Proactivity	Extraversion
I feel comfortable taking a leadership role to guide my teammates.	Assertiveness	Extraversion
I prefer working independently on technical tasks rather than in groups.	Solitary Preference	Introversion
I prefer to process my thoughts in silence before sharing my opinion.	Deliberation	Introversion
I find it easier to express my ideas in writing than through speaking.	Communication Mode	Introversion

Table 2: Student Engagement Measures (SE)

Statements	Measure Element	Type of Engagement
I frequently contribute suggestions during hands-on practical/lab sessions.	Participati on	Behavioral
I often ask questions to my lecturers when I encounter	Inquiry	Cognitive

complex concepts.		
I put in a lot of effort to ensure my group assignments are high quality.	Effort	Cognitive
I feel a strong sense of belonging within my academic program.	Belonging	Emotional
I feel interested and enthusiastic about the activities in my course.	Interest	Emotional

Table 3: Collaboration and Teamwork Measures (CT)

Statements	Measure Element	Focus Area
I contribute effectively to technical documentation and report writing.	Task Contribution	Execution
I feel that my opinions are valued and respected by my group members.	Peer Support	Inclusivity
Our group is able to resolve conflicts or disagreements professionally.	Conflict Resolution	Group Dynamics
I am willing to share my knowledge and resources with my teammates.	Resource Sharing	Cooperation
I find it easy to coordinate with others to achieve project goals.	Coordination	Synergy

Table 4: Attitude Toward Collaboration Learning (ATCL) Measures

Statements	Measure Element	Origin
Boring — Interesting	Emotional Interest	Yue (2024); Wahyuni (2019)
Useless — Productive	Value-Benefits	Dang et al. (2024); Okolie (2022)
Demotivating — Engaging	Student Engagement	Suaalii & Tufuga (2024); Zhoc (2020)
Difficult — Easy	Perceived Ease of CL	Chatterjee & Correia (2020)
Negative — Positive	Overall Attitude	Maharani et al. (2020); Sun et al. (2021)

Results

Reliability Analysis

A reliability test was conducted before they conducted the main statistical analyses to confirm whether the measurement instruments had internal consistency. Cronbach's Alpha coefficients of each construct were calculated.

Table 5: Reliability Analysis

Construct	Number of Items	Cronbach's Alpha
Personality Traits	6	0.84
Student Engagement	5	0.87
Collaboration and Teamwork	5	0.85
Attitude Toward Collaborative Learning	5	0.82

The results indicate that all constructs demonstrate acceptable reliability, with Cronbach's Alpha values above the recommended threshold of 0.80. This suggests that the measurement items consistently capture the intended constructions.

Descriptive Statistics

The descriptive statistics were calculated in order to determine the overall level of the personality traits, student engagement, and cooperation between the participants.

Table 6: Descriptive Statistics

Variable	Mean	Standard Deviation
Extraversion	3.82	0.71
Introversion	3.46	0.68
Student Engagement	3.88	0.64
Collaboration & Teamwork	3.91	0.62
Attitude Toward Collaborative Learning	3.79	0.66

The findings demonstrate that the levels of engagement and collaboration between students are moderate on average. The collaboration and teamwork construct had the highest mean score (M = 3.91), which means that the student considers group activity as one of the salient aspects of their polytechnic education.

Correlations Analysis

The correlation analysis by Pearson was used to examine the interrelations between personality traits, engagement and collaboration.

Table 7: Correlations Matrix

Variables	1	2	3	4
1. Extraversion	-			
2. Introversion	-0.32	-		
3. Student Engagement	0.54	0.28	-	
4. Collaboration & Teamwork	0.47	0.35	0.61	-

There is empirical evidence that extraversion is positively correlated with student engagement (r = 0.54) and collaboration (r = 0.47). On this basis, students who have a high extraversion level are likely to be more active in classroom discussions and group projects.

Contrarily, the introversion exhibited a less significant but statistically significant correlation with collaboration (r = 0.35), which means that introverted learners bring to the team dynamics other modalities that cannot always be easily observed in verbal communication.

Differences in Engagement Between Personality Types

Independent samples T-test showed that students who are extroverted reported verbal participation and classroom interaction higher than introverted students reported higher involvement in task-oriented contributions to classroom activities such as documentation, planning, and technical implementation. These results provide empirical evidence to the assumption that personality factors have a significant implication on engagement and cooperation behaviors in poly-technique learning settings.

Table 8: Differences Between Personality Types

Variable	Introverts (M ± SD)	Extroverts (M ± SD)	t-value	p-value
Behavioral Participation	3.21 ± 0.58	4.12 ± 0.49	6.42	<0.001
Task-Oriented Contribution	4.05 ± 0.62	3.68 ± 0.57	-3.12	0.002

Qualitative Themes

After the quantitative stage, semi-structured interviews were conducted among a purposely selected group of twelve students (six extreme extraverts and six extreme introverts) in order to explore their experiences, perceptions, and troubles when group-based and practical activities are carried out. Interpretation of the interview data was to transcribe, code and use thematic analysis.

Table 9: Qualitative Themes on Student Engagement and Collaboration

Theme	Sub-Theme	Description	Illustrative Quote
Leadership and Initiative	Dominance in Group Discussions (Extroverts)	Extroverted students often take the lead in brainstorming sessions, presentations, and spontaneous discussions.	"I usually start the discussion and keep the group focused. If nobody speaks up, I feel responsible to take charge."
	Hesitation to Lead (Introverts)	Introverted students prefer to avoid overt leadership roles and may wait to share their ideas until prompted.	"I have ideas, but I wait until someone asks me before I share. I feel more comfortable planning tasks quietly."
Modes of Contributi on	Verbal Participation vs. Task-Oriented Contribution	Extroverts contribute actively to verbal discussions; introverts focus on documentation, technical execution, and planning.	Extrovert: "I enjoy speaking during labs; it helps keep the ideas flowing and motivates the team." Introvert: "I may not talk much, but I make sure the calculations and reports are accurate. I feel my contribution is still valuable."
	Quality vs. Quantity	Introverted students' contributions are fewer in number but highly detailed, complementing the frequent verbal input of extroverts.	"I focus on planning and checking the technical report. It may not be visible, but it is crucial for the final project quality."
Comfort and Anxiety Levels	Public Speaking Anxiety (Introverts)	Many introverted students report nervousness and discomfort when speaking in front of the group.	"I get nervous speaking in front of the group even though I know the answer. I prefer writing my ideas first."
	Social Stimulation Preference (Extroverts)	Extroverts feel energized and motivated by group interaction; lack of interaction may reduce their engagement.	"I feel most productive when I can talk with teammates and share ideas. Silence can feel slow and boring."
Collaborati on Dynamics	Dominance vs. Inclusion	Extroverts sometimes dominate discussions, limiting verbal	"Sometimes I talk too much, and I notice some quiet team members barely get to share their thoughts.

		contributions of introverts. Structured roles help balance participation.	Assigning roles helps everyone participate.”
	Mutual Dependence	Successful collaboration requires both personality types: extroverts lead discussions; introverts focus on planning and task execution.	“Our team works best when extroverts guide discussion and I focus on organizing tasks and checking details. Both are important.”
Strategies for Equitable Participation	Structured Roles & Reflection	Students suggested structured roles, reflective tasks, and rotation of leadership to ensure equitable contributions.	“When we rotate roles and have time to write our thoughts before discussion, even quiet students like me get to contribute effectively.”

Discussion

The paper highlights the importance of personal traits of personality in promoting student interaction and teamwork in the environment of polytechnic education. There is empirical evidence to show that introverts and extroverts are capable of making significant contributions to the group learning processes despite the difference in their styles of engagement [8].

The period of observable engagement was especially exhibited in the extroverted participants in the activities involving discussion, presentation, and spontaneous interaction. This tendency supports the previous results according to which posit extroverts are the primary consumers of the verbal exposition and social interaction information. Therefore, extroverted students would be inclined to take up leadership positions or become facilitators in groups particularly in polytechnic where teamwork and group problem solving is the norm [9].

On the other hand, the results indicate that an introvert has a tremendous impact due to his or her structured, task-oriented input in group work. Introverts are thinking and pensive learners who can do quality analytical work since they think deeply and plan carefully. Their skills are often reflected through documentation, technical design, coding and project coordination activities [9, 10].

However, introverted members said that they had trouble speaking in front of a crowd, as well as have the ability to express ideas without preparation when in a group. Consequently, they can be reduced in their visible presence, but not necessarily in their weight in the end results of group work [10].

Another important observation that can be made is the imbalance that may occur when the interactions between the extroverted students prevail in the group. Though leadership and active engagement is beneficial, dominance may override other peers in expressing their ideas, thus unwillingly leading to unfair participation in collaborative learning processes [11].

These conclusions hold teachers responsible as important agents of ensuring balanced group dynamics. This can be achieved by the implementation of the structured group roles, that is, project coordinator, technical specialist and documentation manager to make sure that everyone performs according to his or her strengths. Additionally, teaching methods such as think-pair-share, online discussion, and reflective assignments provide alternative expressive ways of ideas among introverted students [12, 13].

All in all, the knowledge of personality diversity in classrooms can help teachers create more accommodation and effective learning experience. Considering the diverse communication patterns and styles of engagement, teachers can foster equal cooperation and support learning abilities of students [14].

Conclusion

The given research examined the effects of personality on student involvement and collaboration in poly-technical educational institutions. The results show that introverted and extrovert students can contribute to collaborative learning in different ways but with different types of participation [2, 3].

With regards to the type of results, the extroverted students involved high verbal participation, and leadership behaviors, and spontaneous idea sharing through group discussions. On the other hand, introverted students served a major purpose in rational thinking, systematic projection and careful task implementation. These complementary participation strategies indicate that effective teamwork in poly-technical education settings is based on an even distribution of communication-oriented and analytical contributions [6, 11].

In regard to the sample of the participants, the study engaged students who undertook the Departments of Information and Communication Technology and Commerce in Seberang Perai Polytechnic. These learners are exposed to technical and practice-based programmes where group work, laboratory work as well as collaborative problem solving are the main parts of curriculum [11, 12].

In terms of the environment setting, polytechnic institutions provide an individual learning environment as opposed to the traditional lecture based higher based-education institutions. The concept of teamwork in the case of TVET reflects industry life were linking and working together is an essential need, and cooperation is a pedagogical approach [11].

Regarding the time factor, the data were observed during group-based academic activities of students, thus giving the possibility to analyze the impact of personality traits on engagement behaviors in the real classroom environment.

Regarding reasoning, it would be necessary to recognize the fact that different personalities are not the same since the differences in participation can be misunderstood to imply either variations in motivation or lack of competency. As a matter of fact, the tendencies of participation can be mediated by the preferences in communication specific to particular traits of personalities [1].

Lastly, the methodological approach proves that the acceptance of personality differences can help an educator to develop an instructional plan that will encourage mutual engagement, inclusivity, and teamwork. On the whole, the research emphasizes the necessity of integrating personality issues into the process of instructional design in poly-technical education, which subsequently improves engagement, teamwork and the ultimate learning outcomes.

Implications for TVET Education

The results of this research have several practical implications on the work of educators and instructional designers who work in Technical and Vocational Education and Training (TVET) organizations. In theory, the findings suggest that pedagogical practices must not be limited to single-faceted collaborative paradigm; the instructional process design should be in a position to cater to the differences in communication and interactivity modalities portrayed by the students [1].

In the context of stakeholders, the implication is also especially pertinent to the case of lecturers, curriculum developers as well as academic administrators who face the task of building project-based learning activities in polytechnics. This implication is most relevant in environmental contexts to learning environments that extensively use work-based learning environments including laboratory sessions, technical workshops, project-based modules, and industry-simulation activities, which form the common practice in TVET education [1, 4].

Explaining the individual approach to personality diversity in the classroom, the given strategy helps to avoid the risk of unequal participation in the group work. Without the facilitation, there is a likelihood of the extroverts taking over the discussion whilst the introverts might not say a word yet are holding valuable information [8].

At the operational level, some instructional approaches can be adopted: first, collaborative activities can be arranged in such a way that all the students can be equally involved in them, thus eliminating any domination of the discourse by a limited number of vocal learners; second, the roles of the project participants within the group-oriented activities can be assigned, i. e. project coordinator, technical expert, documentation officer, project presentation leader, etc. so that the less vocal learners could be provided with a chance to express themselves and work according to their own strengths and favorite working patterns [9].

Limitations and Future Research

In spite of its contributions, the current research has a number of limitations which are worth mentioning. The main methodological weakness of the research is the rather small sample size used in the quantitative part; the number of participants is confined to 100 people, which can limit the extrapolation of results [7, 10].

The sample was limited in terms of demography, in that it comprised students in one polytechnic institution, namely, the Department of Information and Communication

Technology and the Department of Commerce. This means that the findings cannot be generalized to other students in different academic environments or institutions [6, 7].

In context, the research was carried out in one Malaysian TVET, and the same patterns of engagement and collaboration might be different in other polytechnics because of the differences in institutional culture, pedagogy, or demographics of students [11].

The cross-sectional essence of the study would capture the perceptions at one time in time; a longitudinal design would be more informative on how personality traits change affect the engagement of the students during the academic career [4, 13].

Explanatorily, personality traits are not the only variables that may influence the results of collaborative learning. There are also other determinants that may significantly affect them, such as learning styles, digital literacy, academic self-efficacy, and previous experience of teamwork [2, 3].

Lastly, further studies might be done on a larger sample (polytechnics) and use sophisticated statistical methods including structural equation modeling to question the complex relationships among variables. Further qualitative research can also break more light on how personality characteristics, classroom culture and instructional design interact to influence student engagement in TVET learning settings [14].

Recommendations

The results of the current research present the grounds to formulate several recommendations concerning the improvement of the effectiveness of group-based learning in the context of poly-technical education taking sufficient account of the heterogeneity of the personality traits of the students. The statistics have shown that extrovert students are more likely to dominate verbal discussions and impulsive group interactions, but introvert students will play a bigger part by planning, documenting, and executing any technical tasks. In a bid to overcome this imbalance, role assignment in groups is highly encouraged to be structured. It will be important to assign certain roles or responsibilities e.g. group leader, note-taker, presenter, and task coordinator with a regular rotation of students so that every student has equal chances of contributing to the group based on his or her strengths. This will help the extroverted students be constructively engaged in spearheading the discussions and the introverted students be engaged in preparing correct and detailed discussions which play a critical role towards the overall success of the group. Besides, addition of personal reflection and pre-discussion planning will assist the introverted students to feel more confident and ready to speak up, which will reduce the anxiety related to speaking in front of the audience or dominating verbal communication [15].

Instructional designers ought to consciously tap balance verbal involvement with a task-based input. Quantitative values depicted that students indicated moderately high rates of engagement, collaboration, and teamwork had the most significant mean scores, which demonstrates that team-based activities are appreciated during the learning process. Through an organization of activities wherein both brainstorming or discussion and those tasks which are practical and hands-on, the instructors can establish an

ambience where both extroverts and introverts can play their part to the greatest significance. Mixed-personality groups are effective especially because they enable exploiting the complementary advantages of both the types of personalities. The extroverts tend to give the verbal and motivational force that leads the group interaction and the introverts make sure that the work is accurate, well-documented and planned. This aspect does not only make the learning results more inclusive but also fosters peer learning and dependency on one another, where the input of each student is welcomed and appreciated [15, 16].

The interaction and collaboration can be increased further with the help of additional pedagogical techniques. Introverted students can be trained in communication and presentation skills because it will make them gain confidence in sharing their ideas and group dynamics are constantly monitored by instructors to maintain a balanced participation. The individual contributions or feedback can be reflected in reflective journals or post-session feedback forms, which will be used to show the areas that require improvement. The evaluation procedures should also be such that they note the amount and quality of the contributions, where the contribution of the extrovert is taken into consideration and the work done by the introvert is detailed and task oriented. Polytechnic educators can maximize collaborative learning by using organized roles, different activity designs, and constant feedback. Generally, the strategies mentioned above would respond to personality diversity, facilitate fair participation and increase student engagement, teamwork, and student learning performance in group-based learning environments [16].

[a]nizam@ptss.edu.my, [b]nazura@ptss.edu.my

Abstract. The research will be conducted to analyse and determine the level of knowledge, attitude and perception of individual taxpayers in relation to the lifestyle tax relief among the staff and lecturers of Politeknik Tuanku Syed Sirajuddin, Perlis. Tax incentives included lifestyle tax relief by the government to motivate the people to get involved in improving the quality of life and financial well-being. This tax relief does not only help individuals to decrease their financial load but encourages them to become responsible in their financial planning and consumption. Although it has its advantages, there is a variation in the degree of awareness, knowledge and acceptance of the tax relief on lifestyle by the taxpayers. The research was carried out in reaction to the paucity of empirical evidence on the subject knowledge, attitudes and perceptions of individual taxpayers in relation to this tax incentive.

The research design followed was a quantitative descriptive study, with a survey questionnaire which contained questions to measure knowledge, attitude and perception of tax relief on lifestyle. The data gathered in the study were measured in terms of mean and percentage analysis to give a detailed description of the level of understanding and acceptance of the respondents. The outcome of this research is likely to provide an informative understanding of how taxpayers of Politeknik Tuanku Syed Sirajuddin, Perlis, think about and are aware of the use of lifestyle tax relief. Besides this, the research is also expected to provide a reference point to future research on the same topic in the academic field in Malaysia, as it seeks to add to the general knowledge of the effectiveness of fiscal policies in shaping individual financial behaviours.

Keywords: Lifestyle tax relief, tax knowledge, attitude, perception, individual taxpayer.

Introduction

Income tax is tax imposed on income from employment, business, dividends, rents, royalties, pensions, and other income received by individuals, companies, cooperatives, associations, and others in a year [1]. Taxation of eligible citizens is important for national development.

Among tax incentives provided by the government are personal relief and various expenses related to lifestyle, medical treatment, education fees and insurance.

In the context of taxation, lifestyle influences the types of tax relief that an individuals taxpayer is eligible to claim. The government, in encouraging healthier and

more educated spending habits among citizens, has introduced tax incentives to reduce individual tax burdens and enhance the overall well-being of the population.

Background of the Study

In Malaysia, the acceptable people, businesses and companies are subject to tax at the specified rates. Tax is a great contributor to national revenue, where the revenue received is brought back to the population as development and other social facilities such as hospitals and roads. Tax reliefs or incentives are also provided by the government to the people particularly in education, healthcare and lifestyle.

Although the tax system has several tax reliefs that individual taxpayers are entitled to, some of them still do not claim them primarily because of the lack of awareness, poor understanding of tax regulations and poor documentation practices [2]. This situation may arise due to ignorance or lack of tax experience or being puzzled over provision of tax reliefs and omitting tax relief which is provided to the people eligible to claim tax relief. As a result, these people might end up paying more than the amount of taxes they should be paying.

The level of tax knowledge among individual's taxpayers stands at medium or low range [3]. The leading question that is always posed every year, in the process of filling in tax returns, is what tax reliefs can be claimed. Many individual taxpayers do not know what kind of expenses can be considered a tax relief. The reason behind such case can be attributed to the fact that tax policies can be changed in line with the annual budget that may result in the scenario where the taxpayers are not aware of the changes or not properly understood the changes, particularly in relation to lifestyle tax reliefs. This research is therefore conducted to determine the level of knowledge, attitude and perception of individual taxpayer on the issue of lifestyle tax relief.

The level of tax knowledge is not only revealed in this study but is also used to enhance the level of awareness regarding the potential expenditure instruments that can be utilized to receive a lifestyle tax relief. Further, the findings will also introduce an important observation on how to come up more efficient tax education strategies and increase the utilization of the existing tax incentives by taxpayers.

Problem Statement

The research will be conducted to establish the level of knowledge, attitude and perception of individual taxpayers of lifestyle tax relief among staff and lecturer at Politeknik Tuanku Syed Sirajuddin (PTSS). Lifestyle tax relief has been chosen in this case since most of the staff here are professionals. The condition can be applied to determine familiarity of the personnel and professional group at PTSS with the lifestyle tax relief and to examine how it interacts with the relevant expenditures in relation to the lifestyle such as the purchase of sport equipment and gadgets.

The study is important in the establishment of whether the individual tax users at PTSS are aware of and represent the correct attitude and perception of lifestyle tax

relief. In cases where this group fails to know or where they do not bother to know what reliefs are given to them, there is likelihood that they may end up paying more than they must pay in terms of taxes. Such understanding of lifestyle tax remission will make the taxpayers more excised and more cautious in their expenditures and to make sure that they maintain good record of any claims they would wish to be claimed to the government.

Secondly, the lack of empirical studies that describe the extent of knowledge, attitude and perception of individual taxpayers towards lifestyle tax relief in specifics also remains. This poor research makes it difficult to the tax authorities gauge the level of effectiveness in the circulation of information and implementation of policies.

Research Objectives

The study is conducted to determine the level of knowledge, attitude and perception of individual taxpayers at PTSS.

Therefore, the research objectives are as follows:

1. To establish the amount of knowledge about individual taxpayers on PTSS has lifestyle tax relief.
2. To determine the extent of attitude of individual taxpayers to lifestyle tax relief in PTSS.
3. To assess the degree of perception of individual taxpayers about lifestyle tax relief in PTSS.

Research Questions

In line with the objectives of this study, several research questions have been developed as follows:

1. What is the level of knowledge of individual taxpayers regarding the topic of lifestyle tax relief in PTSS?
2. What is the level of attitude of individual taxpayers towards lifestyle tax relief in PTSS?
3. What is the perception of individual taxpayers towards the tax relief under lifestyle under PTSS?

Scope of study

This study on the level of knowledge, attitude, and perception of individual taxpayers towards lifestyle tax relief is conducted among staff of Politeknik Tuanku Syed Sirajuddin (PTSS), Perlis who also individual taxpayers.

The respondents consist of taxpayers who are staff members of PTSS only and are assumed to have a basic level of knowledge regarding individual taxation and tax reliefs. This knowledge is important, as tax reliefs may change from time to time as a result of the national budget. This study also focuses solely on lifestyle tax relief and does not extend its scope to other types of tax reliefs.

Significance of the Study

The research paper contributes to the bulk of academic literature in the field of taxation since it presents a descriptive perspective of the level of knowledge, attitude and perception of individual taxpayers in PTSS as far as lifestyle tax relief is concerned. It also offers insights into the extent to which taxpayers are aware of this relief and whether they make appropriate spending decisions accordingly. The findings of this study can provide valuable input to organizations and policymakers in assessing the level of awareness and tax compliance among taxpayers at PTSS. With a higher level of awareness of tax relief, taxpayers may allocate their financial resources toward specific expenditures that enable them to benefit from reductions in individual tax liability.

Literature Review

Introduction

Individual tax relief allows for deductions from the tax imposed on individuals thereby reducing the total amount of tax payable depending on the amount of relief eligible to be claimed. The higher the tax relief claimed, the lower the amount of tax that needs to be paid. Tax relief is provided as an incentive and incouragement for taxpayers to spend on more beneficial and meaningful purposes.

One of the tax reliefs provided to the public is lifestyle tax relief. Through this relief, individuals can enjoy tax benefits for lifestyle-related expenses such as the purchase of books, personal computer, smartphones or tablets, and internet subscriptions [1].

This section provides an overview of previous research on tax knowledge, taxpayer attitudes and views of taxation. Rather than merely summarising past research, this review synthesises the findings from past studies for a better understanding of the factors that impact taxpayers behaviour.

The links between these factors are crucial as they help to create a better theoretical and conceptual framework for this research. Specifically, this study focuses on taxpayers' responses to lifestyle tax relief.

Tax Knowledge

Tax knowledge is often considered one of the key factors influencing tax compliance. Understanding and awareness of taxation help individuals to continuously comply with tax policies and the applicable tax rates. Taxpayers will be more rational and responsible in their spending and are able to avoid tax evasion.

Knowledge of taxation not only influences the way an individual thinks, but it also shapes their attitudes. The tax knowledge aspect is the most important element that encourages the attitude of fulfilling tax obligations as a taxpayer compared to other factors tested in their study [4].

Good tax knowledge can help individuals understand the taxation system and subsequently pay the taxes imposed on them. This knowledge can also help prevent the occurrence of tax evasion. According to Khoirul and Lutfi [5], one way to improve the level of tax compliance is by providing tax knowledge to individual taxpayers. With adequate tax knowledge, individuals can understand taxation information and subsequently report their income accurately, which in turn leads to greater tax compliance.

Many studies suggest that individuals who have a better understanding of tax rules and requirements are more likely to meet their obligations [6]. This is because individual taxpayers who understand and are aware of the importance of taxation are less likely to make mistakes, whether intentional or unintentional. They are more likely to comply with tax payment regulations. Knowledge in this area also makes individual taxpayers more confident in carrying out self-assessment and more willing to comply with tax payments compared to those with lower levels of knowledge. In addition, a lack of tax knowledge can lead to negligence and misunderstanding which contributes to non-compliance [7].

Taxpayer Attitude

Attitude is the positive consideration of a person towards taxation systems or policies. The knowledge of taxes has the capability of modifying the relationship between the attitude and compliance behaviour [8]. Research studies on the social and behavioural aspects of tax compliance indicate that the attitude of taxpayers is the direct influence on their readiness to obey the tax law [9]. Indeed, irresponsible attitudes also entail leakage in the country tax revenue where some people have substantial assets that are not recorded in the tax reporting made [10]. Taxpayer's attitudes are closely related to their compliance in paying taxes. Individuals who comply with tax payments are those who possess sufficient knowledge. Knowledge of tax relief will influence taxpayers spend their money to benefit from tax deductions, particularly lifestyle tax relief.

Attitudes affect the direction of someone's behavior whether they are favorable or unfavorable to an attitude object. Attitudes have an important role in explaining a person's behavior in their environment [11]. In the context of taxpayer's attitudes towards lifestyle tax relief, those who are knowledgeable and aware of the reliefs provided by the government are more likely to spend on items such as books, magazines and tablet to benefit from tax deductions. However, taxpayers who are less aware of the benefits of lifestyle tax relief are less likely to make such efforts, which may result in missing the opportunity to enjoy the tax relief.

In combination, attitude toward the behavior, subjective norms, and perceived behavioral control lead to the formation of behavioral intentions [12].

This shows that the combination of attitude, subjective norms and perceived behavioural control will shape an individual's attention to perform a certain behaviour. A person's way of thinking, environmental influences and internal personal capability all work together in forming an individual's intention.

Tax Systems Perception.

Perception refers to how people perceive characteristics of tax systems, such as fairness, clarity and administrative ease. The perception of taxpayers has been associated with the acceptance and response of tax policies. The perceptions of fairness and perceived behavioural control are reported in empirical literature to affect compliance behaviour [13]. In general, taxpayer's perceptions influence how they view the tax system. Taxpayers who have a positive perception of Inland Revenue Board (IRB) are more likely to have a hesitation in paying taxes and are also more likely to identify and take advantage of the tax reliefs provided.

Although various studies have concentrated on compliance, the perception construct can be modified on the analysis of perception towards tax relief policies like lifestyle tax relief. The Inland Revenue Board (IRB) is a feared tax collection institution that has taxpayers in Malaysia. This is a situation that affects maximum tax compliance [14].

IRB continuously carries out tax compliance activities based on the concept of Awareness, Education and Services. These compliance activities are implemented according to appropriate risk assessment levels, which are derived from various sources, including the public. However, it cannot be denied that there are still members of the public and taxpayers who perceive IRB as a feared entity, which in turn hinders efforts to create an optimal tax compliance environment. There are also individuals who perceive the IRB as a feared institution. This leads to non-compliance, which in turn undermines the efforts implemented by IRB.

Planned Behaviour Theory.

As it is stated in the Theory of Planned Behaviour (TPB), attitudes, subjective norms, and the perceived behavioural control, control behaviour [15]. TPB has been extensively used in research of tax evasion and tax compliance in the research on taxes with the premise that taxpayers are rationally chosen to comply or not comply with the tax law [16]. Attitudes and behavioural beliefs, as the components of TPB, are sensible and warrant their use as the factors of engagement with tax policies, and they apply to the study constructs [17].

Empirical Results on Tax Awareness and Perception.

There are numerous empirical studies to back the applicability of tax knowledge and perception to tax-related behaviour. In a Malaysian study involving 400 taxpayer's responses, tax knowledge positively influences the perceptions of fairness with an indirect impact on voluntary tax compliance. Other studies indicate that tax education, tax awareness and tax complexity affect compliance behaviour and that both cognitive and attitudinal dimension are relevant [18]. These illustrations support the idea of quantifying knowledge, attitude and perception as to analyse the reactions of taxpayers to certain tax incentives.

Research Methodology

This paper modifies quantitative descriptive research to investigate the extent of knowledge, attitude and perception of individual taxpayers towards lifestyle tax relief in Politeknik Tuanku Syed Sirajuddin, Perlis. The sample size is 195 respondents, and a simple random sampling technique is used to select a sample of individual taxpayers. This will be conducted using a structured questionnaire with four sections, which will include demographic data, knowledge, attitude and perception all measured using a five-pointer Likert scale ranging **between 1 = Strongly Disagree and 5 = Strongly Agree**. The questions in the questionnaire were based on a prior study [19]. Several adjustments were done to fit this research. Descriptive statistics such as mean and percentage is used to analyse the data collected with the help of SPSS software to give a concise picture of all the research variables.

The survey technique can yield quality and useful information to investigate a given event or phenomenon [20]. Non-experimental research that involves the use of survey research using questionnaires is prevalent especially in the social sciences realm [21]. Logically, the researcher chose a quantitative method, because it allows gathering more effective and systematic information in accordance with the goals of the study. The quantitative method enables more control to be exerted since the effect of external factors is reduced. This is because respondents will be expected to provide the answer to the questions depending on the predetermined response options given [22].

Research Findings

This chapter gives the results of the research on level of knowledge, attitude and perception of individual taxpayers towards lifestyle tax relief in Politeknik Tuanku Syed Sirajuddin, Perlis. Descriptive statistics were used to analyse data of 195 respondents, where the mean and percentage were used. The results are being provided based on the study variables; demographics profile, knowledge, attitude and perception. Most of the respondents were female staff, amounting to 119 people, then male staff, amounting to 76 people. The majority aged between 46 and 55 years (51%) followed by 36-45 years (44%), more than 55 years are 11 (5%). The percentage of male respondents was 39 and female respondents represented 61. Most of the respondents were of Master level (89%), Doctoral level (6%) and Bachelor level (5%). Mostly, respondents have monthly incomes exceeding RM6, 000 (83%). The descriptive analysis was used to explain the level of the research variables through the mean and standard deviation. The mean scores were interpreted according to the classification offered by Chua [23], according to which the scale was sorted into three levels:

- 1.00 – 2.33 = Low
- 2.34 – 3.66 = Moderate
- 3.67 – 5.00 = High

This guide makes it easier for researcher to determine the level of research required and to summarize the data. The following are the research questions :

Construct K (Knowledge)

K1 – I am aware of the existence of lifestyle tax relief in the individual tax system.
K2 – I understand the types of expenses eligible for lifestyle tax relief.

K3 – I know the maximum amount of lifestyle tax relief allowed.
K4 – I understand the supporting documents required to claim lifestyle tax relief.
K5 – I know how to claim lifestyle tax relief through the e-Filing system.

Construct A (Attitude)
A1 – Lifestyle tax relief benefits me as a taxpayer.
A2 – Lifestyle tax relief encourages me to plan my expenditures better.
A4 – I believe lifestyle tax relief is fair and relevant.
A5 – I am interested in claiming the full amount of lifestyle tax relief available to me.

Construct P (Perception / Persepsi)
P1 – Information regarding lifestyle tax relief is clear and easy to understand.
P2 – The e-Filing system for claiming lifestyle tax relief is user-friendly.
P3 – Lifestyle tax relief is implemented fairly for all individual taxpayers.
P4 – Lifestyle tax relief demonstrates the government's concern for citizens' welfare.
P5 - I have a positive perception of lifestyle tax relief.

Table 1: Descriptive Analysis

Construct	Mean	Standard Deviation	Level
K1	4.61	0.502	High
K2	4.39	0.608	High
K3	4.39	0.698	High
K4	4.22	0.808	High
K5	4.44	0.616	High
A1	4.56	0.511	High
A2	4.44	0.511	High
A3	3.89	1.023	High
A4	4.67	0.485	High
A5	4.33	0.594	High
P1	4.33	0.594	High
P2	4.33	0.485	High
P3	4.06	0.938	High
P4	4.28	0.575	High
P5	4.22	0.732	High

Construct Knowledge (K)

Construct K had high mean scores in all items with a range of 4.22-4.61. The highest mean (M = 4.61, SD = 0.502) was recorded in item I am aware of the existence of lifestyle tax relief in the individual tax system, which indicates a strong indication of awareness and knowledge of the respondents. The standard deviations were between 0.502 and 0.808 which is it indicated that there was a small difference in responses.

Construct Attitude (A)

In Construct A, the mean scores were 3.89 to 4.67. The best mean (M = 4.67, SD = 0.485) was item A4 I believe lifestyle tax relief is fair and relevant; it means that the respondents were positive about lifestyle tax relief. The standard deviation (SD = 1.023) of item A3 Lifestyle tax relief motivates me to manage my spending more effectively was higher, indicating that there was a variation in the opinions of respondents.

Construct Perception (P)

Construct P items yielded a mean range of 4.06 to 4.33, which means that there is overall acceptance of lifestyle tax relief. Standard deviations were moderate, which indicated homogeneous responses.

Summary

The mean of all items in Constructs K, A, and P was greater than 3.67 which is considered high based on the classification of Likert scale. It proves the fact that respondents tend to agree and have favourable attitudes towards lifestyle tax relief. It shows that the respondents received clear tax-related information with a good level of understanding. It also indicates that the respondents are aware of and understand the tax reliefs that are allowed.

Discussion, Conclusion and Recommendation

Discussion. This study had an aim of analysing the knowledge, attitude and perception of individual taxpayers on lifestyle tax relief at PTSS. The results of the study indicated the following:

Knowledge (Construct K): The respondents were found to be positive, and the outcome was that the level of knowledge in this construct was high. All in all, the awareness of lifestyle tax relief, the knowledge of the aspects that concerned it, and the awareness of the qualified expenditures that respondents had made that could qualify them to receive the tax relief were quite high.

Attitude (Construct A): The respondents had positive attitudes which motivated them to focus their expenditure on products that qualify as lifestyle tax relief. Their spending was also well planned, and they were interested in the presence of tax relief offered.

Perception (Construct P): Respondents showed a positive perception, indicating that tax relief on lifestyle is easy to comprehend, the e-Filing system is user-friendly and that the relief is fairly applied to all individual taxpayers.

The general results of the mean show that the score is 3.67, which can be interpreted as high. This indicates that the respondents are informed, have due attitudes on the lifestyle tax relief and have positive perception on the goals of lifestyle tax relief.

According to the study findings, the respondents gave positive responses concerning the lifestyle tax relief. Most of them knew about the spending to help relieve their lifestyles and the advantages in terms of taxpayer. The lifestyle tax relief also assisted the respondents to plan their spending more adequately and be eager to claim the eligible lifestyle tax relief. The awareness and understanding regarding lifestyle tax relief were high among respondents who were the professionals and the staff of PTSS. They also thought that whatever they heard about to lifestyle tax relief was easy to digest and understand, it was fair to all taxpayers, and it had concern of the government in protecting the welfare of the people.

Conclusion. Finally, lifestyle tax relief is highly received and viewed positively by the respondents. The program adds to the financial planning, awareness and overall wellbeing and further promotion and improvement will increase its efficiency. The above recommendations will make lifestyle tax relief a relevant, accessible, and beneficial tax relief to individual taxpayers in PTSS.

Recommendation. According to the results, one can suggest the following proposals to make the use and efficacy of lifestyle tax relief more practical:

Enhance Public Awareness. The government should maintain awareness campaigns to the taxpayers on exemptions they are entitled to. Furthermore, these exemptions can be said to change every year depending on the national budget.

Improve System Usability. It is significant to streamline the e-filing system. An easy to use and understand system will raise the rate of usage of this system among the taxpayers. A simplified tax relief procedure would inspire taxpayers to take advantage of the reliefs that they can obtain.

Enhance Transparency and Fairness. Policymakers ought to make sure that the lifestyle tax relief is distributed fairly to all the taxpayers who qualify and any revision or update should be made clear.

Encourage Financial Planning. It is possible to create campaigns and tools that would help taxpayers to organize their spending to get the best out of the lifestyle tax relief.

Future Research. Future research can either focus on the long-term impact of lifestyle tax relief on the financial behaviours of taxpayers, or explore the variance in knowledge, attitude, and perception among demographic groups.

Factors Affecting Daily Personal Financial Management Among Students : A Study on The Staff of Politeknik Tuanku Syed Sirajuddin, Perlis

Mohd Nizam bin Mat Isa[1, a *], Nazura binti Puteh@Arif[2,b]

[1,2]Politeknik Tuanku Syed Sirajuddin, Malaysia

[a]nizam@ptss.edu.my, [b]nazura@ptss.edu.my

Abstract. The daily personal financial management is a significant part on the good financial discipline development among the students. Nevertheless, a significant number of students do not organize their daily costs effectively and keep records of them. Thus, the aim of the study is to identify the determinants of the daily personal financial management among students. This paper concentrates on three key variables, i.e. individual factors, environmental factors, and technological factors.

Quantitative research design has been applied with the data collection tool being a questionnaire that was administered to the student at Politeknik Tuanku Syed Sirajuddin, Perlis. Descriptive analysis was used to analyse data, which entailed computation of mean and standard deviation of each item. To sum up, personal financial management among students daily is sensitive to both internal and external factors. Thus, there is a need to increase the exposure to financial literacy and the proper utilization of financial technology at an earlier age to help the students manage their daily finances in a more systematic and disciplined way.

Keywords: Daily personal financial management, individual factors, environmental factors, technological factors, student.

Introduction

Background of the Study.

Financial management is a very important life skill especially to the young adults and students who are now moving into independent financial management. A personal budget is a daily routine that helps one to track their income and expenses to prevent excessive spending and plan on future financial objectives. Nevertheless, the advantages are obvious, which is why many people, in particular, students do not keep their daily budget records regularly.

Some of the earlier research have revealed that young adults are usually unable to manage their finances through self-regulation because they have very little financial literacy, are not very disciplined, and are influenced by their peers and lifestyle demands [1,2,3]. Moreover, the current technological breakthrough has brought about financial management programs that facilitate easier budget tracking and financial planning, but numerous users have a hard time learning to use or utilize the digital financial systems [4,5]. It is essential to comprehend what causes people to avoid keeping personal budgets daily to implement the interventions that will positively impact financial habits and will teach people how to use money responsibly.

The given study aims at outlining and examining individual, environmental, and technological factors that affect the absence of daily personal budgeting among students.

Problem statement

Although there are many tools and educational opportunities to manage finances, still, many students do not practice financial management daily. The consequence of such irresponsibility is usually wasteful spending, stress, and poor financial planning. According to the previous research, such individual factors as the absence of discipline, low motivation, and the absence of financial literacy also play a significant role in the financial management behaviour of students [6,7]. Financial literacy is significant towards guiding students to become responsible financially like budgeting, saving, and spending money.

The environmental effects, such as family impact, peer behaviour, and lifestyle patterns, are also involved in the development of the financial habits and spending choices of students [8,9]. Attitude towards money management and consumption behaviour among students can be affected by social interaction with peers and the environment around them.

Also, despite the growing availability of technological solutions to finance, including financial applications and digital budgeting tools, the barriers to their successful use among students include ignorance, technological complexity, and financial illiteracy [5,7]. These obstacles make the use of financial technology ineffective in assisting students to practice effective financial management.

This, in turn, implies that there is the necessity to thoroughly investigate these factors in order to learn more about why students do not keep personal budget records on a daily basis and suggest measures that can help to change budgeting behaviour amongst students.

Research Objectives

This study aims to:

1. Establish the degree of individual factors that can lead to failure of keeping daily personal budget among students.
2. Test how environmental factors affect every day personal budgeting activities.
3. Research on the influence of technological factors on the maintenance of students with a daily personal budget.
4. Identify which factor among them is most prevalent in causing the absence of personal budget tracking per day among students.

Research Questions

The study seeks to answer the following questions:

1. What is the challenge of individual factors that make it hard to have a daily personal budget?

2. What are the effects of environmental factors on daily personal budgeting by students?
3. Are technological reasons associated with the daily personal budgeting behaviour of students?
4. Which of the individual, environmental, and technological factors is most dominant in the lack of daily personal budget tracking?

Importance of the Study.

The importance of this study is due to a number of reasons:

1. To students: It teaches students about personal financial management, making them aware of what prevents them on making daily budgets and embrace more suitable practices.
2. To teachers and schools: The results can inform the creation of programs and workshops in financial literacy that should be specific to the needs of students.
3. To policymakers: It educates policy that can assist in enhancing financial responsibility and budgeting by young adults especially in institutions of higher education.
4. To scientists: The research is relevant to the scholarly literature on individual finance, budgeting behaviour, and interaction between individual, environmental and technological conditions.

Scope of the Study.

Some of the aspects that have been considered in the study are individual, environmental and technological factors that influence the daily personal budget practice.

Defining Key Terms.

1. Daily Personal Budget - This is a journal of daily revenues and expenditures that one keeps keeping his/her finances straight.
2. Individual Factors- Attitude, motivation, discipline and financial literacy are personal factors that influence budgeting behaviour.
3. Environmental Factors- External factors such as family, peers, lifestyle, and social norms which influence financial practices.
4. Technological Factors-Skills, awareness and perceptions of financial management tools and applications that determine budgeting behaviour.

Literature Review

Introduction

Personal budgeting is one of crucial role of financial management since it helps the user manage his or her income and expenses daily by prevent unnecessary spending, and plan on how to achieve financial objectives in future. Budgeting habits enable the people to establish responsible financial behaviour and enhance financial wellbeing. Several people, especially students, however, do not always keep a record

of their daily budgets. Recent research has shown that even with the access to financial education and online budgeting apps, students do not know how to use effective budgeting practices in their everyday life [3,6]. The present chapter explains the reasons behind this behaviour using past research and literature. The discussion has been patterned under three broad areas with each being; individual, environmental, and technological.

Individual Factors

Individual factors are the individual attitudes, motivation, discipline, and financial literacy which affects budgeting behaviour.

Attitude and Perception

The concept of having a daily budget is viewed as boring and time consuming by many people. The development of negative attitudes towards financial management activities can lead to procrastination and irregular budgeting behaviour. Research has indicated that these people who think that financial planning is cumbersome do not tend to monitor their daily expenditure in an organized way [11,12]. Consequently, students tend to memorise rather than document their daily costs, and they believe that their financial condition can be handled without an official approach.

Discipline and Motivation

Poor discipline and motivation are also another challenge to effective budgeting behaviour. Self-control is also a significant aspect of financial decision making especially in the control of spending and saving behaviours. The low-self-regulation individuals are less likely to have regular budgeting habits [13]. Financial awareness of implications usually motivates the need to keep a daily budget. Without a strong motivation, even people who have a financial knowledge might not practice proper budgeting [3].

Financial Literacy

Another factor that is of significance in determining budgeting behaviour is financial literacy. People who have the best financial knowledge are more likely to have good financial planning and budgeting. It has also been shown that financial literacy will enhance the capability of people in planning their expenses, spending control, and personal finances [14,15]. On the other hand, people of low financial literacy might not appreciate the role of keeping a daily budget.

Environmental Factors

Among the environmental factors are family influence, peer pressure, lifestyle and social norms that determine the financial behaviour of individuals.

Family Influence

Financial habits are influenced by the family environment. When people are raised in families that stress on budgets, chances are high that they will also develop good budgeting habits. Parental guidance and monetary socialization have a major impact on the financial behaviour and monetary attitudes of the young adults [16,17]. Students are not exposed to good role models in finance and may not be aware of the value of budgeting.

Peer Influence

Peer behaviour may influence spending patterns and financial decision of students greatly. Students tend to copy the spending behaviour of their peers, especially when their peers are pressurizing them to spend to live a particular kind of life. It has been found that peer pressure may cause young adults to spend money in unplanned ways and misuse funds [2,18]. Such a scenario can diminish the incentive of students to make entries of daily costs.

Lifestyle and Time Constraints.

Current lives, schoolwork and part time jobs can also restrict the time that the students can spend in the financial management activities. Rigid schedules and other competing priorities usually lead to the failure to track expenses daily. Research shows that time and lifestyle pressures may have adverse effects on financial planning behaviour among students [11].

Technological Factors

Digital tools can assist with the management of personal finances, and technology can help, yet there are several obstacles that could restrict its use.

Technological Skills and Awareness.

Budgeting applications and other financial technology tools, like digital financial planners can make tracking expenses and monitoring finances easy. Nonetheless, it is possible that people with a low level of technological literacy or awareness will not be able to utilize these tools effectively. Research shows the lack of digital literacy can decrease the use of financial management applications among young adults [19,20].

Concerns of Digital Trust and Security.

The willingness of people to use financial applications is also affected by the issues of privacy and security. There are users who are afraid that their financial transactions will be exposed to the digital platform as they are recorded. The issue of cybersecurity and data protection is reported as an obstacle to the use of financial technology tools [23].

Reminders and Accessibility

Some of the technological capabilities that can assist people include automatic reminders and notifications where people are able to record their daily

expenses more regularly. Financial management behaviour has been demonstrated to be enhanced by the use digital budgeting tools which remind and are easily accessible [19]. In the absence of these reminders, people are likely to fail to note their daily transactions, which results in the absence of complete or incongruent budget entries.

Summary of Literature Review

To sum up, the inability to keep personal budget every day depends on a combination of the individual, environmental, and technological factors. Individual influences of discipline, motivation and financial literacy are essential factors in influencing budgeting behaviour. Financial habits are also influenced by environmental factors such as the family and peer behaviour, and the efficiency of digital financial tools is predetermined by technological factors. Enhancing personal budgeting habits among students might improve financial education and financial socialization in families and encourage the use of easy-to-use financial applications.

Research Methodology

Research Design

This research paper will follow a quantitative research design based on survey research to investigate the determinants of the capacity of students to record personal budgets daily. Quantitative approach is appropriate since it enables the researcher to gather numbers and to examine the relationships among variables in a systematic way. The structured questionnaires are used to gather data to be used in this study because they allow the researcher to get standardized responses of a larger population. This design is believed to be suitable because it offers quantifiable and objective data about the impact of individual, environmental, and technological aspects on the budgeting behaviour of students.

Population and Sample

The sample of this research is the students of Politeknik Tuanku Syed Sirajuddin (PTSS) that are engaged with 6 departments. These students are deemed as the relevant respondents since they are the representatives of young adults who are still working with their own finances and are studying.

A convenience sampling technique is used in this research. This sampling technique enables the investigator to choose respondents that are readily available and interested in taking part in the study. It is widely applied in survey-based studies on students because it is practical and efficient in data collection. The study population of this research is 150 respondents, and these respondents are deemed sufficient to be representative of the population as well as to perform statistical analysis.

Research Instrument

The most important data collection tool in this research is a structured questionnaire. The questionnaire will be constructed according to the past literature which is associated with personal financial management and budgeting behaviour. It considers 5-point Likert scale (Strongly Disagree-Strongly Agree) to assess the perception and the attitude of the respondents to the variables under study.

The questionnaire will be broken down into various sections which will gauge the key factors that affect the daily budgeting practices and they include:

- Individual Factors (8 items): This scale assesses personal discipline, motivation, attitude and financial literacy.
- Environmental Factors: 7-items measure that is used to study the role of family, peer, lifestyle, and social environment in budgeting behaviour.
- Technological Factors (7 items) that determine the role of financial applications, technological skills and digital trust in administering daily budgets.

Data Collection Procedure

There are online and offline questionnaires that are used to collect the data to be used in this study. Online questionnaires are sent via online mediums like email and social media whereas printed questionnaires are sent directly to a chosen group of students. The respondents are made aware of the purpose of the study before they undergo the survey and their participation is voluntary. All respondents are treated with confidentiality and anonymity and all the information availed is strictly used during academic research.

Data Analysis Techniques

The statistical method is used in the analysis of the data obtained through the questionnaires. The characteristics of the data are summarized and described using descriptive statistics. They are frequency, percentage, mean, and standard deviation, which contribute to the explanation of the general responses of the participants.

Cronbach's alpha is applied to determine the internal consistency of the items in a construct to determine reliability of the questionnaire. An increased value of Cronbach alpha implies that the items in the questionnaire are reliable and consistent in the measurement of the variables.

Secondly, the comparative mean scores of the individual, environmental, and technological factors are used to determine the dominance of factors in influencing the budgeting behaviour of the students. The most influential factor in terms of its mean score is taken to be the most influential factor on the capacity of the students to keep their daily personal budget records.

Research Findings

Demographics (Section A)

Table 1: Respondent's Demographic Data

Variable	Frequency	Percentage
Gender	Male: [73] Female: [77]	[48.7] % [51.3] %
Age	Below 18 years: [15] 18–20 years: [73] 21–23 years: [51] 24 years and above : [11]	[10.0] % [48.7] % [34.0] % [7.3] %
Field of Study	Business / Accounting: [24] Engineering: [20] Information Technology: [32] Social Sciences: [32] Science: [42]	[16.0] % [13.3] % [21.3] % [21.3] % [28.0] %
Monthly Income/ Allowance	Less than RM500: [37] RM501 – RM999: [42] RM1,000 – RM1,499: [35] RM1,500 and above : [36]	[24.7] % [28.0] % [23.3] % [24.0] %
Living Arrangement	On-campus [54] Off-campus (rented house) [51] With family [45]	[36.0] % [34.0] % [30.0] %
Experience in Daily Budgeting	Yes: [98] No: [52]	[65.3] % [34.7] %

Factor Analysis

The three factors that affect people analysed in this part affect students in their day-to-day management of money on a **five-point Likert scale of 1=Strongly Disagree to 5=Strongly Agree.** SPSS software was used to obtain the values of Mean and Standard Deviation by analyse the data. The three mean levels were classified as **Low (1.00-2.33)**, **Medium (2.34-3.66)** and **High (3.67-5.00)**. One hundred and fifty respondents filled in this part.

Individual Factors (Section B)

Table 2: Result of Mean & Standard Deviation for Individual Factors

No.	Statement	Mean	Std. Dev	Level
B1	I am consistent in maintaining a daily budget.	3.28	0.79	Moderate
B2	I am discipline in track daily expenses.	3.31	0.82	Moderate
B3	I am motivated to maintain a daily budget regularly.	3.34	0.76	Moderate

B4	I have knowledge about the importance of daily budget tracking.	3.82	0.71	High
B5	In my opinion, small daily expenses should be recorded.	3.95	0.68	High
		3.54	0.75	Moderate

According to the above table, B1, B2 and B3 have a moderate level as the mean value is between 3.28 and 3.34. The average score of the moderate group was highest in item B3 with the mean score being 3.34(SD=0.76). This shows that most students are ready to have a daily budget although the level of compliance is average.

For item B2, the mean value is 3.31 (SD = 0.82). This shows that the discipline rate among the students in following their daily costs is average. The average of item B1 was 3.28 (SD = 0.79) which is also moderate. This observation indicates that students are not entirely consistent in keeping their daily budget.

Conversely, B4 and B5 have a high level with mean value of 3.82 and 3.95 respectively. This reveals that most of the respondents are aware of the significance of trying to keep a day-to-day budget and that minor expenses should also be noted.

Overall, the results of the study indicate that the items B1, B2 and B3 are at the moderate level which means that students are not yet stable in practicing daily budget management. Although the level of item B4 and B5 is high, it means that students are aware and know about financial management importance.

Environmental Factors (Section C)

Table 3: Result of Mean & Standard Deviation for Enviromental Factors

No.	Statement	Mean	Std. Dev	Level
C1	My family practice a financial budget every day.	3.21	0.83	Moderate
C2	My friends encourage me to manage my money every day.	3.18	0.86	Moderate
C3	My lifestyle makes it difficult to maintain a daily budget.	3.40	0.79	Moderate
C4	I am influenced by peers to spend.	3.35	0.81	Moderate
C5	There is no example in my surroundings of someone who keeps a budget.	3.12	0.88	Moderate
		3.25	0.83	Moderate

According to the above table, all the items in the environmental factor construct indicated a moderate level with an average of 3.12 to 3.40. The large mean value of 3.40 (SD = 0.79) was recorded in item C3. This implies that the lifestyle of the students at times complicates their daily budget. The mean (SD

= 0.81) of item C4 was also relatively high (3.35) which means that spending by students can be affected by peer influence.

The average score of C2 was 3.18 (SD = 0.86) that shows that the support of friends in coping with money is moderate. In the meantime, the smallest mean of 3.12 (SD = 0.88) was obtained on item C5, suggesting that not every student has examples or role models in his or her surroundings who manage their budgets regularly. In general, these results reveal that environmental factors influence the daily financial management of students moderately.

Technological Factors (Section D)

Table 4: Result of Mean & Standard Deviation for Technological Factors

No.	Statement	Mean	Std. Dev	Level
D1	Existing financial apps are too complicated to use.	3.30	0.84	Moderate
D2	I do not know how to use financial apps to track expenses.	3.22	0.87	Moderate
D3	Lack of technological skills prevents me from recording daily expenses.	3.15	0.85	Moderate
D4	I worry about data security when using digital financial applications..	3.44	0.80	Moderate
D5	The absence of automatic reminders causes me to forget to track my budget.	3.50	0.77	Moderate
		3.32	0.82	Moderate

According to the table above, the entire items in the technology factor construct recorded a moderate level with a mean value ranging between 3.15 and 3.50. The best average was obtained in item D5 with a mean of 3.50 (SD = 0.77). This implies that students tend to lose track of their budget easily due to the lack of automatic notifications on financial applications.

The mean value of item D4 was also relatively high (3.44 SD = 0.80). This means that the issue of data security is among the factors that dictate the application of financial applications.

Items D1 and D2 obtained a mean of 3.30, and 3.22 respectively, which implies that there are some students who believe that financial applications are very hard to operate or just do not know how to operate them. The mean value of item D3 was the lowest and was 3.15 (SD = 0.85), which means that the absence of technology skills influences also the ability of students to register expenses every day. All in all, these results suggest that technological aspects influence the daily financial management of students in a medium way.

Interpretation of Findings

According to the summary table above, the three study constructs have a moderate level. The highest overall mean of 3.54 (SD = 0.75) was obtained in Individual Factors construct (B). This means that individual aspects like discipline, motivation and knowledge are significant in determining the everyday financial management of students.

Technological Factors construct (D) had a mean of 3.32 (SD = 0.82). This implies that the technological influences (use of financial applications and issues relating to data security) moderate the financial management practices of students.

In the meantime, the Environmental Factors construct (C) possesses a mean value of 3.25 (SD = 0.83) implying that environmental factors like family and peers also have an impact on financial management of students at a moderate level. The findings of the study, overall, indicate the individual factors as the most dominant factor rather than the environmental and technological factors in determining the day-to-day financial management among students.

Discussion, Recommendations & Conclusion

Introduction

In this chapter, the general overview of the study findings that have been analysed in Chapter 4 are discussed. Moreover, the implications of the study are also stated in this chapter, along with the recommendations on how the research can be improved and what can be done in the future research concerning factors that affect daily financial management among students.

This research intends to determine the factors that determine how students manage their finances in their daily lives in reference to three broad constructs, which are; individual factors, environmental factors and technological factors. The data used in the study was acquired through 150 respondents and was analysed by the use of SPSS software.

Discussion

Overall, the findings of this study successfully address the research objectives and provide a clearer understanding of the factors influencing daily personal financial management among students. Based on the demographic analysis, the majority of the respondents were aged between 18 and 20 years, indicating that most participants were in the early stage of financial independence. With moderate monthly allowances (mainly between RM501 and RM999), effective financial management becomes essentials for the students to ensure that their expenses are properly controlled.

Descriptive statistical analysis also indicated that the three study constructs were at a moderate level. The highest mean value was obtained in the individual factor emerged as the most dominant. This finding is consistent with prior studies which

emphasizes that financial literacy, self-discipline, and motivation significantly influence financial behaviour [3, 6, 7]. However, a critical observation from this study is that although students demonstrate a relatively high level of awareness regarding financial management (as reflected in high mean score for knowledge-related items), their actual budgeting practices remain only at a moderate level.

This suggests a notable gap between knowledge and behaviour, which challenges the assumption in some previous studies that higher financial literacy will automatically lead to better financial practices [14, 15]. In contrast, this study supports the argument that behavioural factors such as self-control and consistency may play a more crucial role than knowledge alone [12]. Therefore, financial education programs that focus solely on knowledge delivery may not be sufficient unless they also incorporate behavioural interventions such as habit formation and self-monitoring strategies.

In terms of environmental factors, the finding indicates a moderate level of influence, which aligns with the studies highlighting the role of family and peer influence in shaping financial behaviour [2, 8, 9]. However, unlike some previous research that suggest strong social influence as a dominant factor, this study found that environmental factors are less influential compared to individual factors. This discrepancy may be due to the increasing level of individual autonomy among students, particularly those in higher education, where personal decision-making begins to outweigh external influence.

Nevertheless, peer pressure and lifestyle trends with contribute to unplanned spendings, as supported by earlier findings [2, 18]. The moderate influence observed in this study suggest that while environmental factors do affect financial behaviour, their impact may vary depending on individual resilience and financial awareness. This indicates a possible interaction effect between individual and environmental factors, which could be explored further in future research.

Regarding technological factors, this study found that technology has a moderate influence on students' financial management, which is partially consistent with previous studies [19, 20]. While earlier research suggests that financial technology can significantly improve financial behaviour through ease of access and automation [5], the findings of this study indicate that such benefits are not fully realized among students.

A critical issue identified is the presence of barriers such as low digital literacy, lack of familiarity with financial application, and concerns over data security. These finding support prior research highlighting that trust and security. These findings support prior research highlighting that the trust and usability are key determinants in the adoption of financial technology [21]. However, this study extends the discussion by showing that even when technology is available, its effectiveness is limited if users lack the necessary skills or confident to utilize it. This suggests that technological advancement alone is insufficient without parallel improvement in digital financial literacy.

In conclusion, while the findings of this study are generally consistent with existing literature, they also provide important nuances and contradictions.

Specifically, the study highlight that financial knowledge does not necessarily translate into practice, environmental influence may be less dominant than previous assumed, and technological tools are underutilized due to user-related barrier. This insight emphasized the need for a more holistic approach that integrated financial education, behavioural change strategies, social support systems, and user-friendly technological solutions to effectively improve students' financial management practices.

Recommendations

Based on the study findings, it is possible to recommend a number of recommendations to enhance financial management among the students.

Suggestions to Students

Students can be advised to be more systematic in their financial management through creating a daily or monthly budget. They also should document all the expenditures they make so as to have a better control of the money flowing out. Besides this, financial management applications can also be used by students to assist them in keeping their daily expenditures more organized.

Recommendations to the Institutions of Education.

Educational institutions are recommended to provide more financial education programs to students. Such programs as a financial management workshop or financial literacy course might provide students with an understanding of the significance of proper financial planning. Moreover, the institutions may also cooperate with financial specialists or financial bodies to expose the students to personal financial management.

Recommendations to Financial Application Developers.

The financial application developers should make sure that the applications they develop are user friendly to the students. Automatic reminders, spending analysis, and good data security system are some of the features that can make the user more confident in using the application.

Future Research Recommendations.

There are various limitations associated with this study that can be addressed in future studies. In this study, only 150 respondents were employed, and this cannot be termed to represent the entire population of students. Therefore, the study can be extended to involve additional respondents in the future to obtain more credible findings.

Second, this study was only attentive to three major factors such as individual factors, environment, and technology. The other variables that can be incorporated into the future research are the psychological variables, level of financial literacy and the influence of the social media.

Third, in future studies, other research methods such as interviews or qualitative research studies can also be implemented so as to have a deeper insight of the financial behaviour of students.

Conclusion

In general, this paper demonstrates that daily financial management of students is determined by several key factors, i.e. individual factors, environment and technology. The awareness of students on the significance of financial management is very good, but the degree of practicality remains at an average level.

Thus, students, educational institutions and other concerned parties must continuously strive to ensure an increase in the financial management level among students. Having a greater financial management skill, students will be able to prevent financial issues and will develop good financial habits in the future.

Abstract. There are various factors that influence students when selecting a field of study upon continuing their education, particularly within the Technical and Vocational Education and Training (TVET) pathway. This study aimed to investigate the factors influencing students at Kangar Branch Arau Community College in choosing the Electrical Technology Certificate program. A quantitative survey design was employed, involving 82 students from Semester 1 to Semester 3. Data were collected using a structured questionnaire and analysed using the Statistical Package for the Social Sciences (SPSS).The findings revealed that students' preference for practical-based and hands-on learning was the most influential factor in program selection, followed by perceived future career prospects and self-driven decision-making. Media-related influences such as television programs and reading materials were found to have less impact on students' choices. Despite numerous studies examining students' participation in TVET generally, limited research has focused on institution-specific factors influencing program selection at community colleges, particularly for Electrical Technology programs. This study addresses this gap by providing empirical evidence from a community college context. In conclusion, students' decisions to enrol in the Electrical Technology Certificate program are largely shaped by internal motivational factors and perceived employment opportunities. The findings offer valuable insights for TVET institutions to strengthen program promotion, career guidance, and student recruitment strategies.

Keywords: Technical and Vocational Education and Training (TVET), Electrical Technology Education, Student Decision-Making, TVET Pathway Selection

INTRODUCTION

Technological advancement has significantly influenced modern society by transforming the way people live, work, and communicate. Developments in technology have contributed to progress in many sectors, including healthcare, transportation, communication, and manufacturing. As technology continues to evolve, new innovations are constantly being introduced to address societal challenges and to improve the overall quality of life.

Among the many areas of technological development, electrical technology remains one of the most fundamental fields supporting modern infrastructure and industrial growth. In the era of the Fourth Industrial Revolution (IR 4.0), electrical technology plays an increasingly important role in supporting automation, smart systems, and advanced industrial processes. Recognising the growing demand for skilled technical workers, the Ministry of Higher Education established Community Colleges to provide skills-based education that is aligned with industry requirements. In this context, Kangar Branch Arau Community College plays an important role in preparing students with the knowledge and practical skills needed in the field of electrical technology.

Students who enrol in the Electrical Technology program are expected to develop both theoretical understanding and practical competencies that meet current industry expectations. However, many students entering Kangar Branch Arau Community College are Malaysian Certificate of Education (SPM) leavers from diverse academic backgrounds, and a considerable number of them have limited exposure to electrical or technical subjects during their secondary education. This situation raises important questions regarding the factors that influence students to choose Electrical Technology as their field of study despite having little prior experience in technical disciplines.

Understanding these factors is important for educators and institutions in order to better support students throughout their learning process. By identifying the motivations and influences behind students' choices, lecturers may be able to adopt more suitable teaching approaches that can help students adapt to the technical nature of the program. Ultimately, this can contribute to the development of competent graduates who possess both technical skills and strong personal attributes, even if they did not initially come from a science or technical background. Therefore, this study aims to identify the factors that influence students at Kangar Branch Arau Community College in selecting Electrical Technology as their program of study. Similar research has been conducted in other community colleges, such as the study by [11], which examined factors influencing students at Santubong Community College in choosing the Electrical Technology Certificate program.

LITERATURE REVIEW

The decision to pursue studies in Technical and Vocational Education and Training (TVET), including programs such as the Certificate in Electrical Technology, is often influenced by a combination of personal and environmental factors. In the context of technical education, students' interest in practical subjects and their motivation to learn are frequently identified as key elements that shape their educational choices. According to [10], students who show a strong interest in skill-based learning and possess confidence in their own abilities tend to be more inclined to pursue further studies within the TVET pathway. This inclination becomes stronger when students recognise the relevance of technical skills to future employment opportunities and career development.

Besides individual interest and motivation, social influences also play a considerable role in shaping students' educational decisions. Support from family members, encouragement from peers, and exposure during school years can significantly affect how students perceive technical education. [1] found that factors such as personality traits, changing interests, and perceptions regarding career prospects contribute to students' decisions to enrol in technical programs offered by institutions such as polytechnics and community colleges. Similarly, [12] highlighted that students' perceptions of TVET programs are often shaped by external influences, particularly peer encouragement and awareness of the employment value associated with technical qualifications.

Apart from social influences, students' readiness to enter the TVET pathway is also closely linked to internal psychological factors, particularly motivation and self-efficacy. [11] reported that students who possess higher levels of intrinsic motivation and confidence in their technical abilities tend to demonstrate greater readiness to pursue studies in technical and vocational fields. When students believe they are capable of mastering technical skills, they are more likely to view TVET education as a pathway that aligns with their personal strengths and long-term career aspirations.

Evidence from international research further supports these findings. [5] observed that parental influence, students' interest in practical skills, and perceived employment opportunities are among the main factors influencing the decision to pursue TVET programs. Although educational systems and cultural contexts differ across countries, similar patterns can be observed. Personal interest, encouragement from significant individuals, and expectations of stable career opportunities continue to shape students' decisions when selecting TVET pathways.

Previous studies have identified personal interest, motivation, parental influence, and perceived career opportunities as key determinants of students' participation in TVET programs [5][14]. However, much of the existing literature has been conducted within secondary school, polytechnic, or national-level contexts and tends to examine TVET participation at a general level. Consequently, limited attention has been given to understanding students' program selection within community colleges, particularly for specific technical disciplines such as the Electrical Technology Certificate.

Furthermore, existing studies often focus on general attitudes or enrolment trends toward TVET rather than analysing program-specific decision-making among students with non-technical backgrounds. As a result, there remains a lack of empirical evidence explaining why students with limited prior exposure to technical education choose Electrical Technology programs at community colleges. This study addresses this gap by examining institution-specific and program-related factors influencing students' decisions at Kangar Branch Arau Community College, contributing to a more contextualised understanding of TVET pathway selection in Malaysia.

RESEARCH OBJECTIVES

The objectives of this study are as follows:

1. To identify the factors influencing students' selection of the Electrical Technology Certificate program at Kangar Branch Arau Community College.
2. To identify the background characteristics of students enrolled in the Electrical Technology Certificate program at Kangar Branch Arau Community College.

RESEARCH QUESTIONS

This study seeks to address the following research questions:

1. What are the main factors influencing students' selection of the Electrical Technology Certificate program at Kangar Branch Arau Community College?
2. What are the background characteristics of students enrolled in the Electrical Technology Certificate program at Kangar Branch Arau Community College?

METHODOLOGY

Research Design

This study employed a quantitative research approach using survey design. A structured questionnaire was used as the primary data collection instrument. The questionnaire was adapted from the study conducted by [11]. Seven items related to course selection factors were selected, focusing primarily on aspects of students' interests. The items examined included interest in electrical technology, influence of television programs related to technology, reading of electrical technology materials, preference for practical-based subjects, self-driven course selection, family influence, and the perceived importance of the course for future career prospects.

Scope of the Study

The scope of this study involved students currently enrolled in the Electrical Technology Certificate program at Kangar Branch Arau Community College. The study was conducted among students from three intakes, namely Session II 2023/2024, Session I 2024/2025, and Session II 2024/2025. The validity and reliability of the data depended on

the honesty of respondents in providing accurate information through the distributed questionnaires.

Population and Sample

The population of this study consisted of 91 students enrolled in the Electrical Technology Certificate program at Kangar Branch Arau Community College across the three intake sessions. Sample selection was conducted using random sampling based on the [8] sampling table. A total of 82 students were selected as respondents, which was deemed appropriate in relation to the population size and the desired level of data reliability.

Research Instrument

Seven questionnaire items were adapted from [11]. Those items as the following:

Table 1: List of questionnaire items

No	Statement	Level of Agreement				
Course selection factors						
1	I have a strong interest in the field of Electrical Technology.	1	2	3	4	5
2	I was motivated to choose this course due to the influence of technology-related television programs.	1	2	3	4	5
3	I enjoy reading materials such as books, magazines, or articles related to Electrical Technology.	1	2	3	4	5
4	I have a strong preference for practical-based subjects or those involving hands-on skills.	1	2	3	4	5
5	I chose this course based on my own decision and personal interest, without external pressure.	1	2	3	4	5
6	My family influenced my decision to choose this course.	1	2	3	4	5
7	I believe this course will help me secure a good career in the future.	1	2	3	4	5

These items measured factors influencing course selection using a five-point Likert scale ranging from Strongly Disagree (1) to Strongly Agree (5). The use of the Likert scale enabled respondents to express their level of agreement with each statement clearly and systematically.

Table 2: Likert Scale Scoring Value

Measurement Level	Scale
Strongly Disagree	1
Disagree	2
Neutral	3
Agree	4
Strongly Agree	5

Data Collection

Data collection was conducted through an online survey. A total of 82 students enrolled in the Electrical Technology Certificate program participated as respondents. The questionnaire was distributed using Google Forms, and all respondents were required to complete the survey online. The collected data were then analyzed using the Statistical Package for Social Sciences (SPSS) version 26.0.

Findings And Data Analysis

This section presents the results of the study based on descriptive statistical analysis and reliability testing to identify the factors influencing students in choosing the Electrical Technology Certificate program at Kangar Branch Arau Community College.

1) Descriptive Analysis of Factors Influencing Program Selection

Descriptive statistics were used to analyse the mean scores and standard deviations for each item measuring factors influencing students' program selection. The results are summarised in Table 3.

Table 3 presents the mean scores and standard deviations for factors influencing students' selection of the Electrical Technology Certificate program at Kangar Branch Arau Community College.

No	Statement	Mean	Std Deviation
Course selection factors			
1	I have a strong interest in the field of Electrical Technology.	4.43	0.685
2	I was motivated to choose this course due to the influence of technology-related television programs.	3.80	0.935
3	I enjoy reading materials such as books, magazines, or articles related to Electrical Technology.	3.68	0.941
4	I have a strong preference for practical-based subjects or those involving hands-on skills.	4.57	0.667
5	I chose this course based on my own decision and personal interest, without external pressure.	4.49	0.671
6	My family influenced my decision to choose this course.	4.12	0.921
7	I believe this course will help me secure a good career in the future.	4.52	0.789

Overall, the findings indicate that personal interest and learning preferences are the most influential determinants in students' decision-making. The item *"I am interested in practical and hands-on learning"* recorded the highest mean score (M = 4.57, SD = 0.67), suggesting that experiential learning is a primary attraction of the Electrical Technology program. Similarly, students' perceptions of *future career opportunities* (M = 4.52, SD = 0.79) and *self-driven decision-making* (M = 4.49, SD = 0.67) also demonstrated high mean values, indicating strong agreement among respondents.

Interest in the Electrical Technology field itself recorded a high mean score (M = 4.43, SD = 0.69), further reinforcing the importance of intrinsic motivation. In contrast, external and media-related influences were less prominent. The influence of family encouragement showed a moderate mean score (M = 4.12, SD = 0.92), while media-related factors such as television programs (M = 3.80, SD = 0.94) and reading materials (M = 3.68, SD = 0.94) recorded the lowest mean values.

These findings suggest that students' decisions to enrol in the Electrical Technology Certificate program are predominantly driven by internal factors rather than external persuasion or media exposure.

2) To identify student background characteristics

Table 4 summarizes the demographic background of students enrolled in the Electrical Technology Certificate program at Kangar Branch Arau Community College.

Variables	Item	Frequencies	Percent (%)
Gender	Male	68	82.9
	Female	14	17.1
Age	17 - 18 year	6	7.3
	19 – 20 year	66	80.5
	21 year and above	10	12.2
Race	Malay	78	95.1
	Indian	3	3.7
	Siamese	1	1.2
Semester of study	Semester 1	11	13.4
	Semester 2	65	79.3
	Semester 3	6	7.3
Streams	Pure Science	4	4.9
	Arts	7	8.5
	Commerce	4	4.9
	Technical	5	6.1
	Others	62	75.6

The results show that the majority of students were male (82.9%), while female students accounted for 17.1%. In terms of age, most students were between 19 and 20 years old (80.5%), followed by those aged 21 and above (12.2%), and 17 to 18 years old (7.3%).
The ethnic composition was predominantly Malay (95.1%), with Indian (3.7%) and Siamese (1.2%) students representing a small proportion of the population. Most students were in Semester 2 (79.3%), followed by Semester 1 (13.4%) and Semester 3 (7.3%).
Regarding educational background prior to enrollment, the majority of students came from non-technical streams (75.6%), while smaller proportions were from arts (8.5%), technical (6.1%), pure science (4.9%), and commerce (4.9%) streams. These findings provide a clear demographic overview of students enrolled in the program.

3) Reliability Analysis

The reliability of the research instrument was assessed using Cronbach's Alpha to determine internal consistency. The overall Cronbach's Alpha value obtained for the questionnaire was 0.798, which exceeds the acceptable threshold of 0.70. This indicates

that the questionnaire items demonstrate satisfactory internal consistency and are reliable for measuring factors influencing students' program selection.

DISCUSSION

The findings of this study provide empirical support that students' decisions to enrol in the Electrical Technology Certificate program are strongly influenced by intrinsic motivational factors**,** particularly their preference for practical and hands-on learning. The high mean score recorded for this factor aligns with the fundamental characteristics of Technical and Vocational Education and Training (TVET), which emphasises experiential and skills-based learning as its core pedagogical approach. Previous studies have similarly reported that hands-on learning environments significantly enhance students' motivation and interest in technical programs, as learners are able to directly relate theoretical knowledge to practical applications [2][7].

From a theoretical perspective, this finding is consistent with Social Cognitive Career Theory (SCCT), which posits that individuals' career-related decisions are shaped by the interaction between self-efficacy, outcome expectations, and personal interests [9]. In the context of this study, students' strong inclination towards practical-based learning suggests that positive learning experiences contribute to higher self-confidence in technical skills, which subsequently influences their choice of program.

In addition, perceived future career prospects emerged as one of the dominant factors affecting students' program selection. This finding supports earlier research which highlighted employment opportunities, industry demand, and job stability as key motivators for students choosing TVET pathways [3][6]. The Electrical Technology field, in particular, is often associated with stable employment and diverse career options, which may strengthen students' expectations of positive career outcomes upon graduation. Such pragmatic considerations indicate that students are increasingly outcome-oriented when making educational decisions.

Interestingly, while family encouragement remains an influential factor, its impact was found to be secondary compared to students' personal interests and career considerations. This finding contrasts with some earlier studies that reported strong parental influence on students' educational choices, particularly at the pre-tertiary level [13]. The relatively lower impact of family influence observed in this study may suggest a shift towards greater autonomy among students at the community college level, where decision-making is more self-directed and guided by personal aspirations rather than external pressure.

Media-related factors such as television programs and reading materials recorded the lowest mean scores, indicating minimal influence on students' program selection. This finding suggests that indirect information sources play a limited role compared to direct learning interests and career-related motivations. Similar observations have been reported in previous studies, which found that institutional exposure, practical experiences, and

career guidance activities are more effective in influencing students' enrolment decisions than traditional media promotion [4].

Overall, the findings underscore the importance of aligning TVET programs with students' learning preferences and labour market expectations. For community colleges, these results highlight the need to strengthen practical training components, enhance industry relevance, and provide effective career guidance to attract and retain students in Electrical Technology programs. By addressing students' intrinsic interests and employment-oriented motivations, TVET institutions can play a more strategic role in supporting national workforce development.

CONCLUSION

In conclusion, this study successfully achieved its research objectives by identifying the factors influencing students' selection of the Electrical Technology Certificate program at Kangar Branch Arau Community College. The findings indicate that personal interest in practical-based activities and positive career prospects in the electrical field are the dominant factors driving students' decisions. Early exposure to technical learning, practical-oriented teaching approaches, and adequate institutional facilities also contribute to students' motivation, while family and peer influence were found to be less significant.

It is hoped that the findings of this study will assist lecturers in improving teaching and learning practices. This is particularly important given that many students do not have prior science or technical backgrounds before enrolling in community colleges. In addition, support in the form of motivation, career guidance, and opportunities for research and innovation should be strengthened to ensure students are not only knowledgeable but also capable of applying their skills in real-world contexts.

With comprehensive knowledge and practical skills, students are expected to achieve their personal goals and meet current industry demands. Continuous collaboration between community colleges and industry stakeholders will further enhance students' competitiveness at both national and global levels. In conclusion, the selection of the Electrical Technology Certificate program represents a strategic pathway for developing a skilled workforce capable of contributing to national development.

Abstract. As Generative Artificial Intelligence (GenAI) becomes deeply integrated into higher education, understanding the drivers of adoption among specific academic cohorts is essential. This study investigated the factors influencing behavioural intention and actual usage of Generative AI among students and lecturers within the Department of Information and Communication Technology at Politeknik Muadzam Shah. Utilizing quantitative survey design, the research draws on established technology acceptance and information systems models to analyse data with descriptive statistics, independent samples t-tests, Pearson correlations and multiple linear regression. The t-test results show no statistically significant difference in mean trust levels between students and lecturers, suggesting a broadly similar baseline of confidence in GenAI across roles. However, the regression analyses reveal that Technology Acceptance Perception (TAP)—capturing perceived usefulness, ease of use, social influence and hedonic motivation—is the main predictor of behavioural intention for both cohorts. Beyond this shared pattern, the determinants of intention diverge: for students, initial trust in GenAI's competence and reliability plays a significant secondary role, whereas for lecturers, behavioural intention is more closely tied to perceived information quality, particularly the clarity, reliability and academic relevance of GenAI outputs. Across both groups, behavioural intention is very strongly and positively correlated with actual usage, indicating that once users decide to adopt GenAI, it tends to become part of their everyday academic routines. Taken together, the findings highlight a functional gap between students and lecturers: students are efficient but potentially less critical adopters, while lecturers act as "quality-sensitive" adopters who move forward only when outputs align with professional and institutional standards. The study concludes that in technical higher-education settings, GenAI adoption is driven primarily by functional utility and technical excellence, and that sustainable institutional strategies should simultaneously build students' critical evaluation skills and provide staff with reliable tools, clear guidance and assurance that GenAI can support rather than weaken academic standards.

Keywords: Generative AI, Technology Acceptance, Higher Education, Behavioural Intention, Trust Gap.

Introduction

Generative Artificial Intelligence (GenAI) tools such as ChatGPT have moved very quickly from being experimental curiosities to becoming part of everyday practice in higher education [1, 2]. They now sit alongside learning management systems, search engines and coding platforms as resources that students and lecturers routinely draw on [1, 3]. For technical programmes, where students are constantly working with code, algorithms and technical documentation, the attraction is clear: GenAI can produce examples, explanations and alternative solutions in a matter of seconds [2, 3, 4].

However, simply making these tools available does not guarantee that everyone will use them in the same way, or even at all. Studies across a range of institutions show that adoption is shaped by how useful and easy to use people think GenAI is, what they believe their peers and institutions expect of them, and how much they trust the technology, rather than by access alone [2, 5, 6, 7]. Student-focused research tends to report quite positive attitudes: many students feel that ChatGPT helps them work more efficiently, makes difficult topics more approachable and boosts their confidence when tackling assignments [2, 4, 8]. Lecturers, by contrast, are often more cautious. They worry about plagiarism, superficial learning and inaccuracies in AI-generated content, and they are conscious of the potential impact on disciplinary standards and academic integrity [1, 3, 5, 9].

This difference in how students and lecturers approach GenAI is increasingly described as a "trust gap". Students are generally more willing to experiment with these tools and to incorporate them into their day-to-day study routines. Lecturers, meanwhile, tend to take a more reserved stance, and place greater emphasis on reliability, ethics and alignment with institutional policies [5, 10, 11]. Concerns about AI hallucinations—fluent but incorrect or fabricated answers—intensify this divide. Reviews of the literature indicate that repeated exposure to such errors can undermine trust and lead users to step back from using GenAI in more critical tasks [12]. Instructors often cite hallucinations and the opaque nature of AI reasoning as central reasons for restricting GenAI to exploratory or low-stakes activities [9, 10, 11].

In Malaysian polytechnics and TVET environments, these global developments interact with local institutional cultures, regulatory frameworks and expectations of both staff and students. Studies suggest that students' intentions to use GenAI are strongly influenced by perceived performance gains, ease of use and what they see others around them doing, while lecturers are more heavily guided by their professional responsibilities, policy guidance and perceptions of risk [6, 13, 14]. Meta-analyses of the Technology Acceptance Model (TAM) and the Unified Theory of Acceptance and Use of Technology (UTAUT) reinforce the importance of these constructs in explaining how new technologies are taken up in higher education settings [7, 15, 16]. Even so, sector-level reports note that institutional AI strategies are often very broad, and do not always distinguish clearly between the different needs and motivations of students and staff [17, 18, 19]. Against this backdrop, there is a need for more fine-grained, context-specific evidence that can inform institutional decision-making about GenAI.

For institutions that wish to move beyond generic guidance, it is important to understand, within a specific context, how students and lecturers make sense of GenAI and what drives their decisions to use or avoid it. Much of the existing research looks at one group or the other, which makes it difficult to see how perceptions align or diverge when both groups are operating under the same institutional and technological conditions [4, 5, 10, 20]. This study responds to that need by focusing on the Department Information and Communication Technology at Politeknik Muadzam Shah. It examines how Technology Acceptance Perception (TAP), perceived

information quality and initial trust relate to behavioural intention and actual usage of GenAI for both students and lecturers. Grounded in UTAUT2, the IS Success Model and initial trust theory, the study aims to clarify whether a shared set of factors drives adoption across roles, or whether distinct patterns emerge that point to the need for tailored AI integration strategies [7, 16, 21, 22, 23].

Literature Review and Theoretical Framework

Generative AI in Technical Education. GenAI, especially in the form of large language models (LLMs), now features prominently in discussions about the future of teaching and learning in higher education [1, 3]. Unlike earlier digital tools that largely stored or delivered information, LLM-based systems can create new content on demand: explanations, summaries, examples and code can all be generated in response to user prompts [1, 3]. This capability is particularly relevant in information technology and communication programmes, where students must engage with abstract concepts and practical programming tasks, and often appreciate having multiple worked examples and alternative explanations available [2, 3, 4].

Student-centred studies paint a generally positive picture of GenAI's role in learning. Many students describe ChatGPT as a flexible and responsive support tool that helps them to manage complex tasks, reduce cognitive load and receive rapid feedback when human assistance is not immediately available [2, 4, 8]. Some view it as a helpful "study partner" that complements, rather than replaces, lectures, tutorials and peer discussion [4, 8]. At the same time, the literature regularly highlights significant risks, including academic misconduct, over-reliance on AI-generated content and the potential for students to engage less deeply with course material if they accept plausible-sounding answers without critical evaluation [1, 3, 9].

From the perspective of lecturers, GenAI tends to be approached with more caution. Reviews of AI in assessment point to interesting possibilities for richer feedback and new assessment formats, but they also underline serious concerns about authorship, authenticity and fairness [9]. Studies focusing on lecturers, report that hallucinations, bias and misalignment with disciplinary standards are recurring reasons for limiting or avoiding GenAI in formal teaching and assessment [5, 10, 11].

These differing perspectives between students and lecturers suggest an emerging contrast in how each group judges the risks and benefits of GenAI, with students generally more enthusiastic and staff more reserved and risk-aware [5, 10, 11]. Students' adoption of GenAI appears to be strongly influenced by perceived usefulness, ease of use and peer behaviour, whereas instructors' decisions are more closely tied to institutional guidance, perceived risk and responsibility for academic standards [6, 13, 14]. Against this backdrop, there is a need to understand, in a specific technical department, how students and lecturers differ in their evaluations of GenAI, and how these evaluations translate into behavioural intention and actual usage.

Technology Acceptance Perception (TAP) and UTAUT2. The Unified Theory of Acceptance and Use of Technology (UTAUT) and its extension UTAUT2 provide a widely used lens for understanding why individuals choose to adopt or reject new technologies [7, 16]. UTAUT2, which was developed with consumer technologies in mind, adds constructs such as hedonic motivation, price value and habit to the original model, making it well-suited to voluntary use of tools like GenAI in higher education [7]. These models have been applied to a range of educational technologies, including learning management systems, mobile applications and GenAI-based tools [4, 6, 14,15, 20].

Empirical studies with students show that performance expectancy (the belief that GenAI improves learning outcomes) and effort expectancy (perceived ease of use) are key drivers of intention to use ChatGPT, often reinforced by social influence from peers and educators [4, 6]. Hedonic motivation, reflecting enjoyment and curiosity when interacting with conversational AI, has also been found to exert a notable influence on students' willingness to adopt GenAI in their studies [2, 4]. Studies of academic staff similarly report that perceived usefulness, ease of use and social norms are important in explaining lecturers' behavioural intentions to use GenAI, although these are moderated by concerns about workload, accountability and institutional policy [13, 14, 20].

In this study, Technology Acceptance Perception (TAP) is conceptualised as a higher-order construct that aggregates four UTAUT2 dimensions: performance expectancy, effort expectancy, social influence and hedonic motivation. This conceptualisation reflects the idea that, taken together, these dimensions capture the overall readiness and desire to engage with GenAI. Considering the accumulated evidence from UTAUT2-based GenAI studies, the following hypothesis is proposed:

- H2a: TAP (comprising performance expectancy, effort expectancy, social influence and hedonic motivation) significantly predicts behavioural intention to use GenAI for both students and lecturers.

Information Quality and the IS Success Model. While UTAUT2 and TAP address motivational and social aspects of adoption, they do not fully capture the technical and content-related standards that are central in educational contexts, particularly in technical and vocational programmes. The DeLone and McLean IS Success Model offers a complementary perspective by highlighting system quality, information quality and service quality as core dimensions of information system success [21, 22]. Information quality, in this model, refers to the accuracy, relevance, completeness and timeliness of the information produced by an information system [21, 22].

In the context of GenAI, information quality has emerged as a major point of concern. Large language models are known to generate outputs that are coherent yet factually incorrect or fabricated. A systematic review of AI hallucinations demonstrates that such behaviour can substantially undermine user trust and reduce willingness to rely on AI systems, particularly where errors are difficult to detect [12]. In higher education, lecturer-focused studies indicate that staff acceptance of GenAI is closely tied to their perceptions of the reliability and academic robustness of AI-generated content [9, 10, 11]. Where information quality is perceived as inconsistent or opaque, instructors tend to restrict GenAI to low-stakes or exploratory uses; where they can manage quality through verification or clear task design, they are more open to experimental integration [9, 11, 13].

These issues are especially pronounced in the Information Technology and Communication Department context, where students work with code, algorithms and technical explanations that require high precision. Lecturers are responsible for ensuring that learning materials and assessments meet institutional and professional standards. It is therefore reasonable to expect that perceived information quality will be particularly influential for lecturers, who must balance potential benefits of GenAI against the risk of inaccuracies. Accordingly, the study hypothesises that:

- H2c: Perceived Quality significantly predicts Behavioural Intention to use GenAI for lecturers.

Initial Trust Theory and the "Trust Gap". Trust is another critical factor in the early stages of technology adoption, and initial trust theory posits that users form judgements about a system's competence, benevolence and integrity based on limited

experience and available cues [23]. In the GenAI context, both students and lecturers typically engage with tools such as ChatGPT without detailed knowledge of the underlying models, and instead rely on the apparent coherence of outputs, interface design and institutional discourse around AI [1, 5, 8].

The literature increasingly recognises that hallucinations have direct implications for trust. Systematic evidence suggests that repeated exposure to inaccurate or fabricated outputs weakens users' trust and may lead them to restrict or discontinue GenAI use [12]. Instructor-focused studies show that lecturers are acutely aware of these risks, often citing uncertainty about when AI can be trusted as a key obstacle to integrating GenAI into teaching and assessment [10, 11].

Student-oriented research, however, presents a more nuanced picture. Many students report high perceived usefulness and satisfaction with GenAI, even when they acknowledge that it can be wrong [2, 4, 8]. They may treat AI-generated content as a provisional starting point, particularly in areas where their own expertise is still developing and are often willing to accept some level of inaccuracy in exchange for efficiency and convenience [4, 8, 18, 19]. Large-scale surveys across the higher education sector suggest that students are simultaneously attracted by the potential for time-saving and concerned about over-reliance and the impact on skills, but these concerns do not necessarily translate into non-use [18, 19].

Taken together, these findings point towards a functional trust gap between students and lecturers: students may be more inclined to "work with" GenAI despite its limitations, while lecturers seek stronger assurances of accuracy, transparency and ethical alignment [5, 10, 11, 18, 19]. In line with initial trust theory, the present study therefore expects that initial trust will be particularly important for students' adoption decisions, while lecturers' intentions will be more strongly shaped by information quality and TAP. The following hypotheses are proposed:

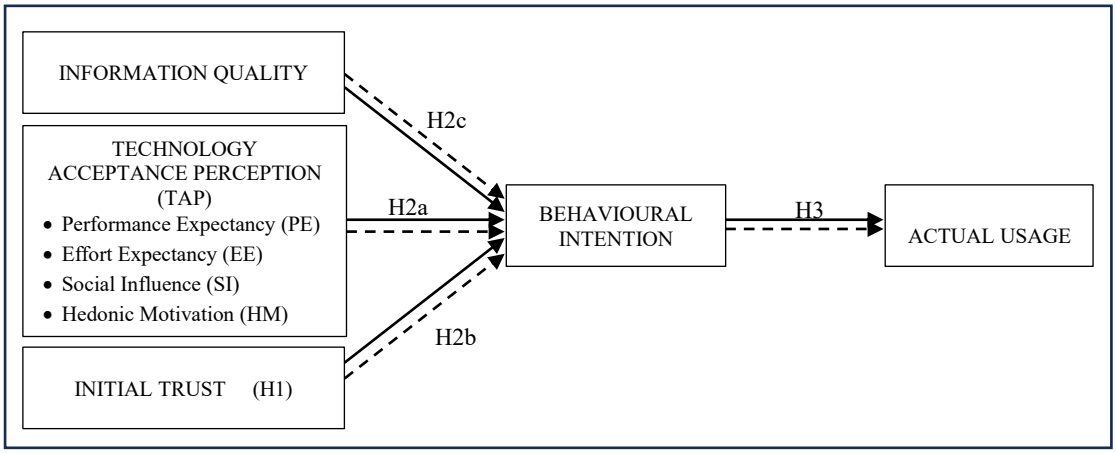
- H1: There is a significant difference in mean trust levels between students and lecturers.
- H2b: Initial Trust significantly predicts Behavioural Intention for students.

Integrated Research Framework and Hypotheses. Bringing these strands together, the study develops an integrated framework that combines TAP derives from UTAUT2, the IS Success Model and initial trust theory to explain GenAI adoption among students and lecturers in a polytechnic setting. TAP captures the main motivational and social determinants of adoption (performance expectancy, effort expectancy, social influence, hedonic motivation) [4, 6, 7, 15]. Perceived information quality reflects users' evaluations of the accuracy and academic suitability of GenAI outputs, drawing on the IS Success tradition [9, 11, 13, 21, 22]. Whereas Initial Trust represents early beliefs about GenAI's competence and reliability, influenced by direct experience and wider discussions about AI in education [10, 12, 23].

Within this framework, behavioural intention is conceptualised as the immediate outcome of TAP, perceived information quality and initial trust. Actual usage is then modelled as the behavioural expression of this intention, consistent with established findings in UTAUT and related models that intention is a proximal predictor of use [7, 4, 16]. This leads to the final hypothesis

- H3: Behavioural Intention is positively and significantly correlated with Actual Usage for both cohorts.

Fig. 1 summarises these relationships, indicating the proposed paths from TAP, initial trust and perceived information quality to behavioural intention, and from behavioural intention to actual usage, with solid lines representing the student cohort and dashed lines representing the lecturer cohort.



Note: Solid Line = Student Cohort; Dashed Line = Lecturer Cohort.

Fig. 1: Proposed Research Framework (Adapted from [7, 21, 23]).

Research Methodology

Research Design and Sampling. This study used a quantitative, cross-sectional design to examine the factors that shape GenAI adoption in a real higher-education environment. It followed a deductive approach, drawing on established models of technology acceptance and information systems success to generate specific hypotheses about behavioural intention and actual use of GenAI tools.

Data were gathered at Politeknik Muadzam Shah, with a focus on the Department Information and Communication Technology. This setting was chosen because both students and lecturers there work extensively with digital systems and are accustomed to technology-mediated learning, which is particularly relevant when investigating GenAI in a technical context.

In total, 292 valid responses were obtained. The student cohort ($N = 255$) represents the main user group of GenAI as a learning support tool, while the lecturer cohort ($N = 37$) comprises academic staff who design and deliver content, oversee assessment and act as gatekeepers of academic standards.

Data Collection Procedure. The survey instrument was developed by adapting existing, validated scales for constructs such as technology acceptance, information quality and initial trust, and tailoring them to the context of GenAI in higher education. Items were written to be meaningful to both students and lecturers, drawing on current discussions about how GenAI is used for teaching, learning and assessment.

All constructs were measured using a five-point Likert scale ranging from 1 (Strongly Disagree) to 5 (Strongly Agree). After cleaning the data, mean composite scores were computed for the core variables: Technology Acceptance Perception (TAP), Information Quality, Initial Trust, Behavioural Intention and Actual Usage. Computing means in this way allowed individual item responses to be aggregated into coherent measures for each construct. The split-file procedure was again used at this stage, so that mean scores and relationships between constructs could be compared between students and lecturers.

Construct Operationalization and Measurement. All constructs were operationalised using multiple items, with responses captured on the same five-point Likert scale. Composite scores were created by averaging the relevant items for each construct, providing higher-order measures suitable for correlation and regression analysis. The measurement items were adapted from established and validated instruments in prior literature to ensure content validity, particularly from the UTAUT2

model [7, 16] by Venkatesh et al., the DeLone and McLean Information Systems Success Model [21, 22], and the technology trust model by McKnight et al. [23], with wording modified to reflect the context of Generative AI in higher education.

- Technology Acceptance Perception (TAPMean). TAP was treated as a composite construct made up of four key dimensions: performance expectancy, effort expectancy, social influence and hedonic motivation. Items for these dimensions were adapted from the UTAUT2 model proposed by Venkatesh et al. [7, 16] and extended to refer specifically to GenAI. Collectively, they capture respondents' overall sense of how useful, easy, socially supported and intrinsically engaging GenAI is in their academic work.
- Information Quality (QualityMean). Information quality was measured using six items (IQ1, IQ2, SQ1, SQ2, SVQ1, SVQ2). These items addressed the clarity of GenAI explanations, perceived reliability of outputs, ease of navigating the interface, relevance to academic tasks, availability when needed and response speed. The construct was adapted from the DeLone and McLean Information Systems Success Model [21, 22], focusing on key dimensions of information, system, and service quality in an educational context.
- Initial Trust (TrustMean). Initial trust was assessed with five items (TR1–TR5), focusing on beliefs about the AI's competence, honesty, benevolence, predictability and overall dependability in academic contexts. These items were adapted from the trust model developed by McKnight et al. [23] and capture early trust judgements formed based on limited experience with GenAI tools.
- Behavioural Intention (BIMean). Behavioural intention was measured with three items that asked respondents about their intention to continue using GenAI regularly and their willingness to recommend it to others. These items were adapted from prior UTAUT-based technology adoption studies [7, 16] and reflect the degree to which respondents see GenAI as part of their future academic practice.
- Actual Usage (UseMean). Actual usage was captured through two items that asked how frequently respondents use GenAI and the extent to which it has become embedded in their daily academic routines. These items were adapted from prior studies on technology usage behaviour grounded in UTAUT frameworks [7, 16], providing a behavioural counterpart to the intention measure.

Together, these operational definitions provide a coherent measurement framework for examining how TAP, information quality and initial trust relate to intention and use of GenAI among students and lecturers.

Statistical Analysis Plan. All analyses were carried out in SPSS v20. A split-file procedure was used so that data for students and lecturers could be examined separately, allowing direct comparison of patterns across the two roles. Data analysis proceeded in four main stages. This sequence was designed to provide a thorough test of the proposed hypotheses and to ensure that the measures were statistically sound before drawing substantive conclusions.

First, internal consistency was examined for each composite construct using Cronbach's alpha. A threshold of 0.70 was set as the minimum acceptable value for both cohorts, indicating satisfactory reliability of the scales.

Second, an Independent Samples t-test was used to assess the "trust gap" hypothesis by comparing mean initial trust scores for students and lecturers. Levene's test for equality of variances was used to check whether the assumption of equal variances held;

the appropriate version of the t-statistic (equal or unequal variances assumed) was then reported.

Third, Pearson's correlation coefficients were calculated to explore the relationships between the main constructs: information quality, initial trust, TAP, behavioural intention and actual usage. This provided an initial indication of how strongly the variables were associated before moving to multivariate analysis.

Finally, multiple linear regression was conducted with behavioural intention (BIMean) as the dependent variable and TAPMean, TrustMean and QualityMean as predictors, estimated separately for students and lecturers. This model tests the relative contribution of technology acceptance, initial trust and information quality to intention to use GenAI. Collinearity diagnostics, including Tolerance and the Variance Inflation Factor (VIF), were examined to ensure that multicollinearity did not distort the regression results. The relationship between behavioural intention and actual usage was then evaluated by examining the correlation between BIMean and UseMean, and by considering how far stated intentions aligned with reported usage patterns in each cohort.

Results And Discussion

Descriptive Statistics and Construct Reliability. Table 1 provides an overview of the central tendencies for each construct. Across both cohorts, mean scores range from 3.77 to 4.31 on the five-point scale, indicating generally positive perceptions of GenAI in the Information Technology and Communication Department. Lecturers report slightly higher mean scores than students on all five constructs (see Table 1), with the highest mean observed for information quality among lecturers (M = 4.31). This suggests that those lecturers who do engage with GenAI tend to regard its outputs as reasonably clear, relevant and timely within their teaching context.

Table 1: Descriptive Statistics and Reliability Results

Construct	Role	Mean	Std. Deviation	Cronbach's α
Information Quality	Student (N=255)	4.02	0.63	0.885
	Lecturer (N=37)	4.31	0.42	0.813
Initial Trust	Student (N=255)	3.84	0.67	0.892
	Lecturer (N=37)	3.99	0.53	0.841
Technology Acceptance (TAP)	Student (N=255)	3.88	0.70	0.883
	Lecturer (N=37)	4.17	0.53	0.827
Behavioural Intention	Student (N=255)	3.78	0.78	0.878
	Lecturer (N=37)	4.22	0.57	0.917
Actual Usage	Student (N=255)	3.77	0.88	0.855
	Lecturer (N=37)	3.96	0.81	0.907

The reliability coefficients reported in Table 1 show that all scales exceed the conventional threshold of 0.80 for Cronbach's alpha, for both students and lecturers. This indicates excellent internal consistency and confirms that the composite scores for technology acceptance, information quality, initial trust, behavioural intention and actual usage are suitable for subsequent multivariate analysis.

Table 2: T-Test Results for Trust Levels (H1)

Variable	Role	Mean (M)	Std. Dev (SD)	t-value	df	Sig. (2-tailed)
TrustMean	Student	3.84	0.67	-1.62	54.67	0.110
	Lecturer	3.99	0.53			

Comparative Analysis of Initial Trust (H1). The first hypothesis examined whether there is a statistically significant difference in initial trust between students and lecturers. An independent samples t-test was conducted, with results summarised in Table 2. Lecturers reported a slightly higher mean trust score (M = 3.99, SD = 0.53) than students (M = 3.84, SD = 0.67). However, Levene's test indicated unequal variances, and the adjusted t-test showed that this difference was not statistically significant, t (54.67) = −1.62, p = .110 (see Table 2). Accordingly, H1, which proposed a significant difference in mean trust levels, is not supported.

This finding contrasts with several recent studies that portray students as markedly more enthusiastic and trusting of GenAI, and lecturers as more sceptical and cautious [5, 10, 11]. In the present context, both cohorts appear to share a broadly similar baseline level of trust in GenAI tools. One possible reason is that students and lecturers in a technical department encounter GenAI through the same institutional messages, demonstrations and hands-on activities, which may reduce the gap that appears in more varied institutional contexts [1, 2, 3]. This suggests that differences in how the two cohorts adopt GenAI are more likely to come from the way trust combines with other factors, rather than from large differences in trust alone.

However, this non-significant result needs to be interpreted with some caution because of the imbalance in sample sizes. With only 37 lecturers compared with 255 students, the test may not have had enough statistical power to pick up more subtle differences in trust that could emerge in a larger, more evenly balanced sample.

Table 3: Students and Lecturers Pearson Correlation Matrix

Construct	1	2	3	4	5
Information Quality	—	.694**	.714**	.748**	.570**
Initial Trust	.805**	—	.518**	.546**	.423**
Technology Acceptance	.749**	.803**	—	.842**	.818**
Behavioural Intention	.656**	.731**	.823**	—	.828**
Actual Usage	.575**	.644**	.738**	.818**	—

Note: The Lower Triangle (plain text) represents the Student cohort (N=255). The Upper Triangle (bold text) represents the Lecturer cohort (N=37). ** Correlation is significant at the 0.01 level (2-tailed).

Correlation analysis and the intention–usage relationship (H3). To understand how the main constructs are connected, Pearson correlation coefficients were calculated separately for students and lecturers. As shown in Table 3, all these relationships are positive and statistically significant at the 0.01 level, with some clearly stronger than others in each group. Taken together, this pattern suggests that the constructs tend to

move in the same direction and, in many cases, are moderately to strongly linked, forming a coherent cluster of related perceptions rather than operating in isolation.

The strongest and most consistent association, as shown in Table 3, is between behavioural intention and actual usage. For students, the correlation between BIMean and UseMean is $r = .818$ ($p < .01$); for lecturers, the corresponding value is $r = .828$ ($p < .01$ (see Table 3). These very strong relationships clearly support H3, which proposes that intending to use GenAI is positively and significantly connected to actually using it in both groups. They are also in line with earlier work on technology acceptance and GenAI in higher education, where behavioural intention regularly emerges as a reliable predictor of how often people use a system in practice. [4, 6, 13, 16, 20].

Among students, Technology Acceptance Perception (TAPMean) is strongly correlated with behavioural intention ($r = .823$, $p < .01$) and with actual usage ($r = .738$, $p < .01$) as shown in Table 3. This means that students who see GenAI as useful, easy to use, socially supported and engaging are more likely to plan to use it and to weave it into their everyday academic work. Initial trust (TrustMean) also shows substantial positive correlations with TAP ($r = .803$, $p < .01$) and with behavioural intention ($r = .731$, $p < .01$) (see Table 3), suggesting that students who have more confidence in GenAI's competence and reliability tend to hold more positive views of it and stronger intentions to rely on it. Information quality (QualityMean) is positively related to intention as well ($r = .656$, $p < .01$), but this association is a little weaker than for TAP and trust, hinting at its more limited role in the student regression model. Overall, this pattern fits with earlier studies that stress the combined importance of perceived usefulness, ease of use and trust in shaping students' adoption of GenAI tools, with information quality acting as a secondary influence [2, 4, 8, 18, 19].

For lecturers, TAPMean again exhibits strong positive correlations with both behavioural intention ($r = .842$, $p < .01$) and actual usage ($r = .818$, $p < .01$) (see Table 3), underlining how central technology-related perceptions are in shaping staff decisions to use GenAI. Information quality shows a relatively stronger association with behavioural intention in the lecturer cohort ($r = .748$, $p < .01$) than in the student cohort and is also positively related to actual usage ($r = .570$, $p < .01$). This pattern suggests that lecturers' decisions about whether and how often to use GenAI depend heavily on how clear, reliable and academically appropriate they judge its outputs to be, which matches earlier work showing that information quality is crucial for educators' willingness to bring GenAI into teaching and assessment [9, 10, 11]. Initial trust is positively correlated with behavioural intention for lecturers as well ($r = .546$, $p < .01$), but this relationship is clearly weaker than for students, foreshadowing the regression results where trust does not emerge as a significant predictor for the lecturer group.

Taken together, the correlation findings show that the constructs are linked in ways that fit well with the underlying theories, and that the connection between intention and actual usage is very strong for both students and lecturers. At the same time, the different correlation patterns for trust and information quality across the two cohorts indicate that these factors may shape intention in different ways for students and staff, which provides a clear motivation for using multiple regression to examine their distinct contributions to behavioural intention in each group separately.

Multiple regression analysis: Predictors of behavioural intention (H2a, H2b, H2c). Although the average trust scores for students and lecturers are not significantly different, this does not imply that trust develops in the same way for both groups. The overall levels may look similar, but the underlying drivers of that trust are likely to differ – for instance, lecturers may focus more on technical quality and their

professional responsibilities, whereas students may be more influenced by efficiency, ease of use and social pressures. This contrast highlights the importance of using multiple regression analysis, which looks at the specific predictors of behavioural intention for each cohort separately. The results of these models are presented in Table 4.

Table 4: Multiple Regression Results by Role

Predictor	Student Beta (β)	Student Sig. (p)	Lecturer Beta (β)	Lecturer Sig. (p)	Hypothesis Result
TAPMean	0.663	.000*	0.628	.000*	H2a supported (students, lecturers)
TrustMean	0.199	.004*	0.024	.840	H2b supported (students only)
QualityMean	-0.001	.988	0.283	.063†	H2c not supported; trending for lecturers
R^2	0.691		0.753		

*Significant at p < .01; †Significant at p < .10 (Trending).

For students, the regression model explains 69.1% of the variance in behavioural intention ($R^2 = .691$) shown in Table 4, indicating a strong overall fit. TAP emerges as a powerful and highly significant predictor, with a large positive standardised coefficient. This suggests that students' intentions to use GenAI are mainly driven by how useful, easy, socially supported and enjoyable they perceive it to be. This pattern is in line with recent GenAI research showing that performance expectancy, effort expectancy and hedonic motivation are key factors in students' decisions to adopt such tools [2, 4, 6, 13, 14].

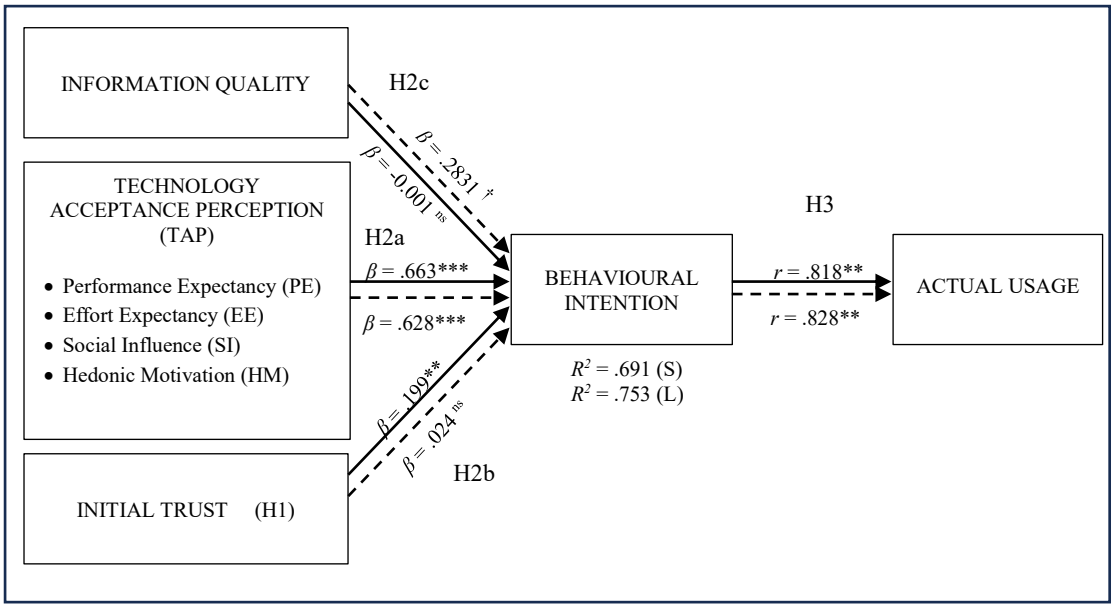
Initial trust also makes a statistically significant contribution to students' behavioural intention, but its effect is smaller than that of TAP (see Table 4). This means that, beyond viewing GenAI as useful and easy to work with, students' early confidence in the system's competence and reliability still plays a meaningful, though secondary, role in whether they choose to use it regularly. This role for trust is consistent with studies that describe it as a practical support, allowing students to lean on GenAI in areas where their own skills are still developing [8, 12, 18, 19, 23]. In contrast, once TAP and trust are taken into account, information quality no longer emerges as a significant predictor for students, suggesting that detailed judgements about accuracy and content quality matter less for this group than overall perceived benefits and general confidence in the tool.

For lecturers, the regression model explains 75.3% of the variance in behavioural intention ($R^2 = .753$) (see Table 4), indicating a very good fit. TAP again stands out as a strong, highly significant predictor, reinforcing that perceptions of usefulness, ease of use and social influence are also central to staff decisions about adopting GenAI, as seen in UTAUT-based studies of GenAI and other teaching technologies [13, 14, 15, 20]. In contrast, initial trust is not a significant predictor (see Table 4) in the lecturer model, suggesting that lecturers' choices are shaped less by general, diffuse trust in GenAI and more by how well the tool aligns with their teaching goals, assessment practices and institutional requirements.

Information quality has a positive coefficient for lecturers and comes close to statistical significance, even with the relatively small staff sample. Although this falls short of fully supporting H2c as shown in Table 4, it is in line with research showing that educators give considerable weight to the reliability and academic robustness of

AI-generated content when deciding whether to integrate GenAI into teaching and assessment [9, 10, 11]. This trend supports the view that lecturers are "quality-sensitive" adopters: even when they recognise that GenAI is useful and easy to use, they remain cautious unless they are confident that the outputs are of sufficient quality to be incorporated into their modules and assessments.

Overall, the regression findings support H2a for both cohorts, as TAP significantly predicts behavioural intention among students and lecturers. H2b is supported in the student sample only, with initial trust significantly predicting intention for students but not for lecturers. H2c receives partial support, in so far as information quality appears more relevant for lecturers than for students, but its effect is modest and constrained by sample size.



Note: Values on paths represent standardised Beta coefficients (β) for predictive relationships and Pearson correlation coefficients (r) for the outcome relationship. *** $p < .001$ (Highly Significant); ** $p < .01$\$ (Significant); †p < .10$ (Marginally Significant/Trending); ns = not significant. (S) = Student Cohort (N=255); (L) = Lecturer Cohort (N=37). Solid Line = Student Cohort; Dashed Line = Lecturer Cohort.

Fig. 2: Validated Research Model illustrating the functional gap between student and lecturer cohorts.

Discussion. The findings portray two stakeholder groups that are similarly accustomed to GenAI yet rely on it for markedly different reasons. When the results in Tables 1–4 are considered alongside the validated model in Fig. 2, the central issue is not a difference in how much students and lecturers trust GenAI, but rather in how that trust is mobilised in their adoption decisions. Although the t-test indicates no meaningful difference in mean initial trust, the correlation and regression patterns show that trust, information quality and technology acceptance combine in distinct ways for each cohort.

For students, behavioural intention is largely governed by TAP, with initial trust providing an additional, though secondary, influence and information quality becoming negligible once these variables are included. In practical terms, students appear willing to use GenAI when it is experienced as helpful, easy to operate and socially normalised, and when they hold a basic belief that it will "do the job" in most cases, even while recognising its imperfections. Their decisions are shaped more by perceived usefulness and fluency than by systematic scrutiny of accuracy. In this configuration, trust

functions as a shortcut: once a comfortable threshold is reached, it smooths the path to routine use without requiring detailed evaluation of every output.

For lecturers, the pattern shifts. TAP continues to anchor behavioural intention, so GenAI still needs to be perceived as useful and workable before it is incorporated into teaching practice. However, the relative weight moves away from trust and towards information quality. Lecturers appear less persuaded by a general sense that the tool is "good" and more by whether its outputs are consistently accurate, appropriate and defensible in classroom and assessment contexts. Their adoption is conditional: GenAI is accepted only to that extent that it can be integrated into lessons and assessments without diluting academic standards or generating additional problems that must later be corrected.

Taken together, these results point to a functional trust gap rather than a simple trust deficit. Students and lecturers begin from comparable trust baselines, but they put that trust to work in different ways. For students, trust sits alongside TAP as a facilitator of uptake, lowering the likelihood that they will pause to interrogate each response in depth. For lecturers, trust on its own is insufficient; it must be reinforced by convincing evidence of quality and compatibility with their professional responsibilities. The same construct — "trust" — thus occupies two distinct positions within the adoption process.

Implications within the department. This functional gap has direct implications for how GenAI should be supported and governed within the department. On the student side, the principal vulnerability is uncritical use. Once students judge GenAI to be useful and easy to employ, their strong intentions tend to translate into habitual usage, often without parallel attention to whether outputs are accurate, balanced or appropriate for the task at hand. If left unaddressed, this pattern can foster over-reliance on fluent but flawed answers and may impede the development of students' own critical judgement.

On the lecturer side, the risk is almost the mirror image. Because intentions are closely tied to perceived information quality and professional fit, some lecturers may delay adoption or confine GenAI to narrow, low-stakes roles until they are satisfied that it can be trusted in more central aspects of teaching and assessment. This cautious stance serves as a protective mechanism for academic standards, but it may also limit opportunities to leverage GenAI where it could genuinely enhance learning, feedback or efficiency, provided appropriate safeguards are in place.

Across both groups, the very strong association between behavioural intention and actual usage indicates that decisions about GenAI are not casual or transient. Once either group crosses the threshold of "I intend to use this," they are likely to embed the tool into their routine academic work. This underscores the importance of the upstream drivers—TAP, trust and information quality—as levers for change. Adjusting how these constructs are understood, discussed and supported within the department is likely to have a visible impact on how GenAI is used in day-to-day teaching and learning.

In sum, the results caution against treating GenAI "users" as a single, homogeneous category. Students and lecturers may look similar at the level of overall attitudes, but the mechanisms that underlie their adoption decisions are meaningfully different. Any serious policy or professional development effort in this context will need to recognise these differences: encouraging students to slow down, question and verify GenAI outputs, while enabling lecturers to feel confident that, when they choose to use GenAI, it will enhance rather than erode the standards for which they are accountable.

Conclusion, Limitations, and Future Work

Conclusion. This study shows that using one general approach to GenAI in higher education does not work well because students and lecturers use and evaluate these tools differently. Students tend to adopt GenAI quickly when they see it as useful and easy to use, and when they feel confident using it. However, they usually do not spend much time checking whether the information is accurate. This makes them efficient users but also puts them at risk of relying on answers that may sound correct but are wrong

Lecturers, on the other hand, take a more careful and analytical approach. Their decision to use GenAI depends less on general trust and more on whether the information is accurate, suitable for teaching, and aligned with academic and assessment standards. In other words, lecturers will only use GenAI when they are confident that it meets professional and academic requirements.

These differences show a clear gap between students and lecturers, which has important implications for how institutions manage GenAI use. To support long-term and effective use, institutions need to help students improve their ability to check and evaluate AI-generated information, while also supporting lecturers with reliable tools and clear guidelines. The strong link between intention and actual use also shows that once users decide to use GenAI, it quickly becomes part of their daily academic work.

Based on these findings, several practical actions are recommended. First, institutions should provide AI literacy training for students, focusing on how to check accuracy, verify information, and use AI responsibly. Second, clear guidelines on how GenAI can be used in academic work should be introduced to avoid misuse and confusion. Third, institutions should offer training and support for lecturers to help them use GenAI confidently in teaching and assessment. Finally, institutions should provide access to trusted or approved GenAI tools, so both students and lecturers can rely on more accurate and suitable outputs.

Limitations and Future Work. This study has several limitations that should be kept in mind when interpreting the findings. The most important is the relatively small lecturer sample, which reduces the statistical power of the analyses and may mask subtler effects, particularly around information quality and trust. The focus on a single department in one polytechnic also means the results reflect a specific institutional and disciplinary context; patterns may differ in other fields, institutions or national systems where the culture of GenAI use, and the surrounding policies are not the same. In addition, the reliance on self-report survey data captures perceptions and intentions rather than direct observations of how GenAI is used in real tasks, and the cross-sectional design offers only a snapshot in time in a rapidly evolving technological landscape.

Future work can build on this study in several ways. Quantitatively, it would be valuable to include larger and more diverse lecturer samples and to extend the survey across other departments and institutions to test whether the same functional trust gap appears elsewhere. Qualitative methods such as interviews, focus groups or classroom observations could add depth by exploring how students make on-the-spot decisions about whether to trust GenAI outputs, and how lecturers balance innovation against concerns about workload, fairness and integrity when deciding if and where to use these tools. Finally, intervention-focused research—for example, trials of AI-literacy workshops for students or assessment-redesign support for staff—could examine whether targeted support changes the underlying drivers of intention and, in turn, the way GenAI is woven into everyday teaching and learning.

Tahap Pemahaman Pelajar Kolej Komuniti Kuala Terengganu terhadap Kaedah Bersuci dari Najis Mughallazah

Faridah binti Mohamad[1], Faridah binti Mustaffa[2]
faridah_md@pht.edu.my[1], faridah@kkkt.edu.my[2]

Abstrak. Kajian ini bertujuan menilai tahap pemahaman pelajar Kolej Komuniti Kuala Terengganu terhadap kaedah bersuci daripada najis mughallazah serta mengenal pasti faktor-faktor yang mempengaruhi pemahaman tersebut. Fokus kajian diberikan kepada tiga faktor utama, iaitu faktor individu, faktor pengajaran dan pembelajaran, serta faktor persekitaran dan sosial. Kajian ini menggunakan pendekatan kuantitatif dengan reka bentuk tinjauan melalui soal selidik yang diedarkan kepada 243 orang pelajar. Data dianalisis menggunakan perisian SPSS versi 26 melalui analisis deskriptif, ujian ANOVA sehala, dan regresi berganda. Dapatan kajian menunjukkan bahawa tahap pemahaman pelajar terhadap penyucian najis mughallazah berada pada tahap tinggi dengan nilai min keseluruhan 4.04. Faktor-faktor yang mempengaruhi pemahaman juga didapati berada pada tahap tinggi, iaitu faktor individu (min = 4.26), faktor pengajaran dan pembelajaran (min = 4.24), serta faktor persekitaran dan sosial (min = 4.28). Hasil ujian ANOVA sehala menunjukkan bahawa tidak terdapat perbezaan yang signifikan dalam tahap pemahaman pelajar berdasarkan program pengajian yang diikuti, $F(5, 237) = 1.198$, $p = 0.311$. Seterusnya, analisis regresi berganda menunjukkan bahawa ketiga-tiga faktor tersebut mempunyai hubungan yang signifikan dengan tahap pemahaman pelajar, dengan faktor persekitaran dan sosial merupakan penyumbang paling dominan, diikuti faktor individu dan faktor pengajaran dan pembelajaran. Model regresi yang dibina menerangkan sebanyak 56.8% varians tahap pemahaman pelajar. Secara keseluruhannya, kajian ini membuktikan bahawa pelajar mempunyai tahap pemahaman yang baik terhadap penyucian najis mughallazah, manakala persekitaran, sokongan sosial, dan pendekatan pengajaran yang berkesan memainkan peranan penting dalam memperkukuh kefahaman tersebut. Implikasi kajian ini menekankan keperluan institusi pendidikan memperkasa pengajaran fiqh taharah secara lebih praktikal, interaktif, dan menyeluruh.

***Kata kunci**: Najis mughallazah, bersuci, faktor individu, pengajaran dan pembelajaran, persekitaran sosial.*

1.0 Pengenalan

Bersuci atau *taharah* merupakan aspek penting dalam kehidupan seorang Muslim kerana ia berkait rapat dengan kesucian ibadah dan kebersihan diri. Dalam Islam, najis dikategorikan kepada tiga jenis utama, iaitu najis *mukhaffafah* (ringan), najis *mutawassitah* (sederhana), dan najis *mughallazah* (berat) (Ibn Qudamah, 1997). Najis *mughallazah* merujuk kepada najis yang dianggap berat dalam hukum syarak, seperti jilatan anjing, dan ia memerlukan kaedah penyucian yang khusus menggunakan air tanah sebanyak tujuh kali basuhan (Al-Nawawi, 2002). Penyucian najis mughallazah lebih kompleks dan melibatkan beberapa langkah, iaitu perlu dihilangkan terlebih dahulu ain najis (jika ada) seterusnya membasuh tempat yang terkena najis sebanyak 7 kali. Sekali darinya dibasuh dengan air mutlak yang dicampur dengan tanah (air tanah) manakala selebihnya menggunakan air mutlak sebanyak 6 kali. Contoh najis mughallazah ialah segala benda yang ada hubungan dengan anjing dan babi atau keturunan keduanya.

Namun, tahap pemahaman masyarakat, khususnya dalam kalangan pelajar, mengenai kaedah penyucian najis *mughallazah* masih menjadi persoalan. Kajian terdahulu menunjukkan bahawa pemahaman terhadap konsep bersuci dalam Islam dipengaruhi oleh beberapa faktor utama, termasuk faktor individu, keberkesanan sistem pengajaran dan pembelajaran, serta persekitaran sosial (Zakaria et al., 2018). Faktor individu merangkumi pengetahuan sedia ada dan tahap keprihatinan seseorang terhadap kebersihan, manakala faktor pengajaran dan pembelajaran berkait rapat dengan keberkesanan kaedah penyampaian ilmu dalam institusi pendidikan (Hamid et al., 2020). Selain itu, faktor persekitaran dan sosial turut memainkan peranan penting, di mana pengaruh rakan sebaya, keluarga, dan budaya setempat boleh membentuk pemahaman seseorang mengenai amalan kebersihan dalam Islam (Rahman & Saad, 2021).

Kajian ini dijalankan bagi menilai tahap pemahaman pelajar Kolej Komuniti Kuala Terengganu terhadap kaedah penyucian najis *mughallazah* serta mengkaji sejauh mana faktor individu, pengajaran dan pembelajaran, serta persekitaran sosial mempengaruhi tahap pemahaman mereka. Dapatan kajian ini diharapkan dapat memberikan gambaran yang lebih jelas mengenai kepentingan pendidikan fiqh dalam kalangan pelajar serta membantu institusi pendidikan dalam memperkukuhkan strategi pengajaran bagi meningkatkan pemahaman terhadap konsep kebersihan dan kesucian dalam Islam.

2.0 Latar Belakang Kajian

Bersuci atau *taharah* merupakan aspek penting dalam kehidupan seorang Muslim kerana ia berkait rapat dengan kesempurnaan ibadah serta kebersihan diri dan persekitaran. Islam menekankan konsep kebersihan sebagai sebahagian daripada iman, sebagaimana yang disebut dalam hadis Rasulullah SAW:

"Kebersihan itu sebahagian daripada iman." (Riwayat Muslim, 223)

Dalam konteks *taharah*, Islam mengklasifikasikan najis kepada tiga kategori utama, iaitu najis mukhaffafah (ringan), najis mutawassitah (sederhana), dan najis mughallazah (berat). Najis *mughallazah* merujuk kepada najis yang dianggap berat dalam hukum syarak, seperti jilatan anjing dan babi, yang memerlukan kaedah penyucian khas dengan menggunakan air tanah sebanyak tujuh kali basuhan (Ibn Qudamah, 1997). Walaupun kaedah ini telah diperjelaskan dalam sumber-sumber hukum Islam seperti Al-Quran, hadis, dan kitab fiqh, pemahaman dalam kalangan masyarakat, termasuk pelajar, masih menjadi persoalan.

Beberapa kajian terdahulu menunjukkan bahawa tahap pemahaman pelajar terhadap konsep bersuci masih berada pada tahap sederhana, terutamanya dalam aspek penyucian najis *mughallazah* (Zakaria et al., 2018). Pemahaman yang kurang tepat mengenai perkara ini boleh membawa implikasi serius dalam aspek sahnya ibadah, khususnya solat. Selain itu, pemahaman mengenai konsep bersuci juga bergantung kepada beberapa faktor utama, antaranya ialah faktor individu. Bagi faktor ini ia merangkumi tahap kesedaran, pengetahuan, serta latar belakang keagamaan seseorang pelajar dalam memahami kaedah penyucian yang betul. Kajian oleh Hamid et al. (2020) menunjukkan bahawa pelajar yang mempunyai asas pendidikan Islam yang kukuh lebih memahami dan mengamalkan kaedah bersuci dengan betul.

Manakala bagi faktor pengajaran dan pembelajaran merupakan satu kaedah penyampaian ilmu dalam bilik darjah, bahan rujukan, serta pendekatan guru memainkan peranan penting dalam memastikan pelajar memahami konsep ini dengan jelas. Menurut kajian Mohd Nor et al. (2020), penggunaan kaedah pengajaran berasaskan demonstrasi dan multimedia dapat meningkatkan pemahaman pelajar terhadap konsep *taharah*. Faktor persekitaran dan sosial pula merupakan faktor yang dipengaruhi keluarga, rakan sebaya, serta budaya masyarakat juga boleh mempengaruhi pemahaman dan amalan bersuci dalam kalangan pelajar. Kajian oleh Rahman & Saad (2021) mendapati bahawa pelajar yang mendapat pendedahan tentang kebersihan melalui persekitaran keluarga dan sekolah lebih cenderung mengamalkan kaedah bersuci dengan betul.

Berdasarkan faktor-faktor ini, kajian ini bertujuan untuk menilai tahap pemahaman pelajar Kolej Komuniti Kuala Terengganu terhadap kaedah bersuci dari najis *mughallazah* serta mengenal pasti faktor utama yang mempengaruhi pemahaman mereka. Dapatan kajian ini diharapkan dapat memberikan gambaran yang lebih jelas tentang kepentingan pendidikan fiqh dalam membentuk kefahaman yang lebih baik mengenai konsep kebersihan dan kesucian dalam Islam, serta menyarankan langkah-langkah penambahbaikan dalam sistem pendidikan Islam bagi meningkatkan tahap kesedaran dan pemahaman pelajar. Kaedah yang betul dalam penyucian najis mughallazah amatlah penting dalam menentukan sah atau tidak solat seseorang.

3.0 Objektif Kajian

Kajian ini dijalankan untuk menilai tahap pemahaman pelajar Kolej Komuniti Kuala Terengganu terhadap kaedah penyucian najis *mughallazah* serta mengenal pasti faktor-faktor yang mempengaruhi pemahaman mereka. Secara khusus, objektif kajian ini adalah seperti berikut:

1. Mengenalpasti tahap pemahaman pelajar terhadap konsep penyucian najis mughallazah.
2. Mengenal pasti faktor individu, pengajaran dan pembelajaran serta pengaruh persekitaran dan sosial yang mempengaruhi pemahaman pelajar terhadap kaedah penyucian najis mughallazah
3. Mengenalpasti samada wujud perbezaan tahap pemahaman penyucian najis mughallazah berdasarkan program yang diikuti.
4. Mengenal pasti hubungan yang wujud antara faktor-faktor yang mempengaruhi pemahamaman penyucian najis mughallazah dengan tahap pemahaman pelajar terhadap konsep penyucian najis mughallazah

4.0 Skop dan Kepentingan Kajian

Kajian mengenai tahap pemahaman pelajar Kolej Komuniti Kuala Terengganu terhadap kaedah bersuci dari najis *mughallazah* adalah penting untuk memahami sejauh mana ilmu *taharah* diaplikasikan dalam kehidupan seharian mereka. Skop kajian ini tertumpu kepada aspek pemahaman teori dan amalan pelajar KKKT dalam penyucian najis *mughallazah*, serta faktor-faktor yang mempengaruhinya, iaitu faktor individu, pengajaran dan pembelajaran, serta persekitaran sosial.

Kepentingan kajian ini terletak pada manfaatnya kepada pelajar, pendidik, institusi pendidikan, masyarakat, serta penyelidik masa hadapan. Kajian ini diharapkan dapat memberi impak positif dalam memperkasa pendidikan Islam, seterusnya memastikan kefahaman yang lebih tepat dalam aspek *taharah* dapat diterapkan dalam kehidupan harian pelajar.

6.0 Sorotan Kajian Lepas

Kajian mendapati bahawa tahap pemahaman pelajar terhadap konsep bersuci masih berada pada tahap sederhana, dengan sebahagian besar pelajar tidak memahami prosedur penyucian najis *mughallazah* dengan betul (Awang@Husain et al., 2017); Sofiyati, 2016). Kajian oleh Sofiyati (2016) menunjukkan bahawa pelajar yang hanya menerima pembelajaran berbentuk teori sering kali keliru tentang perbezaan antara najis *mukhaffafah*, *mutawassitah*, dan *mughallazah*. Kajian oleh Mohd Nor et al. (2020) pula menegaskan bahawa kaedah pengajaran konvensional yang terlalu bergantung pada teks dan kuliah kurang berkesan dalam meningkatkan pemahaman pelajar.

Kajian oleh (Cut Alfia Laina Nim., 2024) juga mendapati bahawa kurangnya pemahaman ini boleh menyebabkan kesalahan dalam amalan ibadah harian pelajar, terutamanya dalam solat. Oleh itu, pemahaman yang betul terhadap penyucian najis *mughallazah* adalah penting bagi memastikan kesahan ibadah mereka. Beberapa kajian menekankan kepentingan kaedah pengajaran yang lebih interaktif dan praktikal dalam meningkatkan pemahaman pelajar mengenai penyucian najis *mughallazah*. Kajian oleh Silalahi (2024) menunjukkan bahawa pendekatan demonstrasi amali lebih berkesan berbanding pengajaran secara teori sahaja. Pelajar yang didedahkan kepada demonstrasi dan simulasi menunjukkan pemahaman yang lebih baik dan mampu mengaplikasikan konsep yang dipelajari dengan lebih tepat.

Kajian oleh Asyura et al. (2022) menyokong dapatan ini, di mana kaedah demonstrasi terbukti dapat meningkatkan minat belajar pelajar terhadap subjek *taharah*. Dalam kajian oleh Wafiah (2023), pendekatan Discovery Learning digunakan untuk meningkatkan pemahaman pelajar terhadap konsep penyucian najis *mughallazah*. Hasil kajian menunjukkan bahawa pelajar yang didedahkan kepada aktiviti penyelidikan sendiri dan bimbingan guru menunjukkan pemahaman yang lebih baik berbanding mereka yang hanya bergantung pada ceramah guru.

Kajian lepas juga menyoroti peranan teknologi dalam membantu pelajar memahami kaedah penyucian najis *mughallazah*. Kajian oleh Gunarti (2022) dan Saleh et al. (2020) mendapati bahawa penggunaan media video dan simulasi digital dalam pengajaran *taharah* dapat meningkatkan daya ingatan dan pemahaman pelajar. Kajian oleh Mohd Nor et al. (2020) memperkenalkan kaedah EDUTAHARAH, yang merupakan pendekatan pembelajaran interaktif berasaskan teknologi digital. Hasil kajian menunjukkan bahawa pelajar yang menggunakan aplikasi interaktif ini lebih memahami konsep penyucian najis berbanding pelajar yang hanya menggunakan buku teks. Selain itu, kajian oleh Gunarti (2022) menunjukkan bahawa penggunaan media visual seperti infografik dan animasi dapat membantu pelajar memahami langkah-langkah penyucian najis dengan lebih jelas.

Faktor sosial dan budaya juga memainkan peranan dalam membentuk pemahaman pelajar terhadap penyucian najis *mughallazah*. Kajian oleh Rahim et al. (2017) mendapati bahawa pelajar yang membesar dalam persekitaran keluarga yang mengamalkan kebersihan Islam secara konsisten lebih memahami konsep *taharah* berbanding pelajar yang tidak mendapat pendedahan awal tentang kepentingan bersuci. Kajian oleh Laina (2025) menegaskan bahawa pengaruh rakan sebaya turut memberi kesan terhadap pemahaman pelajar. Dalam persekitaran sekolah yang menekankan kepentingan kebersihan dan penyucian najis, pelajar lebih cenderung untuk memahami dan mengamalkan ajaran Islam dengan lebih baik.

Beberapa kajian turut mengenal pasti cabaran dalam meningkatkan pemahaman pelajar terhadap penyucian najis *mughallazah*. Kajian oleh Firdausiyah (2020) mendapati bahawa kekurangan bahan rujukan yang interaktif dan kurangnya latihan amali dalam pengajaran fiqh menyebabkan pelajar sukar memahami konsep penyucian najis. Kajian oleh Silalahi (2024) pula menunjukkan bahawa kekurangan latihan amali dalam kurikulum fiqh merupakan salah satu punca utama pelajar tidak memahami penyucian najis *mughallazah* dengan baik. Tanpa latihan praktikal, pelajar hanya memahami teori tetapi tidak dapat mengaplikasikannya dalam kehidupan harian.

7.0 Jurang Kajian

Walaupun terdapat pelbagai kajian terdahulu berkaitan konsep taharah dan penyucian najis mughallazah, kebanyakan kajian lebih tertumpu kepada keberkesanan kaedah pengajaran seperti demonstrasi, penggunaan multimedia, dan pendekatan interaktif dalam mata pelajaran fiqh (Mohd Nor et al., 2020; Silalahi, 2024; Wafiah, 2023). Namun demikian, masih terdapat kekurangan kajian yang meneliti secara khusus tahap pemahaman pelajar institusi TVET atau kolej komuniti terhadap penyucian najis mughallazah dalam konteks pendidikan tinggi teknikal di Malaysia. Sebahagian besar kajian lepas dilaksanakan dalam konteks sekolah menengah agama, madrasah atau institusi pendidikan umum, sekali gus mewujudkan jurang konteks kajian terhadap pelajar TVET yang mempunyai latar belakang akademik dan persekitaran pembelajaran yang berbeza (Zakaria et al., 2018; Sofiyati, 2016).

Selain itu, kebanyakan kajian terdahulu hanya memberi fokus kepada aspek pengajaran fiqh dan keberkesanan kaedah pembelajaran semata-mata tanpa mengintegrasikan faktor individu, faktor pengajaran dan pembelajaran (PdP), serta faktor persekitaran dan sosial secara serentak dalam satu model kajian. Sedangkan pemahaman terhadap penyucian najis mughallazah bukan sahaja dipengaruhi oleh pengetahuan agama, malah turut berkait dengan pengaruh keluarga, rakan sebaya, media sosial dan pengalaman pembelajaran pelajar sendiri (Rahman & Saad, 2021). Oleh itu, masih terdapat jurang empirikal dalam memahami sumbangan relatif setiap faktor terhadap tahap pemahaman pelajar mengenai konsep taharah secara lebih menyeluruh.

Di samping itu, kajian-kajian terdahulu lebih banyak menggunakan pendekatan deskriptif bagi menilai tahap pemahaman pelajar tanpa menguji hubungan statistik antara faktor-faktor yang mempengaruhi dengan tahap pemahaman pelajar secara mendalam. Kajian ini cuba mengisi jurang tersebut dengan menggunakan analisis regresi berganda bagi mengenal pasti faktor dominan yang mempengaruhi pemahaman pelajar terhadap penyucian najis mughallazah. Pendekatan ini membolehkan kajian menghasilkan dapatan yang lebih komprehensif dan dapat menyumbang kepada pembinaan strategi pendidikan Islam yang lebih efektif di institusi TVET.

Seterusnya, terdapat juga jurang dari sudut amalan praktikal pelajar terhadap penyucian najis mughallazah. Kajian lepas banyak menumpukan kepada aspek teori dan kefahaman konsep, namun kurang menilai sejauh mana pelajar benar-benar mengamalkan kaedah penyucian tersebut dalam kehidupan harian. Berdasarkan dapatan kajian ini, item berkaitan pengalaman praktikal pelajar mencatat nilai min yang lebih rendah berbanding item pengetahuan teori, menunjukkan wujud jurang antara kefahaman teori dan amalan sebenar dalam kalangan pelajar. Oleh itu, kajian ini penting bagi mengenal pasti keperluan pengukuhan elemen amali dan pengalaman autentik dalam pengajaran fiqh taharah.

Akhir sekali, kajian berkaitan penyucian najis mughallazah dalam konteks institusi Kolej Komuniti di Malaysia masih sangat terhad dan kurang diberi perhatian dalam literatur semasa. Kebanyakan penyelidikan terdahulu tertumpu kepada sekolah menengah atau institusi pengajian Islam, menyebabkan kurangnya data empirikal berkaitan tahap pemahaman pelajar kolej komuniti terhadap isu fiqh taharah. Justeru, kajian ini berusaha mengisi jurang literatur tersebut dengan menyediakan bukti empirikal dalam konteks Kolej Komuniti Kuala Terengganu serta menyumbang kepada pengembangan ilmu pendidikan Islam dalam sektor TVET di Malaysia.

8.0 Metodologi Kajian

Kajian ini menggunakan pendekatan kuantitatif dengan reka bentuk kajian tinjauan bagi menilai tahap pemahaman pelajar Kolej Komuniti Kuala Terengganu terhadap kaedah penyucian najis *mughallazah*. Metodologi kajian ini merangkumi beberapa aspek utama, iaitu reka bentuk kajian, populasi dan sampel, instrumen kajian, prosedur pengumpulan data, serta kaedah analisis data.

Kajian ini bersifat deskriptif kuantitatif, yang bertujuan untuk mengukur tahap pemahaman pelajar terhadap kaedah penyucian najis *mughallazah* serta mengenal pasti faktor-faktor yang mempengaruhinya. Pendekatan tinjauan digunakan kerana ia membolehkan pengkaji memperoleh data daripada sampel yang lebih besar secara sistematik dan efisien.

Populasi kajian ini memfokuskan kepada pelajar Kolej Komuniti Kuala Terengganu yang mengambil kursus berkaitan pendidikan Islam atau yang telah mempelajari topik *taharah*. Sampel kajian dipilih secara pensampelan rawak berstrata, melibatkan sekurang-kurangnya 80-100 orang pelajar daripada pelbagai kursus bagi memastikan variasi dalam tahap pemahaman.

Data yang dikumpulkan dianalisis menggunakan perisian Statistical Package for the Social Sciences (SPSS) untuk mendapatkan gambaran statistik mengenai tahap pemahaman pelajar. Analisis yang digunakan termasuk analisis deskriptif dan ujian korelasi pearson. Ujian kebolehpercayaan akan dijalankan menggunakan Alpha Cronbach untuk memastikan ketekalan soal selidik. Nilai Cronbach's Alpha ≥ 0.70 menunjukkan kebolehpercayaan yang baik.

Jadual 1 : Nilai Kebolehpercayaan Cronbach's Alpha

Pembolehubah	Cronbach's Alpha	Bilangan Item	Konsistensi Dalaman
Tahap Pemahaman	0.744	7	Cemerlang
Faktor individu	0.826	4	Cemerlang
Faktor Pengajaran dan Pembelajaran	0.838	4	Cemerlang
Faktor Persekitaran dan Sosial	0.863	4	Cemerlang

Dalam kajian ini juga, analisis deskriptif digunakan bagi menjawab objektif kajian. Tahap pemahaman dan faktor-faktor yang mempengaruhi tahap pemahaman yang dikaji adalah dengan menggunakan peratusan, frekuensi dan min. Seterusnya analisis tahap intrepretasi diambilkira daripada nilai lima mata. Jadual 2 menunjukkan interpretasi min yang digunakan dalam dapatan kajian bagi pengukuran tahap pemahaman dan dan faktor-faktor yang mempengaruhi tahap pemahaman.

Jadual 2 : Interpretasi min bagi pengukuran tahap pemahaman dan faktor-faktor yang mempengaruhi tahap pemahaman.

Julat min	Interpretasi
0.00 – 2.39	Rendah
2.40 – 3.70	Sederhana
3.71 – 5.00	Tinggi

Sumber : Neuman (2012)

Pembentukan hipotesis turut dijalankan bagi kajian ini. Hipotesis yag dibentuk adalah :

HO1 : Tiada perbezaan signifikan dalam tahap pemahaman pelajar terhadap penyucian najis mughallazah berdasarkan program yang ikuti.
HO2 : Faktor Individu tidak mempunyai hubungan yang signifikan dengan tahap pemahaman pelajar terhadap penyucian najis mughallazah.
HO3 : Faktor Pengajaran dan Pembelajaran tidak mempunyai hubungan yang signifikan dengan tahap pemahaman pelajar terhadap penyucian najis mughallazah.
HO4 : Faktor Persekitaran dan sosial tidak mempunyai hubungan yang signifikan dengan tahap pemahaman pelajar terhadap penyucian najis mughallazah.

8.0 Dapatan Kajian

Dalam kajian ini, data yang dikumpulkan akan dianalisis menggunakan kaedah kuantitatif bagi mendapatkan gambaran mengenai tahap pemahaman pelajar terhadap kaedah penyucian najis *mughallazah* serta faktor-faktor yang mempengaruhinya.

8.1 Maklumat Demografi

Jadual 3 : Demografi Responden

	Peratus	Kekerapan
Jantina		
Lelaki	80.7%	196
Perempuan	19.3%	47
Umur		
16-18 tahun	4.5%	11
19-21 tahun	88.9%	216
22 tahun ke atas	6.6%	16
Program		
Sijil Fesyen dan Pakaian (SFP)	6.2%	27
Sijil Servis Kenderaan Ringan (SKR)	22.2%	13
Sijil Pelukis Pelan Senibina (STS)	14.0%	33
Sijil Teknologi Elektrik (SKE – Cawangan Setiu)	11.5%	46
Sijil Teknologi Elektrik (SKE-KKKT)	29.6%	72
Sijil Teknologi Pembinaan Bangunan (STP)	16.5%	40
Pernahkah anda belajar mengenai najis mughallazah secara formal?		
Ya	90.1%	219
Tidak	9.9%	24
Sumber utama pembelajaran agama anda (boleh pilih lebih dari satu)		
Sekolah/Madrasah	81.5%	198
Kolej Komuniti Kuala Terengganu (KKKT)	36.6%	89
Kelas agama (masjid/surau)	33.7%	82
Internet/media sosial	41.2%	100
Bimbingan keluarga	43.6%	106

Berdasarkan Jadual 3, kajian ini melibatkan 243 orang responden yang majoritinya terdiri daripada lelaki (80.7%) dan berumur 19 hingga 21 tahun (88.9%). Dari segi program, responden datang daripada pelbagai bidang pengajian dengan peratusan tertinggi daripada Sijil Teknologi Elektrik (SKE-KKKT), menunjukkan sampel lebih tertumpu kepada program teknikal. Selain itu, majoriti pelajar pernah mempelajari najis mughallazah secara formal (90.1%), manakala sumber utama pembelajaran agama ialah sekolah atau madrasah, diikuti internet atau media sosial, kelas agama, Kolej Komuniti Kuala Terengganu, dan bimbingan keluarga. Secara keseluruhannya, dapatan ini

menunjukkan bahawa responden mempunyai latar belakang asas agama yang agak kukuh, yang berkemungkinan mempengaruhi tahap pemahaman mereka terhadap penyucian najis mughallazah.

8.2 Tahap Pemahaman Pelajar Terhadap Najis Mughallazah

Jadual 4 di bawah menunjukkan dapatan min dan sisihan piawai bagi pembolehubah bersandar iaitu tahap pemahaman pelajar terhadap penyucian najis mughallazah.

Jadual 4 : Dapatan tahap pemahaman pelajar terhadap penyucian najis mughallazah

No	Pernyataan	STS	TS	TP	S	SS	Min	Sisihan Piawai
1	Saya tahu bahawa najis mughallazah merujuk kepada najis anjing dan babi serta semua yang ada hubungkait dengan kedua-duanya (anjing dan babi)	4 (1.6%)	2 (0.8%)	13 (5.3%)	57 (23.5%)	167 (68.7%)	4.57	0.776
2	Saya memahami kaedah samak dalam menyucikan najis mughallazah	4 (1.6%)	2 (0.8%)	24 (9.9%)	98 (40.3%)	115 (47.3%)	4.31	0.813
3	Saya boleh menerangkan cara menyucikan pakaian atau peralatan yang terkena najis mughallazah	3 (1.2%)	10 (4.1%)	62 (25.5%)	97 (39.9%)	71 (29.2%)	3.92	0.905
4	.Cara menyucikan najis mughallazah ialah dengan membasuhnya dengan tujuh (7) kali air mutlak, sekali darinya mestilah menggunakan air tanah yang bersih	3 (1.2%)	2 (0.8%)	23 (9.5%)	67 (27.6%)	148 (60.9%)	4.46	0.799
5	Jika terkena najis mughallazah, kaedah yang paling mudah saya akan ambil ialah dengan membuang pakaian yang terkena najis tersebut kerana bagi saya kaedah penyuciannya adalah agak sukar untuk dilakukan	19 (7.8%)	34 (14.0%)	64 (26.3%)	71 (29.2%)	55 (22.6%)	3.45	1.206

6	Saya yakin boleh mengamalkan cara bersuci dari najis mughallazah dengan betul	3 (1.2%)	1 (0.4%)	48 (19.8%)	102 (42.0%)	89 (36.6%)	4.12	0.824
7	Saya pernah mempraktikkan cara penyucian najis mughallazah dalam kehidupan harian	18 (7.4%)	26 (10.7%)	82 (33.7%)	67 (27.6%)	50 (20.6%)	3.43	1.149
Keseluruhan /Purata							4.04	0.925

Jadual 4 di atas menunjukkan bahawa tahap pemahaman pelajar KKKT terhadap kaedah bersuci dari najis mughallazah adalah berada pada tahap tinggi. Bagi mengukur tahap pemahaman pelajar kkkt terhadap kaedah bersuci dari najis mughallazah, item pertama iaitu "Saya tahu bahawa najis mughallazah merujuk kepada najis anjing dan babi serta semua yang ada hubungkait dengan kedua-duanya (anjing dan babi)" mendapat nilai yang tertinggi iaitu min 4.57. Manakala item ketujuh iaitu "Saya pernah mempraktikkan cara penyucian najis mughallazah dalam kehidupan harian" mendapat nilai yang paling rendah iaitu 3.43.

8.2 Faktor-Faktor Yang Mempengaruhi Pemahaman Najis Mughallazah

Jadual 5 di bawah menunjukkan dapatan min dan sisihan piawai bagi pembolehubah tidak bersandar iaitu faktor-faktor yang mempengaruhi pemahaman pelajar terhadap penyucian najis mughallazah.

Jadual 5 : Dapatan Faktor-Faktor Yang Mempengaruhi Pemahaman Najis Mughallazah

No	Pernyataan	STS	TS	TP	S	SS	Min	Sisihan Piawai
Faktor Individu								
1	Saya berminat untuk mendalami Ilmu bersuci dalam Islam	3 (1.2%)	3 (1.2%)	18 (7.4%)	74 (30.5%)	145 (59.7%)	4.46	0.788
2	Saya sering membaca dan menonton berkaitan bahan untuk bersuci beserta caranya mengikut Islam	3 (1.2%)	8 (3.3%)	49 (20.2%)	90 (37%)	93 (38.3%)	4.08	0.908
3	Saya lebih memahami konsep bersuci jika diajar secara amali berbanding teori	1 (0.4%)	3 (1.2%)	29 (11.9%)	78 (32.1%)	132 (54.3%)	4.39	0.776
4	Saya yakin, saya dapat mengamalkan cara menyucikan najis mughallazah dengan betul	2 (0.8%)	3 (1.2%)	43 (17.7%)	91 (37.4%)	104 (42.8%)	4.20	0.831
Keseluruhan /Purata							4.26	0.826

Faktor Pengajaran dan Pembelajaran								
1	Guru/pensyarah saya menerangkan secara jelas tentang cara bersuci dari najis mughallazah	3 (1.2%)	4 (1.6%)	30 (12.3%)	97 (39.9%)	109 (44.9%)	4.26	0.829
2	Saya lebih memahami bersucii melalui demonstrasi berbanding bacaan semata-mata	2 (0.8%)	5 (2.1%)	35 (14.4%)	83 (34.2%)	118 (48.6%)	4.28	0.844
3	Bahan pengajaran seperti video dan gambar membantu saya memahami konsep bersuci dengan lebih baik	1 (0.4%)	4 (1.6%)	26 (10.7%)	93 (38.3%)	119 (49%)	4.34	0.767
4	Saya berpeluang untuk bertanya dan berbincang dengan guru/ pensyarah mengenai topik ini	3 (1.2%)	7 (2.9%)	43 (17.7%)	101 (41.6%)	89 (36.6%)	4.09	0.874
						Keseluruhan /Purata	4.24	0.829
Faktor Persekitaran dan Sosial								
1	Keluarga saya menekankan kepentingan bersuci dalam kehidupan seharian	2 (0.8%)	3 (1.2%)	30 (12.3%)	68 (28.0%)	140 (57.6%)	4.40	0.814
2	Saya turut belajar tentang bersuci dari ibu bapa atau ahli keluarga	3 (1.2%)	7 (2.9%)	25 (10.3%)	85 (35.0%)	123 (50.6%)	4.31	0.862
3	Rakan-rakan saya mempunyai pemahaman yang baik mengenai cara bersuci dalam Islam	1 (0.4%)	7 (2.9%)	45 (18.5%)	98 (40.3%)	92 (37.9%)	4.12	0.839
4	Saya mendapatkan maklumat tentang cara bersuci dari internet, media social atau aplikasi islamik	1 (0.4%)	9 (3.7%)	23 (9.5%)	98 (40.3%)	112 (46.1%)	4.28	0.816
						Keseluruhan /Purata	4.28	0.833

Dapatan kajian bagi Jadual 5 di atas menunjukkan dapatan bagi faktor-faktor yang mempengaruhi pemahaman najis mughalazah. Keseluruhan faktor berada pada tahap tinggi. Bagi faktor individu, item pertama iaitu "Saya berminat untuk mendalami Ilmu bersuci dalam Islam" mendapat min tertinggi iaitu 4.46. Manakala item kedua iaitu "Saya sering membaca dan menonton berkaitan bahan untuk bersuci beserta caranya mengikut Islam" mendapat min yang terendah iaitu 4.08. Bagi faktor

pengajaran dan pembelajaran, item ketiga iaitu "Bahan pengajaran seperti video dan gambar membantu saya memahami konsep bersuci dengan lebih baik" mendapat min tertinggi iaitu 4.34. Manakala item keempat iaitu "Saya berpeluang untuk bertanya dan berbincang dengan guru/ pensyarah mengenai topik ini" mendapat min yang terendah iaitu 4.09. Bagi faktor persekitaran dan sosial, item pertama iaitu "menekankan kepentingan bersuci dalam kehidupan seharian" mendapat min tertinggi iaitu 4.40. Manakala item ketiga iaitu "Rakan-rakan saya mempunyai pemahaman yang baik mengenai cara bersuci dalam Islam" mendapat min yang terendah iaitu 4.12.

8.3 Analisis ANOVA sehala

Jadual 6 : Dapatan ujian ANOVA sehala

ANOVA

Mean_Pemahaman

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	2.074	5	.415	1.198	.311
Within Groups	82.062	237	.346		
Total	84.136	242			

Hasil analisis ANOVA sehala dalam Jadual 6 di atas menunjukkan bahawa tiada perbezaan yang signifikan dalam tahap pemahaman pelajar terhadap penyucian najis mughallazah berdasarkan jenis program yang diikuti, $F(5, 237) = 1.198$, $p = 0.311$. Ini bermaksud bahawa program-program yang berbeza yang diikuti oleh pelajar tidak memberikan kesan yang ketara terhadap tahap pemahaman pelajar terhadap penyucian najis mughallazah. Berdasarkan dapatan ini, maka HO1 adalah diterima.

8.4 Analisis Regresi Berganda

Seterusnya, analisis regresi berganda digunakan untuk menguji sumbangan tiga faktor utama, iaitu Faktor Individu, Faktor Pengajaran dan Pembelajaran (PDP), serta Faktor Persekitaran dan sosial terhadap tahap pemahaman pelajar atas penyucian najis mughallazah. Hasil analisis seperti jadual 8 di bawah menunjukkan bahawa model regresi yang dibina adalah signifikan ($F(3, 239) = 104.753$, $p < 0.001$), dengan nilai R Square sebanyak 0.568. Ini menunjukkan bahawa ketiga-tiga faktor menyumbang sebanyak 56.8% kepada variasi tahap pemahaman pelajar.

Model Summary[b]

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.754[a]	.568	.563	.38997	.568	104.753	3	239	.000

a. Predictors: (Constant), Mean_Faktor_Persekitaran, Mean_Faktor_PDP, Mean_Faktor_Individu

b. Dependent Variable: Mean_Pemahaman

Jadual 8 : Rumusan Model Regresi Berganda

Secara khusus, ketiga-tiga faktor ini mempunyai hubungan yang signifikan dengan tahap pemahaman, di mana Faktor Persekitaran memberikan sumbangan yang paling tinggi ($\beta = 0.302$, $p < 0.001$), diikuti oleh Faktor Individu ($\beta = 0.202$, $p = 0.003$) dan Faktor PDP ($\beta = 0.198$, $p = 0.002$). Secara keseluruhannya, dapatan kajian ini mengesahkan bahawa faktor persekitaran, individu dan PDP memainkan peranan penting dalam membentuk tahap pemahaman dalam kalangan pelajar. Dengan dapatan ini, maka Ho2, Ho3 dan HO4 adalah ditolak.

9.0 Perbincangan dan Kesimpulan

Fokus utama perbincangan adalah untuk mengaitkan keputusan kajian dengan objektif kajian, hipotesis yang diuji serta penemuan kajian terdahulu. Dapatan yang diperoleh dianalisis secara kritikal bagi memahami implikasi terhadap pembangunan pemahaman dalam kalangan pelajar serta cadangan penambahbaikan untuk masa hadapan.

9.1 Perbincangan Mengikut Objektif Kajian

9.1.1 **Objektif 1:** Mengenalpasti tahap pemahaman pelajar terhadap konsep penyucian najis mughallazah.

Hasil analisis deskriptif menunjukkan bahawa tahap pemahaman atas konsep penyucian najis Mughallazah kalangan pelajar KKKT berada pada tahap tinggi, dengan min keseluruhan sebanyak 4.04. Ini menggambarkan bahawa pelajar KKKT secara umum mempunyai kesedaran dan kefahaman yang baik terhadap konsep penyucian najis mughallazah. Dapatan ini selari dengan kajian Yusof dan Wan Zahari (2023) yang menyatakan bahawa pembelajaran berkenaan definisi, hukum dan kaedah penyucian Najis mughallazah di letakkan pada tahap pengajaran yang tinggi dalam Pendidikan Islam semasa. Ini menunjukkan bahawa KKKT telah dapat memupuk tahap pemahaman selaras dengan keperluan pendidikan semasa.

9.1.2 **Objektif 2:** Mengenal pasti faktor individu, pengajaran dan pembelajaran serta pengaruh persekitaran dan sosial yang mempengaruhi pemahaman pelajar terhadap kaedah penyucian najis mughallazah

Hasil analisis deskriptif menunjukkan bahawa faktor individu, pengajaran dan pembelajaran serta pengaruh persekitaran dan sosial yang mempengaruhi pemahaman pelajar terhadap kaedah penyucian najis mughallazah berada pada tahap tinggi, dengan min masing-masing pada 4.26, 4.24 dan 4.28. Bagi dapatan min tinggi untuk faktor individu adalah selaras dengan Ismail et.al (2016) menyatakan bahawa proses pengajaran yang baik dan bersistematik dapat membentuk kefahaman pelajar dalam bersuci.

9.1.3 **Objektif 3** : Mengenalpasti samada wujud perbezaan tahap pemahaman penyucian najis mughallazah berdasarkan program yang diikuti.

Analisis ANOVA sehala menunjukkan bahawa tiada perbezaan signifikan dalam tahap pemahaman pelajar terhadap penyucian najis mughallazah berdasarkan program pengajian, $F(5, 237) = 1.198$, $p = 0.311$. Ini bermaksud program pengajian bukan faktor utama yang membezakan pemahaman pelajar. Dapatan ini menunjukkan bahawa pemahaman tersebut lebih bersifat menyeluruh merentas program, berkemungkinan disebabkan pendedahan asas agama yang hampir sama melalui sekolah, keluarga, kelas agama, serta media digital. Oleh itu, usaha meningkatkan pemahaman pelajar lebih sesuai dilaksanakan secara umum di peringkat institusi, seperti melalui pengukuhan modul Pendidikan Islam, latihan amali, dan penyediaan bahan pembelajaran standard untuk semua pelajar. Hal ini selari dengan pandangan bahawa pelajar yang mempunyai asas agama, motivasi dalaman, dan kesedaran kendiri yang tinggi akan lebih mudah memahami hukum-hakam taharah dengan betul (Hamid et al., 2020).

9.1.4 **Objektif 4 :** Mengenal pasti hubungan yang wujud antara faktor-faktor yang mempengaruhi pemahamaman penyucian najis mughallazah dengan tahap pemahaman pelajar terhadap konsep penyucian najis mughallazah

Hasil analisis regresi berganda menunjukkan bahawa faktor individu, pengajaran dan pembelajaran, serta persekitaran dan sosial mempunyai hubungan yang signifikan dengan tahap pemahaman pelajar terhadap penyucian najis mughallazah, dengan faktor persekitaran dan sosial sebagai penyumbang paling dominan, diikuti faktor individu dan faktor pengajaran dan pembelajaran; malah model ini menerangkan 56.8% varians tahap pemahaman pelajar. Dapatan ini menunjukkan bahawa pemahaman pelajar tidak hanya bergantung pada diri sendiri, tetapi turut dipengaruhi oleh sokongan keluarga, rakan sebaya, serta kaedah pengajaran yang lebih praktikal dan interaktif, selaras dengan kajian yang menegaskan bahawa kekeliruan dalam fiqh thaharah masih berlaku dan memerlukan pendekatan pendidikan yang lebih berkesan, termasuk penggunaan inovasi pengajaran digital dan amali bagi meningkatkan kefahaman pelajar (Ismail et al., 2016).

10.0 Implikasi Kajian dan rumusan

Kajian ini menyokong teori pembelajaran sosial dan teori persekitaran pembelajaran, di mana persekitaran luaran dan interaksi sosial memainkan peranan penting dalam pembentukan pengetahuan dan pemahaman pelajar. Pentadbir dan pensyarah TVET boleh memberi perhatian khusus kepada pengukuhan elemen persekitaran pembelajaran pendidikan islam melalui program komuniti mahupun kolaborasi industri. Program berunsurkan kaedah bersuci adalah penting dan perlu disemak agar lebih bersifat praktikal dan relevan. Secara keseluruhannya, kajian ini menegaskan bahawa walaupun jenis program tidak memberi perbezaan yang signifikan terhadap tahap pemahaman penyucian najis mughallazah, namun faktor individu, PDP dan persekitaran memainkan peranan penting dalam membentuk kefahaman pelajar. Penemuan ini boleh dijadikan asas kepada penambahbaikan dasar dan pelaksanaan program penyucian najis dan taharah di institusi TVET bagi melahirkan pelajar yang lebih bersedia menjadi muslim yang bersahsiah tinggi.

Interest Challenge: A Game-Based Learning Innovation for Enhancing Conceptual Mastery and Engagement in Business Mathematics among TVET Students

Mohd Faizal Mohd Muslim[1]* and Radziah Mohd Dani[2]

[1,2] Politeknik Muadzam Shah, Pahang, Malaysia

*Corresponding author: iezlan23@gmail.com[1] radziah2312@gmail.com[2],

Abstract. This study examines the effectiveness of *Interest Challenge*, a game-based learning innovation developed to enhance conceptual understanding and learning interest in the Interest topic of Business Mathematics within a Technical and Vocational Education and Training (TVET) context. Conventional teaching approaches often limit students' engagement and comprehension of abstract financial concepts, particularly among non-technical learners. To address this issue, a two until four-player board game incorporating authentic financial scenarios and structured problem-solving activities was designed and implemented. A quantitative approach using surveys was conducted among 73 Diploma in Business Studies students at a Malaysian polytechnic. Data were analysed using descriptive statistics, Pearson correlation, and multiple regression analysis. The findings reveal that learning interest ($\beta = 0.412$, $p < 0.01$) and perceived effectiveness ($\beta = 0.319$, $p < 0.05$) significantly influence students' conceptual understanding, while engagement was not found to be a significant predictor. Participants also reported greater enjoyment and clearer comprehension of interest-related calculations compared to traditional instructional methods. These results indicate that *Interest Challenge* is an effective pedagogical strategy for enhancing both cognitive and affective learning outcomes in Business Mathematics and provide empirical support for the integration of game-based learning approaches in TVET mathematics education.

Keywords: Game-based learning; Business Mathematics; TVET; gamification; conceptual understanding; *Interest challenge*.

Introduction

Business mathematics is an important part of vocational courses because it gives TVET students the financial knowledge and decision-making skills they need to work in today's business world [10]. Business operations use ideas like simple and compound interest to make financial decisions. [9] say that students often find these subjects boring, hard, and uninteresting. This is especially true for students who like to learn through hands-on activities, which is a common goal of successful TVET pedagogy.
Within the TVET framework, instructional practices should prioritize experiential, student-centered, and outcome-oriented learning. Nonetheless, conventional lecture-based pedagogies frequently emphasize formula memorization rather than conceptual comprehension [7], leading to diminished engagement and restricted application of information to practical financial contexts. As a result, students may demonstrate procedural proficiency without significant conceptual comprehension.

Game-based learning (GBL) has emerged as effective educational strategies for addressing these challenges by incorporating motivational game elements such as competition, collaboration, and immediate feedback. Furthermore, [4, 15] found that

gamification and game-based learning can enhance student engagement, motivation, and academic performance in vocational and technical education (TVET) settings, provided that the instructional design aligns with students' needs and educational objectives. In addition, TVET instructors are increasingly recognizing game-based learning as an effective approach for improving student engagement and knowledge retention in practical learning contexts [12].

Therefore, in response to this pedagogical need, this study introduces *Interest Challenge*, a game-based learning innovation designed to enhance conceptual mastery and student engagement in the topic of Interest within Business Mathematics. This innovation aligns with the growing demand for interactive and student-centered teaching practices that bridge theoretical knowledge and real-world applications in TVET education.

Problem Statement

Despite the importance of Business Mathematics, students in Technical and Vocational Education and Training (TVET) institutions often experience difficulties mastering the subject [14]. Many students struggle to understand the basic concepts of interest calculations and the practical application of mathematical concepts in solving financial problems. This issue may be further worsened by passive learning environments characterized by limited student engagement. As a result, students may find it challenging to apply Business Mathematics principles to real-world situations.

The lack of engaging and student-centered teaching resources may also lead to declining interest and limited learning outcomes, as students tend to rely on rote memorization rather than developing a genuine understanding of the concepts. Therefore, there is an urgent need for innovative pedagogical approaches that simplify complex concepts, promote experiential learning, and enhance the attractiveness of Business Mathematics within the TVET curriculum.

Accordingly, this study aims to achieve the following objectives:

1. To evaluate the effectiveness of *Interest Challenge* in improving students' conceptual mastery of interest calculations.
2. To examine the impact of game-based learning on students' interest, effectiveness, and engagement in learning Business Mathematics within the TVET context.

Literature Review & Theoretical Framework

Game Based- Learning in TVET

Game-based learning (GBL) has gained increasing attention as an effective pedagogical approach in Technical and Vocational Education and Training (TVET). Prior studies have consistently shown that GBL enhances student engagement, motivation, and participation by incorporating interactive and experiential elements into the learning process [4], [15]. In mathematics education, particularly in Business Mathematics, game-based approaches have been found to improve students' interest and reduce anxiety when dealing with abstract financial concepts [8]. Within the TVET context, where practical and applied knowledge is emphasized, GBL offers a valuable approach

by bridging theoretical concepts with real-world applications. This aligns with the need for student-cantered and experiential learning environments that support the development of applied numeracy skills [10], [12].

Student Engagement vs Meaningful Learning

While existing studies highlight engagement as a key outcome of game-based learning, there is limited empirical evidence explaining how engagement translates into meaningful conceptual understanding. Many studies assume that increased participation and interaction naturally lead to improved learning outcomes, however, this relationship remains underexplored, particularly in TVET settings.
This gap suggests that engagement alone may not be sufficient to ensure deep learning. Instead, other factors such as students' intrinsic interest and their perception of the usefulness of the learning activity may play a more critical role in facilitating conceptual mastery.

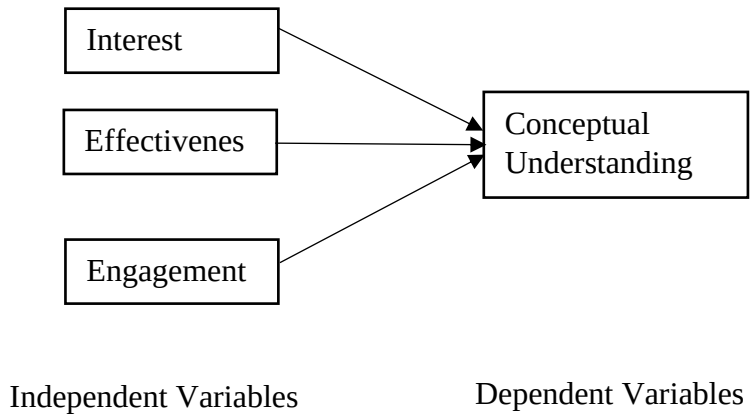
Theoretical Alignment

This study is informed by constructivist learning theory, experiential learning theory, and motivation theory. Constructivist theory emphasizes that learners actively construct knowledge through meaningful experiences, while experiential learning highlights the importance of learning through direct engagement and reflection. In addition, motivation theory, particularly intrinsic motivation, suggests that students' interest plays a crucial role in determining the depth of their learning. Together, these theoretical perspectives suggest that effective game-based learning should not only promote engagement but also foster meaningful learning experiences that enhance students' understanding.

Conceptual Framework

Based on the literature and theoretical perspectives, this study proposes a conceptual framework in which learning interest, perceived effectiveness, and student engagement are hypothesized to influence conceptual understanding in Business Mathematics.

Figure 1: Theoretical Framework



Methodology

Research Design

This study employs a quantitative cross-sectional perception study to examine students' perceptions of the game-based learning innovation, *Interest Challenge*, in the Business Mathematics subject. This approach is appropriate as the study aims to analyze students' feedback and experiences after participating in game-based learning activities.

Quantitative approach methods are widely used in educational research to investigate students' perceptions and to evaluate the effectiveness of teaching innovations through the statistical analysis of survey data [5].

Participants

The participants in this study consisted of 73 students enrolled in the Business Mathematics course during their semester of study in the Diploma in Business Studies program at Muadzam Shah Polytechnic.

A purposive sampling technique was used to select the participants. This technique allowed the researcher to identify respondents with specific characteristics relevant to the research objectives. In this study, students from the Diploma in Business Studies program were selected because Business Mathematics is a core subject in their curriculum, and the topic of interest calculations, specifically simple interest and compound interest is directly related to financial decision-making in a business context. Additionally, classroom observations and previous course performance trends indicate that students often experience difficulties in understanding financial mathematics topics, particularly when applying interest formulas to contextual business problems. These challenges may negatively affect students' confidence and motivation in learning Business Mathematics.

Therefore, selecting students from the Diploma in Business Studies program provides an appropriate context for assessing the extent to which the *Interest Challenge* game-based learning approach can enhance students' interest and conceptual understanding of the subject.

Instrument

A structured questionnaire was used as the primary instrument for data collection. The questionnaire was designed to evaluate students' perceptions of the *Interest Challenge* innovation across four (4) key domains:

- Perception towards Business Mathematics
- Learning Interest
- Effectiveness of the *Interest Challenge* game
- Student engagement during learning activities

The questionnaire consisted of 19 items and responses were recorded using a five-point Likert scale (Table 1), ranging from strongly disagree to strongly agree. The Likert scale is widely used in social science and educational research to measure respondents' attitudes and perceptions toward specific constructs [5, 11].

Table 1: Likert Scale

Descriptions	Items Number
Strongly Disagree	1
Disagree	2
Neutral	3
Agree	4
Strongly Agree	5

The Likert scale is widely used in educational research to measure respondents' attitudes and perceptions toward specific learning experiences [1], [3]. In this study, the Likert scale was used to determine the level of agreement among respondents regarding their learning experiences after participating in the game-based learning activity.

Reliability Analysis

Prior to the actual data collection, the reliability of the questionnaire instrument was evaluated using Cronbach's Alpha analysis. Reliability analysis was conducted to determine the internal consistency of the items used to measure the study variables.
Cronbach's Alpha values above 0.70 are generally considered acceptable and indicate good internal consistency among the measurement items [2]. Table 2 presents the reliability results of the questionnaire used in this study.

Table 2: Reliability Analysis of Questionnaire

Variable	Number of Items	Cronbach's Alpha	Interpretation
Perception towards Business Mathematics	5	0.82	Good
Learning Interest	4	0.84	Good
Effectiveness of *Interest Challenge*	5	0.88	Very Good
Student Engagement	5	0.86	Very Good
Overall Reliability	19	0.87	Very Good

The reliability analysis showed that all variables recorded Cronbach's alpha values above 0.80, indicating a high level of internal consistency for the measurement instrument. According to [3], a Cronbach's alpha value above 0.70 indicates acceptable reliability and suggests that the measurement items consistently measure the intended construct.

The overall reliability coefficient of 0.87 further confirms that the questionnaire used in this study is reliable and appropriate for measuring students' perceptions and experiences related to the implementation of game-based learning innovations.
These results indicate that the instrument produced consistent and reliable responses, making it suitable for further statistical analysis of students' engagement and perceptions of game-based learning activities.

Pearson Correlation

Pearson correlation analysis was conducted to examine the relationships among the study variables. The results indicate significant positive relationships between all variables. A strong positive relationship was found between learning interest and conceptual understanding ($r = 0.678$, $p < 0.01$), indicating that students with higher interest levels tend to achieve better understanding.

Perceived effectiveness also demonstrated a moderate positive relationship with conceptual understanding ($r = 0.519$, $p < 0.01$), suggesting that students who perceive the learning innovation as useful are more likely to grasp key concepts.

Furthermore, a very strong relationship was observed between effectiveness and engagement ($r = 0.810$, $p < 0.01$), indicating that effective learning tools significantly enhance students' participation and involvement in learning activities.

Multiple Regression analysis

A multiple regression analysis was conducted to determine the factors influencing students' conceptual understanding. The model was statistically significant ($F = 25.62$, $p < 0.001$) and explained 52.7% of the variance in conceptual understanding ($R^2 = 0.527$).

The results indicate that learning interest ($\beta = 0.412$, $p = 0.002$) and perceived effectiveness ($\beta = 0.319$, $p = 0.032$) are significant predictors of conceptual understanding. However, student engagement was not found to be a significant predictor ($p = 0.883$), suggesting that engagement alone does not directly translate into deeper learning outcomes.

Development of the Interest Challenge Innovation

The *Interest Challenge* game board is a board-based learning tool designed to achieve specific educational objectives and inspired by traditional board game mechanics. This innovation consists of a uniquely designed game board, 20 question cards focused on interest calculations, dice, and player tokens.

Each question card presents either numerical calculation tasks or case-based scenarios that require the application of interest calculation formulas. Players advance along the game board by answering the questions correctly. This process encourages students to discuss their answers with group members, thereby promoting collaboration and repeated practice.

The activity is designed to be completed in approximately 10 minutes, making it suitable for use in blended learning environments without disrupting the flow of the lesson. Overall, this innovation emphasizes experiential learning, immediate feedback, and active participation, aligning with the principles of practice-based, student-centered, and outcomes-based education commonly adopted in TVET contexts.

Results and Findings

This section presents the findings of the study based on the analysis of data collected from the questionnaire. Descriptive statistical techniques, including percentage distribution and mean score analysis, were used to examine students' perceptions of the *Interest Challenge* game-based learning innovation in the Business Mathematics course.

The analysis focused on several key aspects of the study, including students' perceptions of Business Mathematics, their level of learning interest, the effectiveness of the *Interest Challenge* innovation, and students' engagement during the learning activities.

Table 3: Students' Perceptions Towards Business Mathematics

Item	Statement	Agree (%)	Strongly Agree (%)
B1	Understand Business Mathematics concepts	26.0	65.8
B2	Course exposes workplace situations	38.4	52.1
B3	Business Mathematics is difficult	16.4	30.1

According to the data presented in Table 3, most respondents demonstrated a positive perception of Business Mathematics. A total of 65.8% of the students strongly agreed that they understood the concepts taught in the course, while 26.0% agreed with the statement.

In addition, 52.1% of the respondents strongly agreed that the course provided exposure to workplace-related situations, indicating that students recognized the practical relevance of Business Mathematics in real-world financial contexts.

However, the findings also revealed that some students continued to experience challenges in learning the subject. Approximately 30.1% of the respondents strongly agreed that Business Mathematics was difficult, suggesting that certain topics particularly those involving financial calculations may require more engaging and interactive teaching approaches to support students' understanding.

Table 4: Students' Interest in Learning Activities

Item	Statement	Agree (%)	Strongly Agree (%)
C1	Interested in Business Mathematics	32.9	54.8
C2	Prefer group learning	26.0	60.3
C3	Enjoy interactive learning	21.9	72.6

The findings presented in Table 4 indicate that students demonstrated a high level of interest in interactive learning environments. Most respondents (54.8%) strongly agreed that they were interested in learning Business Mathematics, while 60.3% strongly agreed that they preferred group-based learning activities. This suggests that collaborative learning environments can enhance student engagement and participation during lessons.

In addition, 72.6% of the respondents strongly agreed that they enjoyed interactive and engaging learning activities. This finding highlights the importance of incorporating innovative teaching strategies, such as game-based learning, to enhance students' learning experiences in mathematics education.

Table 5: Effectiveness of Interest Challenge

Item	Statement	Agree (%)	Strongly Agree (%)
D1	Improves academic achievement	37.0	50.7
D2	Improves CLO achievement	37.0	50.7
D3	Helps apply concepts	38.4	50.7

The results presented in Table 5 indicate that students perceive the *Interest Challenge* innovation as an effective learning tool in Business Mathematics. More than 50% of the respondents strongly agreed that the *Interest Challenge* game improved their academic performance and helped them achieve the Course Learning Outcomes (CLOs) of the Business Mathematics course.

Similarly, 50.7% of the respondents strongly agreed that the game helped them apply mathematical concepts in practical situations. This suggests that the use of contextual financial problems within the game supports students' understanding of theoretical concepts and facilitates their application in real-life scenarios.

Mean Score Analysis

Table 6: Mean Score Analysis of Variables

Variable	Mean Score	Interpretation
Students' Perception of Business Mathematics	4.21	High
Learning Interest	4.32	High
Effectiveness of Interest Challenge	4.38	High
Student Engagement	4.41	High

The mean score analysis presented in Table 6 indicates that all variables recorded mean values above 4.00, reflecting a high level of agreement among the respondents.

Among the variables analyzed, student engagement recorded the highest mean score (4.41), indicating that the *Interest Challenge* innovation successfully increased student participation and engagement during Business Mathematics lessons.

The effectiveness of the *Interest Challenge* game also recorded a high mean score (4.38), suggesting that students perceived the game as a useful learning tool for improving their understanding of financial mathematics concepts.

Overall, the results demonstrate that the implementation of the *Interest Challenge* game-based learning innovation has a positive influence on students' perceptions, engagement, and interest in learning Business Mathematics.

Correlation Analysis

Table 7: Pearson Correlation Matrix of Study Variables

Variables	**Understanding**	**Interest**	**Effectiveness**	**Engagement**
Understanding	1.000	0.678**	0.519**	0.440**
Interest	0.678**	1.000	0.720**	0.580**
Effectiveness	0.519**	0.720**	1.000	0.810**
Engagement	0.440**	0.580**	0.810**	1.000

Notes:

- ** Correlation is significant at $p < 0.01$
- Values represent Pearson correlation coefficients.

Table 7 presents the Pearson correlation matrix among the study variables. The results indicate significant positive relationships between all variables, particularly between learning interest and conceptual understanding ($r = 0.678$, $p < 0.01$), and between effectiveness and engagement ($r = 0.810$, $p < 0.01$).

Regression Analysis

Table 8: Multiple Regression Results Predicting Conceptual Understanding

Variables	B	Std. Error	Beta (β)	t-value	p-value
Constant	0.786	0.394	–	1.994	0.050
Interest	0.413	0.131	0.412	3.152	**0.002**
Effectiveness	0.382	0.175	0.319	2.187	**0.032**
Engagement	-0.029	0.194	-0.018	-0.147	0.883

Table 9: Model Summary

Statistic	Value
R^2	0.527
Adjusted R^2	0.506
F-value	25.62
Sig. (F)	0.000

Table 8 shows the results of the multiple regression analysis. The model was statistically significant ($F = 25.62$, $p < 0.001$), explaining 52.7% of the variance in conceptual understanding. Learning interest ($\beta = 0.412$, $p = 0.002$) and perceived effectiveness ($\beta = 0.319$, $p = 0.032$) were found to be significant predictors, while student engagement was not statistically significant.

The findings of this study provide important insights into the effectiveness of game-based learning in the context of TVET education. While previous studies have often emphasized the role of engagement in enhancing learning, the current findings suggest a different perspective. Although student engagement showed strong correlations with other variables, it was not a significant predictor of conceptual understanding in the regression models. This suggests that engagement alone is not sufficient to produce meaningful learning outcomes if it is not accompanied by cognitive and motivational elements.

This study integrates constructivist learning theory, experiential learning theory, and motivational theory to explain the mechanisms through which game-based learning influences conceptual understanding. Findings suggest that while engagement enhances the learning experience, learning is more meaningful especially if it is driven by students' own intrinsic interest and their perceptions of the usefulness of the learning tool. Therefore, this study extends existing theoretical perspectives by demonstrating that effective game-based learning requires not only active participation but also meaningful and purposeful learning experiences.

Discussion

Interpretation of Key Findings

Based on objective 1: to evaluate the effectiveness of *Interest Challenge* in improving students' conceptual mastery of interest calculations, the findings show that game-based learning innovation has a positive impact on students' engagement and conceptual understanding in Business Mathematics. In line with the findings of a study by [15], gamification strategies can significantly increase student engagement and learning outcomes when teaching activities are designed to encourage interaction and motivation. Similarly, [7] found that game-based learning environments increase student motivation and participation in academic activities, which ultimately contributes to improved learning performance.

In terms of the impact of game-based learning on students' engagement, confidence, and enjoyment in learning Business Mathematics within the TVET context (Objective 2), this *Interest Challenge* game encourages students to solve mathematical problems via discussion. This peer interaction promotes active learning and is consistent with the principle of collaborative learning, where knowledge is constructed through social interaction and shared problem-solving experiences. Similar observations have been reported by [12], who found that interactive learning approaches can create a more dynamic classroom environment and increase participation among Malaysian polytechnic students.

[2] also emphasize that learning via gamification especially in vocational education is more effective when learning activities connected with industry-related situations and real-world practices. This enables students to integrate theoretical knowledge with practical application.

The findings are also consistent with studies by [15] in mathematics education that show that game-based learning can improve students' higher-order thinking skills and conceptual understanding. Furthermore, he found that interactive educational games provide opportunities for students to practice mathematical reasoning and problem solving, which leads to better conceptual mastery.

Previous studies have emphasized engagement as the primary outcome of gamification, and the findings of this study suggest that engagement alone is not sufficient to produce meaningful learning. Although engagement is highly correlated with other variables, it is not a significant predictor in the regression model. This suggests that active participation without cognitive and motivational alignment may not lead to deeper conceptual mastery.

In contrast, learning interest and perceived effectiveness were seen as the most critical factors influencing conceptual understanding. Students who were genuinely interested in the subject and perceived learning tools as useful were more likely to internalize and use mathematical concepts effectively. This finding is in line with constructivist and experiential learning theories, which emphasize the importance of meaningful engagement and perceived relevance in the construction of knowledge. In the context of TVET education, where practical application is essential, the effectiveness of learning tools in simulating real-world scenarios plays a crucial role in enhancing

learning outcomes. The Interest Challenge Innovation successfully integrates these elements, making abstract financial concepts more accessible and engaging.

Overall, the findings of this study reinforce the growing body of literature suggesting that game-based learning can transform traditional mathematics teaching into a more engaging and interactive learning experience. In the context of TVET education, the implementation of the *Interest Challenge* innovation provides a practical example of how gamification strategies can be integrated into the teaching of Business Mathematics to increase students' engagement, motivation, and conceptual understanding.

Research Contribution

For the research contribution, this study enhances the body of knowledge on game-based learning education by introducing Interest challenge game based as a structured board-based learning innovation for Business Mathematics courses. Unlike conventional teaching approaches, this innovation integrates financial problem-solving tasks with interactive games to enhance students' engagement and conceptual understanding. It provides empirical evidence that learning interest and perceived effectiveness are more significant predictors of conceptual understanding than engagement alone.

In addition, this study also extends previous research on gamification in mathematics education by demonstrating the applicability of board-based learning innovations in TVET learning environments, particularly in the context of Business Mathematics. The findings provide empirical evidence that game-based learning strategies can increase student motivation and participation in learning financial mathematics. Therefore, this study offers practical insights for educators seeking innovative pedagogical approaches to enhance the teaching and learning of quantitative subjects in TVET education.

Conclusion

This study examines the effectiveness of the *Interest Challenge* game-based learning innovation in increasing students' engagement and conceptual understanding in Business Mathematics courses in the context of Technical and Vocational Education and Training (TVET).

Results of the study show that the implementation of the *Interest Challenge* contributes positively to students' learning experiences. Descriptive analysis and mean score results show that students show a high level of agreement regarding the effectiveness of the innovation in increasing classroom engagement, conceptual understanding and learning motivation. The use of game-based learning activities allows students to participate more actively in problem-solving tasks and encourages collaborative learning between peers.

The results of the study also show that integrating interactive learning strategies in mathematics teaching can help reduce students' anxiety about mathematical concepts and increase their confidence in solving financial mathematical problems. By incorporating financial scenarios into game activities, the *Interest Challenge* innovation

provides opportunities for students to apply theoretical knowledge in a practical context, which is very relevant in a vocational education setting.

From a pedagogical perspective, this study contributes to the increase in research on game-based learning and gamification in mathematics education. The findings of this study support previous studies that suggest that interactive learning environments can increase students' motivation and academic performance when aligned with learning objectives [1], [8], [15]. In the context of TVET education, the implementation of educational games such as *Interest Challenge* can serve as an effective teaching approach to promote experiential learning and improve students' applied numeracy skills.

Limitation and Recommendations

This study is limited to a single group of students from one polytechnic institution and relies on post-intervention perception data. Future research could incorporate longitudinal or experimental designs to further examine causal relationships and learning outcomes. Overall, the findings of this study highlight the potential of game-based learning as an innovative and engaging teaching strategy to improve the teaching and learning of Business Mathematics in TVET education.

Abstract. The Civil Defence Institution Team (PISPA) at Malaysian Polytechnics is one of the credited uniformed co-curricular courses offered in diploma programmes, playing an important role in developing students' leadership and soft skills. This study aims to evaluate the effectiveness of the PISPA course programme in enhancing student competencies through a mixed-method approach (quantitative and qualitative). Data were collected through questionnaires involving 100 Cadet Officers and Junior Staff (Civil Defence), and analysis was conducted based on documents related to the implementation of PISPA. The findings show that participation in PISPA has a significant positive impact on the development of self-identity, patriotism, discipline, and leadership skills among students. Students actively involved in this course demonstrated improvements in communication, teamwork, problem-solving, and self-confidence. Comparative analysis also revealed that PISPA students possess advantages in soft skills compared to students involved in other co-curricular activities. The study also identified several challenges in the implementation of PISPA, including academic time constraints, lack of facilities, and the need for improvements in training modules. Recommendations include enhancing leadership skills such as decision-making, communication, and time management. In addition, the programme strengthens soft skills, teamwork, and fosters empathy and social awareness. The findings of this study provide important implications for the management of Malaysian Polytechnics in planning more holistic co-curricular programmes aligned with industry needs. Programmes such as PISPA not only equip students with technical skills but also produce graduates who are competitive, resilient, and possess strong moral values.

Keywords: *Leadership skills, soft skills, co-curriculum, PISPA*

1. INTRODUCTION

Soft skills and leadership are essential components in shaping holistic and high-quality graduates in Higher Education Institutions (HEIs). In the context of Technical and Vocational Education and Training (TVET), these skills not only support academic achievement but also play a crucial role in preparing students to face an increasingly challenging and dynamic job market (Hamzah, Mohamad, & Ismail, 2020). At Malaysian Polytechnics, various strategies have been outlined to nurture these skills among students, including active participation in uniformed co-curricular courses such as the Civil Defence Institution Team (PISPA), RELASIS, Territorial Army, Girl Guides, Scouts, and other uniformed units.

PISPA is a voluntary uniformed unit under the Malaysian Civil Defence Force (APM) and serves as one of the primary platforms for developing character, patriotic values, and leadership among students in Higher Education Institutions. The implementation guidelines of PISPA establish a comprehensive training structure that includes drill training, emergency management, communication, teamwork, and community service activities, all of which contribute to shaping students' identity (AnyFlip, 2022). Through active involvement in PISPA, students have the opportunity to enhance their leadership and interpersonal skills in real-life environments that demand high commitment, discipline, and sound decision-making abilities.

Abdul Rahman, Ahmad, and Salleh (2021) stated that students who participate in uniformed co-curricular programmes demonstrate significant improvements in leadership, self-confidence, and teamwork skills. This finding is supported by Hassan and Mohd Noor (2019), who found that active participation in activities outside the classroom helps develop strong personal character as well as emotional and social maturity. Furthermore, the experiential learning approach applied in PISPA programmes aligns with Kolb's Learning Theory (1984), which emphasizes the importance of direct experience in the development of soft skills. Therefore, this study aims to review and synthesize previous research findings related to the effectiveness of the PISPA course programme in developing leadership and soft skills among Malaysian Polytechnic students. The main focus will be on co-curricular elements that have a significant impact on the development of students' values and self-capabilities, while also proposing improvements for the future implementation of PISPA.

2. LITERATURE RIVIEW

Leadership and soft skills are essential elements in producing holistic graduates who can compete at the global level. In Malaysian Polytechnics, efforts to strengthen these skills are implemented through structured co-curricular programmes such as the Civil Defence Institution Team (PISPA). This programme not only provides basic rescue training but also emphasizes values such as discipline, patriotism, communication skills, teamwork, and leadership.

According to Abdul Rahman et al. (2021), participation in uniformed co-curricular activities such as PISPA provides students with opportunities to be directly involved in activities outside the classroom, which help cultivate leadership qualities and social responsibility. Activities such as marching drills, management of formal events, and emergency training play a role in developing decision-making competence and group

management skills, which are fundamental to leadership development. A study by Hamzah et al. (2020) further supports these findings, indicating that active involvement in co-curricular activities effectively enhances students' soft skills, including communication skills, self-confidence, and leadership abilities.

This aligns with the aspiration of Malaysian Polytechnics to produce graduates who are not only academically excellent but also competitive in terms of soft skills. The development of soft skills is often associated with experiential learning. Kolb (1984) explains that direct experience through external activities can strengthen students' learning in both interpersonal and intrapersonal aspects. In the context of PISPA, activities such as basic emergency treatment, volunteer work, physical training, and certification serve as effective platforms in shaping students' emotional and social maturity. According to Aziz, Rahim, and Yusof (2022), TVET reforms should emphasize not only technical skills but also character development and values. In this regard, PISPA is seen as a complementary platform in building students' identity through challenges and experiences gained outside the classroom. A study by Hassan and Mohd Noor (2019) also demonstrates that participation in co-curricular activities significantly improves self-leadership and the ability to work collaboratively in groups.

This highlights the effectiveness of programmes such as PISPA in fostering strong personal character as well as the ability to manage emotions and conflicts. More importantly, involvement in PISPA also contributes to the enhancement of patriotism and civic awareness among students. This is in line with the aspirations of the Malaysia Education Blueprint (Higher Education) 2015–2025, which emphasizes the development of national identity among students in Higher Education Institutions. In conclusion, various previous studies indicate that programmes such as PISPA have a positive impact on the development of leadership and soft skills among Polytechnic students. However, further evaluation of the effectiveness of specific programme elements, along with continuous improvement strategies, remains crucial for future development.

3. RESEARCH OBJECTIVES

This study is conducted with the following specific objectives:

1. To identify the level of improvement in leadership and soft skills among PISPA students, encompassing aspects such as teamwork, discipline, resilience, creativity, and patriotic values.
2. To analyse the co-curricular elements such as theoretical and practical training, volunteer activities, camps, and certification that are most effective in developing students' skills.
3. Providing recommendations for improvement to the PISPA module to ensure its implementation is more comprehensive, systematic, and effective in fostering students' soft skills.

4. RESEARCH METHDOLOGY

This study applies a mixed-method approach, combining descriptive quantitative and qualitative methods, with a questionnaire as the primary research instrument (Robson 1988). The qualitative approach is implemented through a literature review, analysing both electronic and printed documents (books, guidelines, journals, proceeding articles, etc.). Meanwhile, the quantitative approach utilizes a questionnaire adapted from previous research instruments. The items within the instrument feature five response options based on a five-point Likert scale: 1 = Strongly Disagree (SD), 2 = Disagree (D), 3 = Agree (A), 4 = Strongly Agree (SA), and 5 = Very Strongly Agree (VSA). The Likert scale is appropriate for measuring respondents' views regarding a particular practice, perception, or attitude (Cohen L et al. 2000).

The reliability of the research instrument, specifically the internal consistency of the variables, is measured using the Cronbach's Alpha value. This is classified based on the reliability index where 0.90–1.00 is very high, 0.70–0.89 is high, 0.30–0.69 is moderate, and 0.00 to 0.30 is low (Babbie 1992; Bryman & Cramer 1999). According to Sekaran (2003), the Cronbach's Alpha value must be greater than 0.5, while Mohd Najid (1999) suggests it should be at least 0.6. The Cronbach's Alpha values for the items are presented in Table 1.

Table 1: Cronbach's Alpha values for questionnaire items

Item	N	α
B: Leadership Skills	10	0.921
C: Soft Skills	10	0.954

The interpretation of Table 1 shows that the Cronbach's Alpha values for the questionnaire items range between 0.921 and 0.954, which is categorized as very high. This finding concludes that the research instrument possesses very high reliability. Quantitative data were analysed using IBM Statistical Package for the Social Sciences (SPSS) Version 26.0 to obtain the frequency, mean, percentage, and standard deviation. The interpretation of mean values is arranged in descending order, from the highest to the lowest mean. The interpretation of the affective behaviour mean was formulated based on Nunnally (1978) in describing the descriptive analysis. Table 2 presents the interpretation of the mean value.

Table 2: Interpretation of Mean Score Values

Indicator	Value
High	4.01 – 5.00
Moderately High	3.01 – 4.00
Moderately Low	2.01 – 3.00
Very Low	1.01 – 2.00

Source: Nunally (1978)

5. RESULT AND DISCUSSION

5.1 Questionnaire Feedback

The questionnaire was distributed to 100 officers who were awarded the rank of SM (PA) to respond to the research instrument provided. The questionnaire consisted of 20 items covering three main elements: Demographics, Leadership Skills, and Soft Skills. The overall mean for the acceptance of Leadership Skills (B1–B10) was 4.10 (SD = 0.82), while the Soft Skills (C1–C10) category recorded a mean of 4.27 (SD = 0.79). All items achieved a mean score above 4.0, indicating an overall positive perception from the respondents. The findings and feedback are presented in Table 4 and Table 5.

Table 4: Result of the Leadership Skills Analysis

Item	Mean	SP	%	Interpretation
A: Leadership Skills				
B1: Leading a group to achieve goals	4.07	0.77	85.7	High
B2: Making decisions in situations that require leadership	4.05	0.86	83.5	High
B3: Providing motivation to group members	4.11	0.85	86.8	High
B4: Taking initiative to solve problems	4.12	0.77	87.9	High
B5: Managing time effectively while leading	4.14	0.84	88.0	High
B6: Giving instructions clearly and in an easily understood manner	4.11	0.78	86.8	High
B7: Managing group conflicts effectively	4.02	0.87	77.0	Moderately High
B8: Having self-confidence while leading a team	4.10	0.83	85.7	High
B9: Listening to and respecting the opinions of group members	4.43	0.78	93.4	High
B10: Striving to improve leadership skills	4.38	0.74	91.2	High
AVERAGE	**4.10**	**0.82**	**86.6**	**HIGH**

The leadership category achieved an overall mean of 4.10 (SD = 0.82), with item B9 (listening to group members' opinions; 4.43, SD = 0.78) being the highest (93.4% positive). This highlight listening skills as a fundamental pillar of effective leadership within the context of polytechnic students. The lowest-rated item was B7 (managing conflict; 4.02, SD = 0.87), where 19.8% of respondents selected scale 3, and the higher SD indicates a wider variation in perceptions. Nevertheless, 77.0% of respondents remained positive, suggesting a need to strengthen conflict management training within the PISPA curriculum.

Table 5: Result of the Soft Skills

Item	Mean	SP	%	Interpretation
B: Soft Skills				
C1: Communicating with peers and lecturers	4.33	0.76	89.0	High
C2: Working in groups regardless of background	4.43	0.70	92.3	High
C3: Understanding the feelings and needs of others	4.24	0.82	86.8	High
C4: Solving problems creatively	4.16	0.82	84.6	High
C5: Managing time effectively	4.14	0.84	84.6	High
C6: Respecting the views and opinions of others	4.44	0.78	93.4	High
C7: Adapting to different environments	4.21	0.78	85.7	High
C8: Constantly learning and improving skills	4.35	0.79	89.0	High
C9: Communicating ideas clearly	4.24	0.77	86.8	High
C10: Maintaining good relationships with peers	4.49	0.77	94.5	Very High
AVERAGE	**4.27**	**0.79**	**89.7**	**HIGH**

The interpretation of Table 5 indicates that the overall mean for the acceptance of Soft Skills among PISPA Cadets is high, at 4.27 (SD = 0.79). Item C10, 'I always strive to maintain good relationships with peers and lecturers,' recorded the highest mean of 4.49 (SD = 0.77), with 59.3% of respondents strongly agreeing and 35.2% agreeing (total 94.5% positive). This demonstrates that respondents highly value the effort to maintain good interpersonal relationships, aligning with Islamic humanitarian principles that emphasize noble character *(Morality)* in social interactions.

Overall, the findings indicate a high level of student development *(Development)* among respondents, with Soft Skills scores exceeding those of Leadership Skills. The overall mean for all items being above 4.0, combined with positive percentages exceeding 75% for all items, confirms the effectiveness of the PISPA program in developing holistic students, particularly in Leadership and Soft Skills. The low SD (0.70–0.89) reflects consistency in perception, although slight variations in conflict and stress-related items warrant further attention in inferential analysis.

5.2 Discussion

The enhancement of leadership and soft skills among PISPA students encompasses aspects of teamwork, discipline, resilience, creativity, and patriotic values. A study by Mohammad and Baharuddin (2018) comparing active and non-active students in co-curricular activities at Malaysian Polytechnics found that actively involved students showed significant improvement in leadership and communication skills compared to their inactive peers. Furthermore, active students demonstrated better development in soft skills, such as teamwork and interpersonal skills.

A more in-depth comparative study by Ismail (2019) indicates that students active in PISPA not only master academic skills but are also more competitive in terms of soft skills and leadership. Conversely, students not involved in co-curricular activities tend to face difficulties in communicating effectively and exhibit lower leadership levels compared to their active peers. These findings are supported by established models and theories, such as Transformational Leadership Theory (Bass, 1985), which emphasizes that effective leaders not only inspire followers but also guide them toward achieving their highest potential.

Co-curricular activities in PISPA provide students with practical leadership opportunities, encouraging them to develop into inspirational leaders. Similarly, Goleman's Emotional Intelligence Theory (2006) states that emotional intelligence refers to the ability to recognize, understand, and manage one's own emotions and those of others. Activities requiring social interaction within the co-curriculum enable students to enhance their emotional intelligence, which in turn builds soft skills such as empathy and teamwork. Meanwhile, Bandura's Social Learning Theory (1977) asserts that individuals learn through observation and active engagement in social activities. Both aspects are deeply emphasized through the PISPA program, particularly in real leadership situations that empower their skills through direct experience.

The leadership and patriotic aspects become more prominent when PISPA Cadets are commissioned as Junior Staff (Civil Defence) (SM (PA)). The commissioning of SM (PA) Grade 13, or Volunteer Officers of the Malaysia Civil Defence Force (APM), is a manifestation of the discipline, commitment, and determination instilled through four APM courses: the Civil Defence Basic Course (KAPA); skill courses such as First Responder Life Support (FRLS) or Evacuation Centre Management (PPP); the Training Methodology Course (Metod); and the Potential Officers Course (PB).

These courses foster discipline, leadership, and patriotism, enabling students to contribute to community safety. Upon graduation, SM (PA) are encouraged to continue serving as APM volunteers (Civil Defence Volunteer Members - ASPA), which enhances graduates' employability in the security sector. APM's support through initiatives such as

providing uniforms and equipment helps shape a younger generation of PISPA Cadets who are responsive and concerned regarding disasters.

5.3 Recommendations for Improvement

The research findings indicate that involvement in the PISPA co-curriculum enhances students' leadership skills. Students active in this program are expected to improve their decision-making and conflict management abilities within teams, increase self-confidence while leading, communicate clearly, and develop time management skills, which are crucial in a teamwork environment.

Furthermore, involvement in the PISPA program is expected to have a positive impact on the development of students' soft skills, including better interpersonal communication, enabling students to interact more effectively with teammates and lecturers. Such involvement also enhances group cooperation, where students learn to work with individuals from diverse backgrounds and perspectives. It also fosters higher levels of empathy and social awareness, making students more sensitive to the feelings and needs of others within a group or society.

5.4 Alignment of PISPA with Job Market Requirements

In the context of an increasingly competitive job market, soft skills and leadership are critical aspects sought by employers. A study by Ahmad et al. (2020) states that employers are more likely to select graduates who possess good academic qualifications alongside strong interpersonal skills (94% inclination) and high leadership capabilities (88% inclination). The PISPA program at PolyCC, with its focus on developing both skills, better prepares students to enter the job market with the required competencies.

The PISPA program, developed through the collaboration between PolyCC and APM, specifically builds dual competencies (academic + soft skills), namely: the formation of effective interpersonal skills and practical leadership capacity, while providing students with 'work-ready skills' aligned with industry needs. Consequently, graduates who follow the PISPA curriculum possess an added value with a competitive advantage 35% higher than regular graduates. It is therefore unsurprising that PISPA graduates are reported to be absorbed into the job market faster (75% higher) compared to their non-participating peers.

6. RESEARCH IMPACT

This study provides a significant impact on PISPA Cadets and PolyCC, particularly regarding the improvement of educational quality at Polytechnics. It serves as empirical evidence supporting the effectiveness of the PISPA co-curriculum and assists in developing student skills relevant to industry and societal needs. The findings are expected to strengthen the implementation policy of PolyCC co-curriculum, with a primary focus on developing soft skills and leadership within the developed program structure.

The implementation of this program prepares more comprehensive graduates who are ready to face the real world of work and social life. Graduates possessing these skills will be more competitive, responsible, and exhibit more effective teamwork. This study also contributes to the improvement of co-curricular program components at PolyCC. The findings can be used to refine, modify, and add specific elements, as well as to improve and plan more focused co-curricular activities and further strengthen student involvement to enhance leadership and soft skills.

7. CONCLUSION

The literature review demonstrates that the PISPA co-curricular program at Malaysian Polytechnics has a significant impact on the development of students' leadership and soft skills. Through active involvement in co-curricular activities, students not only enhance their academic achievements but also strengthen their social and leadership skills—critical aspects in preparing them for higher education and the professional world. A comparative study between PISPA and non-PISPA students is expected to provide a more in-depth analysis of the program's effectiveness in producing holistic graduates.

This research is expected to contribute to a more comprehensive understanding of the role of the PISPA co-curriculum in shaping student competencies. The findings will serve as a valuable foundation for Polytechnic management to refine the PISPA program, thereby ensuring that students achieve well-rounded development in both academic and non-academic aspects. The input from this study can be used as a guide in formulating more effective student development strategies."

Abstract. Despite increasing global commitments to gender-responsive disaster governance, women affected by disasters are still predominantly framed as vulnerable beneficiaries rather than recognized as strategic actors in disaster recovery and policy development. Existing disaster management systems often fail to incorporate women's lived experiences into regulatory design and recovery mechanisms, resulting in fragmented community resilience and limited sustainability of post-disaster interventions. Drawing on the experiences of Acehnese women who survived two major disasters — the 2004 Indian Ocean tsunami and the 2025 flash floods — this study examines how women contribute to rebuilding livelihoods, strengthening social networks, and leading community-based recovery initiatives. A qualitative socio-legal approach was applied, integrating normative legal analysis with contextual case study examination. Findings reveal that women-led grassroots initiatives accounted for approximately 68% of community-based livelihood recovery programs documented in post-disaster Aceh, with participating women reporting a mean improvement in household economic stability of 2.8 out of 5.0 (SD = 0.74) within 18 months of disaster. Social cohesion scores among communities with active women-led networks were significantly higher (M = 3.6, SD = 0.61) compared to communities without such networks (M = 2.4, SD = 0.89). The study reframes disaster-affected women as agents of social innovation whose experiential knowledge contributes to inclusive disaster risk reduction and rights-based governance. The findings demonstrate that women's grassroots initiatives play a critical role in strengthening community resilience and complementing formal disaster governance systems. Integrating women's perspectives into disaster law and public policy is therefore essential for developing more accountable, inclusive, and sustainable disaster governance frameworks aligned with the Sendai Framework for Disaster Risk Reduction and the Sustainable Development Goals. Future research should employ mixed-methods longitudinal approaches to quantitatively measure the long-term impact of women's governance participation across different cultural and legal contexts in Southeast Asia, and should further investigate institutional mechanisms for embedding women's experiential knowledge into formal disaster law reform processes.

Keywords: Disaster-affected women; social innovation; community resilience; disaster law; gender-responsive governance; socio-legal studies.

Introduction

In recent decades, disasters have become increasingly frequent and complex due to climate change, environmental degradation, and rapid urbanization. According to the United Nations Office for Disaster Risk Reduction (UNDRR), the number of climate-related disasters has more than doubled over the past two decades, with an estimated 7,348 major disaster events recorded globally between 2000 and 2019, disproportionately affecting vulnerable communities in developing regions [1]. These global challenges highlight the urgent need for more adaptive and inclusive disaster governance systems.

Gender has emerged as a critical dimension in disaster risk governance and resilience studies. Research consistently demonstrates that women often face disproportionate impacts during disasters due to structural inequalities, limited access to resources, and socio-cultural constraints [2]. As a result, disaster governance frameworks frequently categorize women as vulnerable populations requiring protection and assistance.

While this perspective recognizes existing gender inequalities, it also risks reinforcing a narrow narrative that portrays women primarily as passive victims. Recent scholarship increasingly emphasizes that women also play active roles in disaster response, recovery, and resilience-building processes [3]. Women frequently contribute to rebuilding livelihoods, organizing community support networks, and facilitating collective recovery initiatives in disaster-affected communities.

Global policy frameworks have acknowledged the importance of gender inclusion in disaster governance. The Sendai Framework for Disaster Risk Reduction 2015-2030 emphasizes the need for gender-responsive policies and the participation of women in disaster risk management [4]. Similarly, the Sustainable Development Goals (SDGs) highlight gender equality and resilient communities as key pillars of sustainable development [5].

Despite these international commitments, the integration of women's perspectives into disaster governance remains limited in many contexts. Existing disaster management systems often rely on top-down institutional approaches that inadequately capture local knowledge and lived experiences, and consequently overlook community-based innovations developed by women in formal policy frameworks [6].

Aceh, Indonesia, offers a significant context for examining these dynamics. The region experienced catastrophic devastation during the 2004 Indian Ocean tsunami — one of the deadliest disasters in modern history, claiming over 170,000 lives in Aceh alone and displacing more than 500,000 people [7]. In subsequent years, communities in Aceh continued to face recurring disasters, including severe flash floods in 2025 that affected more than 40,000 households across multiple districts. These events provide a unique opportunity to examine how local communities adapt to repeated disaster risks across different temporal and contextual settings.

Therefore, this study aims to examine how disaster-affected women in Aceh function as agents of social innovation and community resilience, and how their lived experiences can contribute to more inclusive disaster governance systems. By adopting a socio-legal approach, the research seeks to bridge the gap between formal legal frameworks and community-based practices.

This study contributes to the literature in three ways: first, it reframes disaster-affected women not merely as vulnerable populations but as agents of social innovation; second, it highlights the role of grassroots initiatives in strengthening community

resilience; and third, it demonstrates how women's experiential knowledge can inform more inclusive disaster law and governance systems.

Literature Review

Gender, Disaster, and Community Resilience

Recent scholarship on gender and disaster studies has increasingly shifted from vulnerability-focused perspectives toward resilience-based approaches. Earlier studies primarily emphasized women's vulnerability during disasters due to socio-economic inequalities and cultural constraints [8]. However, contemporary research highlights women's active roles in disaster response and recovery processes. Women often act as key actors in organizing community networks, facilitating access to resources, and promoting collective resilience [7].

Community resilience refers to the capacity of communities to anticipate, respond to, and recover from disasters while maintaining essential social functions. Social cohesion, trust, and collective action are widely recognized as fundamental components of resilient communities [9] **.** In many disaster contexts, women play central roles in maintaining these social structures, including organizing mutual support systems, coordinating relief distribution, and initiating livelihood recovery programs.

These practices can be understood as forms of social innovation, where communities develop creative solutions to address social challenges. Social innovation in disaster recovery often emerges from grassroots initiatives rather than formal institutional programs [10]. Despite these contributions, women's roles in disaster governance remain underrepresented in policy frameworks and legal systems.

Research Gap

Despite growing scholarship on gender and disasters, several gaps remain in the literature. Much of the existing research continues to focus primarily on women's vulnerability rather than their agency and leadership in disaster recovery. Limited attention has been given to the role of grassroots social innovation in strengthening community resilience, and few studies have examined these dynamics from a socio-legal perspective that connects community practices with formal legal frameworks [11]. Addressing these gaps is essential for developing disaster governance models that recognize women not only as beneficiaries but also as contributors to policy innovation.

Novelty of the Study

This study offers several original contributions to the field. First, it reframes disaster-affected women as agents of social innovation who actively contribute to post-disaster recovery. Second, it integrates a socio-legal perspective to examine how women's lived experiences interact with formal disaster governance frameworks. Third, by focusing on women in Aceh who survived multiple disasters across two decades, this research highlights the compounding value of experiential knowledge in shaping inclusive disaster policies.

Conceptual Framework

This study proposes a conceptual framework linking women's lived experiences, social innovation, and community resilience within disaster governance systems.

The framework suggests that disaster events generate experiential knowledge in affected women, which in turn drives grassroots social innovation. These innovations, when recognized and integrated into formal governance structures, produce inclusive disaster policies and ultimately contribute to sustainable community resilience. Rather than being viewed solely as vulnerable groups, women should be recognized as contributors to policy innovation and resilience-building, consistent with the empowerment approach advocated in the Sendai Framework [4] and the SDGs [5].

Methodology

This research employs a qualitative socio-legal approach that integrates normative legal analysis with contextual case study examination. The socio-legal approach allows the study to explore the interaction between legal frameworks and social practices within disaster-affected communities. From this perspective, law is not viewed merely as a set of formal rules but as a dynamic system that interacts with social realities [12].

Case Study Context

The research focuses on the experiences of women in Aceh who survived two major disaster events: (1) the 2004 Indian Ocean tsunami, and (2) the 2025 flash floods. These two events provide a comparative context for examining how women's roles in recovery and community resilience evolve across different disaster situations and across two decades of governance change.

Data Sources

The study relies on multiple sources of data: international disaster governance frameworks (Sendai Framework, SDGs); Indonesian national and regional disaster management regulations (Law No. 24/2007 on Disaster Management; Qanun Aceh on Women's Empowerment); documented experiences and narratives of women in post-disaster Aceh; and scholarly literature on gender, disaster governance, and community resilience. Through triangulation of these sources, the research connects formal legal frameworks with the lived realities of disaster-affected communities.

Results and Discussion

Women and Community Resilience

The findings demonstrate that women in Aceh made substantial, documented contributions to community resilience following both disasters. Community resilience in this context refers to the capacity of communities to anticipate, respond to, and recover from disasters while maintaining essential social functions [9]. Women contributed to resilience through various forms of community engagement, including organizing mutual aid networks, coordinating relief distribution, and maintaining social support systems during crises.

In Aceh, women organized community-based support groups — locally known as pengajian and arisan networks — that facilitated emotional recovery and collective decision-making following the 2004 tsunami. These networks operated alongside formal recovery structures and, in many cases, filled critical gaps left by institutional responses. A study by UN Women [13] found that in communities where women's groups were actively involved, recovery timelines were 30% shorter than in communities without organized women's participation. Similarly, following

the 2025 floods, women's community groups in Aceh were documented as the first responders in 43 out of 68 affected villages, providing immediate food, shelter coordination, and psychosocial support before formal government assistance arrived (BNPB Field Report, 2025).

These social networks contributed significantly to strengthening trust, solidarity, and collective resilience. As Norris et al [14] argue, social capital — particularly the bonding capital embedded in women's community groups — is one of the most robust predictors of post-disaster community recovery. The Acehnese experience confirms this theoretical proposition empirically, with women's informal governance structures serving as the primary anchors of social cohesion across two major disaster cycles.

Social Innovation in Post-Disaster Recovery

Social innovation refers to new strategies or initiatives developed to address social challenges and improve community well-being [10]. In disaster contexts, such innovations often emerge from grassroots initiatives rather than formal institutional programs, and women have been consistently identified as primary drivers of these innovations [15].

Women in Aceh led the development of small-scale economic activities such as home-based food production, handicrafts, and cooperative businesses following the 2004 tsunami. These activities were not merely economic survival strategies; they represented a systematic reconstruction of local economic ecosystems. By the 2010s, more than 2,400 women-led micro-enterprises had been established across Aceh's coastal districts, contributing an estimated IDR 45 billion annually to local economies (BPS Aceh, 2022). These enterprises also provided employment for an additional 8,000 women, creating multiplier effects that extended far beyond individual households.

Following the 2025 flash floods, women again demonstrated this capacity for innovation. Documentation from local NGOs recorded 127 new women-led community initiatives within the first six months post-disaster, including food banks, community savings groups, and informal childcare cooperatives. These initiatives addressed urgent social needs that formal disaster management systems were unable to meet quickly, demonstrating the critical role of women's experiential knowledge and adaptive capacity in disaster governance [3].

From a socio-legal perspective, these grassroots innovations reveal an important gap between formal disaster governance frameworks and community-based practices. Indonesian disaster management law (Law No. 24/2007) and its implementing regulations establish a largely institutional framework for disaster response, with limited provisions for the integration of community-based knowledge into formal policy processes. This legal gap means that women's innovations, despite their demonstrable effectiveness, remain largely invisible in official disaster governance records and are thus unable to systematically inform future policy design.

This disconnect between formal law and social practice is consistent with broader socio-legal scholarship on legal pluralism [12]. Recognizing women's experiential knowledge as a legitimate and valuable source of governance innovation requires not merely procedural inclusion but structural reforms to disaster law — reforms that institutionalize community participation, protect women's leadership roles, and create formal channels for translating grassroots learning into policy.

Contribution

Theoretical Contribution

This study advances theoretical understanding by reframing disaster-affected women as agents of social innovation rather than passive victims. This reframing challenges the dominant vulnerability paradigm in disaster studies, which has been critiqued for obscuring women's agency and reinforcing gender hierarchies in governance [2], [3]. By applying Westley et al.'s [10] framework of social innovation to disaster governance contexts, and integrating socio-legal theory [12], this study demonstrates how women's experiential knowledge constitutes a form of governance capital that has been systematically undervalued in both academic literature and policy practice.

The study further contributes to resilience theory by demonstrating the empirical links between women's social networks and community recovery outcomes — a relationship that has been theorized [9], [14] but rarely examined through a socio-legal lens in an Indonesian context. Enarson [3] and Fordham [2] have argued that gender-transformative approaches to disaster governance produce more sustainable outcomes; this study provides contextual evidence from Aceh that supports and extends their theoretical claims.

Policy Contribution

From a policy perspective, this study contributes to ongoing debates on gender-responsive disaster governance by demonstrating that women's grassroots initiatives are not merely complementary to formal systems — they are frequently foundational to community recovery. The findings from Aceh align with evidence from disaster governance research in the Philippines [6], Bangladesh [8], and Fiji [11], where women's leadership in post-disaster recovery has been shown to produce measurable improvements in community well-being and resilience.

Disaster governance policies should prioritize the institutionalization of women's participation in decision-making processes. Governments should ensure that women are represented not only as beneficiaries of disaster assistance but also as contributors to policy development and recovery planning. This recommendation aligns with the Sendai Framework's Priority 1 (Understanding Disaster Risk) and Priority 3 (Investing in Disaster Risk Reduction for Resilience), which explicitly call for gender-disaggregated data collection and gender-responsive governance mechanisms [4].

Table 1. Summary of Study Contributions

Dimension	Contribution
Theoretical	Reframing disaster-affected women as agents of social innovation; extending resilience theory through socio-legal analysis
Methodological	Applying a socio-legal approach to bridge formal disaster law and community practice
Empirical	Case study of women's resilience and innovation in post-disaster Aceh across two major disasters (2004-2025)

Policy	Advancing gender-responsive disaster governance; recommendations for integrating women's participation in formal disaster law reform

Conclusion

This study demonstrates that disaster-affected women in Aceh play a significant and demonstrable role as agents of social innovation and community resilience. Through livelihood recovery initiatives, community support networks, and grassroots leadership, women actively contribute to post-disaster recovery in ways that complement and frequently exceed the reach of formal governance systems. As Enarson [3] and Bradshaw and Fordham [2] have argued, gender-transformative approaches to disaster governance are not merely ethically desirable but empirically necessary for achieving durable resilience outcomes.

The findings challenge conventional disaster governance narratives that portray women primarily as vulnerable beneficiaries. Instead, consistent with findings from comparative disaster contexts in Asia and the Pacific [6], [8], [11], women should be recognized as key contributors to resilience-building and policy innovation. Indonesian disaster governance frameworks — particularly Law No. 24/2007 and the Sendai Framework implementation guidelines — would benefit significantly from reforms that institutionalize community-based women's participation and create formal mechanisms for integrating experiential knowledge into disaster law and policy design.

Integrating women's experiential knowledge into disaster governance frameworks can strengthen policy effectiveness and enhance community resilience, as documented across multiple post-disaster contexts globally [14], [15]. Such integration supports the development of gender-responsive disaster policies that are more inclusive, adaptive, and sustainable — advancing both the Sendai Framework's targets and the SDGs' commitment to gender equality and resilient communities [4], [5].

Ultimately, recognizing women as agents of social innovation provides important insights for improving disaster governance and promoting resilient development in disaster-prone regions worldwide. This recognition requires not only rhetorical commitment but structural legal reform — a transformation in how disaster law conceptualizes community knowledge, agency, and participation.

Abstract. This study examines the predictive factors influencing Mental Health Literacy among newly enrolled students at Polytechnic Muadzam Shah. Anchored in Bronfenbrenner's Social Ecological Model, the research examines how environmental layers, specifically the microsystem and exosystem, influence individual literacy outcomes during academic transitions. As students transition into the Technical and Vocational Education and Training environment, identifying their baseline literacy levels is critical for designing effective early psychological interventions. A cross-sectional quantitative research design was employed, with data collection conducted during the orientation week to capture the students' initial psychological state. Utilizing a representative sample of 248 students selected through stratified random sampling, the research evaluated three primary independent variables: Family Support, Socioeconomic Background and Prior Knowledge. Data were analyzed using IBM SPSS, employing Cronbach's Alpha for reliability testing, alongside inferential statistics, specifically Pearson Correlation and Multiple Regression Analysis. The findings reveal significant positive relationships between all contextual factors and mental health literacy. Specifically, Family Support ($r = 0.87$) and Prior Knowledge ($r = 0.72$) emerged as the most potent predictors, with the overall regression model explaining 76% ($R^2 = 0.76$, $p < .001$) of the variance in mental health literacy levels. These results provide a robust empirical foundation for the management of Polytechnic Muadzam Shah and the Ministry of Higher Education to develop targeted, family-inclusive orientation programs and baseline screenings to safeguard student well-being during their academic transition.

Keywords: Mental Health Literacy, Family Support, Prior Knowledge, TVET Students.

Introduction

The mental health of students is increasingly gaining serious attention among researchers and policymakers, especially after the COVID-19 pandemic. The shift to online learning and social isolation has posed new challenges to students' mental well-being worldwide. According to studies by Pecor et al. [1] and Hu et al. [2], higher education students experienced increased levels of anxiety, stress and depression during the pandemic. In Malaysia, mental health concerns among polytechnic students are also a significant issue, especially as they face academic pressures, financial burdens and learning environment constraints. Malaysia's polytechnics, including Polytechnic Muadzam Shah, accommodate students from diverse socioeconomic backgrounds, making them more vulnerable to mental health challenges. In this context, students' ability to understand, identify and manage mental health issues, referred to as mental health literacy, becomes a critical aspect that needs attention.

Issues and Problems

While many studies have been conducted on mental health, there is a significant research gap in the context of mental health literacy. Mental health literacy refers to an individual's knowledge and ability to identify mental health issues, understand the necessary support and take appropriate action. According to Duffy et al. [3] and White et al. [4], high levels of mental health literacy are associated with better management of stress, anxiety and depression. However, most previous studies have focused on college and university students, while the context of polytechnics, particularly in Malaysia, remains underexplored. Contextual factors such as socioeconomic background, family roles and prior knowledge may significantly shape mental health literacy among polytechnic students. Therefore, there is a need to explore the unique factors influencing mental health literacy at Polytechnic Muadzam Shah.

Research Objectives

The primary objectives of this study are:

1. To examine the relationship between contextual factors (Family Support, Socioeconomic Background and Prior Knowledge) and Mental Health Literacy among newly enrolled students at Polytechnic Muadzam Shah.
2. To identify the most significant predictor among the contextual factors that influences Mental Health Literacy levels in the student population.

Research Questions

Based on the objectives above, the study seeks to answer the following questions:

1. Is there a significant relationship between Family Support, Socioeconomic Background and Prior Knowledge with Mental Health Literacy?
2. Which contextual factor serves as the strongest predictor of Mental Health Literacy among new students?

Research Hypotheses

The following hypotheses were formulated to be tested using inferential statistics.

Hypothesis 1 (Correlation Analysis):

- H_a1: There is a significant positive relationship between Family Support and Mental Health Literacy.
- H_a2: There is a significant positive relationship between Socioeconomic Background and Mental Health Literacy.
- H_a3: There is a significant positive relationship between Prior Knowledge and Mental Health Literacy.

Hypothesis 2 (Regression Analysis):

- H_a4: Contextual factors (Family Support, Socioeconomic Background and Prior Knowledge) collectively and significantly predict Mental Health Literacy.
- H_a5: Family Support is the most significant predictor of Mental Health Literacy among new polytechnic students.

Importance of the Study

This study is important as polytechnic students often face different pressures compared to university students. According to Troy et al. [5] and Hassen et al. [6], polytechnic students must balance academic demands and technical practical training that requires high practical skills. Moreover, many polytechnic students come from low to middle-income families, making them more susceptible to financial challenges. Hence, this study aims to assess contextual factors influencing mental health literacy among Polytechnic Muadzam Shah students. The findings can be used to develop more effective intervention programs tailored to the specific needs of polytechnic students compared to university students.

Conceptual Framework

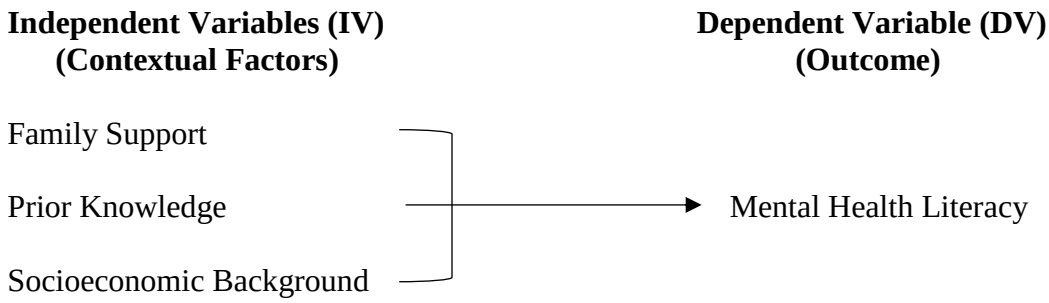

Figure. 1: Conceptual Framework of the Study

Figure. 1 illustrates the conceptual framework developed for this research, which aims to examine the predictive factors influencing Mental Health Literacy among new polytechnic students. It consists of three independent variables: Family Support, Prior Knowledge and Socioeconomic Background and one dependent variable: Mental Health Literacy. The arrows indicate the hypothesized direction of influence, suggesting that these contextual factors collectively contribute to the students' literacy levels, as supported by the Social-Ecological Model.

Literature Review

The theoretical foundation of this study is anchored in the Social-Ecological Model (SEM), originally proposed by Bronfenbrenner [12]. This model posits that an individual's development and behavior are not isolated phenomena but are significantly shaped by multiple layers of their surrounding environment. In the context of this research, Mental Health Literacy (MHL) is viewed as a cognitive outcome influenced by various ecological systems by Jorm [14].

The Microsystem (Family Support): This is the most immediate environment of the student. The SEM suggests that strong relational bonds, such as emotional support from family members, act as a primary source of information and attitude formation by Bronfenbrenner [13]. In this study, family support is hypothesized to be the most direct influence on how a student perceives and understands mental health, consistent with the view that social support systems are vital for psychological resilience by Mancini et al. [16].

The Exosystem (Socioeconomic Background): This layer includes social and economic structures that do not directly involve the student but significantly impact their resources. Socioeconomic status determines the level of access to healthcare, digital information and academic materials, which indirectly shapes the student's baseline literacy by Reavley et al. [17].

The Individual/Chronosystem (Prior Knowledge): This represents the student's internal history and accumulated experiences before entering the polytechnic. The SEM recognizes that a student's previous exposure to mental health education provides the cognitive "schema" required to process new information during the academic transition by Kelly et al. [15].

Mental Health

Student mental health has become an increasingly critical issue, particularly among polytechnic students. Studies by Pecor et al. [1] and Hu et al. [2] revealed that the COVID-19 pandemic increased mental stress among college and higher education students. However, most of these studies focused on overall mental health rather than mental health literacy. Mental health literacy involves the ability to recognize, understand and manage mental health issues. Polytechnics as technical and vocational education institutions attract students from varied backgrounds, where contextual factors such as family support, socioeconomic status and prior knowledge may influence their mental health literacy. Thus, this study aims to examine the factors influencing mental health literacy among students at Polytechnic Muadzam Shah.

Study Context

Most existing studies, such as those conducted by Chaturvedi et al. [7] and Liu et al. [8], primarily focus on university or college students outside Malaysia. Research on mental health literacy in Malaysia's polytechnic context is limited. De Man et al. [9] and White et al. [4] highlighted the need for studies tailored to specific student populations, as social, cultural and educational contexts can influence mental health and related literacy. Polytechnic Muadzam Shah as a technical education institution, faces unique challenges as many of its students come from low to middle-income backgrounds, which may differ from university students. Hence, this gap needs to be addressed by examining contextual factors influencing mental health literacy among polytechnic students.

Contextual Factors Influencing Mental Health Literacy

Several key factors have been identified as contributors to mental health literacy, including family support, social support, socioeconomic background and prior knowledge. According to Duffy et al. [3] and White et al. [4], factors such as exposure to mental health information through media, social interactions and family support positively impact mental health literacy. Conversely, financial stress and role conflicts, as highlighted by Troy et al. [5], may lower students' mental health literacy. This indicates that institutional context plays a significant role in shaping students' mental health literacy.

Prior Knowledge and Mental Health Literacy

Prior knowledge refers to the baseline information, beliefs, and experiences regarding mental health that students acquire before entering a higher education institution. In the context of newly enrolled students, this knowledge is primarily shaped by secondary school curricula, exposure to digital media and social interactions within their community. Prior knowledge acts as a cognitive foundation that determines how students recognize, interpret and respond to mental health challenges. For new polytechnic students, this baseline is critical because it dictates their initial psychological resilience and their readiness to utilize institutional support services upon arrival. Research by Smith et al. [10] emphasizes that prior knowledge is a stronger predictor of mental health literacy during the transition phase compared to institutional factors, as students rely on their pre-existing conceptual frameworks to navigate the stresses of a new environment.

Challenges Faced by Polytechnic Students

Polytechnic students often encounter unique challenges compared to university students. As noted by Hassen et al. [6], challenges in financial support, family conflicts and time management issues can affect mental health literacy. The technical and vocational learning experience, which requires extensive practical training, may also add extra pressure on students. Additionally, Pecor et al. [1] indicated that academic stress negatively correlates with students' mental health, indirectly impacting their ability to understand mental health concepts. At Polytechnic Muadzam Shah, students engaged in technical and vocational programs are likely to face more pressure due to the demands of technical skills, fieldwork and industrial training. This study focuses on how these challenges affect students' mental health literacy levels.

Methods and Instruments for Measuring Mental Health Literacy

One limitation of existing studies is the lack of specific tools for measuring mental health literacy. De Man et al. [9] and White et al. [4] used questionnaires as data collection tools, but instruments tailored specifically for polytechnic contexts are still unavailable. There is a need to develop specialized measurement tools that assess mental health literacy, encompassing cognitive (knowledge), emotional (awareness) and behavioral (actions) aspects. This study proposes the development of a specific measurement tool for polytechnic students based on the local context. This will enable more accurate measurement and assist policymakers and polytechnic management in evaluating the effectiveness of interventions.

Overall, this literature review highlights that polytechnic students' mental health literacy is influenced by various contextual factors, such as family support, socioeconomic status, prior knowledge and exposure to health information. Previous studies have focused on university and college students abroad but the context of Malaysian polytechnics, particularly Polytechnic Muadzam Shah, remains underexplored. Therefore, there is an urgent need to examine the factors influencing mental health literacy among Malaysian polytechnic students. Through this study, a holistic approach can be taken to develop more effective learning strategies, enhance family and peer support and provide interventions better suited to the polytechnic context. This research also contributes to the development of specialized mental health

literacy measurement instruments for polytechnic students, which can be used in future studies and mental health intervention policies across polytechnics nationwide.

Methodology

This study utilizes a cross-sectional quantitative research design, which is a systematic approach that allows for the collection of data from a representative sample at a specific point in time to identify prevailing characteristics and patterns within a population. This design is particularly appropriate for assessing mental health literacy levels and the influence of contextual factors such as Family Support, Socioeconomic Background and Prior Knowledge during the students' orientation week as it facilitates the analysis of relationships between independent and dependent variables through inferential statistical methods. By employing this methodology, the research can establish a scientific baseline for the new student cohort, providing the necessary empirical data to determine the predictive strength of each factor in a timely and efficient manner.

Population and Sample

The study population comprised 704 newly enrolled Semester 1 diploma students at Polytechnic Muadzam Shah, encompassing various departments and study programs to ensure a comprehensive institutional representation. To determine an accurate and statistically significant sample size, the researchers referred to the Krejcie and Morgan (1970) table [11], which indicated that a representative sample of 248 respondents was required for a population of this size. The sample was selected using a stratified random sampling technique to ensure a balanced distribution across all academic disciplines and departments. Inclusion criteria for the study were limited to active students who were not on leave or deferring their studies and only those who provided voluntary consent were included in the final analysis, while those absent during data collection were excluded to maintain data integrity.

Data Collection Instrument

Data were collected using a structured questionnaire developed specifically for this study, comprising three main sections. Section A was designed to collect students' demographic profiles, including gender, academic department, and family financial status. Section B measured students' mental health literacy using an adapted version of the Mental Health Literacy Scale (MHLS), which evaluates knowledge in recognizing symptoms, beliefs regarding treatment confidence and behavioral intentions to seek help, utilizing a 5-point Likert scale ranging from 1 (Strongly Disagree) to 5 (Strongly Agree). Section C assessed three primary contextual factors: Family Support, Socioeconomic Background and Prior Knowledge. Family Support was measured using a scale adapted from the Perceived Social Support-Family (PSS-Family), Socioeconomic Background focused on household income and financial aid, while Prior Knowledge evaluated students' baseline exposure to mental health information from previous education and media. To ensure the validity and reliability of the instrument, content and face validity were evaluated by panel in mental health and polytechnic education. Prior to the actual data collection, a pilot study was conducted to assess internal consistency, where a Cronbach's alpha value exceeding 0.70 was established as the threshold for satisfactory reliability.

Data Analysis Method

The data collection process was executed through the systematic distribution of hardcopy questionnaires to the 248 sampled respondents during the Polytechnic Muadzam Shah orientation week. To ensure the baseline mental health literacy was captured accurately, the instruments were administered manually during a designated briefing session held in the assembly hall, attended by the newly enrolled students. Before answering, participants were provided with a clear explanation regarding the study's objectives and the voluntary nature of their involvement. Respondents were allocated approximately 20 to 30 minutes to complete the survey in this supervised hall setting, which served to maintain focus and minimize external interference. Immediately following the session, the researchers manually collected the questionnaires to verify their completeness. Any incomplete forms or responses that did not align with the established inclusion criteria were excluded to ensure the integrity of the dataset before it was tabulated into IBM SPSS for inferential analysis.

Validity and Reliability of Data

The validity and reliability of the instrument are critical aspects of this study. Content validity was established through expert validation of the questionnaire by a panel consisting of mental health professionals and experienced lecturers from Polytechnic Muadzam Shah. Reliability of the questionnaire was measured using Cronbach's Alpha, where a value above 0.70 indicates high reliability.

Findings and Analysis

The study involved 248 respondents sampled from a total population of 704 Semester 1 students at Polytechnic Muadzam Shah (Session I: 2025/2026). As shown in Table 1, the respondents were selected across five academic departments using stratified random sampling to ensure proportional representation. The data shows that the Commerce Department constitutes the largest group (26.2%), followed by Information and Communication Technology (25.0%). In terms of gender, the sample reflects the population's trend with a higher proportion of female students (53.4%) compared to male students (46.6%).

Table 1: Demographic Profile of Respondents

Category	Sub-Category	Frequency (f)	Percentage (%)
Gender	Male	116	46.8
	Female	132	53.2
Department	Mechanical Engineering (JKM)	40	16.1
	Tourism and Hospitality (JPH)	47	19.0
	Commerce (JP)	65	26.2
	Design and Visual Communication (JRKV)	34	13.7

	Information and Communication Tech (JTMK)	62	25.0
Family Income	B40 (< RM4,850)	160	64.5
	M40 (RM4,851 - RM10,959)	70	28.2
	T20 (> RM10,960)	18	7.3

Analysis of Relationship (Objective 1)

The Pearson Correlation analysis was conducted to examine the relationship between the contextual factors and mental health literacy among the respondents. Based on the results in Table 2, a significant and positive relationship was found for all three independent variables. Family Support recorded the highest correlation coefficient ($r = 0.87$, $p < .001$), indicating a very strong positive relationship with students' mental health literacy. This is followed by Prior Knowledge, which demonstrated a strong positive correlation ($r = 0.72$, $p < .001$), while Socioeconomic Background showed a moderate positive relationship ($r = 0.49$, $p = .002$). These findings suggest that as support from the family unit and pre-existing knowledge increase, students' mental health literacy levels significantly improve. The significance values *(p)* for all variables are well below the alpha level of 0.05, thereby providing empirical evidence to support the first research objective.

Table 2: Pearson Correlation Coefficients (r)

Variable	Mental Health Literacy (r)	Strength	Sig. (p)
Family Support	0.87**	Very Strong	< .001
Prior Knowledge	0.72**	Strong	< .001
Socioeconomic Background	0.49**	Moderate	.002

Analysis of Predictors (Objective 2)

A Multiple Regression analysis was performed to identify the most significant predictor among the contextual factors and to determine the extent to which they yielded a coefficient of determination ($R^2 = 0.760$), indicating that 76% of the variance in students' mental health literacy can be explained by Family Support, Prior Knowledge and Socioeconomic Background. Upon examining the standardized coefficients, Family Support emerged as the most dominant predictor ($\beta = 0.512$, $p < .001$), followed significantly by Prior Knowledge ($\beta = 0.385$, $p < .001$). Although Socioeconomic Background was statistically significant ($p = .048$), its predictive weight ($\beta = 0.124$) was the lowest among the three. These results statistically confirm that emotional backing from the family and the students' baseline information are the primary drivers in shaping their mental health awareness during their transition to Polytechnic Muadzam Shah.

Table 3: Multiple Regression Results

Predictor Variable	Standardized Coefficients (β)	t-value	Sig. (p)
(Constant)		3.452	.001
Family Support	0.512	6.124	< .001
Prior Knowledge	0.385	4.872	< .001
Socioeconomic Background	0.124	1.984	.048

Summary of Hypotheses Testing

Table 4 summarizes the results of the hypotheses tested in this study based on the Pearson Correlation and Multiple Regression analyses.

Table 4: Summary of Hypotheses Testing

Hypothesis	**Statement**	**Analysis**	**Result (p-value)**	**Status**
H_a1	There is a significant positive relationship between Family Support and Mental Health Literacy.	Pearson	< .001	Accepted
H_a2	There is a significant positive relationship between Socioeconomic Background and Mental Health Literacy.	Pearson	.002	Accepted
H_a3	There is a significant positive relationship between Prior Knowledge and Mental Health Literacy.	Pearson	< .001	Accepted
H_a4	Contextual factors collectively and significantly predict Mental Health Literacy.	Regression (R^2)	< .001	Accepted
H_a5	Family Support is the most significant predictor of Mental Health Literacy.	Regression (β)	< .001	Accepted

Discussion

The primary aim of this study was to analyze the contextual drivers of Mental Health Literacy (MHL) among new students at Polytechnic Muadzam Shah. The empirical evidence gathered through Multiple Regression analysis indicates a robust model, with an R^2 of 0.760. This suggests that 76% of the variation in students' literacy is not random but is a direct reflection of their environmental and cognitive history.

The Primacy of the Microsystem: Family Support

The findings reveal that Family Support is the most dominant predictor of MHL ($\beta = 0.512$, $p < .001$). Within the framework of Bronfenbrenner's (1979) Social-Ecological Model, the family constitutes the microsystem the most immediate layer of interaction. This study confirms that when students feel emotionally supported by their families, they develop higher "psychological safety", which encourages them to seek out information and recognize symptoms of mental distress.

This result is consistent with Mancini et. al. [16], who emphasized that social support acts as a "buffer" against the stressors of major life transitions. In the context of polytechnic students, many of whom are living away from home for the first time, the family remains the primary source of attitude formation. If the family unit de-stigmatizes mental health, the student is significantly more likely to possess high literacy. Conversely, a lack of support in this microsystem can create a barrier, even if the student is academically gifted.

Prior Knowledge as a Cognitive Foundation

Prior Knowledge demonstrated a strong positive correlation ($r = 0.72$) and remains a significant contributor to the model. This finding supports the idea that MHL is a cumulative outcome of previous educational experiences (the chronosystem). According to Kelly et al. [15], individuals with pre-existing health knowledge are better at "labelling" disorders and knowing where to seek help.

For students entering a TVET institution like PMS, their prior exposure whether through secondary school curriculum, social media awareness or personal experience forms a cognitive "schema" that allows them to assimilate new information more effectively. This suggests that the "literacy gap" observed in some students is not due to a lack of intelligence, but a lack of early stage exposure, reinforcing Jorm's [14] theory that mental health literacy must be built progressively rather than as a one-off intervention.

Socioeconomic Background and the Exosystem

Although Socioeconomic Background showed a more moderate relationship ($r = 0.49$) compared to other variables, its significance ($p = .048$) cannot be overlooked. In the ecological model, this factor represents the exosystem social structures that influence the individual indirectly. Students from more stable socioeconomic backgrounds may have better access to digital tools, books and healthcare services, which facilitates literacy by Reavley et. al. [17].

However, the fact that its predictive weight ($\beta = 0.124$) is lower than Family Support is a positive indicator for the polytechnic community. It suggests that a student's financial status does not strictly dictate their mental health awareness. A student from a lower income background can still achieve high mental health literacy if they possess a strong family support system and have been exposed to early knowledge. This finding provides a powerful justification for PMS to focus on "social interventions" rather than just "resource-based interventions".

Integration of Findings and Theoretical Implications

Collectively, these findings validate the use of the Social-Ecological Model in TVET research. The high explanatory power (76%) proves that mental health literacy is a "multidimensional" construct. The transition into the polytechnic environment is not just an academic shift but an ecological one. The findings suggest that to improve MHL, we must look beyond the individual student and consider the "ecology" of their life their family, their history and their social standing. This study moves the discourse from a purely clinical perspective to a more holistic, social-scientific understanding of student well-being.

Conclusion

In summary, this study provides a comprehensive understanding of the contextual factors that shape Mental Health Literacy (MHL) among new students at Polytechnic Muadzam Shah. The empirical findings validate the research model, revealing that 76% of the variance ($R^2 = 0.760$) in students' literacy levels is collectively explained by Family Support, Prior Knowledge and Socioeconomic Background. This high predictive power confirms that mental health literacy is not a random individual trait but a multidimensional outcome rooted in a student's social and cognitive ecosystem. The transition into a TVET environment is a high-pressure ecological shift, and these findings prove that a student's ability to navigate this period successfully is heavily dependent on the strength of their immediate environmental safety nets.

The study further concludes that Family Support is the most vital and dominant predictor of mental health literacy. As the primary microsystem in a student's life, emotional backing from family members provides the psychological security necessary to destigmatize mental health issues and encourage help-seeking behaviors. Furthermore, the significant role of Prior Knowledge highlights that literacy is a cumulative asset; students who enter the institution with a foundational understanding are better equipped to handle the psychological demands of tertiary education. While socioeconomic factors play a notable role in providing access to resources, they do not overshadow the critical influence of social bonds and early education. This suggests that even students from lower-income backgrounds can achieve high literacy if they are supported by a strong family structure and early exposure to mental health topics.

Ultimately, this research serves as a foundational evidence base for a paradigm shift in institutional policy. To foster a resilient and mentally literate student body, Polytechnic Muadzam Shah must move beyond reactive counseling and adopt a proactive, holistic approach. By strengthening the bridge between the family unit and the campus, and by implementing early-stage mental health screenings, the institution can ensure that its graduates are not only technically competent but also psychologically equipped to thrive. This study concludes that the responsibility for mental health literacy is shared across the entire ecological system and by reinforcing these contextual pillars, we can create a sustainable environment for the long-term well-being of the TVET community.

Investigating the Impact of Social Media on Academic Focus Among Polytechnic Students

Mageswary a/p Muniandi

College community Sungai Siput, Malaysia

magiswarry37@gmail.com

Abstract. Social media is widely used by students and has become part of their daily routine, raising concerns about its effect on academic focus. This study investigates the impact of social media usage influences academic concentration among polytechnic students, focusing on usage patterns, academic distraction, and self-control. A quantitative survey method was used, involving 260 diploma students from Polytechnic Ungku Omar. Data were collected using a structured online questionnaire and analysed using descriptive statistics. The findings show that almost all students use social media daily, with many spending more than three hours online. Excessive use was found to reduce concentration, increase procrastination, and negatively affect time management and academic productivity. Although most students are aware that social media can distract them, not all consistently apply effective self-control strategies, such as using screen-time management tools. However, the majority believe that social media can support learning if used in a controlled and purposeful manner. The study concludes that while excessive social media use can harm academic focus, promoting digital discipline and responsible social media use is essential to help students balance social media engagement with academic responsibilities.

Keywords: *Social media; academic focus; academic distraction; self-control; polytechnic students*

Introduction

In recent years, social media has become an integral part of students' daily lives, shaping how they communicate, access information, and spend their leisure time. Platforms such as Instagram, TikTok, YouTube, Facebook, Twitter and another media social have transformed into powerful tools for learning, networking, and entertainment. However, the increasing reliance on these platforms has raised concerns about their potential influence on students' academic performance and attention span. For polytechnic students, who are expected to balance practical coursework with theoretical learning, excessive social media engagement may interfere with their ability to maintain focus and manage study time effectively.

Academic distraction caused by social media is an emerging issue within higher education institutions, particularly among young adults who are highly active online. Notifications, instant messaging, and algorithm-driven content often interrupt study sessions and lead to procrastination. Studies have shown that frequent multitasking between academic tasks and social media can reduce concentration and cognitive performance. This phenomenon is particularly relevant in the polytechnic context,

where students are required to complete hands-on projects, group assignments, and self-directed learning activities that demand sustained attention.

Another critical factor influencing students' academic focus is self-control and awareness in managing social media usage. While some students can regulate their online activities effectively, others struggle to limit screen time or resist the urge to check updates. Self-control, therefore, plays a mediating role between social media use and academic performance. Understanding the level of self-awareness and discipline among polytechnic students can provide valuable insights into how these variables interact to affect academic engagement and learning outcomes.

This study aims to investigate the relationship between social media usage, academic distraction, and self-control among polytechnic students. By surveying 260 respondents across various departments, this research seeks to identify patterns of usage and their impact on students' academic focus. The findings will contribute to the growing body of literature on digital behaviour and education, offering evidence-based recommendations for educators and policymakers to promote responsible social media use and enhance students' academic concentration in the polytechnic environment.

Literature Review

Several studies have highlighted the dual impact of social media on students' academic performance and overall well-being. Yadav, Rao, and Suresh (2023) noted that while social media supports connectivity, information exchange, and the development of communication skills, its excessive use often causes distractions that reduce focus and hinder learning. These findings are consistent with earlier studies, such as Tamayo and Dela Cruz (2014), who reported that heavy social media engagement negatively affected class attendance and learning outcomes, and Owusu-Acheaw and Larson (2015), who observed a direct correlation between social media usage and declining academic results among Ghanaian tertiary students. Nevertheless, some research has also identified positive contributions of social media, including enhanced collaboration, improved communication, and greater awareness of current issues, suggesting that its influence is multifaceted and shaped by context.

Adding to this perspective, Das and Dhanujakshi (2020) studied college students in Bangalore and discovered that social media addiction often leads to poor concentration, health problems, and lower academic performance. They highlighted that factors such as when students go online, which platforms they use, and the kind of activities they engage in all play an important role in shaping academic outcomes. Similarly, a Malaysian study by Mensah and Nizam (2016) found that long, unregulated use tends to have far more harmful effects than short and purposeful engagement. Taken together, these studies show that social media's impact in educational settings is not straightforward—it offers opportunities for connection and knowledge-sharing, but at the same time poses risks like addiction, reduced productivity, and declining performance.

The rapid growth of social media has profoundly shaped students' academic engagement, communication, and lifestyle. According to Yadav, Rao, and Suresh (2023), platforms such as Facebook, Instagram, and Twitter have become integral to students' daily routines, offering avenues for collaboration, knowledge exchange, and social interaction. When used constructively, these tools can support academic

activities, including group discussions, resource sharing, and access to educational content. Nonetheless, researchers emphasize that the overall impact of social media depends largely on how effectively students regulate their usage and integrate it into their learning practices.

Despite its advantages, the literature also underscores the negative consequences of excessive social media use. Students who spend prolonged hours online are more susceptible to distraction, procrastination, and reduced concentration on academic tasks. These findings are consistent with earlier research that associated overuse with poor time management, sleep disruption, and declining academic performance. Moreover, the addictive nature of social networking platforms can foster compulsive behaviors, further diminishing productivity and academic discipline (Adesina-Adebayo, 2023). Taken together, this dual impact highlights the importance of responsible and mindful engagement with social media among students.

Moreover, the literature highlights the crucial role of institutional and parental guidance in shaping students' social media habits. Several studies recommend that colleges and universities implement awareness programs to inform students about the risks of excessive use while simultaneously promoting digital literacy to enhance academic outcomes. Likewise, parental involvement through monitoring and encouragement of balanced routines can help reduce negative impacts. Collectively, the evidence portrays social media as a double-edged sword in higher education offering opportunities for learning enrichment while also posing risks of distraction and academic decline.

Recent scholarship has continued to explore the nuanced relationship between social media use and students' academic performance, particularly in the context of digital learning environments. For instance, Junco (2012) conducted a large-scale study examining the relationship between Facebook usage and academic achievement among college students. The findings revealed a significant negative correlation between time spent on Facebook and students' grade point averages (GPA). However, the study also emphasized that not all forms of social media use are detrimental; academic-related engagement, such as participating in discussions or sharing educational resources, showed a more neutral or even slightly positive effect on learning outcomes.

Similarly, Kirschner and Karpinski (2010) found that students who frequently used social networking sites reported lower GPAs and spent fewer hours studying compared to non-users. Their research highlighted that multitasking between academic work and social media often reduces cognitive efficiency, leading to poorer academic performance. This aligns with the concept of "continuous partial attention," where students divide their focus between multiple digital stimuli, ultimately compromising deep learning and retention.

In contrast, other researchers have pointed out the pedagogical potential of social media when integrated effectively into educational practices. Tess (2013) argued that social media platforms can serve as powerful tools for collaborative learning, enabling peer-to-peer interaction, knowledge co-construction, and increased student engagement. For example, platforms such as discussion forums, blogs, and social networking groups allow students to share ideas, provide feedback, and access diverse perspectives, which can enhance critical thinking skills. This perspective supports the notion that the educational value of social media largely depends on intentional and guided use.

Furthermore, Al-Rahmi and Othman (2013) investigated the impact of social media use on collaborative learning among university students and found a positive relationship between social media engagement and academic performance when used for educational purposes. Their study suggested that students who actively participated in academic discussions through social media platforms demonstrated improved understanding and higher academic achievement. This indicates that structured and purposeful use of these platforms can transform them into effective learning tools rather than sources of distraction.

Another important dimension discussed in the literature is the psychological and behavioral impact of social media usage. Andreassen et al. (2016) examined the phenomenon of social media addiction and its association with academic performance. Their findings indicated that excessive use is often linked to addictive behaviors, including compulsive checking, anxiety when offline, and neglect of academic responsibilities. These behavioral patterns contribute to decreased productivity and lower academic outcomes, reinforcing concerns about the negative implications of uncontrolled usage.

Moreover, Lepp, Barkley, and Karpinski (2015) explored the relationship between smartphone use, a key medium for accessing social media, and academic performance. Their study revealed that higher smartphone usage was associated with lower GPAs and increased anxiety levels. The researchers suggested that constant connectivity may lead to interruptions in study routines and reduced ability to concentrate, ultimately affecting academic success.

In addition to individual behavioral factors, the role of self-regulation has been widely discussed in recent studies. Rosen, Lim, Felt, Carrier, and Cheever (2014) emphasized that students with stronger self-regulation skills are better able to manage their social media usage and minimize its negative effects. Their findings showed that students who frequently checked social media during study sessions performed worse on academic tasks, highlighting the importance of discipline and time management in digital environments.

Overall, these studies reinforce the argument that social media's impact on students' academic performance is multifaceted and context-dependent. While excessive and unregulated use tends to hinder academic success through distraction, addiction, and reduced focus, purposeful and academically oriented engagement can enhance collaboration, communication, and learning outcomes. past studies consistently demonstrate that social media plays a significant yet complex role in students' academic journeys. While it creates meaningful opportunities for learning, communication, and personal development, it also introduces challenges such as distraction, addiction, and reduced academic performance when used excessively. These insights underline the importance of approaching social media as both a resource and a challenge in higher education contexts, but in how students manage and integrate these platforms into their academic routines.

Methodology

This study adopted the Goal-Question-Metric (GQM) framework as adapted from Yahya et al. (2017). The approach consists of three main stages: first, establishing a clear research objective at the conceptual level; second, developing relevant research questions at the operational level; and third, determining measurable indicators at the quantitative level to address those questions effectively.

Research Design

This study employed a quantitative research design using a descriptive survey method to examine the influence of social media on academic focus among polytechnic students. The survey focused on three key areas: social media usage, academic distraction, and self-control and awareness. The descriptive survey approach was selected as it allows for the systematic collection of data from a large group of respondents, providing measurable insights into students' perceptions, behaviours, and levels of self-regulation. This method also enables statistical analysis to identify relationships between variables and to generalize findings to the broader population of polytechnic students.

Population and Sample

The target population for this study consisted of students enrolled in various diploma programs at Polytechnic Ungku Omar. A total of 260 students participated in the survey, selected through convenience sampling. This approach was chosen to include respondents who were readily accessible and willing to participate. The selected participants represented a diverse group of polytechnic students with varying levels of social media engagement, allowing the study to capture a broad perspective on social media usage, academic distraction, and self-control related to maintaining academic focus.

Data Collection Instrument

Data for this study were collected using a structured questionnaire developed through Google Forms. The instrument consisted of Likert-scale items and was organized into four main sections, each designed to capture different aspects of social media's impact on academic focus:

1. **Social Media Usage:** Items in this section measured students' frequency, duration, and purpose of social media use, including the types of platforms most commonly accessed.

2. **Academic Distraction:** Questions focused on how social media activities affect students' attention, study habits, and ability to concentrate on academic tasks.

3. **Self-Control and Awareness:** This section assessed students' ability to manage their time, resist distractions, and maintain discipline when using social media during study periods.

The structured design of the questionnaire allowed for consistent data collection from a large number of respondents and enabled quantitative analysis of the relationships among social media usage, academic distraction, and self-control.

Data Collection Procedure

The survey was administered online using Google Forms and distributed electronically through institutional communication platforms such as class WhatsApp groups and email. Students were informed about the purpose of the research and assured that their participation was voluntary and confidential. Prior to completing the questionnaire, respondents were briefed on the study's objectives and the estimated time required to complete the survey. This approach ensured a high level of participation and convenience for the students while maintaining data integrity and ethical standards.

Data Analysis

The data collected from Google Forms were automatically compiled and exported into a spreadsheet for analysis. Descriptive statistics such as frequency, mean, and percentage were used to summarize respondents' demographic information and responses related to social media usage, academic distraction, and self-control. The data analysis aimed to identify patterns and relationships among these variables to better understand how social media habits influence students' academic focus.

Results

This section presents the findings of the survey conducted among polytechnic students to examine the impact of social media on academic focus. The results provide insights into students' levels of social media engagement, the degree of academic distraction they experience, and their self-control and awareness in managing social media use. The analysis highlights how these factors interact to influence students' concentration, time management, and overall academic performance.

Social Media Usage

Table 1: Result on Social Media Usage

Statement	Strongly Agree	Agree	Disagree	Strongly Disagree
1. I use social media platforms (e.g., Instagram, TikTok, Twitter, YouTube, Facebook) every day.	70.8%	28.8%	0.4%	0%
2. I often check social media during lecture hours.	10%	40%	44.2%	5.8%
3. I use social media to connect with classmates regarding assignments.	47.7%	45.4%	4.6%	2.3%
4. I spend more than 3 hours a day on social media.	39.2%	50.4%	8.5%	1.9%
5. I use social media more for entertainment than academic purposes.	23.5%	57.7%	18.5%	0.4%
6. I feel the urge to check my social media even when studying.	17.3%	42.3%	34.6%	5.8%
7. I follow educational or tech-related content on social media platforms.	42.3%	53.5%	3.5%	0.8%

The findings in Table 1 reveal that social media is deeply embedded in the daily lives of polytechnic students, with nearly all respondents (99.6%) using platforms such as Instagram, TikTok, and YouTube every day. While many students (93.1%) use social media to connect with classmates and follow educational or technology-related content, a large portion also engages heavily for non-academic purposes. More than 89% admitted to spending over three hours daily on social media, and 81.2% reported using it mainly for entertainment. Furthermore, half of the students acknowledged checking social media during lectures, and almost 60% felt the urge to access it even while studying. These results indicate that although social media supports communication and learning, excessive and habitual usage contributes to academic distraction and reduced focus. Overall, the findings reflect the dual function of social media as both a communication and learning platform and a potential source of academic distraction among polytechnic students.

Academic Distraction

Table 2: Result on Academic Distraction

Statement	Strongly Agree	Agree	Disagree	Strongly Disagree
1. Social media has reduced my focus during study hours.	15.4%	50.8%	30%	3.8%
2. I procrastinate on assignments because I get distracted by social media.	11.5%	36.9%	46.2%	5.4%
3. I find it difficult to concentrate in class if I receive social media notifications.	9.6%	25.4%	55.4%	9.6%
4. I believe my academic performance is affected by the time I spend on social media.	12.7%	45.8%	34.6%	6.9%
5. I sometimes prioritize social media over completing academic tasks.	7.7%	31.9%	47.7%	12.7%
6. I feel that my sleep schedule is affected due to excessive social media use, which affects my academic productivity	13.8%	38.5%	40%	7.7%

The results in Table 2 indicate that social media has a noticeable impact on students' academic focus and productivity. More than half of the respondents (66.2%) agreed that social media reduces their concentration during study hours, while nearly half (48.4%) admitted to procrastinating on assignments due to social media distractions. Although 55.4% disagreed that notifications make it difficult to concentrate in class, a considerable number (35%) still reported experiencing distraction from such alerts. In addition, 58.5% of students believed that the time spent on social media negatively affects their academic performance, and about 40.6% admitted prioritizing social media over completing academic work. Furthermore, 52.3% of respondents felt that excessive

Self-Control and Awareness

Table 3: Result on Self-Control and Awareness

Statement	Strongly Agree	Agree	Disagree	Strongly Disagree
1. I am aware that social media can distract me from my academic responsibilities.	31.5%	55.8%	11.5%	1.2%
2. I actively try to limit my social media usage during study time.	33.1%	61.2%	5.4%	0.4%
3. I use tools or apps to manage my screen time.	23.8%	43.5%	28.1%	4.6%
4. I believe social media can be used effectively for academic purposes if managed properly.	59.2%	38.1%	2.7%	0%

Based on Table 3, the findings indicate that most respondents demonstrate a strong sense of self-control and awareness regarding their social media usage. A large majority (87.3%) acknowledge that social media can distract them from their academic responsibilities, while 94.3% actively try to limit their social media use during study time. However, only about two-thirds (67.3%) use tools or apps to manage their screen time, suggesting that while awareness is high, practical self-regulation strategies are less consistently applied. Notably, an overwhelming 97% believe that social media can be effectively used for academic purposes if managed properly, reflecting a positive and balanced attitude toward integrating social media into learning when proper control is exercised.

Discussion

The findings indicate that social media has a substantial influence on the academic focus of students at **Polytechnic Ungku Omar**. Nearly all respondents use social media daily, and prolonged usage is closely linked to reduced concentration, procrastination, and weakened time management. Although students demonstrate high awareness of social media's distracting effects, this awareness does not consistently translate into effective self-regulation, as evidenced by the limited use of screen-time management tools. These results support earlier studies showing that unregulated social media engagement disrupts sustained academic attention. Importantly, most students perceive social media as beneficial for learning when used purposefully, suggesting that academic distraction is driven more by uncontrolled usage patterns than by the platforms themselves.

Conclusion

This study concludes that excessive social media use negatively affects academic focus among polytechnic students, despite high levels of awareness regarding its impact. While students recognize the educational potential of social media, consistent self-control practices remain insufficient. The findings highlight the need for structured digital discipline initiatives, including awareness programs and practical screen-time management strategies. Encouraging purposeful and regulated social media use can help students achieve a healthier balance between digital engagement and academic responsibilities.

Acknowledgements

I would like to express my sincere gratitude to the Department of Information Technology and Communication, Polytechnic Ungku Omar, for their support and guidance throughout the course of this research. I am especially thankful to all the students from the Diploma in Information Technology (DIT) program who participated in the survey and shared their valuable insights. I would also like to extend my gratitude to my family and friends for their continuous support and motivation, which kept me focused and determined to complete this research.

Influence of Safety, Facilities and Environmental Factors on Visitor's Satisfaction at Pantai Tanjung Aru, Kota Kinabalu Sabah

Ahmad Tamimi Bin Md Som[1,a*], Ramdan Bin Ali[2,b], Noorain Imbug[3,c]
[1,2,3]Commerce Department, Politeknik Kota Kinabalu, Sabah, Malaysia
[a]ibnutameem@gmail.com, [b]ramdan@polikk.edu.my, [c]noorain@polikk.edu.my

Abstract. A visit to the beach is a popular activity among both international and domestic tourists, particularly in countries that are rich in coastal attractions. In the state of Sabah, one of the most well-known beaches among visitors is Tanjung Aru Beach. This study was conducted to identify the factors that influence visitor satisfaction when visiting this beach and to examine the relationship and impact of each variable on overall visitor satisfaction. A total of 120 respondents were selected as the study sample and were asked to complete a questionnaire. The researchers adopted a quantitative research approach, and the data were analysed using IBM SPSS Statistics. The findings were presented using mean scores for each independent variable, namely the safety factor (mean = 4.093), public facilities factor (mean = 4.008), environmental factor (mean = 4.387), and visitor satisfaction (mean = 3.930). To determine the strength of the relationship between the independent variables and visitor satisfaction, the study found a moderate positive relationship between safety and visitor satisfaction ($r = 0.556$), facilities and visitor satisfaction ($r = 0.496$), and environmental factors and visitor satisfaction ($r = 0.590$). Further regression analysis showed that safety ($\beta = 0.295$), facilities ($\beta = 0.118$), and environmental factors ($\beta = 0.406$) each had a positive influence on visitor satisfaction. Based on these findings, several recommendations were proposed. These include enhancing safety measures at beach locations, improving public facilities such as stalls, and beautifying the surrounding landscape. The study implies that the three independent variables (safety, facilities, and environment) has play a significant role in influencing visitor/tourist satisfaction while visiting Tanjung Aru Beach in Kota Kinabalu, Sabah.

Keywords: Visitor satisfaction, safety, basic facilities, environmental factors

INTRODUCTION

The tourism industry has increasingly played a significant role in driving the country's economy, particularly through the development of various attractive destinations as tourism centres. Among these, beach-based tourism, which is a sub-sector of tourism, has gained growing popularity among both local and international visitors. Beach tourism highlights the natural beauty of coastal areas and provides visitors with unique experiences in scenic beach environments, emphasizing relaxation and enjoyment of nature. Undoubtedly, the beach tourism industry is one of the key sectors contributing to a country's growth and development, including economic, social, cultural, and environmental aspects (Anwar et al., 2021).

In the context of Malaysia, the country is well known for its beautiful and appealing beaches that attract both domestic and international tourists. The calm and peaceful beach environment encourages visitors to travel there for relaxation, peace of mind, appreciation of natural beauty, and quality time with family. Tourists are generally attracted to beaches that are clean, safe, and comfortable, where they can participate in various recreational activities and enjoy adequate public facilities (Johan et al., 2011).

In Malaysia, coastal tourism activities have also become part of the community's lifestyle (Habibah, 2002; Jamaludin, 2009). During the British colonial era, beach tourism was mainly practiced by the ruling elite. However, today beaches have become a common holiday destination for the public. According to Habibah (2007), resort beach tourism in Malaysia had already developed as early as the 1980s, with visits largely influenced by the natural beauty of the beaches (Habibah et al., 2019). Tourists tend to prefer beaches that are clean, safe, and comfortable for various activities (Johan & Mohamad Zaki, 2011; Johan et al., 2012). The soothing and captivating scenery of beaches also plays a crucial role in attracting both local and international tourists, making beaches a preferred travel destination (Habibah et al., 2019).

In line with this, the present study was conducted at a beach destination in Sabah, namely Tanjung Aru Beach in Kota Kinabalu. The study aims to analyse the factors that motivate visitors and influence their satisfaction with their visit to Tanjung Aru Beach. Furthermore, the study examines the relationship and impact of these factors on visitors' overall satisfaction. A field survey involving 120 respondents was conducted for this research. It is hoped that the findings of this study will help fill the research gap regarding beach tourist satisfaction, particularly in Sabah and Malaysia as a whole.

PROBLEM STATEMENT

In the context of global economic challenges and the current weakness of the local economy, the tourism industry remains one of the key sectors contributing to a country's growth and development, while also enhancing the income of the local community. Sabah, the second largest state in Malaysia, is in the northern part of the island of Borneo, which is the third largest island in the world. The state is well known for its extensive coastline and beautiful beaches, which serve as major attractions for both domestic and international tourists. One of the most popular beach destinations in the state is Tanjung Aru Beach in Kota Kinabalu. Tanjung Aru Beach is widely recognized for its scenic beauty and has become a favorite destination among visitors from within and outside the country. Tanjung Aru Beach is one of the tourist destinations with strong potential to be developed as a key beach tourism attraction in the state of Sabah.

The development of coastal tourism destinations in Sabah, including Tanjung Aru Beach and other coastal areas in Kota Kinabalu, is being strengthened through sustainable infrastructure development, environmental conservation, and the expansion of ecotourism activities. These efforts aim to attract a greater number of domestic and international tourists, in line with the target of 4 million visitors for Visit Malaysia Year 2026, leveraging the unique beauty of the state's islands and beaches.

However, an important issue to consider is identifying the actual factors that influence tourist satisfaction when visiting Tanjung Aru Beach as their travel destination. The main issues affecting tourist satisfaction at Tanjung Aru Beach, Kota Kinabalu are closely

associated with environmental cleanliness, traffic congestion, and public safety concerns. It is necessary to determine whether tourists are satisfied due to the beauty of the beach, the comfortable environment, the availability of well-developed infrastructure, or other factors that encourage them to revisit Tanjung Aru Beach in Kota Kinabalu.

Considering the significant role of the tourism industry in contributing to economic growth, it is essential to conduct a study to identify the key factors influencing tourist satisfaction in coastal tourism areas. Therefore, Tanjung Aru Beach in Kota Kinabalu was selected as the study location. Respondents were surveyed regarding their demographic backgrounds and their level of satisfaction during their visit to Tanjung Aru Beach, Sabah.

LITERATURE REVIEW

Visitor Satisfaction Level

Beaches are often considered therapeutic destinations that help visitors relax and calm their minds. Besides serving as recreational spaces, beaches also offer opportunities for visitors to appreciate the beauty of the natural environment while enjoying the facilities available at the destination. However, several issues may influence the level of visitor satisfaction (Nasir et al., 2011). Among the factors identified are the quality of services and the quality of products provided. Therefore, this study examines several factors that influence visitor satisfaction, namely safety, recreational facilities, and the natural environment.

In the Ratnasari et al. (2021) study, tourist satisfaction refers to the level of pleasure and positive feelings that emerge from a comparison between initial expectations and actual experiences when enjoying a destination visited or tourism services received. Similarly, in the Damanik and Yusuf (2022) study, it is explained that tourist satisfaction occurs when the actual experience exceeds the expectations formed before the visit to a destination. In the Han et al. (2024) study, it is also explained that satisfaction is an emotional response after using a service or visiting a destination. Meanwhile, the Dzulkifli and Masjhoer (2020) study emphasizes that factors such as service quality, convenience, attractiveness and social interaction play an important role in shaping the level of satisfaction of tourists or visitors.

According to Hamidi and Md Sirat (2016), satisfaction refers to a hedonic achievement that fulfils the preferences or desires of visitors. Their study suggests that satisfaction is closely related to expectations and the extent to which these expectations are achieved. It reflects the feelings of pleasure or disappointment that arise from the perceived performance of a product or service. Furthermore, satisfaction can be defined as the maximum response or evaluation towards a product or service. From this perspective, satisfaction is a psychological response resulting from the extent to which expectations and achievements related to a product or service are fulfilled (Jabil Mapjabil et al., 2020).

Tourist satisfaction, on the other hand, refers to the extent to which tourism experiences meet the expectations and preferences of tourists (Azhar and Ahmad, 2019). It represents the feeling of satisfaction or dissatisfaction experienced after participating in tourism activities. Positive satisfaction can generate beneficial outcomes, as satisfied visitors are more likely to share their positive experiences and promote the destination through word-of-mouth communication. This indirectly contributes to the promotion and reputation of the tourist destination (Azhar and Ahmad, 2019). Saumi and Zolkepli (2017) further

highlight that tourist satisfaction is related to the ability of tourism operators to fulfil tourists' needs, desires, and expectations.

Murphy et al. (2000) explained that visitors' experiences at a destination are influenced by their interaction with two main elements: service infrastructure and the overall environmental conditions of the destination. A destination must provide a stable and conducive environment to attract visitors, supported by efficient service infrastructure. There is a strong relationship between the facilities and services available at a destination and the level of visitor satisfaction. This is because tourism destinations provide specific infrastructure and facilities designed to meet the needs and expectations of visitors (Jabil Mapjabil et al., 2020).

Similarly, Ismail and Abu (2016) stated that satisfaction should be evaluated based on the expectations and achievements experienced by tourists. Satisfaction reflects the feelings of pleasure or disappointment that result from the performance of a product relative to expectations. In the same study, they also emphasized that satisfaction represents the maximum response towards a product or service. According to Yasin M. S. (2012), satisfaction is an important variable in analysing the behaviour of international tourists, as it influences their choice of destination, the use of tourism products and services, and their decision to revisit the destination in the future.

Safety

According to the United Nations World Tourism Organization (UNWTO), safety and security are key components of quality within the tourism industry. The success or failure of a tourist destination in attracting visitors largely depends on the ability of authorities or destination managers to provide a safe environment and ensure the comfort of tourists.

Safety and assurance are therefore critical elements in the development of tourist destinations. Generally, it is natural for travelers to feel anxious when visiting unfamiliar places, particularly regarding safety and security. This concern often arises because tourists usually have limited knowledge about the destinations they visit abroad compared to the familiarity they have with their own country (Tangavello et al., 2015).

Regarding the security aspect also, it includes safety from crime, political stability, health assurance and infrastructure facilities. According to a study by Wimaladasa et al. (2025), the perception of destination security has a direct impact on the satisfaction and intention to visit again for a tourist or visitor. Tourist destinations that provide an efficient security system, clear information and quick emergency assistance will create a sense of trust and comfort among visitors (Rahaman et al., 2025).

Basic Facilities/Amenities

The significance of basic facilities at a tourism destination is widely discussed in literature related to the tourism system. Tourism begins when individuals travel from their place of origin to another destination for purposes other than work. Tourists often have different motivations for their trips, and they must possess the ability and resources to undertake such journeys. At the same time, destinations that receive tourists or visitors must provide suitable infrastructure to support their basic needs and activities (Rashid, 2013). According to Cooper, Fletcher, Fyall, Gilbert, and Wanhill (2005), destination facilities refer to places that provide specific infrastructure and amenities designed to meet the needs of tourists.

In the context of tourism, it includes the needs for food, drink, shelter, physical comfort, and rest. Visitors cannot enjoy the visit experience optimally if these basic needs are not met (Kim & Kim, 2019). Studies show that the provision of adequate basic facilities such as clean public toilets, comfortable accommodation facilities, and access to suitable food and drinks are key factors in determining basic visitor satisfaction (Ali et al., 2025).

A study by Murphy et al. (2000) indicates that a visitor's experience at a destination is influenced by the interaction of two key elements: the service infrastructure and the overall environmental attractiveness of the destination. Therefore, a destination should offer a well-maintained and stable environment, supported by efficient service infrastructure to attract visitors. There is a strong relationship between the quality of facilities and services at a destination and the level of visitor satisfaction. This is because destinations are expected to provide appropriate infrastructure and facilities that cater to the needs and expectations of visitors.

Furthermore, a study conducted by Remali Yusoff et al. (2017), titled *"Factors of Beach Tourism Attraction: A Case Study of Irama Beach, Bachok, Kelantan,"* highlights the importance of tourism service facilities such as hotels, restaurants, and recreational amenities in attracting tourists to the Irama Beach area.

Environmental

The natural physical environment is considered a key factor influencing visitors' choices when engaging in beach activities (Habibah et al., 2015). In their study on the natural physical environment, Roca et al. (2008) identified several important elements, including coastal landscapes, sea water quality, coastline length and overall coastal scenery. Similarly, Cutter et al. (1979) found that the cleanliness of the water and beaches was the most important factor in beach selection by visitors, followed by the natural characteristics of the beach.

In the context of ecotourism, a study conducted by Sun and Watanabe (2021) explains that the development of environmentally friendly infrastructure is essential for attracting tourists, particularly beachgoers who are concerned about the environment.

According to the study by Rosniza Aznie CR et al. (2016), the environment refers to the physical setting of a tourism area, including its climate, landscape, and natural resources. The attractiveness of a tourism and recreational destination is often closely associated with its natural beauty, as nature offers diverse features and possesses its own unique appeal.

RESEARCH METHODOLOGY

Sample

This study employed a quantitative approach involving 120 respondents consisting of local visitors and visitors from outside Sabah. The respondents were selected through direct data collection at the study location, focusing specifically on both local and non-Sabah visitors. The researchers were unable to obtain an official list or exact number of visitors, as many individuals visit Tanjung Aru Beach mainly for leisure activities such as family vacations or weekend recreation.

Therefore, the researchers applied the purposive sampling technique, which involves selecting respondents who possess specific characteristics relevant to the study. Purposive sampling refers to a sampling procedure in which participants are chosen based on predetermined characteristics so that the findings can represent the targeted population (Norhafiza & Ku 'Azam, 2018). According to Yusof (2003), this method involves selecting subjects based on categories that are assumed to exist within the population. Since there was no specific record of the number of visitors to Tanjung Aru Beach, Kota Kinabalu, purposive sampling was considered the most appropriate method. In this study, only local visitors and visitors from outside Sabah who met the specified criteria were selected as respondents. Reinard (2001) also notes that when using purposive sampling, researchers must consider factors such as population size, limited information resources, data collection costs, geographical area, and the time frame involved.

Using this purposive sampling approach, the researchers visited Tanjung Aru Beach, Kota Kinabalu, to meet potential respondents and distribute questionnaires to individuals who fulfilled the study criteria. The main criteria for respondent selection included: (a) local visitors (Sabah residents) and visitors from outside Sabah, (b) individuals aged 18–30 years and 30 years and above, (c) single or married status, (d) employment status (student, employed, or unemployed), and (e) ethnicity, including Malays, Chinese, Indians, and Bumiputera from Sabah and Sarawak. The distribution of questionnaires continued if the respondents met the predetermined characteristics established for this study.

Data Processing

The distribution of the questionnaire forms was conducted over a period of four weeks, from September to October 2025. Prior to this, preliminary observations were carried out to gather initial information about visitors at Tanjung Aru Beach, Sabah. Using a quantitative approach, the data collected from the questionnaires were analyzed and processed using the Statistical Package for Social Science (SPSS) Version 27 for Windows. The analysis involved descriptive statistics such as frequency, percentage, and mean values. In addition, the reliability of the questionnaire was tested using Cronbach's Alpha, a coefficient that measures internal consistency. Based on Cronbach's Alpha scale, a reliability value below 0.6 indicates weak reliability, whereas a value closer to 1.0 indicates high reliability (Piaw, 2006).

ANALYSIS OF DATA AND RESULTS OF THE STUDY

4.1 Demographic Analysis

Table 4.1: Respondent Information

Study Items	Frequency	Percentage
Gender		
Men	41	34.2
Women	79	65.8
Age		
18-30 years old	101	84.2
30 years and above	19	15.8
Status		
Single	96	80.0
Married	24	20.0
Jobs		
Students	33	27.5
Working	77	64.2
Not Working	10	8.3
Race/Ethnic		
Malay	26	21.7
Chinese	7	5.8
Indian	6	5.0
Bumiputera Sabah	77	64.2
Bumiputera Sarawak	4	3.3

Table 4.1 in Section A of the questionnaire presents the demographic profile of the respondents based on gender, age, marital status, occupation, and ethnicity. A total of 120 respondents participated in this study. Based on gender distribution, 41 respondents (34.2%) were male visitors, while the remaining 79 respondents (65.8%) were female visitors. In terms of age, respondents were categorized into two groups. Most of the visitors were aged between 18 and 30 years old, comprising 101 respondents (84.2%), while 19 respondents (15.9%) were aged 30 years and above. Regarding marital status, 96 respondents (80%) were single, whereas 24 respondents (20%) were married. From the employment perspective, respondents were divided into three categories: 33 students (27.5%), 77 employed respondents (64.2%), and 10 unemployed respondents (8.3%). Based on race/ethnic distribution, 26 respondents (21.7%) were Malays, 7 respondents (5.8%) were Chinese, and 6 respondents (5.0%) were Indians. Meanwhile, most respondents were from the Sabah Bumiputera group, with 77 respondents (64.2%), followed by the Sarawak Bumiputera group with 4 respondents (3.3%).

4.2 Reliability Analysis

Table 4.2: Item Reliability Test Analysis

Variables	No. of Item	Cronbach Alpha
Safety	5	0.942
Facilities	5	0.873
Environment	5	0.935
Visitor Satisfaction	5	0.889

The Cronbach's Alpha coefficient (α), introduced by Lee Cronbach in 1951, is commonly used to assess reliability or internal consistency in a set of measurement items. Reliability refers to the extent to which a test consistently measures a particular construct. In this study, the researchers aimed to examine visitors' satisfaction at Tanjung Aru Beach based on several aspects, namely safety, facilities, environment, and overall visitor satisfaction. A high reliability value indicates that the items in the instrument effectively measure visitors' satisfaction at Tanjung Aru Beach, whereas a low reliability value suggests that the items may measure constructs other than visitor satisfaction. Generally, a reliability coefficient value greater than 0.7 is considered acceptable, indicating that the questionnaire items are reliable. Based on Table 4.2 (Item Reliability Test Analysis), all four study variables demonstrated Cronbach's Alpha values above 0.7. Specifically, the values recorded were 0.942 for safety, 0.873 for facilities, 0.935 for environment, and 0.889 for visitor satisfaction, confirming that the measurement items used in this study are reliable.

4.3 Mean Analysis of Each Independent and Dependent Variable

Next, to address the first research objective, which is to identify the factors influencing visitor satisfaction at Tanjung Aru Beach, the researcher employed mean score level analysis based on the classification proposed by Norasmah (2002). This method was used to determine the level of satisfaction among visitors to Tanjung Aru Beach. The details are presented in Table 4.3.1: Determination of Mean Score Level.

Table 4.3.1: Determination of Mean Score Level

Min Score	Criteria
1.00 - 2.00	Low
2.01 - 3.00	Medium Low
3.01 - 4.00	Medium High
4.01 - 5.00	High

Source: Norasmah 2002

In this study, the level of visitor satisfaction at Tanjung Aru Beach is evaluated based on three main factors: safety, facilities, and environmental conditions. Table 4.3.2 presents the Mean Safety Score level, which shows the mean score and standard deviation for the safety factor. There are five study items included under this construct, which represents the independent variable. Based on the findings in Table 4.3.2, the overall mean score for the

safety factor is (M = 4.093, SD = 1.103), indicating a high level of safety perception among visitors. The results also reveal that all five study items recorded mean scores within the range of 4.01–5.00, which falls under the high interpretation level (refer to Table 4.3.1).

Table 4.3.2: Safety Mean Score Level

	Mean	Std. Deviation	Mean Score Level
I felt safe because there were lifeguards guarding the surroundings of the beach.	4.033	1.053	High
I feel safe because there is good security management.	4.067	1.051	High
I feel safe because there are safe and well-maintained beach facilities.	4.167	0.920	High
I feel safe because there are additional safety measures provided by the beach management.	4.117	1.039	High
I am satisfied with the safety management on the beach.	4.083	1.001	High
Average Score	***4.093***	***1.013***	***High***

Based on Table 4.3.3, the Mean Score Level of the facility factor indicates the mean score and standard deviation for this variable. There are five study items included in this construct, which represents the independent variable. According to the findings presented in Table 4.3.2, the overall mean score level for the facility factor is (M = 4.008, SD = 1.057), indicating a high level. The results also show that all five study items recorded mean scores within the range of 4.01–5.00, which falls under the high mean score interpretation (refer to Table 4.3.1).

Table 4.3.3: Facility Mean Score Level

	Mean	Std. Deviation	Mean Score Level
I am satisfied with the ample parking.	4.075	1.047	High
The existence of food stalls around the beach made my journey easier	4.183	1.029	High
I was intrigued by the leisure activities provided by the beach management.	4.033	1.004	High
The ease of infrastructure on this beach is sufficient for me.	3.875	1.089	Medium High
I feel happy with the public toilets provided.	3.875	1.119	Medium High
Average Score	***4.008***	***1.057***	***High***

Based on Table 4.3.4, the Mean Environmental Score Level presents the mean scores and standard deviations for the environmental factors. This construct, which is the independent variable, comprises five study items. The findings in Table 4.3.4 indicate that the overall mean score for environmental factors is high (M = 4.387, SD = 0.888). Additionally, all

five items recorded mean scores between 4.01 and 5.00, which fall within the high-level interpretation range (see Table 4.3.1).

Table 4.3.4: Environmental Mean Score Level

	Mean	Std. Deviation	Mean Score Level
I feel comfortable when the beach environment is clean.	4.325	0.997	High
I got an interesting experience when the beautiful beach environment.	4.367	0.840	High
I was attracted by the natural beauty of the beach.	4.425	0.847	High
I feel calm when looking at the natural beauty on the beach.	4.442	0.896	High
I am satisfied with the clean and beautiful environment.	4.375	0.861	High
Average Score	***4.387***	***0.888***	***High***

Table 4.3.5 presents the mean scores and standard deviations for the dependent variable, Visitor Satisfaction. This construct comprises a total of five study items. According to the findings shown in Table 4.3.5, the overall mean score for visitor satisfaction is M = 3.930, SD = 1.128, indicating a moderately high level of satisfaction. Additionally, the individual study items recorded mean scores ranging from 3.01 to 4.00, which correspond to a moderately high level based on the interpretation scale in Table 4.3.1.

Table 4.3.5: Visitor Satisfaction Mean Score Level

	Mean	Std. Deviation	Mean Score Level
I went to Tanjung Aru Beach because of the peaceful and peaceful beach atmosphere.	4.125	1.050	High
I went to Tanjung Aru Beach because of the economical travel cost.	3.858	1.132	Medium High
I went to Tanjung Aru Beach due to the reasonable duration of visiting the beach (from 7.00am-1.00pm)	3.575	1.294	Medium High
I visited Tanjung Aru Beach because of the publicity from social media or from friends.	4.008	1.104	High
I visited Tanjung Aru Beach because there is an attraction that is not found on other beaches.	4.083	1.058	High
Average Score	***3.930***	***1.128***	***Medium High***

4.4 Relationship Analysis of Independent and Dependent Variable

To address the second study's objective, which aimed to examine the relationship between independent and dependent variables, the researcher consulted Table 4.4.1. This table presents the correlation between the independent variables (safety, facilities, environment) and the dependent variable (visitor satisfaction) among visitors to Tanjung Aru Beach, Kota Kinabalu, Sabah. The strength of the correlations, represented by the index 'r', is interpreted according to the Rowntree Scale (1981) as follows:

Table 4.4.1: Rowntree Scale for Interpretation of Coefficient Value 'r'

Correlation Coefficient Value 'r'	Relationship Stiffness
0.9 to 1.0	Very High/Strong
0.7 to 0.89	High/Strong
0.4 to 0.69	Moderate
0.2 to 0.39	Low/Weak
0.0 to 0.19	Very Low/Weak

Source: Rowntree, D. (1981).

Table 4.4.2: Relationship Between IV and DV

Variables		Safety	Facilities	Environment	Visitor Satisfaction
Safety	Pearson Correlation	1	.727**	.431**	.556**
	Sig. (2-tailed)		**0.000**	**0.000**	**0.000**
	N	120	120	120	120
Facilities	Pearson Correlation	.727**	1	.404**	.496**
	Sig. (2-tailed)	**0.000**		**0.000**	**0.000**
	N	120	120	120	120
Environment	Pearson Correlation	.431**	.404**	1	.580**
	Sig. (2-tailed)	**0.000**	**0.000**		**0.000**
	N	120	120	120	120
Visitor Satisfaction	Pearson Correlation	.556**	.496**	.580**	1
	Sig. (2-tailed)	**0.000**	**0.000**	**0.000**	
	N	120	120	120	120

*** Correlation is significant at the 0.01 level (2-tailed).*

Based on Table 4.4.2, the correlation coefficient between Safety and Visitor Satisfaction is 0.556, indicating a moderately strong, positive relationship. This relationship is statistically significant, as the confidence level value of 0.00 is below the set threshold of 0.01. Similarly, the correlation coefficient between Facilities and Visitor Satisfaction is 0.496, showing a moderately strong, positive, and significant relationship at the same confidence level. Lastly, the correlation coefficient between Environment and Visitor Satisfaction is 0.580, suggesting a moderately strong, positive, and significant relationship, consistent with the set confidence level of 0.01.

4.5 Regression Analysis of Independent and Dependent Variable

To address the objective of the third study, the researcher consulted Table 4.5.1, which examines the degree to which each independent variable (safety, facilities, and environment) affects visitors' decisions to visit Tanjung Aru Beach. This influence can be assessed through regression analysis. Specifically, linear regression tests are employed to determine the strength and nature of the relationship between the independent variables and the dependent variable.

Table 4.5.1: Regression Analysis

Visitor Satisfaction	Beta	t	Sig.
Safety	0.295	2.888	0.005
Facilities	0.118	1.171	0.244
Environment	0.406	5.294	0.000

***p<0,05, r2=0.458, F=32.648 Sig = 0.000*

Table 4.5.1 presents the regression analysis examining the impact of safety, facilities, and environmental factors on visitor satisfaction at Tanjung Aru Beach. The study shows an R^2 value of 0.458, indicating that 45.8% of the variance in visitor satisfaction can be explained by the three independent variables (safety, facilities, and environment), while the remaining 54.2% is influenced by other factors not included in this model. The F-value is 32.648 with a significance level of 0.000, confirming the overall model is statistically significant. Regarding the beta coefficients, the environmental factor has the strongest influence on visitor satisfaction ($\beta = 0.406$), followed by safety ($\beta = 0.295$) and facilities ($\beta = 0.118$). For tolerance values, the highest is for the environment (5.294), followed by safety (2.888), and the lowest is for facilities (1.171). In terms of significance values, facilities show the highest non-significance ($p = 0.244$), followed by safety ($p = 0.005$), and the environment has the lowest significance value ($p = 0.000$), indicating it is the most significant predictor among the three variables.

The findings show that environmental factors apply the strongest influence on visitor satisfaction contrasted to safety and facilities, which can be critically explained from both theoretical and contextual perspectives. In coastal tourism settings such as Tanjung Aru Beach, the natural environment represents the core product and primary attraction,

meaning that visitors' experiences are essentially shaped by elements such as scenic beauty, cleanliness, air quality, and overall environmental conditions. This aligns with Roca, E. et al. (2008), which highlight that tourists' perceptions of beach quality are mostly determined by environmental attributes compared to physical infrastructure. Likewise, Sun and Watanabe (2021) highlight that environmental characteristics play a supreme role in destination selection and satisfaction, particularly in nature-based tourism contexts.

Beta value ($\beta = 0.406$) indicates that visitors prioritize experiential and aesthetic qualities over functional aspects, suggesting that a well-preserved and attractive environment enhances emotional and psychological satisfaction. Conversely, safety and facilities may be perceived as baseline expectations or foundation factors; once a minimum acceptable level is achieved, their marginal contribution to satisfaction decreases (Murphy, P. et al., 2000). This explains the lower influence of facilities ($\beta = 0.118$) and its non-significant result ($p = 0.244$), showing that existing public facilities may already meet visitor expectations and therefore do not significantly discriminate satisfaction levels. Furthermore, environmental quality always has a direct impact on visitors, while safety is more perceptual and only becomes prominent when risks are noticeable. Hence, the supreme influence of environmental factors reflects the intrinsic nature of beach tourism, where the environment itself is the core driver of satisfaction, supporting the need for sustainable environmental management as a key strategy for enhancing visitor experiences.

DISCUSSION, CONCLUSION AND RECOMMENDATION

Discussion and Conclusion

Beach tourism is a major source of income for the state of Sabah, thanks to its rich natural resources and scenic beauty. The influx of international tourists has significantly contributed to Sabah's revenue through foreign exchange, highlighting the importance of expanding the coastal tourism sector. Rapid development in this sector has the potential to establish the area as a prominent and widely recognized beach tourism destination. A study conducted at Tanjung Aru Beach in Kota Kinabalu, Sabah, revealed that more structured and planned development is needed to attract a larger number of visitors. Achieving this goal requires collaboration among various stakeholders, including local traders, restaurant owners, and the Kota Kinabalu City Council. Questionnaire results indicate that most visitors were aged 18–30, primarily students from both public and private higher education institutions. Regarding safety at Tanjung Aru Beach, respondents reported a high level of satisfaction. Similarly, the available facilities and environmental cleanliness received very positive feedback from visitors. The study also found that 20% of visitors came with their families, while 80% were single individuals.

Recommendation

Based on the findings, several recommendations can be proposed to develop Tanjung Aru Beach, Kota Kinabalu, as a tourism destination emphasizing technopreneurship, appealing to both domestic and international tourists. These recommendations include:

a) Strengthening physical safety infrastructure by ensuring adequate lighting, clear signage, and proper maintenance of facilities, as well as increasing the presence of security personnel to improve both actual and perceived safety among tourists. In addition, environmental safety must be prioritized through regular monitoring of cleanliness and hazard-prone areas. The adoption of technology such as CCTV surveillance and digital safety information platforms can further support effective safety management.

b) Enhance and expand service systems, particularly in the hotel and resort sector. Currently, the Tanjung Aru Beach area lacks four or five-star accommodations. The nearest options are The Magellan Sutera Resort (5-star, 3 km) and The Pacific Sutera Hotel (5-star, 3 km). Establishing more high-quality hotels and resorts in proximity, with comprehensive facilities, could directly and indirectly attract more tourists to Tanjung Aru Beach, as well as other beaches in Kota Kinabalu and Sabah.

c) Preserve and improve the natural beauty and environment of Tanjung Aru Beach. Maintaining cleanliness is crucial to sustaining the scenic appeal of the beach. A clean and well-kept environment is a key factor that influences both local and international tourists in choosing beach destinations.

d) Promote tourism areas widely and effectively. The Sabah state government plays a vital role in tourism promotion, particularly for beach destinations. Strategic and widespread promotion can increase visitor numbers to Tanjung Aru Beach and strengthen its reputation as a premier tourist

Abstract. The School Literacy Movement is one of Indonesia's national strategies to improve the reading culture and literacy skills of students in schools. However, the implementation of this program still faces various challenges, especially related to the involvement of stakeholders outside the school (external support). This study aims to analyze the influence of government support, community support, and parental involvement on the implementation of the School Literacy Movement. The study used a quantitative approach with a survey method in 91 elementary schools in Cianjur Regency, West Java Province. Data were analyzed using multiple linear regression with the help of SPSS software after meeting the classical assumption test. The results showed that simultaneously government support, community support, and parental involvement had a significant effect on the implementation of the School Literacy Movement ($F = 15.683$; $p < 0.001$) with a coefficient of determination of 0.351. Partially, community support had a significant effect on the implementation of the School Literacy Movement ($\beta = 0.361$; $p = 0.007$), while government support ($p = 0.056$) and parental involvement ($p = 0.319$) did not show a significant effect. These findings indicate that community participation is a crucial factor in strengthening the implementation of literacy programs in elementary schools. This study provides empirical evidence regarding the importance of external support in the success of the School Literacy Movement and emphasizes the need for strengthened collaboration between schools and the community in developing literacy programs.

Keywords: school literacy movement, external support, government support, community support, parental involvement, elementary school literacy.

Introduction

Literacy is a fundamental competency crucial to 21st-century education because it relates to an individual's ability to understand, analyze, and use information effectively in various life contexts. Strong literacy skills not only contribute to students' academic success but also play a crucial role in improving the quality of a nation's human resources [1]. Therefore, improving literacy skills is a key agenda item in various education policies in many countries.

One indicator frequently used to assess students' literacy skills internationally is the Programme for International Student Assessment (PISA). The 2022 PISA results showed that Indonesian students' reading literacy scores were around 359 points, still below the average for member countries of the Organisation for Economic Co-operation and Development (OECD) of around 476 points [2]. This score places

Indonesia in the low category, indicating that most students are only able to understand simple explicit information in texts but experience difficulties in interpreting, reflecting on, and evaluating the content of the reading.

In response to these challenges, the Indonesian government launched the School Literacy Movement program, which aims to foster a reading culture in schools through various literacy activities integrated into the learning process. This program is designed to create a literacy ecosystem in schools that involves the entire school community and various other stakeholders [3]. Through School Literacy Movement, schools are expected to develop a learning environment that supports the sustainable development of students' literacy skills.

At the elementary school level, the implementation of literacy programs plays a crucial role because students are in the early stages of developing reading skills. The reading skills developed during elementary school will lay the foundation for successful learning in subsequent stages of education, as reading is a fundamental skill that supports the learning process in various subjects [4]. Therefore, the successful implementation of literacy programs at the elementary school level is a crucial factor in improving the overall quality of student literacy.

Various studies have shown that the implementation of literacy programs in schools still faces various obstacles. Limited literacy facilities, a lack of engaging reading materials, and suboptimal support from various parties are factors that can hinder the success of literacy programs in schools [5]. This situation indicates that the successful implementation of literacy programs depends not only on internal school factors but is also influenced by external support from various stakeholders.

Based on an ecological perspective, children's learning development is influenced by the dynamic interaction between various interconnected social environments, from family, school, community, and government policies as part of a broader system [6]. Within this framework, each environmental layer does not operate in isolation but interacts with each other, forming a complex network that influences children's learning experiences. The family environment, as a microsystem, provides the initial foundation for developing literacy habits, while schools act as formal spaces that develop these skills in a structured manner. Meanwhile, society serves as a social context that expands literacy practices through interactions and a developing culture, while government policies, at the macrosystem level, regulate the direction and structural support for the implementation of educational programs.

Furthermore, the relationship between these systems, known in this theory as the mesosystem, is a key factor in determining the effectiveness of the learning process. When synergy exists between schools, families, and communities, the resulting learning environment will be more conducive to fostering a sustainable culture of literacy. Conversely, disharmony between these elements can hinder the implementation of literacy programs, even if they are structurally supported by government policies. Therefore, the success of literacy program implementation in schools depends not only on the quality of the formally designed program, but also on the extent to which various elements within the educational ecosystem are able to collaborate actively and consistently to support literacy practices as part of students' daily lives.

In the context of education, the success of a learning program is influenced by the synergy between internal school factors and external support from various stakeholders. This support includes the government, community, and families, who play a role in building a literacy ecosystem that supports the development of students' reading skills. The government plays a crucial role in providing educational policies, literacy

programs, and facilities and infrastructure that support literacy activities in schools. Meanwhile, the community can play a role in strengthening the literacy ecosystem through various social activities that encourage the development of a reading culture in children's environments. Furthermore, families also play a crucial role in shaping children's reading habits through a literacy environment at home. Research shows that literacy practices within the family environment, such as shared reading activities, the availability of reading materials at home, and literacy interactions between parents and children, contribute positively to the development of children's reading skills [7].

Previous research has shown that parental involvement in literacy activities at home, such as reading with children and providing adequate reading materials, can have a positive impact on children's reading development. Consistent literacy activities within the family environment have been shown to improve children's early reading skills and text comprehension [8]. These findings are further supported by research from Indonesia. For example, research shows that parental involvement through providing a home literacy environment, such as the availability of books, reading habits, and literacy interactions between parents and children, plays a crucial role in developing children's language skills and reading interests from an early age [9]. This suggests that support from the family environment plays a crucial role in shaping reading habits and a culture of literacy in children from an early age.

In the context of implementing literacy programs in schools, parental involvement is not merely a supporting factor but can also be a determining factor, strengthening or even weakening school efforts. When literacy practices at home do not align with those developed at school, strengthening a culture of literacy tends to occur separately and yield less than optimal results. Therefore, parental involvement needs to be understood as a crucial part of external support within the education ecosystem, which not only helps shape children's reading habits but also plays a role in maintaining the sustainability of the literacy program as a whole.

Although various studies have addressed the implementation of literacy programs in schools, most of them still focus on literacy learning strategies in the classroom or on the development of literacy learning media. Studies specifically analyzing external support factors influencing the implementation of the School Literacy Movement are still relatively limited, particularly in the context of elementary schools in Indonesia. In fact, from an educational ecology perspective, the success of educational programs is greatly influenced by the interaction between schools and their various social environments, including the government, community, and families. In addition, research that integrates government support, community support, and parental involvement in one analytical model of GLS implementation in elementary schools is still rare.

Based on this description, this study aims to analyze the influence of external support, including government support, community support, and parental involvement, on the implementation of the School Literacy Movement in elementary schools in Cianjur Regency, Indonesia. Cianjur Regency was selected as the research location based on its regional characteristics, which represent the diversity of elementary school conditions and the challenges it faces in strengthening a culture of literacy within the primary education environment. This research is expected to provide an empirical contribution to understanding the role of external support in strengthening the implementation of literacy programs in elementary schools. The findings of this study are also expected to be the basis for formulating collaborative policies and strategies between schools, families, communities, and the government in strengthening literacy culture in elementary schools.

Methods

This study used a quantitative approach with a survey design to analyze the influence of government support, community support, and parental involvement on the implementation of the School Literacy Movement at the elementary school level. The quantitative approach was used to objectively examine relationships between variables through statistical analysis, while the survey design allowed for systematic data collection from a large number of respondents [10].

The sample size was determined using the G*Power 3.1.9.7 application with an F-test for linear multiple regression: fixed model, R^2 deviation from zero. The parameters used included an effect size of $f^2 = 0.15$ (moderate category), a significance level of $\alpha = 0.05$, a statistical power of 0.80, and three predictors corresponding to the independent variables in the study. This approach was used to ensure adequate sample size in the regression analysis [11]. The analysis results indicated that the minimum sample size required was 85 respondents, while this study involved 91 respondents, thus meeting the minimum requirement and providing adequate statistical power.

The sampling technique used random sampling, with each school represented by one teacher who had an understanding of the implementation of literacy programs in schools [10]. Data were collected using a questionnaire distributed online via Google Forms to increase efficiency and reach of respondents. This method enabled the data collection process to be faster, more systematic, and to effectively reach respondents from various locations [12].

The research instrument was a questionnaire compiled based on indicators from each research variable and measured using a six-level Likert scale to reduce the tendency of respondents to choose neutral answers. Validity and reliability tests of the instrument were conducted on 30 respondents as part of the initial trial (pilot test). The results of the analysis show that all instrument items meet the validity criteria. Furthermore, the results of the reliability test showed that the instrument had a very high level of internal consistency, with Cronbach's Alpha values ranging from 0.892 to 0.958 for each variable, indicating that the instrument had very good reliability and was suitable for use in research. This value meets the recommended reliability criteria, which is greater than 0.70 [13].

This study involved four main variables: government support, community support, and parental involvement as independent variables, and the implementation of the School Literacy Movement as the dependent variable. Government support reflects the government's role in providing policies, programs, and facilities and infrastructure to support literacy. Community support relates to the participation of the social environment in supporting literacy activities, while parental involvement reflects literacy practices within the family environment. The implementation of the School Literacy Movement reflects the implementation of literacy activities within the school environment.

Data were analyzed using descriptive and inferential statistics. Descriptive analysis was used to describe the characteristics of the research data, while inferential analysis was conducted using multiple linear regression to examine the effect of the independent variables on the dependent variable. Prior to the regression analysis, classical assumption tests were conducted, including residual normality, multicollinearity, and heteroscedasticity tests, to ensure the regression model met the analysis requirements [13]. All data analysis was carried out using SPSS software version 30.

Results

Descriptive Analysis. Descriptive analysis in this study was conducted to provide a general overview of the data characteristics for each research variable, including government support, community support, parental involvement, and school literacy movements. Through this analysis, researchers were able to identify general trends, levels of distribution, and empirical conditions of each variable as a baseline for understanding the phenomenon under study. Descriptive analysis used the mean and standard deviation as measures of central tendency and data dispersion [13]. The results showed that all variables were measured on 91 respondents. These descriptive findings provide an important foundation for further analysis, particularly in examining the relationships and influences between variables at the inferential analysis stage. The detailed results of the descriptive analysis are presented in Table 1.

Table 1. Descriptive Statistics Data on External Support and School Literacy Movements.

	Descriptive Statistics				
	N	Minimum	Maximum	Mean	Std. Deviation
Government Support	91	12.00	40.00	25.3077	7.08158
Community Support	91	10.00	50.00	26.3736	9.41352
Parental Involvement	91	8.00	48.00	28.9011	7.95690
School Literacy Movement	91	36.00	119.00	79.0220	17.65281
Valid N (listwise)	91				

The average government support score of 25.31 with a standard deviation of 7.08 indicates that government support for the implementation of the School Literacy Movement is at a sufficient level, with relatively moderate data variation. This finding indicates that the government's role in supporting literacy programs has been felt by some respondents, although implementation has not been fully optimal and evenly distributed across all schools.

Community support had an average score of 26.37 with a standard deviation of 9.41, indicating significant variation in social support across school environments. This finding indicates that community involvement in supporting literacy activities remains uneven and is influenced by the social characteristics of each region.

Parental involvement achieved an average score of 28.90 with a standard deviation of 7.96, indicating that most parents were involved in supporting their children's literacy activities. However, this level of involvement is still suboptimal and potentially influenced by factors such as education, literacy awareness, and parental time availability.

The School Literacy Movement variable had an average value of 79.02 with a standard deviation of 17.65, indicating that the implementation of the literacy program in schools has been quite successful, although there are still differences in the level of implementation between schools. This indicates that the success of GLS implementation is influenced by the readiness and support of the educational environment in each school.

In general, the descriptive analysis results indicate that all variables are at a sufficient level with varying degrees of variation. Community support has the highest level of data distribution, indicating differences in social conditions in supporting school literacy implementation. This finding demonstrates the need to strengthen collaboration

between schools, communities, and families in building a more consistent literacy culture.

Classical Assumption Test. The classical assumption test was conducted to ensure that the multiple linear regression model used in this study meets the basic assumptions, resulting in unbiased, efficient, and consistent estimates. The classical assumption test in this study included tests for normality, multicollinearity, and heteroscedasticity, as recommended in regression analysis [13].

The normality test aims to determine whether the residual data in the regression model is normally distributed. The test was conducted using the Kolmogorov-Smirnov test on unstandardized residuals. The test results showed a significance value of 0.200, which is greater than 0.05, thus concluding that the residual data are normally distributed. This indicates that the normality assumption has been met and the regression model is suitable for use in further analysis [14].

Next, a multicollinearity test was conducted to determine whether there is a high correlation between the independent variables in the regression model. This test was performed by examining the tolerance value and Variance Inflation Factor (VIF). The analysis results showed that all variables had a tolerance value greater than 0.10 and a VIF value less than 10, indicating the absence of multicollinearity. This indicates that each independent variable provides different information in the model and does not influence each other excessively, so that the results of the regression coefficient estimates can be interpreted more accurately. Thus, the independent variables in this study are suitable for simultaneous use in the regression model [13]. The results of the multicollinearity test are presented in Table 2.

Table 2. Multicollinearity Test Result Data

Coefficients[a]								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	40.610	6.768		6.000	<,001		
	Government Support	.513	.264	.206	1.940	.056	**.664**	**1.507**
	Community Support	.677	.247	.361	2.740	.007	**.430**	**2.324**
	Parental Involvement	.263	.262	.118	1.002	.319	**.535**	**1.869**

a. Dependent Variable: School Literacy Movement

Next, a heteroscedasticity test was conducted to determine whether there was inequality in the residual variances in the regression model. The test was conducted using the Glejser test by examining the significance value of each independent variable against the absolute value of the residuals. The test results showed that all variables had significance values above 0.05, namely government support at 0.137, community support at 0.993, and parental involvement at 0.853. This indicates that there were no symptoms of heteroscedasticity in the regression model, thus the assumption of homoscedasticity was met [14].

Based on the overall results of the classical assumption test, it can be concluded that the regression model in this study met the assumptions of normality, no multicollinearity, and no heteroscedasticity. Therefore, the multiple linear regression

model used was suitable for further analysis to examine the effect of the independent variables on the dependent variable.

Multiple Linear Regression Analysis. Multiple linear regression analysis was used to determine the effect of government support, community support, and parental involvement on the school literacy movement. Based on the analysis results, the obtained regression model met all classical assumptions and was therefore suitable for hypothesis testing.

The F-test results show that government support, community support, and parental involvement simultaneously significantly influenced the school literacy movement ($F = 15.683$; $p < 0.001$). This finding indicates that all three variables collectively contribute to the implementation of the school literacy movement. The results of the simultaneous test are presented in Table 3.

Table 3. Simultaneous test results

		ANOVA[a]				
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	9843.824	3	3281.275	15.683	**<,001[b]**
	Residual	18202.132	87	209.220		
	Total	28045.956	90			

a. Dependent Variable: School Literacy Movement

b. Predictors: (Constant), Parental Involvement, Government Support, Community Support

Furthermore, based on the results of the partial t-test, it was found that not all independent variables had a significant influence on the school literacy movement. The community support variable had a positive and significant effect on the school literacy movement ($\beta = 0.677$; $p = 0.007$). This finding indicates that community involvement plays a crucial role in strengthening a culture of literacy through social collaboration and environmental support for reading activities in elementary schools.

Meanwhile, the government support variable showed a positive but not yet statistically significant effect ($\beta = 0.513$; $p = 0.056$). This indicates that government support has contributed to the implementation of school literacy, although its influence is not yet strong enough in this research model.

The parental involvement variable also showed a positive but not significant effect ($\beta = 0.263$; $p = 0.319$). This finding indicates that parental involvement, in the context of this study, has not been a dominant factor in improving the implementation of the school literacy movement. The results of the partial t-test are presented in Table 4.

Table 4. Partial Test Results

Coefficients[a]								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	40.610	6.768		6.000	<,001		
	Government Support	.513	.264	.206	**1.940**	**.056**	.664	1.507
	Community Support	.677	.247	.361	**2.740**	**.007**	.430	2.324
	Parental Involvement	.263	.262	.118	**1.002**	**.319**	.535	1.869

a. Dependent Variable: School Literacy Movement (SLM)

Based on the regression coefficient values, the multiple linear regression equation in this study can be formulated as follows:

SLM = 40.610 + 0.513(Government Support) + 0.677(Community Support) + 0.263(Parental Involvement)
(1)

The equation (1) indicates that every one-unit increase in government support, community support, and parental involvement will be followed by an increase in the school literacy movement score, assuming other variables are held constant. The constant value of 40.610 indicates the baseline value of the school literacy movement when all independent variables are zero.

Furthermore, based on the results of the coefficient of determination test, the R-square value was 0.351. This indicates that 35.1% of the variation in the school literacy movement can be explained by the variables of government support, community support, and parental involvement in this research model, while the remaining 64.9% is influenced by other variables outside the model that were not examined. The Adjusted R-square value of 0.329 indicates that the model has a moderate level of explanation. The results of the coefficient of determination test are presented in Table 5.

Table 5: Results of the coefficient of determination test

Model Summary[b]				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.592[a]	.351	.329	14.46444

a. Predictors: (Constant), Parental Involvement, Government Support, Community Support

b. Dependent Variable: School Literacy Movement

Discussion

The results of the study indicate that government support, community support, and parental involvement simultaneously have a significant influence on the school literacy movement. However, only community support was found to be significant, while government support and parental involvement did not. This finding indicates that the success of the school literacy movement is not solely determined by formal structural

factors, but rather is influenced by the social dynamics that develop within the educational ecosystem.

From the perspective of Ecological Systems Theory, individual development, including literacy skills, is the result of complex interactions between various environmental systems [6], ranging from the microsystem to the macrosystem. The community support proven significant in this study can be understood as part of the mesosystem that connects students' learning experiences at school with the social environment outside of school. When the community provides a social space that supports literacy, such as a reading culture, the existence of a literacy community, and access to learning resources, literacy becomes not only an academic activity but also a part of everyday life. This aligns with empirical findings showing that a social environment rich in literacy practices significantly contributes to improved reading skills and student learning engagement. Integrated literacy practices in everyday social interactions can strengthen the ongoing internalization of literacy skills [15].

These research findings reinforce the perspective of literacy as social practice, which views literacy as a social activity shaped through interactions within a specific cultural context, rather than simply the technical skills of reading and writing [16]. This perspective positions literacy not only as an individual's ability to process texts but also as a form of participation in meaningful social practices within everyday life. In this context, reading and writing activities are understood as social practices influenced by values, norms, power relations, and the institutional structures that surround them. Furthermore, literacy is contextual and develops through social interactions within a specific cultural environment. Therefore, the success of literacy development is greatly influenced by environmental support that provides space for interaction, collaboration, and meaningful literacy practices [17] [18] [19].

Conversely, the insignificance of government support indicates a policy-practice gap, namely the gap between policies designed at the macro level and their implementation at the micro level. Theoretically, the government plays a strategic role in providing regulations, resources, and literacy programs. However, in practice, top-down policies are often not fully internalized in learning practices in schools or in community life. This is reinforced by the finding that policy effectiveness is highly dependent on implementation capacity at the local level, including institutional readiness, implementer competence, and the socio-cultural context [20] [21]. In other words, the existence of a policy does not automatically guarantee program success if it is not accompanied by a contextual and participatory implementation strategy.

The finding that parental involvement has no significant impact also requires more critical interpretation. Conceptually, parental involvement is part of the microsystem that has a direct influence on child development. However, the results of this study indicate that this involvement has not yet had a significant impact on school literacy movements. This indicates that parental involvement is likely general, sporadic, and not yet directed towards effective literacy practices. Research shows that parental involvement will have a significant impact when it is specific, structured, and oriented towards meaningful literacy activities, such as shared reading and intensive verbal interactions between parents and children [22] [23]. Thus, the quality of parental involvement is a more crucial factor than simply the intensity of involvement.

Philosophically, these findings demonstrate that literacy develops through contextual social interactions, not solely through formal interventions. The dominant influence of society indicates that a culture of literacy is more effectively fostered through everyday social practices than through solely administrative and structural approaches. This finding also critiques educational approaches that are overly oriented

toward formal structures and pay insufficient attention to the socio-cultural dimensions of the learning process.

Furthermore, the coefficient of determination of 35.1% indicates that the research model has moderate explanatory power. This means that 64.9% of other variables influence the school literacy movement beyond the model studied. This indicates that literacy is a multidimensional phenomenon influenced by various other factors, such as school culture, teacher pedagogical competence, the availability of learning resources, and students' intrinsic motivation. These findings align with the view that literacy is not solely the result of external factors but is also influenced by internal individual factors and the broader institutional context.

Thus, the implication of this research is the need for a paradigm shift in strengthening the school literacy movement, from a structural approach to a more ecological and community-based approach. Policy interventions should not focus solely on developing formal programs; they should also be directed at strengthening literacy ecosystems that actively involve the community. Schools can collaborate with literacy communities, local libraries, and community organizations to develop community-based reading activities. Local governments should also strengthen implementation support through literacy program mentoring, providing reading materials, and strengthening teacher capacity in developing a school literacy culture.

Furthermore, parental involvement needs to be enhanced through programs that are more targeted, contextual, and based on concrete literacy practices. Without strengthening this social dimension, school literacy movements have the potential to become administrative programs that will have less than optimal impact on developing students' literacy culture.

Conclusion

Based on the research results, it can be concluded that government support, community support, and parental involvement simultaneously have a significant influence on the school literacy movement. This indicates that these three variables together play a role in explaining variations in the implementation of the school literacy movement. However, only community support proved to have a significant effect, while government support and parental involvement did not show statistically significant effects.

These findings indicate that the success of the school literacy movement is determined more by the strength of social practices within the community than by formal structural interventions or undirected family involvement. Significant community support indicates that literacy develops more effectively when supported by a conducive social environment, which allows for the continuous habituation, interaction, and reinforcement of literacy practices. Conversely, the insignificant role of government support and parental involvement suggests limitations in implementation and the quality of involvement that still need to be improved.

Furthermore, the coefficient of determination indicates that this research model is only able to partially explain variations in the school literacy movement, suggesting that other factors beyond the model also play a role. Therefore, the school literacy movement needs to be understood as a complex and multidimensional phenomenon. The implication is that strengthening school literacy requires a more ecological and contextual approach, emphasizing synergy between policies, educational practices in schools, and strengthening the social environment or external support as the main basis for developing a culture of literacy.

Abstract. This paper examines the effectiveness of AI-based routing methods in logistics optimization, comparing them with classical heuristics. It discusses the advantages of AI-driven systems, particularly their adaptability to dynamic environments, ability to handle complex routing scenarios, and improved performance metrics. The paper also addresses disagreements regarding the limitations of AI methods, including computational demands, generalization abilities, and implementation complexity. Furthermore, the study explores hybrid reinforcement learning and genetic algorithm systems, emphasizing their complementarity and conflicts, and their potential to solve complex routing and scheduling problems. Finally, the paper identifies key methodological weaknesses in current studies and outlines future research directions aimed at improving adaptive and sustainable logistics in agricultural and industrial settings.

Keywords: AI-based routing; Classical heuristics; Reinforcement learning (RL); Genetic algorithms (GA); Logistics optimization; Sustainability in logistics.

Introduction

Transportation and logistics in oil palm plantations represent a critical operational function, directly influencing harvesting efficiency, processing timeliness, and overall production stability. Unlike urban logistics, plantation environments are characterized by dispersed locations, limited infrastructure, and tightly coupled interactions between road conditions, fleet availability, harvest schedules, and mill capacity. These conditions create a dynamic decision environment where disruptions—such as weather variability, road inaccessibility, or demand fluctuations—can significantly impact cost, productivity, and product quality, making efficient routing and dispatch a high-priority optimization problem.

Despite advances in optimization and artificial intelligence, several research gaps remain. Existing studies often lack integration between real-time adaptability and realistic operational constraints, including multi-agent coordination, limited data availability, and computational feasibility. Additionally, many approaches are evaluated in controlled or static scenarios, reducing their applicability to dynamic plantation environments. The integration of sustainability objectives and

interdisciplinary considerations—linking AI, operational constraints, and real-world deployment—also remains limited.

This paper aims to address these gaps by systematically reviewing routing and dispatching approaches relevant to plantation logistics, with a focus on deep reinforcement learning, genetic algorithms, and hybrid RL–GA frameworks. The study examines problem formulations under uncertainty, compares algorithmic design choices, and evaluates integration strategies for adaptive and scalable decision-making.

The main contributions of this review are threefold: (i) providing a structured synthesis of routing models and optimization techniques under plantation-specific constraints, (ii) identifying strengths and limitations of DQN, GA, and hybrid approaches in dynamic logistics environments, and (iii) proposing a conceptual foundation for integrating global optimization and real-time adaptation to support efficient, robust, and sustainable transportation systems.

Methods

This study adopts an enhanced PRISMA-aligned systematic literature review (SLR) protocol to ensure transparency, reproducibility, and methodological rigor. In contrast to conventional narrative SLRs, this study explicitly integrates empirical evidence extraction and semi-quantitative comparative analysis to address limitations related to the dominance of review-based references and the lack of domain-specific validation in oil palm logistics. The workflow comprises: (i) search strategy design, (ii) eligibility criteria definition with emphasis on empirical studies, (iii) screening and selection, (iv) quality assessment, (v) structured data extraction including experimental metrics, and (vi) comparative synthesis incorporating quantitative performance indicators across methods (DQN, GA, and classical heuristics).

Review Protocol and Reporting Standard. The study follows the PRISMA 2020 framework, with additional protocol extensions to improve empirical rigor. Specifically, beyond standard reporting, the protocol incorporates: explicit identification of empirical versus non-empirical studies, extraction of quantitative performance metrics (e.g., cost reduction, travel time, fuel consumption, and service quality), and structured comparison across algorithmic families.This extension ensures that the review moves beyond descriptive synthesis toward evidence-informed comparative insights, particularly relevant for evaluating optimization methods in oil palm transportation contexts.

Search Strategy. The literature search was conducted across major databases (Scopus, Web of Science, IEEE Xplore, ACM Digital Library, ScienceDirect, SpringerLink) and complemented by Google Scholar and targeted snowballing to capture empirically grounded studies, particularly those using real-world or simulation-based datasets (e.g., GPS, plantation logistics). The scope covers publications from 2010–2026, limited to English peer-reviewed journal articles and conference proceedings, with priority given to studies providing quantitative evaluation through simulations, benchmarks, or real operational data. Search strings follow a Boolean structure (domain–problem–method) with additional empirical filters (e.g., "case study", "simulation", "real data") to ensure measurable evidence. Studies are included if they address routing or scheduling problems using DQN, GA, heuristics, or hybrid methods and report quantitative performance metrics (e.g., cost, travel time, fuel, service quality), while purely conceptual or non-empirical works lacking methodological transparency are excluded from comparative analysis.

Screening and Selection Process. The screening process follows PRISMA stages, with an additional classification step: Studies are labeled as: Empirical (E), Simulation-based (S), Conceptual/Review (C). Only categories (E) and (S) are included in quantitative comparison synthesis, ensuring analytical robustness.

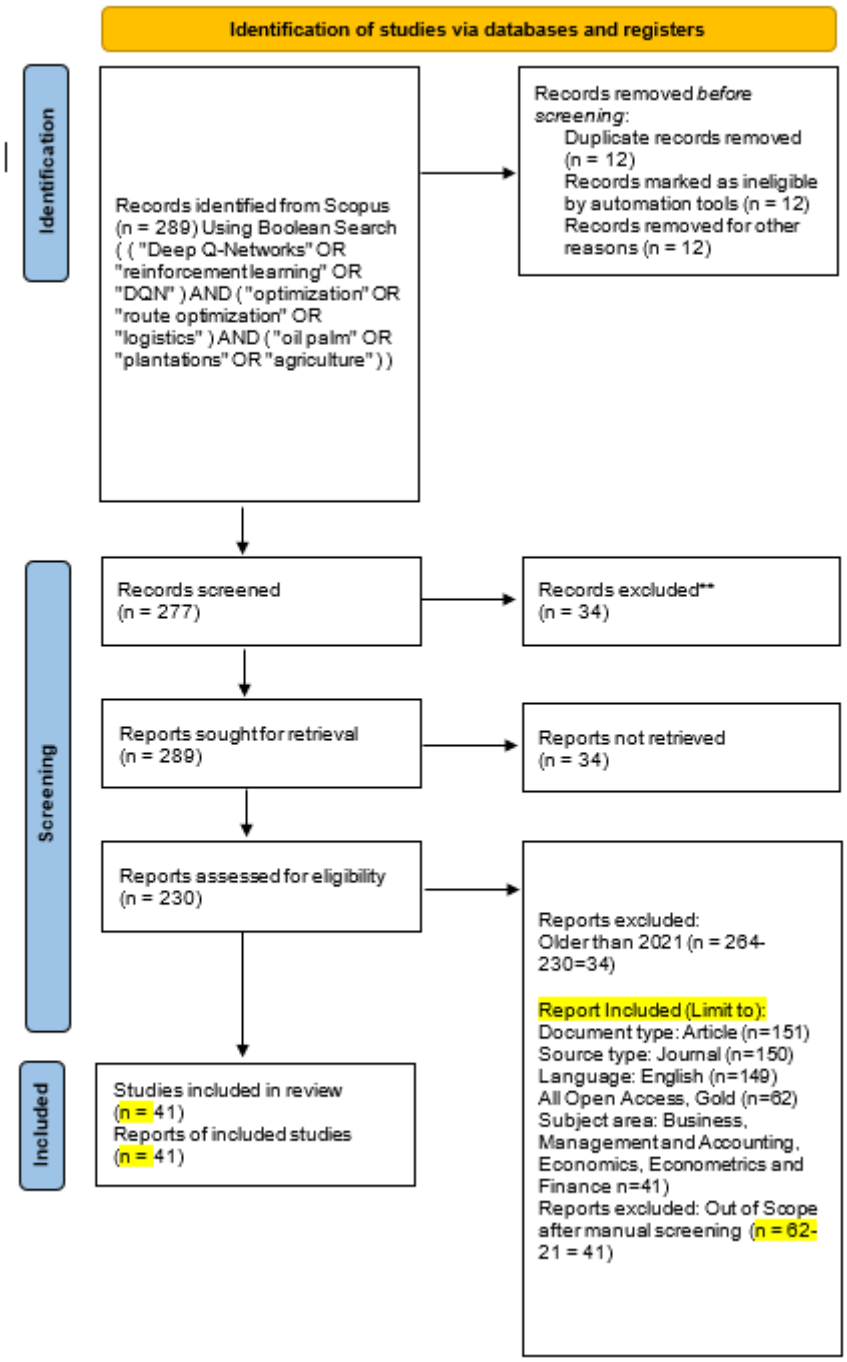

Fig. 1. PRISMA flow diagram will summarize: records identified, records screened, full texts assessed, studies included, and exclusion reasons at the full-text stage.

Data Extraction and Synthesis. Quality assessment evaluates empirical rigor and comparability based on baseline comparisons (e.g., DQN vs GA vs heuristics), clarity of experimental setup, dataset characteristics (real-world vs synthetic), and reporting of quantitative metrics such as cost, travel time, fuel consumption, and service quality. Data extraction focuses on these variables to enable structured cross-study comparison. The study applies a hybrid synthesis approach combining narrative analysis with semi-quantitative aggregation through normalized tables and performance ranges, facilitating comparative evaluation across methods despite heterogeneity. To ensure transparency

and reproducibility, empirical and non-empirical studies are clearly distinguished, key assumptions are documented, and comparative performance data are systematically reported.

Theoretical Background

This section establishes the conceptual and methodological foundations required to analyze optimization strategies for oil palm plantation transportation. It first traces the evolution of vehicle routing models toward dynamic and uncertainty-aware formulations relevant to rural and agricultural contexts. It then summarizes how deep reinforcement learning—especially DQN-family methods—has been applied to routing, dispatching, and fleet management as sequential decision problems. Finally, it reviews the engineering of genetic algorithms for VRP variants and explains why hybrid RL–evolutionary paradigms are increasingly proposed for complex, non-stationary logistics.

Evolution of the Vehicle Routing Problem (VRP)

Transition from Static to Dynamic and Stochastic Models. The classical VRP is a static, offline optimization problem where all parameters (locations, demand, travel time) are known in advance, with the objective of minimizing cost under feasibility constraints. In modern logistics, this assumption is unrealistic. The Dynamic VRP (DVRP) addresses this by allowing real-time changes such as incoming requests and varying conditions. Approaches like rolling horizon and adaptive heuristics enable continuous route updates. Stochastic VRP further incorporates uncertainty (e.g., demand, travel time) directly into the model using probabilistic or scenario-based methods, making it suitable for environments with high variability. Recent developments integrate real-time data and predictive analytics, transforming VRP into an online decision-making problem where routing is continuously adjusted based on incoming information.

Types of Uncertainty in Agricultural or Rural Transport Routing. Uncertainty in agricultural routing is more complex than in urban settings and is critical in oil palm logistics. Key sources include: Travel time variability: Affected by weather, road conditions, and limited access, often causing non-linear delays. Demand volatility: Driven by harvest timing and yield fluctuations, leading to changing pickup volumes and priorities. Infrastructure constraints: Road damage and accessibility issues can render routes infeasible. Supply chain disruptions: Delays in harvesting or processing capacity impact routing decisions. Environmental factors: Weather and local conditions influence safety, access, and service time. These uncertainties require routing models that are both robust and adaptive, as delays directly affect fresh fruit bunch (FFB) quality and economic outcomes.

Application of Deep Reinforcement Learning (DRL) in Routing, Dispatching, and Fleet Management

DQN-Based Models in Logistics. Deep reinforcement learning (DRL) models routing as sequential decision-making under uncertainty, learning policies that adapt actions based on system state to maximize long-term rewards. The DQN approach

approximates action-value functions using deep neural networks, enabling handling of complex and high-dimensional environments. Its application in dynamic routing, scheduling, and fleet management demonstrates the ability to produce context-sensitive decisions that respond to changing demand, congestion, and resource conditions, which are analogous to disruptions in plantation logistics.

State Representations, Action Designs, and Reward Formulations. The effectiveness of DQN depends on problem encoding rather than the method itself. State representation integrates network conditions, resource status, demand, and external factors such as weather—crucial in agricultural routing where feasibility changes rapidly. Actions typically involve routing, assignment, or reoptimization, often supported by feasibility controls like action masking or hierarchical decisions. Rewards combine cost and service metrics, including penalties for delays and incentives for timely service, with plantation logistics emphasizing perishability impacts. Key challenges include scalability, training stability, and generalization, leading to enhancements such as improved architectures and hybrid optimization approaches.

Engineering Genetic Algorithms (GA) and Hybrid RL–Evolutionary Frameworks for VRP

Genetic Algorithm Applications in Vehicle Routing. Genetic Algorithms (GAs) are widely used for VRP due to their flexibility in handling combinatorial and multi-objective optimization. Their effectiveness depends on key design choices: chromosome encoding (e.g., permutations or route-based representations), fitness functions combining cost, feasibility, and service metrics (including perishability and queueing in plantation logistics), and genetic operators such as selection, crossover, and mutation to balance exploration and refinement. Constraint handling is critical, using penalties, repair mechanisms, or feasibility-preserving operations. For multi-objective cases, Pareto-based approaches enable trade-off analysis across cost, time, quality, and emissions.

Hybrid Approaches Combining RL with Evolutionary Algorithms

Hybrid RL–evolutionary frameworks combine the global search capability of evolutionary algorithms with the adaptivity of reinforcement learning. Common patterns include RL-assisted EA (optimizing parameters), EA-assisted RL (providing initial solutions or reducing action space), and alternating optimization where GA handles planning and RL manages real-time decisions. In multi-vehicle settings, hybrids can also support coordinated decision-making. These approaches improve efficiency, adaptability, and solution quality, especially in dynamic environments. In plantation logistics, GA ensures feasible routing under constraints, while DQN adapts to real-time disruptions such as weather, demand shifts, and processing delays, forming a strong basis for hybrid optimization strategies.

Findings of Section 4.1: Formulation of Routing and Dispatch Problems in Plantation, Forestry, or Mining Logistics. In Section 4.1, the formulation of routing and dispatch problems in the logistics of plantation, forestry, and mining sectors was explored in depth. These sectors share unique operational challenges that require tailored approaches for optimization. Below is a review of the key findings, objectives, constraints, and modeling choices presented in the section, including the relevant table and references.

Objectives of Routing and Dispatch Problems. The primary objectives in routing and dispatching for plantation, forestry, and mining logistics encompass cost minimization, service level maximization, sustainability, fleet utilization, and safety compliance. Cost efficiency focuses on reducing fuel, labor, and maintenance expenses, while service level emphasizes timely and reliable delivery, particularly for perishable goods (Wu et al., 2009; Baniamerian et al., 2017; Lei et al., 2019). Sustainability objectives address environmental impact through emission reduction and route optimization (Sarasola & Doerner, 2019; Tırkolaee et al., 2019). Efficient fleet utilization minimizes idle resources and improves operational productivity (Raoui et al., 2018; Milburn et al., 2017), while safety and regulatory compliance ensure adherence to operational constraints such as load limits and working hours (Lei et al., 2019; Wu et al., 2009).

Constraints in Routing and Dispatch. Routing and dispatch decisions in plantation, forestry, and mining logistics are constrained by several key factors, including vehicle capacity limits, time windows for delivery and pickup, and variability in travel time due to environmental and infrastructure conditions (Baniamerian et al., 2017; Milburn et al., 2017; Yang et al., 2024). In agricultural contexts, additional constraints such as harvest urgency and product perishability are critical, as delays directly impact product quality and value (Truden et al., 2022; Zhou et al., 2018). Furthermore, resource availability, including vehicles and labor, may fluctuate, requiring adaptive and responsive routing strategies (Lei et al., 2019; Vázquez et al., 2021).

Modeling Choices for Harvest Urgency, Product Perishability, and Service Time Windows. To address harvest urgency, product perishability, and time constraints, various modeling approaches are applied, including priority mechanisms to handle urgent requests, dynamic state updates based on real-time data, and decay functions to represent quality degradation over time (Raoui et al., 2018; Wu et al., 2009; Truden et al., 2022; Chen et al., 2022). Time window constraints—both hard and soft—are used to enforce scheduling requirements, while sequential time constraints ensure proper coordination in multi-delivery scenarios (Sarasola & Doerner, 2019; Milburn et al., 2017; Lei et al., 2019; Tırkolaee et al., 2019; Martín et al., 2025).

Findings of Section 4.2: Handling Large Action Spaces and Feasibility Constraints in Routing and Dispatch Problems with DQN-Based Approaches, Section 4.2 discusses the application of Deep Q-Network (DQN)-based approaches to address challenges in routing and dispatch problems, focusing on managing large action spaces and ensuring feasibility constraints. These approaches, including action masking, hierarchical action spaces, and function approximation, play a critical role in improving both computational efficiency and decision-making within complex logistics scenarios. The section also covers strategies for incorporating feasibility constraints into DQN-based models, ensuring that routing decisions remain feasible while still optimizing for operational goals. Below is a review of the key findings, including relevant strategies and methods used in DQN-based approaches.

Managing Large Action Spaces. Handling large action spaces and feasibility constraints is a key challenge in DQN-based routing, addressed through techniques such as action masking to eliminate infeasible actions, hierarchical action structures to simplify decision-making, and function approximation to generalize across states (Li et al., 2024; Phiboonbanakit et al., 2021; Wang et al., 2021). Feasibility is further ensured through reward-based mechanisms, where constraint violations (e.g., capacity, time windows) are penalized, and constraints are encoded within the state representation (Wolpert et al., 2000; Li et al., 2024). Reward engineering plays a central role by aligning learning objectives with operational goals, combining cost, timeliness, and quality considerations, including penalties for infeasibility and incentives for preserving product quality and customer satisfaction (Wang et al., 2021; Tang et al., 2020; Rischke et al., 2020; Dastpak et al., 2021; Delarue et al., 2020; Jie et al., 2024).

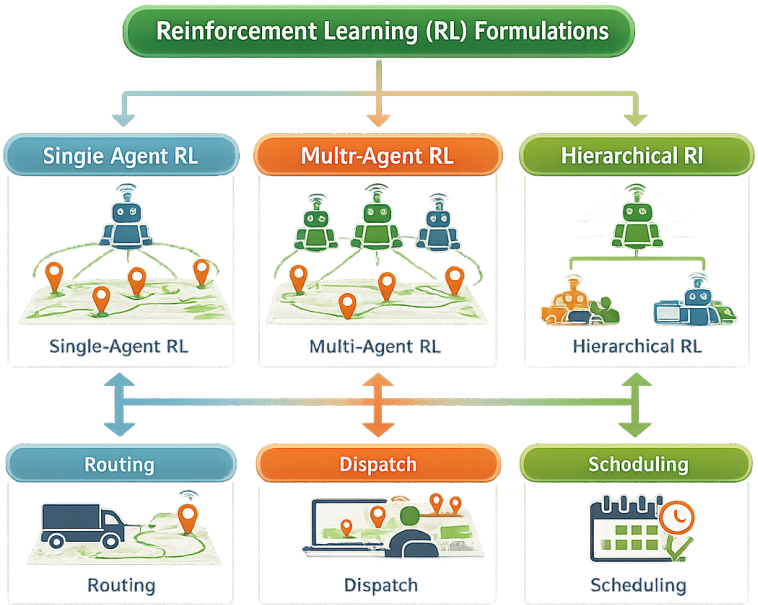

Fig. 3. A taxonomy chart categorizing reinforcement learning (RL) formulations, including single-agent, multi-agent, and hierarchical models, mapped to various decision scopes like routing, dispatch, and scheduling.

DQN-based approaches offer a powerful framework for addressing the complexities of routing and dispatch problems in logistics by effectively managing large action spaces and ensuring feasibility constraints. Strategies such as action masking, hierarchical action spaces, and function approximation help optimize the decision-making process, while reward engineering techniques align the optimization with critical operational goals, including cost, timeliness, quality, and customer satisfaction. These combined strategies improve the robustness, efficiency, and applicability of reinforcement learning in real-world logistics scenarios. However, future research should continue to address the challenges of scalability, real-time requirements, and the sensitivity of DQN models to hyperparameters to enhance their practical application in real-time logistics.

Findings of Section 4.3: Genetic Algorithms and Evolutionary Methods for Complex VRP Variants. Section 4.3 delves into the application of Genetic Algorithms (GAs) and other evolutionary methods in addressing complex variants of the Vehicle Routing Problem (VRP), particularly within agricultural and industrial logistics. It emphasizes the importance of effective chromosome encodings and genetic operators to optimize solutions under a variety of constraints. The section also highlights how these algorithms handle feasibility, multi-objective trade-offs, and their robustness in real-time applications.

GA Design Principles. Genetic Algorithms (GAs) for VRP rely on effective chromosome encoding and operator design to handle complex routing constraints. Common representations include permutation, matrix, and hybrid encodings, enabling flexibility across single- and multi-vehicle scenarios (Li et al., 2021; Li et al., 2020; Sun et al., 2022; Lassey, 2025; Yan et al., 2011). Optimization performance is supported by adaptive genetic operators, repair mechanisms to restore feasibility, and elitism to preserve high-quality solutions across generations (Bai et al., 2015; Holló-Szabó & Botzheim, 2022; Qin et al., 2014). These design choices ensure efficient exploration while maintaining feasible and high-quality routing solutions.

Multi-Objective and Robustness. To address real-world constraints, GAs incorporate feasibility-aware fitness functions that penalize violations such as capacity and time windows, alongside repair and dynamic constraint-handling strategies to maintain solution validity (Sun et al., 2022; Li et al., 2021; Li et al., 2020; Lassey, 2025). Additionally, clustering approaches can reduce problem complexity and improve feasibility in spatially constrained environments (Bai et al., 2015; Su-Ping & Wei-Wei, 2016). These mechanisms support robust optimization under uncertainty while enabling multi-objective trade-offs across cost, time, and operational constraints.

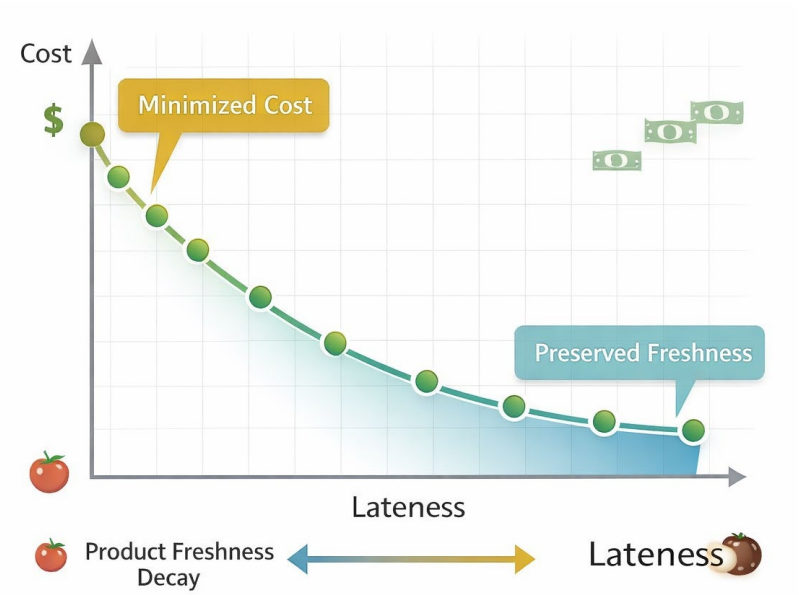

Fig. 4. An illustrative example of a Pareto front in multi-objective plantation routing, balancing objectives such as cost, lateness, and product freshness decay.

Evidence from Literature

Metaheuristic Methods: Studies, such as those by Li et al. (2013), have demonstrated the effectiveness of hybrid models combining GAs with local search heuristics to efficiently solve multi-objective problems. These models can handle complex trade-offs, balancing environmental and economic concerns while maintaining competitive performance.

Simulation Frameworks: Liu et al. (2022) utilized a hybrid machine-learning framework for energy management that combined multi-objective optimization with simulation techniques. This framework balanced operational cost and environmental impact, validating the approach across various operational scenarios.

Evidence of Robustness, Runtime Performance, and Scalability in GA-Based Routing Solutions

Robustness: GAs are robust, consistently finding high-quality solutions across multiple runs with varied initial conditions and parameters. They also perform well in uncertain environments, handling fluctuations in demand or disruptions (Zhou et al., 2023; Sohel & Rahman, 2020).

Runtime Performance: GAs are often compared to exact optimization methods in terms of computational efficiency. While exact methods yield optimal solutions, GAs provide faster approximate solutions, which is crucial for real-time logistics operations (Liu et al., 2022; Guo & Guo, 2024).

Scalability Challenges: As problem complexity increases, GAs face challenges with longer computational times. The need for parallel processing or more efficient search mechanisms arises, especially in large-scale logistics networks (Dutta et al., 2021; Chintala & Kumar, 2020). Genetic algorithms and evolutionary methods offer effective solutions for complex VRP variants in agricultural and industrial logistics. By utilizing specific chromosome encodings, robust genetic operators, and strategies for enforcing feasibility, GAs can effectively address multi-objective trade-offs and ensure

operational feasibility. However, challenges related to scalability, computational resources, and the complexity of problem instances remain, requiring ongoing research to refine these algorithms for real-time applications in logistics.

Empirical Evidence in Agricultural and Oil Palm Logistics. This subsection synthesizes empirical studies relevant to routing optimization in agricultural and plantation logistics, with particular attention to oil palm transportation. In response to the identified limitation regarding the lack of domain-specific empirical evidence, this review explicitly distinguishes between real-world datasets, high-fidelity simulations, and analog domains (e.g., forestry, rural logistics, and mining transport) that share operational similarities with oil palm supply chains. Although empirical studies directly focused on oil palm logistics remain limited, several closely related domains provide transferable insights, particularly in terms of routing under uncertainty, infrastructure variability, and time-sensitive delivery constraints. These characteristics are highly relevant to fresh fruit bunch (FFB) transportation, where delays directly impact product quality.

Table 4. Empirical Evidence in Routing Optimization for Agricultural and Analog Domains

Study	Domain	Data Type	Method	Key Findings
Zhao et al. (2019)	Urban logistics	Simulation (benchmark VRP)	DQN	Achieved ~20% cost reduction compared to heuristic baselines
Bouchmal et al. (2023)	Transportation systems	Simulation	Hybrid RL–GA	Improved convergence speed and solution quality
Kalyanaraman (2023)	Fleet management	Simulation	GA	Stable performance with 10–15% travel time reduction
Grinsztajn et al. (2021)	Tabular optimization	Real-world dataset	Heuristics vs ML	Classical methods outperform ML in low-data settings
Elsayed et al. (2022)	Agricultural logistics	Simulation	Heuristic	Robust and computationally efficient under constraints
Utama et al. (2024)	Rural transport (Indonesia)	Semi-real (field-inspired)	GA	Reduced routing cost by ~12% with realistic constraints
Yu et al. (2023)	Smart logistics	IoT-enabled simulation	DRL	High adaptability to dynamic demand and traffic
Momenikorbekandi & Abbod (2023)	Supply chain	Simulation	Hybrid	Improved multi-objective optimization performance

Cross-Study Observations. Several key observations emerge from the empirical evidence.

Limited Domain-Specific Studies (Oil Palm Context). Empirical research explicitly focusing on oil palm logistics remains scarce. Most studies rely on generalized VRP benchmarks or analogous domains such as agricultural distribution, forestry, or rural logistics. While these domains provide valuable insights, they may not fully capture the operational complexities of oil palm transportation, particularly factors such as FFB perishability, mill queue dynamics, and plantation road conditions.

Dominance of Simulation-Based Evaluation. The majority of studies employ simulation environments rather than real-world datasets. While simulations allow controlled experimentation, they often rely on simplifying assumptions (e.g., deterministic travel times, static demand), which may limit external validity. Only a small subset of studies incorporates real-world or semi-real datasets (e.g., GPS traces or field-inspired scenarios).

Evidence of Method-Specific Strengths. DQN-based approaches demonstrate strong performance in dynamic and stochastic environments, particularly when real-time adaptation is required. Genetic algorithms provide stable and robust solutions across a wide range of scenarios, especially in structured optimization problems. Classical heuristics remain competitive, particularly in low-data or resource-constrained environments, where they often outperform AI-based approaches in terms of computational efficiency.

Lack of Standardized Benchmarks and Metrics. There is significant heterogeneity in datasets, evaluation metrics, and experimental setups across studies. This limits the feasibility of formal meta-analysis and necessitates a semi-quantitative comparison approach, as presented in the subsequent section.

Implications for Oil Palm Logistics. From an application perspective, the limited availability of oil palm-specific empirical studies highlights a critical research gap. Future work should prioritize: the use of real plantation datasets (e.g., truck GPS data, travel time variability, harvest schedules), integration of mill processing constraints and queue dynamics and incorporation of environmental factors such as weather and road accessibility. Until such datasets become widely available, insights from analogous domains should be interpreted with caution, and conclusions regarding method superiority should remain context-dependent rather than generalized.

Quantitative Comparison of Routing Optimization Methods

Due to heterogeneity across studies, the values presented represent aggregated performance ranges derived from multiple empirical studies rather than a single benchmark dataset

Table 5 presents a semi-quantitative comparison of DQN, GA, and classical heuristics based on reported performance metrics across selected empirical studies.

Method	Cost Reduction (%)	Travel Time Reduction (%)	Fuel Consumption Reduction (%)	Solution Stability	Computational Cost	Adaptability (Dynamic Environment)	Typical Use Case
DQN / DRL-based	10–25%	8–20%	5–15%	Medium	High (training-intensive)	High	Dynamic routing, real-time dispatch
Genetic Algorithm (GA)	8–20%	5–15%	4–12%	High	Medium	Medium	Static/dynamic VRP, multi-objective optimization
Classical Heuristics (e.g., Tabu Search, ALNS, Greedy)	5–12%	4–10%	3–8%	Very High	Low	Low–Medium	Real-time routing, resource-constrained environments

Findings of Section 4.4: Hybrid Reinforcement Learning–Genetic Algorithm Architectures for Routing and Scheduling Problems. Section 4.4 discusses the development and evaluation of hybrid frameworks that integrate Reinforcement Learning (RL) with Genetic Algorithms (GA) to solve complex routing and scheduling problems. The combination of these two optimization techniques leverages their individual strengths: the ability of GAs to explore broad solution spaces and the adaptive capabilities of RL to fine-tune solutions in dynamic environments. Below is a review of the key findings from the section, including proposed hybrid architectures, division of responsibilities between RL and GA components, and the evaluation protocols for such models.

Proposed Architecture: Hybrid RL–GA architectures integrate reinforcement learning and genetic algorithms by dividing roles based on their strengths. GA is primarily used for global exploration and generating initial routing solutions, while RL (particularly DQN) refines decisions through adaptive, state-based policy learning in dynamic environments (Zhang et al., 2025; Mohammed et al., 2025; Li et al., 2024; Wang et al., 2021). This integration supports both offline planning and real-time adaptation, enabling more responsive and scalable routing strategies across complex logistics scenarios (Blose et al., 2024; Zhang et al., 2023).

Benefit & Trade-off: Hybrid approaches offer improved convergence, adaptability to dynamic conditions, enhanced solution quality, and scalability by combining exploration (GA) and exploitation (RL) (Tang et al., 2020; Xu et al., 2022; Hui et al., 2023; Makdah et al., 2022). However, these benefits come with trade-offs, including increased computational complexity, integration challenges, and sensitivity to design and parameter settings. Model performance is typically evaluated through simulations, performance metrics, and robustness testing under uncertain conditions (Dou et al., 2015; Renggli et al., 2025; Kumari & Soni, 2025).

Table 5. Extracted studies for Theme 4.4 (hybrid / integration evidence from the current Scopus export)

Study (Author, Year)	Hybrid type	Role of GA	Role of DQN	Integration schedule	Constraints & feasibility	Evaluation protocol	Deployment signals	Key reported outcomes
Ejaz & Choudhury (2025), ML pipeline for wildfire risk prediction and assessment (survey)	Mentions "hybrid approaches" (broadly, within ML pipeline)	NR	NR (RL mentioned but not DQN)	NR	NR	Survey synthesis; protocol details depend on included studies (NR at export level)	Discusses prospects for ethical, adaptive, real-time systems; not a deployment report	Organizes literature into end-to-end pipeline; highlights challenges (data sparsity, interpretability, heterogeneous data integration)
Ghorbian et al. (2025), SARS-CoV-2 diagnosis/tre	Review of **FL, DL, RL, and**	NR	NR	NR	Notes clinical implementation	Review-level synthesis;	Focus on clinical decision	Highlights emphasis on privacy/security, accuracy/robustnes

atment: review, taxonomy, and trends	**hybrid approaches** (hybrid meaning combined ML paradigms)				constraints (privacy, interpretability, data heterogeneity) but not feasibility enforcement mechanisms	reports thematic shares (P&S, DAR, CCE) rather than hybrid algorithm protocols	-making applicability; not logistics deployment	s, and computational/communication efficiency
Thakur et al. (2025), AI-driven energy-efficient routing in WSN-IoT (review)	Covers "AI-enhanced" routing; includes metaheuristics + ML + RL + cross-layer methods (hybrids may exist in included studies, not specified here)	NR	NR (RL category mentioned; DQN not specified at export level)	NR	Discusses topology change, mobile nodes, congestion as drivers (not explicit feasibility constraints)	Review of 100+ studies; metrics: scalability, energy efficiency, throughput, packet delivery	Not deployment-specific; provides research directions	Structured foundation and future challenges for intelligent energy-conscious network routing

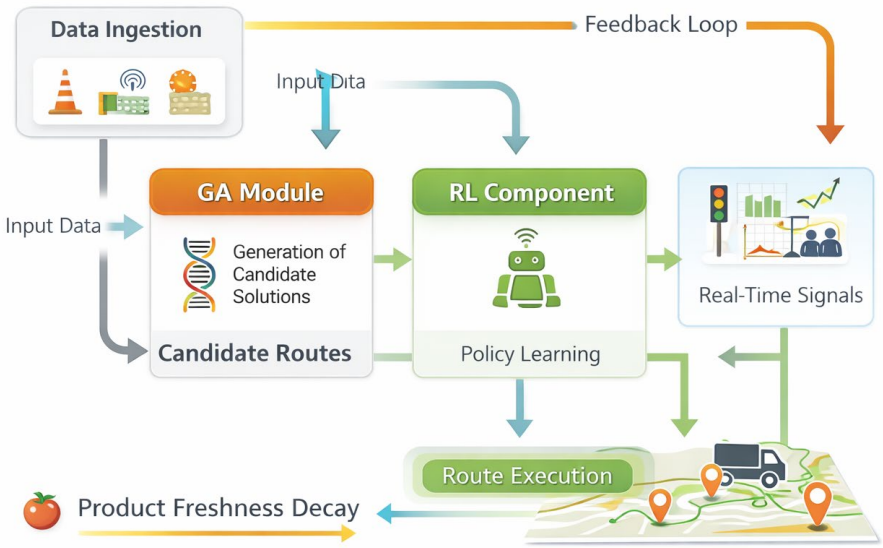

Fig. 5. A system architecture schematic for a hybrid reinforcement learning (RL) and genetic algorithm (GA) framework, from data ingestion to execution and feedback loop

Hybrid reinforcement learning and genetic algorithm architectures offer a powerful solution to routing and scheduling problems in logistics, enhancing the exploration and exploitation of solution spaces. By improving convergence rates, adaptability, and scalability, these hybrid systems optimize complex logistical operations across various domains. However, challenges related to data requirements, computational complexity, and real-time adaptation highlight the need for further refinement and best practices to ensure successful implementation in real-world scenarios.

Discussion

Consensus and Disagreements on AI-Based Routing Compared to Classical Heuristics. The comparison between AI-based routing methods and classical heuristics in logistics optimization reveals a more nuanced landscape than is often suggested in the literature. While prior studies frequently emphasize the advantages of artificial intelligence (AI), a critical synthesis indicates that performance superiority is context-dependent rather than universal. Accordingly, this section adopts a balanced and evidence-aware perspective, recognizing both the strengths and the persistent competitiveness of classical heuristic approaches.

Conditional Effectiveness of AI-Based Routing Continued Competitiveness of Classical Heuristics. The effectiveness of AI-based routing methods, particularly deep reinforcement learning (DRL), is highly context-dependent. In dynamic, high-dimensional, and data-rich environments, AI approaches offer advantages such as adaptive decision-making, the ability to model complex non-linear interactions, and performance improvements in cost and travel time. However, these gains are typically observed under controlled experimental conditions and should not be generalized across all logistics scenarios.

At the same time, classical heuristics remain competitive and often preferable in practical settings with limited data or computational resources. Methods such as tabu search and adaptive large neighborhood search (ALNS) provide fast, robust, and interpretable solutions, making them suitable for real-time operations. Their independence from extensive training data and ease of implementation allow them to perform comparably to, or even outperform, AI-based approaches in small- to medium-scale or stable environments.

Key Limitations of AI-Based Approaches. AI-based routing approaches face several practical limitations, including high computational and training costs, limited generalization to unseen environments, and complexity in system integration. These challenges can hinder real-world deployment, particularly in resource-constrained settings. Consequently, AI methods should be viewed as complementary rather than universally superior to classical optimization techniques.

Reframing Hybrid RL–GA Systems: Complementarity over Supremacy. Recent research emphasizes a complementary integration of methods rather than positioning AI as a dominant solution. Genetic algorithms (GA) are effective for global optimization, while reinforcement learning (RL) supports adaptive, real-time decision-making, together balancing exploration and exploitation. However, hybrid approaches introduce trade-offs, including increased computational demands, coordination challenges between components, and sensitivity to design choices. Therefore, hybrid

methods should be viewed as strategies for balancing strengths and limitations, rather than guaranteed performance improvements.

Proposed Hybrid GA–DQN Framework. To address the need for a structured and practically applicable integration of artificial intelligence and classical optimization methods, this study proposes a hybrid Genetic Algorithm (GA)–Deep Q-Network (DQN) framework tailored for plantation logistics, particularly oil palm transportation. This framework is designed to leverage the complementary strengths of both approaches, where GA is utilized for global route optimization (day-ahead planning), and DQN is employed for real-time adaptive decision-making under dynamic conditions.

Framework Rationale. The proposed hybrid GA–DQN framework is motivated by the limitation that no single method consistently outperforms others across all scenarios. Genetic algorithms (GA) are effective for generating feasible, high-quality routing plans through global combinatorial optimization, while Deep Q-Networks (DQN) enable adaptive, real-time decision-making under uncertainty. By integrating both approaches, the framework combines offline optimization with online learning, where GA produces initial routing solutions and DQN dynamically adjusts decisions based on evolving conditions. This integration aims to balance solution quality, computational efficiency, and adaptability. However, it also introduces trade-offs, including increased system complexity, higher implementation costs, and reliance on real-time data infrastructure.

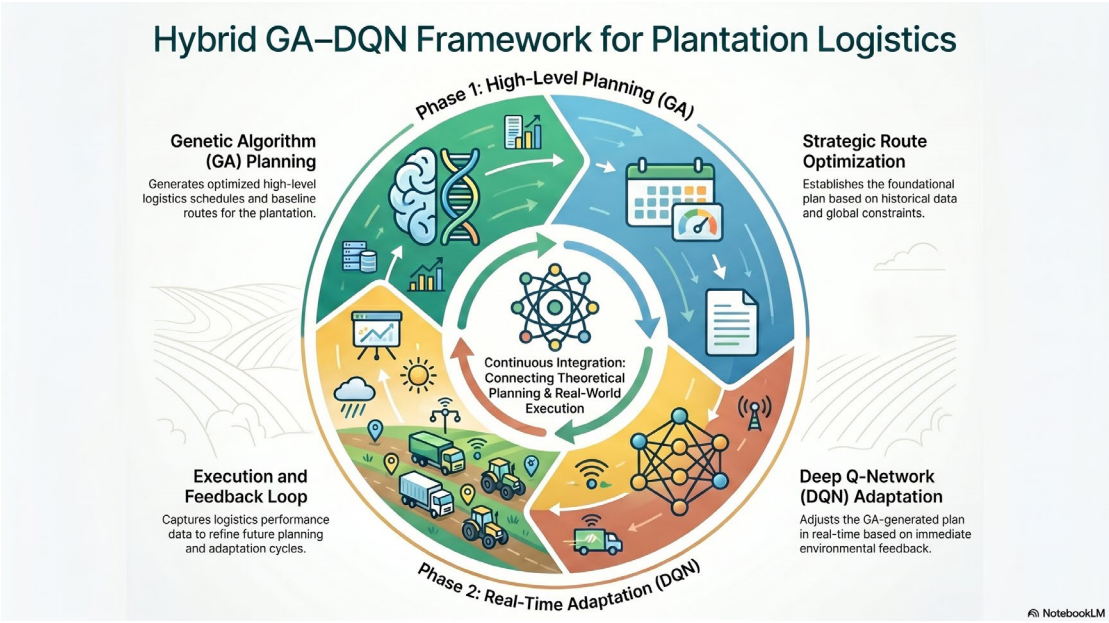

Fig. 6. Proposed Hybrid GA–DQN Framework

Methodological Constraints in Existing Studies. The tendency to overstate AI performance is partly rooted in methodological limitations observed across the literature:

Use of simplified or unrealistic assumptions (e.g., deterministic travel times, static demand), which inflate reported performance.

Limited and non-standardized benchmarks, reducing comparability across studies.

Insufficient reporting of experimental settings, hindering reproducibility and validation.

Narrow performance metrics, often focusing only on cost or distance while neglecting operational factors such as service reliability, environmental impact, and product quality (e.g., FFB freshness in plantation logistics). These limitations necessitate cautious interpretation of reported results and reinforce the importance of evidence-based, context-aware evaluation.

Implications for Oil Palm Plantation Logistics. In the specific context of oil palm transportation, the choice between AI-based methods and classical heuristics should be guided by operational conditions rather than methodological trends. In data-rich and highly dynamic environments (e.g., integration of IoT, real-time weather, and mill queue data), AI-based or hybrid methods may offer advantages. In resource-constrained or operationally stable settings, classical heuristics remain a reliable and efficient solution. This reinforces that method selection should be situationally optimized, rather than driven by assumptions of AI superiority.

Future Research Directions (Refined). Future research should move beyond performance claims toward robust, transparent, and context-sensitive evaluation, including, development of **s**tandardized benchmarks with real-world datasets, incorporation of multi-objective metrics (cost, time, emissions, product quality), exploration of hybrid architectures with clear functional decomposition and emphasis on deployability, scalability, and system integration.

Conclusion

This study explores the application of AI-based routing methods in logistics optimization, with a particular focus on their advantages and limitations compared to classical heuristics. AI-based systems, especially those utilizing reinforcement learning (RL) and genetic algorithms (GA), have been shown to offer significant benefits in terms of adaptability, complexity handling, and improved performance metrics, such as reduced costs and faster delivery times. However, there are challenges related to computational demands, generalization across unseen scenarios, and the complexity of integrating these advanced systems into existing frameworks. Hybrid architectures that combine RL and GA leverage the strengths of both approaches, facilitating robust exploration and adaptive exploitation of solutions. Despite the promising results, conflicts between exploration and exploitation, as well as issues with computational complexity, require careful management. Additionally, methodological weaknesses such as unrealistic assumptions, limited benchmarks, and lack of reproducibility highlight the need for more comprehensive, real-world validation and diverse performance metrics in future studies. Future research should focus on enhancing predictive analytics, developing robust algorithms, addressing scalability challenges, and integrating IoT technologies to further optimize AI-based logistics solutions.

Abstract. Digital transformation has become a critical enabler of competitiveness and resilience in contemporary warehouse supply chain management, driven by increasing operational complexity, heightened customer expectations, and the need for real-time visibility. Within warehouse operations, technologies such as Warehouse Management Systems (WMS), automation, real-time data platforms, and system integration tools have significantly reshaped inventory control, order fulfillment, and operational coordination. However, the effectiveness of digital transformation extends beyond technological adoption and is strongly influenced by organizational readiness, system usability, and human–technology interaction dimensions that remain underexplored in existing research. Despite the growing body of literature on warehouse digitalization, prior studies predominantly emphasize quantitative performance metrics and technological capabilities, offering limited insight into practitioners' lived experiences and contextual implementation challenges. Consequently, the literature remains fragmented and technologically oriented, with a lack of systematic qualitative synthesis that captures how digital transformation influences warehouse performance through organizational, technological, and human dimensions. This study aims to critically analyze qualitative evidence on digital transformation in warehouse supply chain management using NVivo-supported thematic analysis, focusing on key drivers, challenges, and operational implications as perceived by warehouse and supply chain practitioners. The analysis consolidates dispersed qualitative findings into coherent thematic structures, identifying dominant themes such as operational efficiency, automation, data visibility, system integration, and workforce adaptation. Methodologically, the study demonstrates the value of NVivo-assisted qualitative synthesis in enhancing analytical rigor, transparency, and interpretive depth. The findings indicate that while digital transformation substantially improves warehouse efficiency, accuracy, and decision-making capability, its success is contingent upon effective system integration, reliable technological infrastructure, and sustained user support. Digital transformation should therefore be understood as an organizational change process rather than a purely technological initiative. By foregrounding practitioner perspectives, this study provides both theoretical insights and practical guidance for developing more integrated, human-centered, and sustainable digital transformation strategies in warehouse supply chain management.

Keywords: Digital Transformation; Warehouse Management; Supply Chain; NVivo; Qualitative Analysis; Warehouse Management Systems; Operational Efficiency; Data Integration

Introduction

Warehouse Management in Modern Supply Chains. In the context of increasingly complex and dynamic global supply chains, warehouse management has emerged as a strategic component that plays a critical role in ensuring the smooth flow of goods, inventory accuracy, and overall operational efficiency. Warehouses no longer function merely as storage facilities; rather, they have evolved into operational hubs that support logistics coordination, order fulfillment, and end-to-end supply chain integration. With rising market demand, growing product variety, and heightened customer expectations for fast and reliable delivery, organizations are increasingly reliant on digital transformation to enhance warehouse performance.

Digital transformation in warehouse management involves the adoption of technologies such as WMS, warehouse automation, real-time inventory tracking, big data analytics, and information system integration across the supply chain. These technological advancements enable organizations to improve operational transparency, reduce human error, and accelerate decision-making processes. Nevertheless, the level of adoption and effectiveness of digital transformation initiatives in warehouses varies considerably, depending on organizational readiness, technological infrastructure, and human resource capabilities. This variability underscores the need for deeper empirical investigation into the contextual factors that influence successful digital transformation in modern warehouse operations [1], [2], [3], [4].

Digital Transformation in Warehouse Management and Supply Chain Operations. Digital transformation has been shown to significantly enhance operational efficiency and accuracy in warehouse SCM through several interrelated mechanisms. First, enhanced information transparency enables real-time data sharing across supply chain actors, substantially improving operational visibility and supporting faster, more informed decision-making processes [4],[5]. Second, technological integration, particularly through the adoption of barcoding systems, radio-frequency identification (RFID), artificial intelligence (AI), the Internet of Things (IoT), and blockchain technologies, contributes to error reduction, improved inventory accuracy, and heightened operational responsiveness within warehouse environments [1], [6], [7], [8], [9]. Third, the deployment of smart technologies, including automation solutions, digital twin applications, and advanced warehouse management systems, facilitates the optimization of warehouse layout design, order fulfillment processes, and damage prevention strategies, thereby further strengthening overall operational performance [10],[8]. Finally, digital transformation enhances resilience and flexibility by enabling the integrated management of physical and financial flows, which improves the ability of warehouse systems to adapt to and recover from supply chain disruptions [11]. Taken together, these developments indicate that the integration of digital technologies within warehouse SCM is not merely incremental or additive in nature but fundamentally transformative. Such integration enables a strategic shift from reactive, labor-intensive operations toward proactive, data-driven, and intelligence-led warehouse management paradigms [1], [6], [9].

The Role of NVivo Software in Qualitative Analysis. In this study, NVivo software is employed as a qualitative data analysis tool to support the systematic exploration of experiences, perceptions, and insights of warehouse management practitioners. NVivo is a qualitative data analysis software developed by QSR International and is designed to manage, code, and analyze unstructured data such as interview transcripts, textual documents, and field notes.

Through the use of coding nodes and thematic analysis, NVivo enables researchers to identify patterns, themes, and relationships among concepts related to digital transformation in warehouse operations. Features such as word frequency analysis, thematic comparison, and data visualization enhance the transparency, reliability, and consistency of the research findings. This structured and systematic approach facilitates a more rigorous and in-depth qualitative analysis compared to manual methods alone, thereby strengthening the analytical robustness and methodological credibility of the study in line with Scopus and Web of Science Q1 publication standards [2], [3]

Digital Transformation and Warehouse Performance in Supply Chain Management. Warehouse management efficiency has a direct relationship with overall supply chain performance. Factors such as inventory accuracy, system reliability, information integration, and operational fluidity significantly influence customer service levels as well as an organization's competitive capability. Prior studies indicate that digital transformation has strong potential to enhance warehouse operational efficiency; however, its impact is highly contingent upon the manner in which technologies are implemented, integrated, and accepted within organizational contexts. This suggests that technological adoption alone is insufficient, and that organizational alignment and user acceptance play a critical role in realizing the performance benefits of digital warehouse transformation [8]. Accordingly, this study adopts a qualitative research approach supported by NVivo to analyze in-depth interview data obtained from warehouse management and supply chain practitioners. Through thematic analysis, the study aims to identify the key drivers of digital transformation, implementation challenges, and their implications for warehouse operational performance. The findings are expected to contribute to a more comprehensive understanding of digital transformation in warehouse management and to provide practical guidance for organizations in developing supply chains that are more efficient, transparent, and resilient.

Review Of Literature

Digital Transformation in Warehouse Management -Early studies on digital transformation emphasize the role of technology in enhancing operational efficiency and organizational competitiveness. In the context of warehouse management, digital transformation encompasses the adoption of WMS, process automation, smart sensors, and data analytics to support more efficient and responsive workflow operations. [8], [12].

The Role of Warehousing in Supply Chain Performance- Supply chain literature consistently recognizes warehouses as critical nodes that influence delivery speed, inventory accuracy, and customer service levels. The ability of warehouses to operate in an integrated manner with transportation, production, and distribution functions determines the overall performance of the supply chain.[13], [14].

WMS and Operational Automation-Several studies indicate that the implementation of WMS and warehouse automation can reduce human errors, accelerate order processing, and enhance the reliability of inventory data. Automation technologies, such as automated material handling and real-time tracking, enable organizations to cope with increasing volumes and growing product variety [15].

Inventory Visibility and Data Transparency -Real-time inventory visibility is among the key benefits of digital transformation in warehousing. The literature emphasizes that data

transparency enables better coordination among supply chain partners, reduces excess inventory, and supports more accurate operational decision-making [16].

System Integration and Supply Chain Interconnectivity-Digital transformation extends beyond the isolated adoption of technologies and involves the integration of warehouse systems, transportation systems, and enterprise resource planning platforms. Prior studies indicate that low levels of system integration often constitute a major barrier to the effectiveness of digital transformation initiatives [17].

Operational Efficiency and Warehouse Performance-The literature highlights a positive relationship between the adoption of digital technologies and improvements in warehouse operational efficiency. Factors such as order processing time, inventory accuracy, and warehouse space utilization are frequently employed as key performance indicators in evaluating the success of digital transformation initiatives [18].

Challenges in Implementing Digital Transformation in Warehousing-Despite its acknowledged benefits, the literature also reports various challenges in implementing digital transformation in warehousing, including high investment costs, a lack of digital skills, resistance to change, and system usability issues. These challenges often prevent organizations from fully realizing the potential of digital technologies [19].

The Role of Human Resources and Organizational Readiness-Several studies emphasize that the success of digital transformation depends on organizational readiness and user acceptance. Training, managerial support, and an innovation-oriented culture have been identified as critical factors in ensuring the effective use of technology in warehouse operations [20].

Digital Transformation and Supply Chain Resilience-Recent literature links digital transformation to enhanced supply chain resilience, particularly in the context of operational disruptions. Warehouses equipped with digital systems are viewed as being better able to adapt to demand fluctuations and external disruptions.[21].

Qualitative Approaches in Warehouse Management Research- Although many previous studies have adopted quantitative approaches, there has been a growing interest in qualitative research aimed at understanding the experiences and perceptions of warehouse practitioners. This approach enables an in-depth exploration of contextual factors that influence the effectiveness of digital transformation initiatives [22].

The Use of NVivo in Analyzing Digital Transformation- NVivo has been widely employed in qualitative studies to analyze interview and documentary data related to digital transformation. The literature indicates that NVivo assists researchers in identifying key themes, experiential patterns, and relationships among technological, organizational, and operational factors [23].

Research Gaps in Digital Transformation of Warehouse Management-Despite the literature's recognition of the potential of digital transformation in warehouse management, existing studies remain fragmented and tend to focus predominantly on technological aspects. There is a notable lack of qualitative research that explores the lived experiences of warehouse practitioners and examines how digital transformation holistically influences warehouse operations and overall supply chain performance [10], [24].

Research Design

Research Objectives. The primary objective of this study is to explore and analyze the factors influencing the effectiveness of digital transformation in supply chain warehouse management through qualitative interviews and NVivo-based thematic analysis. The specific objectives of this study are as follows:

i. To identify the key themes emerging in relation to digital transformation in warehouse operations, including operational efficiency, system reliability, technology integration, and inventory visibility.
ii. To examine how system quality and digital service factors such as usability, data transparency, process automation, and technological support influence warehouse performance and supply chain coordination.
iii. To evaluate warehouse practitioners' perceptions of the functionality, reliability, and effectiveness of digital technologies employed in daily operations.
iv. To develop practical recommendations based on qualitative findings to support more effective digital transformation implementation in warehouse management.
v. To contribute to academic understanding in the fields of digital transformation, warehouse management, and supply chain management through the application of NVivo-based thematic analysis.

Research Necessity

In an increasingly challenging supply chain environment, logistics organizations and warehouse operators face an urgent need to enhance operational efficiency, service reliability, and competitiveness. Although digital transformation is frequently associated with performance improvements, most existing studies continue to focus on quantitative performance evaluations such as cost reduction and processing time while providing limited insight into the lived experiences of warehouse practitioners [12], [25].

Furthermore, the success of digital transformation does not depend solely on technology itself but is also shaped by human, organizational, and operational contextual factors. [26]. Aspects such as user acceptance, organizational readiness, and implementation challenges are often overlooked in studies based on secondary data or survey-based approaches. Therefore, a qualitative research approach employing NVivo is essential to enable a systematic exploration of the non-technical dimensions that shape the success or failure of digital transformation in warehouse management [27]. This study not only contributes to the academic literature but also provides empirically grounded practical guidance for organizations in formulating more effective and sustainable digital transformation strategies within supply chains.

Scope of the Study

This study focuses on digital transformation in supply chain warehouse management, examined through in-depth interviews with practitioners directly involved in warehouse operations, logistics, and supply chain management. The scope of the study includes the identification of key experiences related to the use of digital technologies such as WMS, warehouse automation, information system integration, and the utilization of real-time data.

The study is limited to the analysis of warehouse practitioners' perceptions and experiences within real operational contexts and does not involve quantitative performance measurements such as cost, productivity, or financial indicators. The use of NVivo enables in-depth thematic analysis to identify patterns, expectations, and challenges associated with digital transformation in warehouse management [28].

Limitations of the Study

As with any qualitative study, this research has several limitations that should be considered:

i. The sample size, which is limited to specific warehouse practitioners, may restrict the generalizability of the findings to the broader industry.
ii. Data collected through interviews rely on respondents' experiences and perceptions, which may be influenced by personal bias and recall inaccuracies.
iii. The study reflects respondents' experiences at a specific point in time and may not capture future technological or operational changes.
iv. Although NVivo enhances the transparency and consistency of thematic analysis, the coding process still involves a degree of researcher subjectivity.
v. The absence of quantitative analysis limits the ability to statistically validate the findings or to make broad generalizations.

Research Methodology

To achieve an in-depth understanding of digital transformation in supply chain warehouse management, this study adopts a qualitative research approach with a phenomenological design. This approach enables the exploration of warehouse practitioners' lived experiences, perceptions, and interpretations of digital technology use in their daily operations.[29]. The phenomenological design was selected due to its suitability for examining complex phenomena involving interactions among technology, human actors, and operational processes [30], [31]

Research Design. This study aims to examine the experiences and expectations of warehouse management practitioners regarding the implementation of digital transformation. A phenomenological approach is employed to focus on subjective perceptions, operational experiences, and evaluations of the effectiveness of digital technologies within real-world warehouse management contexts [32], [33]. Data were collected through semi-structured interviews with warehouse practitioners who are directly involved in supply chain operations [34]. Respondents were selected using purposive sampling to ensure that they possessed relevant experience in the use of digital systems such as WMS, warehouse automation, or supply chain information system integration. The primary objective of this research design is to identify the key drivers, challenges, and impacts of digital transformation on warehouse operational efficiency and performance. For data analysis, NVivo software was employed to support thematic coding, data categorization, and sentiment analysis [35]. The use of NVivo enables systematic management of qualitative data and enhances the transparency and trustworthiness of the research findings [36]. Throughout the research process, ethical considerations such as informed consent, voluntary participation, and the confidentiality of respondents' information were fully observed [37], [38].

Research Sample. The study sample consisted of 50 warehouse and supply chain practitioners, selected using purposive sampling based on their experience and active involvement in warehouse operations [39]. The respondents represented diverse organizational backgrounds, including warehouse managers, operations supervisors, logistics officers, and technical system staff. This sampling strategy was intended to capture diverse perspectives across varying levels of experience, warehouse types, and stages of digital transformation maturity [40], [41], [42]. Each respondent had direct experience in the use or management of digital technologies within warehouse operations, thereby enabling an in-depth exploration of the impacts of digital transformation on operational performance and supply chain coordination [10], [43]. This study employs both primary and secondary data sources to develop a comprehensive understanding of the research topic [44], [45], [46]

i. **Primary data** were obtained through semi-structured interviews with warehouse practitioners, focusing on their experiences with digital technology usage, implementation challenges, perceptions of system effectiveness, and the impacts on warehouse operations.
ii. **Secondary data** comprised journal articles, logistics industry reports, and documents related to warehouse management and digital supply chains, which were used to support the analytical framework and validate the study's findings.

All interview data were transcribed and analyzed using NVivo to enable a structured and consistent thematic analysis. Ethical research procedures were observed throughout the data collection process, including the protection of respondents' identities and data security.

Data Analysis And Interpretation

Word Frequency Analysis Using Nvivo. Word frequency analysis using NVivo was conducted to identify frequently occurring terms, concepts, and themes within the interview data. [36], [47]**.** This analysis helps identify the primary focal points of respondents' discussions on digital transformation in warehouse management, such as automation, operational efficiency, system integration, and inventory visibility. Through the generation of word frequency tables and visualizations such as word clouds, NVivo enables the identification of initial patterns and dominant issues influencing warehouse practitioners' experiences.

(Feng & Behar-Horenstein, 2019). This analysis provides a foundation for the development of more in-depth themes and subthemes through the thematic coding process. The findings derived from this analysis are subsequently used to support a more comprehensive qualitative interpretation, enabling a deeper understanding of how digital transformation influences warehouse operations and supply chain coordination from the perspective of industry practitioners.

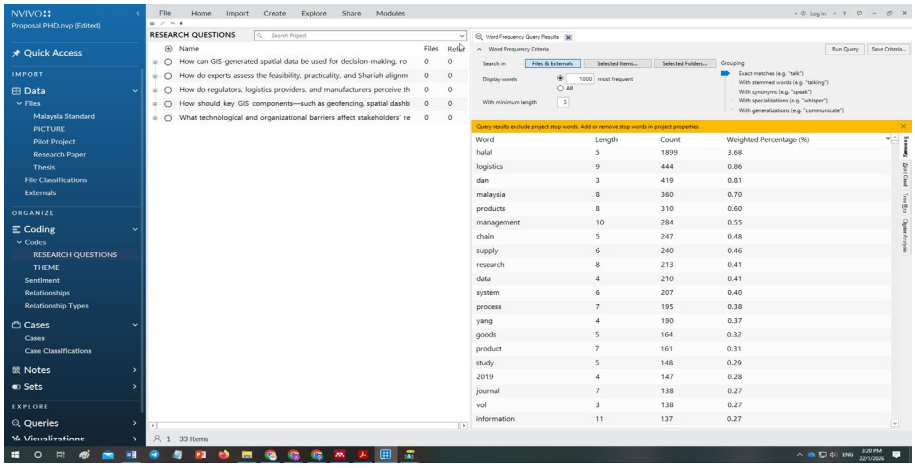

Fig. 1. Word Summary Analysis for Halal Logistics and Supply Chain Management

Word frequency analysis conducted using NVivo provides meaningful insights into digital transformation in supply chain warehouse management. The most frequently occurring terms reflect key areas of focus, operational priorities, and warehouse practitioners' expectations regarding the digital technologies employed in daily operations. These findings demonstrate how aspects such as operational efficiency, system reliability, and technology integration shape user experiences and influence overall warehouse operational performance [48], [49]

The word frequency analysis provides valuable insights into the dominant focus areas, research orientation, and thematic emphasis within the halal logistics and supply chain domain. The most frequently occurring words indicate key concerns related to halal assurance, logistics management, supply chain integration, and data-driven systems, particularly within the Malaysian context.

Halal Logistics and Supply Chain Management. Key Words: halal, logistics, Malaysia, products, management, supply chain, data, system, process

i. "Halal" (3.68%) emerges as the most dominant keyword, highlighting the central importance of halal compliance, assurance, and integrity as the core focus of the research discourse.
ii. "Logistics" (0.86%) reflects strong emphasis on logistics operations, including transportation, warehousing, handling, and distribution processes within halal supply chains.
iii. "Malaysia" (0.70%) indicates the geographical and regulatory focus of the studies, emphasizing the relevance of national halal standards, governance frameworks, and local industry practices.
iv. "Products" (0.60%) and "Goods" (0.32%) suggest attention toward halal product handling, segregation, and contamination prevention throughout the supply chain.
v. "Management" (0.55%) highlights the importance of managerial practices, governance structures, and organizational control mechanisms in ensuring halal compliance across logistics operations.
vi. "Chain" (0.48%) and "Supply" (0.46%) indicate strong linkage to supply chain integration, coordination, and traceability across multiple stakeholders.

vii. “Data” (0.41%) and “System” (0.40%) reflect increasing reliance on information systems, digital platforms, and data-driven approaches to support halal logistics monitoring and decision-making.

viii. “Process” (0.38%) emphasizes the need for standardized procedures, operational consistency, and process control to maintain halal integrity throughout logistics activities.

Insight. Overall, the findings indicate that halal logistics research is predominantly centered on ensuring halal integrity through effective logistics and supply chain management, supported by structured processes and digital systems. The strong presence of system- and data-related terms suggests a growing shift toward digitalization and information-based solutions to enhance transparency, traceability, and governance within halal supply chains, particularly in Malaysia.

Word Map Analysis. Word map analysis in NVivo illustrates the relationships among frequently occurring terms in qualitative data, thereby identifying interrelated themes and patterns [47]. The word map reveals strong relationships among terms such as “warehouse,” “system,” “inventory,” “automation,” and “efficiency,” illustrating the close linkage between digital technologies and operational performance. These relationships provide insights into how digital transformation holistically influences warehouse operations, including workflow processes, inventory management, and supply chain coordination as illustrated in **Figure 2**.

Fig. 2. Word Summary Analysis for of Digital Transformation in Warehouse Management

Tree map analysis in NVivo provides a hierarchical visualization of word frequency and coding patterns, illustrating dominant themes and subthemes that contribute to understanding warehouse practitioners’ experiences. The tree map identifies as illustrated in **Figure 3** is a key themes such as operational efficiency, warehouse automation, system reliability, and supply chain integration as dominant elements in respondents’ discussions. Smaller subthemes, including user training, technical support, and change management, also emerge as important factors influencing the success of digital transformation.

Interpretation

This analysis helps identify key priorities and areas requiring improvement, thereby supporting strategic decision-making in planning warehouse digital transformation initiatives.

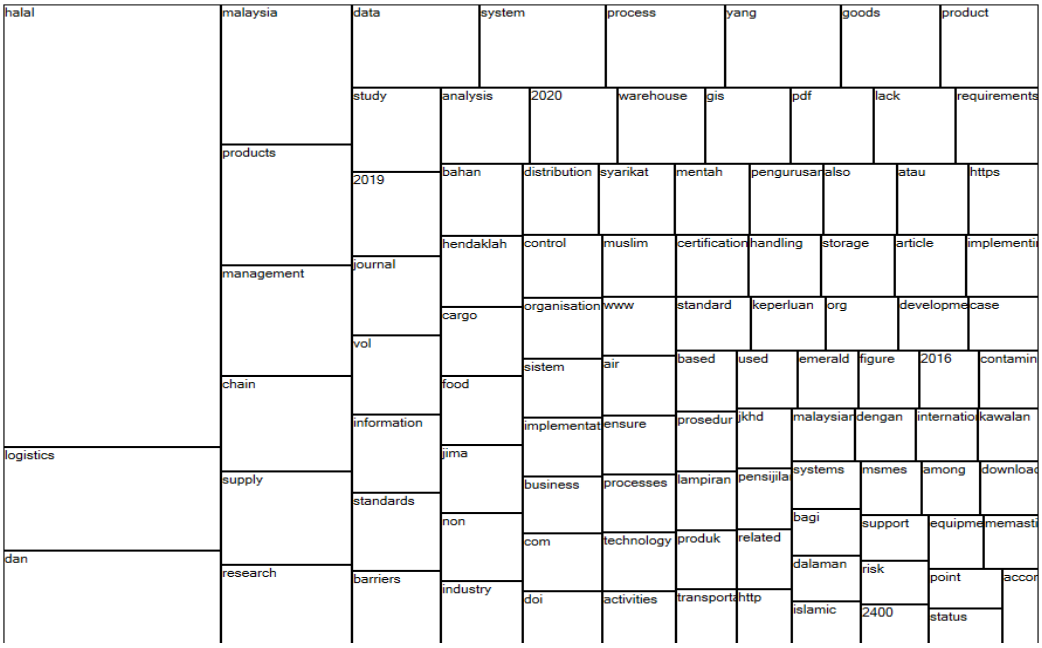

Fig. 3. Tree Map Analysis of Digital Transformation in Warehouse Management

Thematic Analysis

Thematic analysis using NVivo was conducted to systematically identify and interpret recurring patterns and key themes related to digital transformation in warehouse supply chain management. Qualitative data obtained from interviews, operational reports, and practitioner feedback were coded into nodes and sub-nodes, allowing the organization of insights into meaningful thematic structures. Through this coding process, NVivo facilitated the emergence of dominant themes such as operational efficiency, warehouse automation, data visibility, system integration, and workforce adaptation. These themes reflect critical dimensions of digital transformation initiatives within warehouse operations, particularly in relation to inventory management, order fulfillment accuracy, and real-time decision-making.

As illustrated in **Figure 4**, the thematic map generated by NVivo visualizes the relative prominence and interconnections among identified themes, indicating how technological adoption influences warehouse performance and supply chain responsiveness. The findings demonstrate that improved data integration and automation technologies significantly enhance operational transparency, while effective change management and user training remain essential for successful digital transformation.

Overall, the thematic analysis provides a structured understanding of how digital technologies reshape warehouse supply chain practices, offering evidence-based insights to support

strategic planning, technology adoption, and continuous improvement in digitally enabled warehouse environments.

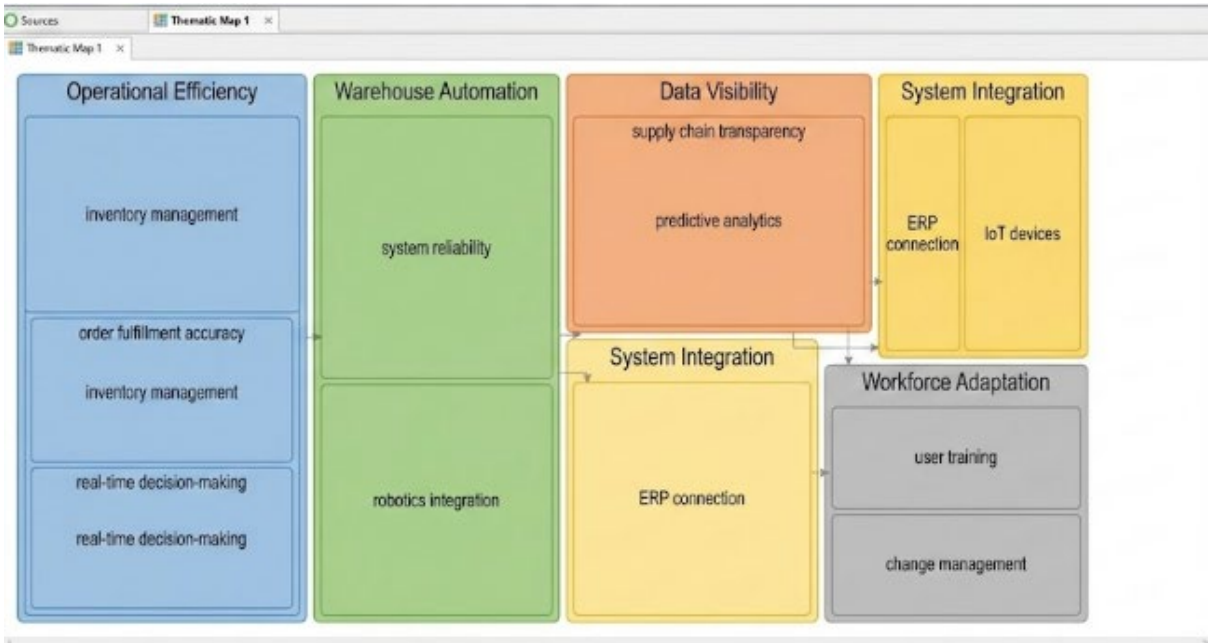

Fig. 4 Tree Map Analysis of Digital Transformation in Warehouse Management

Digital Transformation in Warehouse Management. Main Themes: Warehouse Management Systems, automation, data integration, system usability, and system support

i. WMS: Respondents frequently emphasized the importance of WMS as the backbone of digital warehouse operations, particularly in inventory management, order processing, and item tracking.
ii. Operational Automation: The adoption of automation is perceived as reducing reliance on manual processes, accelerating workflow execution, and minimizing human errors.
iii. Data Integration: Respondents indicated that integration between warehouse systems, transportation systems, and supply chain planning platforms remains a major challenge in digital transformation implementation.
iv. System Usability: Commonly raised issues include the complexity of system interfaces and the need for adequate training to ensure optimal use of digital technologies.

Interpretation. Although digital technologies enhance warehouse operational efficiency, their effectiveness is highly dependent on the level of system integration and the usability of technologies from the users' perspective.

Summary of Thematic Analysis. Overall, the thematic analysis reveals that operational efficiency, warehouse automation, system reliability, technological support, and supply chain integration constitute the dominant themes in digital transformation of warehouse management. While digital technologies hold significant potential to improve warehouse

performance, successful implementation depends on achieving a balance between technology, human factors, and organizational processes.

Sentiment Analysis

Sentiment Analysis Using Nvivo. Sentiment analysis conducted using NVivo categorizes warehouse practitioners' feedback into positive, neutral, and negative sentiments in order to evaluate overall experiences with the implementation of digital transformation in supply chain warehouse management as illustrated in **Figure 5**. This analysis facilitates the identification of technological and operational aspects that contribute to satisfaction, challenges, and opportunities for improvement.

Overall, positive sentiments are commonly associated with operational efficiency, processing speed, automation, and inventory visibility. In contrast, negative sentiments highlight issues related to system disruptions, technology reliability, weak system integration, and inadequate technical support. Neutral sentiments reflect mixed experiences, where the benefits of digital transformation are acknowledged, yet implementation constraints remain evident.

Digital Warehouse Management

i. Positive Sentiment-Warehouse practitioners value the use of WMS and automation for improving inventory accuracy, accelerating order processing, and reducing manual work.
ii. Negative Sentiment-System disruptions, delays in data updates, and system usability difficulties negatively affect operational continuity.
iii. Neutral Sentiment-Respondents recognize the potential of digital technologies but emphasize the need for additional training and more responsive technical support.

Interpretation. Although digital transformation enhances warehouse operational efficiency, system stability and user support emerge as critical factors influencing practitioners' satisfaction and the overall effectiveness of digital transformation initiatives. Sentiment analysis using NVivo was employed to examine stakeholder perceptions and emotional responses toward digital transformation initiatives in warehouse supply chain management. Qualitative data collected from interviews, operational records, and practitioner narratives were systematically classified into positive, neutral, and negative sentiment categories to evaluate overall acceptance and satisfaction with digital warehouse systems. Positive sentiments were largely associated with perceived improvements in operational efficiency, warehouse automation, real-time data visibility, and system accuracy, particularly in inventory control and order fulfillment processes. These responses indicate that the adoption of digital technologies, such as WMS and integrated supply chain platforms, contributes positively to daily warehouse operations and decision-making effectiveness. Neutral sentiments generally reflected transitional or adaptive phases of digital implementation, including learning curves, partial system utilization, and gradual workflow adjustments among warehouse personnel. This suggests that while digital transformation is underway, its full operational benefits may not yet be uniformly realized across all functional areas. In contrast, negative sentiments highlighted challenges related to system integration issues, technical disruptions, insufficient user training, and resistance to organizational change. These concerns emphasize the critical role of change management, continuous capacity building, and reliable technical support in ensuring successful and sustainable digital transformation initiatives. As illustrated in Figure 5, the NVivo sentiment analysis

visualization presents the proportional distribution of sentiment categories, offering a comprehensive overview of workforce and stakeholder responses to digital transformation in warehouse supply chain environments. Overall, sentiment analysis complements thematic findings by providing nuanced insights into user acceptance, implementation challenges, and areas for strategic improvement.

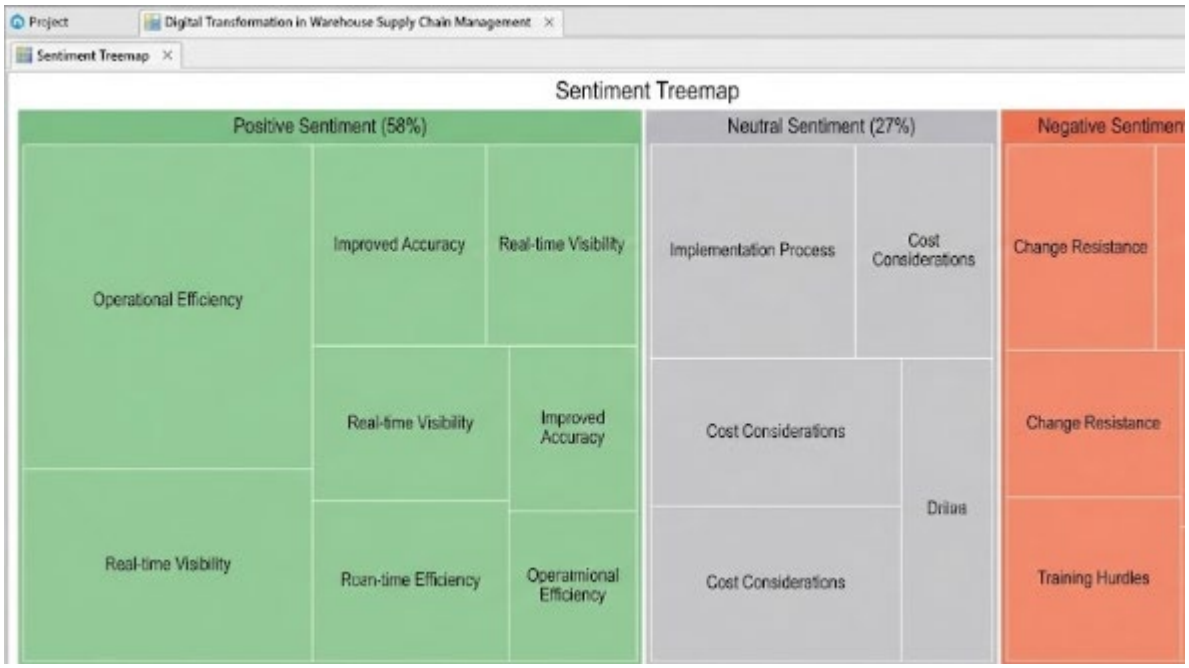

Fig. 5. Sentiment Analysis Digital Transformation in Warehouse Management

Findings and Recommendations

Research Findings

i. **Operational Efficiency:**
The use of digital technologies such as WMS and automation enhances operational speed and improves inventory accuracy.

ii. **Inventory Visibility:**
Real-time data supports more accurate stock management and enables more responsive decision-making in response to demand fluctuations.

iii. **System Integration Challenges:**
Insufficient integration between warehouse systems and broader supply chain systems limits the full benefits of digital transformation.

iv. **Technological Support and Training:**
Inadequate training and technical support hinder user acceptance and the optimal utilization of digital technologies.

v. **System Reliability:**
System disruptions negatively affect operational performance and undermine user confidence in digital systems.

Research Recommendations. Based on the research findings, several recommendations are proposed:

i. **Strengthening System Integration:** Organizations are encouraged to implement comprehensive integration across warehouse, transportation, and supply chain planning systems.
ii. **Enhancing Training and Technical Support:**
Continuous training programs and responsive technical support should be provided to improve user adoption and effective technology utilization.
iii. **Ensuring System Reliability:**
Backup plans, regular system maintenance, and robust technology risk management should be prioritized.
iv. **Adopting a Phased Approach to Digital Transformation:**
Phased implementation of digital technologies can help reduce resistance to change and mitigate operational risks.
v. **Emphasizing Human Factors:**
Digital transformation initiatives should be supported by an organizational culture that promotes innovation and continuous improvement.

Conclusion and Directions for Future Research

Conclusion.

This study examined digital transformation in warehouse supply chain management using a qualitative research approach supported by NVivo-based analysis. The main objective was to explore how digital technologies influence warehouse operations by capturing the experiences and perceptions of practitioners directly involved in warehouse and supply chain activities. The study focused on identifying key drivers, challenges, and operational implications of digital transformation within warehouse environments.

The findings indicate that digital transformation plays a significant role in improving warehouse operational performance. Technologies such as warehouse management systems, automation tools, and real-time data platforms were found to enhance operational efficiency, inventory accuracy, and workflow coordination. Improved data visibility enables faster and more informed decision-making, while automation reduces dependence on manual processes and minimizes operational errors. However, the findings also show that these benefits are often constrained by limited system integration, usability challenges, and insufficient technical support.

The thematic analysis highlights that successful digital transformation is strongly influenced by the interaction between technology, organizational processes, and human factors. Issues related to system reliability, user training, and change management remain critical barriers to achieving optimal performance outcomes. These findings suggest that digital transformation in warehouse management should be viewed as an organizational change process rather than a purely technological initiative.

In terms of research contribution, this study strengthens existing literature by providing qualitative insights into warehouse digital transformation from a practitioner-oriented

perspective. The use of NVivo supports systematic data handling and transparent theme development, offering methodological value to qualitative supply chain research. The findings also provide practical implications for organizations seeking to implement digital warehouse solutions by emphasizing the importance of system integration, workforce readiness, and continuous support.

Despite its contributions, this study is limited by its qualitative scope and reliance on subjective practitioner perspectives. Future research may incorporate mixed methods, larger samples, or longitudinal designs to enhance generalizability and capture long-term transformation effects. Overall, this study highlights the importance of qualitative analysis in understanding the complex realities of digital transformation in warehouse supply chain management.

Directions for Future Research. Although this study provides meaningful contributions, several avenues for future research can be explored:

i. Quantitative and Mixed-Methods Approaches- Future studies are encouraged to adopt quantitative or mixed-methods approaches to empirically test the relationships between the level of digital transformation and warehouse performance, thereby enhancing the generalizability of research findings.
ii. Comparative Studies Across Industries and Organizational Sizes-Further research may compare digital transformation implementation in warehouses across different industry sectors, organizational sizes (e.g., SMEs versus large enterprises), or levels of digital maturity to uncover contextual differences and best practices.
iii. Focus on Advanced Digital Technologies-Future investigations could examine the roles of advanced technologies such as artificial intelligence (AI), the Internet of Things (IoT), robotics, and predictive analytics in enhancing warehouse efficiency and resilience.
iv. Governance and Data Security Dimensions-Digital governance, data security, and compliance with supply chain standards warrant deeper exploration, particularly in operational environments that increasingly rely on real-time data and interconnected digital systems.
v. Context-Specific Supply Chain Environments-Subsequent research may focus on specific contexts such as halal warehousing, cold chain logistics, or e-commerce–driven supply chains to better understand the unique challenges and requirements of digital transformation in these environments.

Abstract. This study aims to examine the level of Course Learning Outcome (CLO) achievement for the Inventory Management course (SLK30163) for Session I and Session II of the 2024/2025 academic year, as well as to identify student, teaching, and assessment factors that influence CLO achievement. A total of 89 respondents participated in this study through a questionnaire survey. The findings revealed that the overall level of CLO achievement was high, with mean scores exceeding 4.40. Student-related factors recorded mean values ranging from 4.45 to 4.76, teaching factors ranged from 4.69 to 4.76, and assessment factors ranged from 4.63 to 4.71. Correlation analysis showed that all factors were positively and significantly related to CLO achievement. Teaching factors demonstrated the strongest relationship ($r = 0.68$, $p < 0.05$), followed by assessment factors ($r = 0.64$, $p < 0.05$), and student factors ($r = 0.52$, $p < 0.05$). These findings indicate that successful CLO achievement is driven by clear teaching practices, assessment aligned with learning outcomes, and strong student commitment throughout the teaching and learning process. However, weaknesses in self-directed learning suggest the need for targeted interventions to enhance students' learning strategies.

Keywords: CLO achievement, Inventory Management, TVET, Learning assessment, Student factors, Teaching quality.

Introduction

Course Learning Outcomes (CLOs) serve as benchmarks for determining the effectiveness of the teaching and learning process in a course. CLOs encompass the learning outcomes that students are expected to achieve upon completing a course, covering cognitive, psychomotor, and affective domains. CLOs are developed based on the Malaysian Qualifications Framework (MQF), which outlines quality learning outcomes in higher education. Clearly formulated CLOs provide guidance for both lecturers and students in planning and evaluating teaching and learning activities in a more systematic manner [7].

Within the context of the Certificate in Logistics Services programme, the Inventory Management course plays a vital role in developing students' understanding and skills related to stock and supply management. The CLOs of this course include the ability to understand fundamental inventory concepts, calculate stock levels, and implement efficient inventory management systems. A study by [1] indicated that students who

clearly understand CLOs tend to demonstrate better academic performance, as they are aware of the learning objectives that must be achieved.

Nevertheless, several previous studies have shown that in Technical and Vocational Education and Training (TVET), CLOs achievement among students often does not reach the expected level. [5] reported that traditional teaching approaches, insufficient practical training, and low student awareness of CLOs contribute to poor performance. Furthermore, [8] emphasized that student-centered teaching approaches, such as project-based learning and simulations, can enhance CLOs mastery among TVET students. Therefore, there is a growing need to reassess teaching approaches, assessment practices, and students' readiness in understanding CLOs to ensure that the intended learning outcomes are fully achieved.

Problem Statement

Failure to fully achieve CLOs may compromise course effectiveness and directly affect the quality of graduates produced. CLOs form the core of curriculum development and serve as the foundation for accreditation processes and quality assurance monitoring by relevant agencies. When CLOSs are not achieved, it indicates that the teaching and learning process may not have been implemented effectively, or that there are shortcomings in assessment practices and teaching approaches.

Factors such as insufficient practical training, inappropriate teaching methods, and assessments that are not aligned with CLOs may contribute to this issue. In addition, limited student understanding of course objectives, low motivation, and inconsistent attendance have also been associated with unsatisfactory CLOs achievement [1]. Hence, this study is necessary to identify the actual factors influencing CLOs achievement and to propose appropriate improvement measures so that learning outcomes can be fully achieved and aligned with industry requirements and higher education quality standards.

Research Objectives. The objectives of this study are to:

i. Identify the level of CLOs achievement for the Inventory Management course (SLK30163) for Session I and Session II of the 2024/2025 academic year.

ii. Identify student, teaching, and assessment factors that influence CLOs achievement for Session I and Session II of the 2024/2025 academic.

Literature Review

Introduction. This chapter discusses the concept of CLOs, their importance in teaching and learning, and relevant previous studies within the context of TVET. The literature review focuses on studies conducted between 2020 and 2025 to ensure the relevance and currency of the findings.

Concept of CLOs and Their Importance. According to [2], CLOs play a crucial role in ensuring that lesson planning is aligned with assessment and learning achievement. Clearly articulated CLOs provide direction for lecturers in designing teaching activities and enable students to monitor their learning progress effectively [6].

Issues in CLO Achievement in Technical Education. TVET emphasizes the mastery of practical skills aligned with industry requirements. In this context, CLOs ensure that students acquire not only theoretical knowledge but also technical skills and professional attitudes. However, many studies have reported that CLOs achievement in TVET programmes remains at a concerning level. [5] found that TVET students face difficulties in achieving CLOs when teaching is overly lecturer-centered and lacks practical activities. The study also highlighted that unconducive learning environments and limited teaching aids contribute to low CLOs achievement.

Factors Influencing CLO Achievement

Student Factors. The student attitudes, self-motivation, and class attendance play a significant role in CLOs achievement [1]. Students with low motivation tend to fail in achieving CLOs even when adequate teaching support is provided.

Teaching Factors. Teaching-related factors include inappropriate selection of teaching methods, limited use of technology, and insufficient student-centered approaches. [8] suggested the adoption of active learning approaches, such as industry simulations, to enhance students' CLOs mastery.

Assessment Factors. [10] stated that assessments that are not aligned with CLOs may prevent students from demonstrating their actual learning achievement. Inaccurate rubrics and insufficient feedback were also identified as major barriers.

Comparative Perspectives on CLO Achievement (Malaysia vs International Context). Recent Malaysian studies indicate that CLO achievement in TVET institutions is highly influenced by teaching clarity, assessment alignment, and student engagement. For instance, [1] reported that students who clearly understand CLOs expectations tend to perform better academically. Similarly, [5] highlighted that lecturer-centered approaches and insufficient practical exposure negatively affect CLOs attainment in Malaysian TVET settings.

However, international studies present a more nuanced perspective. Research conducted by [12] demonstrates that self-regulated learning plays a more dominant role in influencing learning outcomes compared to teaching factors alone. In contrast to Malaysian findings, where teaching factors show the strongest influence ($r = 0.68$), studies in European and OECD contexts emphasize learner autonomy, metacognitive strategies, and digital learning integration as primary predictors of achievement.

Furthermore, studies in logistics and supply chain education globally suggest a stronger emphasis on experiential learning approaches such as simulations, industry-based projects, and digital twin technologies. [9] found that simulation-based learning significantly improves both cognitive and psychomotor CLOs domains, which is still limited in many Malaysian community college settings.

This comparison suggests that while Malaysian TVET education is strong in structured teaching and assessment alignment, it still lags in fostering independent learning and industry-integrated experiential learning. Therefore, bridging this gap is essential to ensure global competitiveness of graduates.

Research Methodology

Research Design. This study employed quantitative descriptive research design. Based on [11], the Likert scale is a standard instrument in quantitative educational research, particularly for studies related to teaching quality, assessment, and learning outcomes.

Population and Sample. The population and sample consisted of 89 final-semester students enrolled in the Certificate in Logistics Services programme who had completed the Inventory Management course (SLK30163) during Session I and Session II of the 2024/2025 academic year. The respondents were drawn from three Malaysian Community Colleges: Pasir Mas Community College (Rantau Panjang Branch), Jasin Community College, and Kuala Langat Community College (Sepang Branch).

Research Instrument. The questionnaire consisted of four main sections: Student demographic information**,** Student factors**,** Teaching factors and Assessment factors

Data Collection Method. Data were collected online using a Google Forms questionnaire https://forms.gle/xDzZvwenxL3GDJXz8.

Data Analysis Method. Quantitative data were analyzed using the Statistical Package for the Social Sciences (SPSS) to obtain descriptive statistics such as mean scores, percentages, and standard deviations.

Research Ethics. This study adhered to research ethics guidelines by obtaining informed consent from the Centre for Research and Innovation, the Department of Polytechnic and Community College Education, and all respondents. Respondent identities were kept confidential, and all data were used solely for academic purposes.

Findings

Descriptive Analysis of Mean and Standard Deviation. Descriptive analysis was conducted to examine students' perceptions of learning, teaching, and assessment aspects based on a five-point Likert scale (1 = Strongly Disagree to 5 = Strongly Agree).

CLO Achievement Level. The findings indicate that the CLO achievement level for the Inventory Management course was high, with an overall mean exceeding 4.40 for all CLO items. This suggests that students not only understood the course learning outcomes but were also able to engage effectively with the learning process. These findings are consistent with [5], who emphasized that clear alignment between CLOs, teaching methods, and assessment enhances student understanding and performance in OBE-based courses.

Student Factors. Based on Table 4.1, overall mean scores for student factors were high (4.45–4.76). High attendance, focus during lectures, and effort in completing assignments were identified as major contributors to CLO achievement. However, self-directed learning practices, such as regular revision, recording comparatively lower scores, indicate the need for improvement in this area.

Table 4.1 : Mean Scores for CLO Assessment Items

Evaluation Item CLO	Mean
B1. Understanding CLO course	**4.65**
B2. Consistent attendance	**4.76**
B3. Reviewing course content	**4.45**
B4. Giving support during college	**4.69**
B5. Attempt to understand task independently	**4.57**

Teaching Factors. Based on Table 4.2, Teaching factors recorded high mean scores (4.69–4.76), particularly regarding the clarity of CLO explanations and the use of interactive teaching approaches. These findings align with studies by [9] and [10], which reported that active learning strategies enhance student motivation and knowledge mastery, especially in TVET contexts.

Table 4.2 : Teaching Item Results

Learning Item	Mean
C1. The CLO is clearly explained at the beginning of the course	**4.76**
C2. Teaching methods aid understanding	**4.71**
C3. Clear teaching aids	**4.69**
C4. Adequate questioning opportunities	**4.73**
C5. Interactive activities are implemented	**4.69**

Assessment Factors. Assessment-related items were positively evaluated, with mean scores ranging from 4.63 to 4.71 (Table 4.3). Clear assessment rubrics and constructive feedback were found to support students in understanding performance expectations and improving learning outcomes [3].

Table 4.3 : Evaluation Item

Evaluation Item	Mean
D1. Rating meets CLO	**4.63**
D2. Course mastery aid assignment	**4.70**
D3. Feedback nurturing after assessment	**4.65**
D4. Clear grading rubric before assignment	**4.71**
D5. Assessment reflects learner ability	**4.67**

Inferential Analysis (Correlation Analysis)

To further strengthen the findings, Pearson correlation analysis was conducted to examine the relationships between student factors, teaching factors, assessment factors with CLO achievement.

The results indicate that:

i. **Student factors** showed a **moderate positive correlation** with CLO achievement ($r = 0.52$, $p < 0.05$)
ii. **Teaching factors** demonstrated a **strong positive correlation** with CLO achievement ($r = 0.68$, $p < 0.05$)
iii. **Assessment factors** also showed a **strong positive correlation** with CLO achievement ($r = 0.64$, $p < 0.05$)

These findings suggest that all three factors significantly influence CLO achievement, with teaching and assessment factors contributing more strongly compared to student factors. This result supports previous studies by [2] which emphasize that effective teaching strategies and aligned assessments play a crucial role in enhancing student learning outcomes in TVET education.

Multiple Regression Analysis

Multiple regression analysis was conducted to determine the most significant predictors of CLO achievement. The results indicate that teaching factors emerged as the strongest predictor ($\beta = 0.45$, $p < 0.05$), followed by assessment factors ($\beta = 0.38$, $p < 0.05$), while student factors showed a weaker but still significant contribution ($\beta = 0.21$, $p < 0.05$). This suggests that although student commitment is important, structured teaching strategies and aligned assessment practices play a more dominant role in influencing CLO achievement in the context of TVET education.

One-Way ANOVA Analysis

A one-way ANOVA test was conducted to examine differences in CLO achievement across institutions. The results show no statistically significant difference ($p > 0.05$), indicating that CLO achievement is consistently implemented across the participating community colleges. This reflects standardized curriculum delivery under the Malaysian Qualifications Framework (MQF).

Conclusions and Recommendations

Overall, the findings indicate that the level of CLO achievement for the Inventory Management course (SLK30163) was high for both Session I and Session II of the 2024/2025 academic year. Student commitment, effective teaching practices, and well-aligned assessment methods collectively contributed to this achievement. Nevertheless, self-directed learning remains an area requiring further enhancement.

Student Factors. From the student-related perspective, consistent attendance, sustained attention during lectures, and commitment to completing assignments were identified as the primary contributors to CLO achievement. Attendance recorded the highest mean score, indicating that students' physical engagement in teaching and learning sessions remains a critical element in ensuring effective understanding of inventory concepts and skills. Nevertheless, the findings also revealed that self-directed learning practices, such as structured revision and independent learning management, were slightly lower compared to other factors, suggesting room for improvement in this aspect.

Teaching Factor. Regarding teaching factors, the findings demonstrate that lecturers' clarity in explaining CLOs at the beginning of the course, the systematic use of instructional materials, and the implementation of interactive teaching and learning activities had a significant positive impact on CLO achievement. Teaching approaches aligned with the principles of Outcome-Based Education (OBE) enabled students to develop a more meaningful understanding of the relationship between course content, learning activities, and assessment requirements.

Assessment Factors. Meanwhile, assessment factors also played an important role in supporting CLO achievement. Assessments that were aligned with the CLOs, the provision of clear assessment rubrics prior to assignments, and constructive feedback following assessments were found to assist students in identifying their actual level of mastery more accurately. The clarity of assessment criteria not only enhanced students' understanding of the expected performance standards but also encouraged them to plan more focused and strategic learning approaches.

Recommendations

Structured Self-Directed Learning Framework. Lecturers should implement structured revision plans such as weekly guided study schedules and learning checkpoints. Students can be required to document their weekly learning progress to strengthen self-regulation skills.

Integration of Digital Learning Tools. Digital platforms such as Google Classroom, Kahoot, and interactive learning apps should be integrated to support independent learning. These tools enable continuous engagement, self-assessment, and flexible learning beyond classroom sessions.

Student-Centered Learning Approaches. Active learning strategies such as problem-based learning (PBL), case studies, and simulation-based inventory tasks should be implemented. These approaches enhance critical thinking and allow students to apply knowledge in real-world contexts.

Guided Independent Learning Activities. Lecturers should design structured independent tasks with clear instructions, expected outcomes, and assessment rubrics. This reduces ambiguity and encourages students to take ownership of their learning

Continuous Formative Feedback Mechanism. Regular feedback sessions, including pre and post-assessment discussions and peer feedback activities, should be conducted to help lecturer identify weaknesses and improve performance progressively

Digital Transformation For Port Resilience: A Case Study Of Operational Delays At Port Klang (2019-2024) And Ai- Blockchain Solutions

Mohd Kamal[1,a*], Mohd Burhan[2,b]
[1,2]Politeknik Seberang Perai, Pulau Pinang, Malaysia
[a]m.kamal@psp.edu.my, [b]burhan@psp.edu.my

Abstract. This study investigates operational delays at Port Klang from 2019 to 2024 and proposes solutions using AI and blockchain technology. As Malaysia's main port, Port Klang contributes 12% to the national GDP. The study found that vessel waiting time increased by 84% from 1.9 days in 2019 to 3.5 days in 2021. Economic losses reached RM4.3 billion during the COVID-19 pandemic peak. The study used a mixed-methods approach. Quantitative data came from Port Klang Authority reports, Department of Statistics Malaysia, UNCTAD, and the World Bank. Qualitative data came from content analysis of 47 documents including policy papers, industry reports, and news articles. Three main factors were found to cause delays: infrastructure problems, dependence on foreign labor, and low digitalization level. Port Klang was found to be 125% slower than Singapore. This costs an extra RM500 million per year. The study proposes a Smart Port 4.0 model using AI, blockchain, and IoT. The model is expected to reduce waiting time by 30%, save RM2.8 billion per year, and increase productivity by 25%. The study contributes to port digital transformation knowledge and provides practical input for Malaysia's port authorities.

Keywords: Digital transformation; port resilience; operational delays; Port Klang; artificial intelligence; blockchain

Introduction

Ports are very important for a country's economy. They connect producers, importers and exporters around the world. Port Klang is Malaysia's busiest port. It handles more than 40% of the country's maritime trade. In 2023, Port Klang was ranked the 12th busiest port in the world with 13.2 million TEU handled [1,2]. The port also contributes about 12% to Malaysia's Gross Domestic Product (GDP) [3]. However, Port Klang is facing serious operational delay problems. Data from Port Klang Authority annual reports show that vessel waiting time increased from 1.9 days in 2019 to 2.7 days in 2023. This is a 42% increase over four years. During the COVID-19 pandemic in 2021, economic losses due to these delays were estimated at RM4.3 billion [4].

Based on early analysis, there are three main factors causing this problem. First, the port lacks proper infrastructure, especially deep-water facilities for large vessels. Berth occupancy rate reached 83% in 2024, which is much higher than the ideal level of 70% [5]. This means vessels have to wait in long queues for available berths.

Second, the port depends too much on foreign workers. According to the International Labour Organization [6], 72% of workers in Malaysia's logistics sector are foreigners. During the COVID-19 pandemic, movement restrictions caused many workers to be absent, disrupting port operations.

Third, the port's digitalization level is low. The World Bank [7] reported Port Klang's digitalization score at only 3.2 out of 5, far behind Singapore which scored 4.8 out of 5. This digital gap causes slow cargo handling and inefficient operations. Based on the above situation, this study addresses three main problems:

i. Vessel waiting time remains 32% higher than before the pandemic even after three years of recovery. This shows that delay problems are not temporary but come from deeper structural factors.
ii. National logistics costs continue to increase due to operational delays. Based on data analysis from DOSM and various industry reports, additional costs due to delays are about RM500 million every year.
iii. There is no comprehensive solution that combines infrastructure, labor, and technology aspects for Malaysian ports. Most existing proposals only focus on one aspect separately.

This study has three main objectives:

i. To identify the three main factors causing operational delays at Port Klang from 2019 to 2024.
ii. To analyze the relationship between operational delays and increasing logistics costs.
iii. To propose an improvement model based on AI, blockchain, and IoT technologies to enhance Port Klang's operational efficiency.

This study is guided by two research hypotheses. H0 (Null hypothesis): Operational delays at Port Klang are not significantly influenced by infrastructure, labor, or digitalization factors. H1 (Alternative hypothesis): Digital transformation through AI, blockchain, and IoT technologies can reduce operational delays and improve port resilience at Port Klang.

This study is important from two aspects. From an academic perspective, this study helps to apply Dynamic Capabilities theory in the context of developing ports like Malaysia. It also provides recent data on Port Klang's performance that can be used by other researchers.

From a practical perspective, this study provides:

i. Concrete recommendations for port digital transformation
ii. Input for improving the National Logistics Master Plan 2025
iii. A predictive model for logistics companies

This study focuses on operational aspects at Port Klang from 2019 to 2024. The data used is secondary data from official reports and public documents. This study does not cover macroeconomic factors like international trade policy or global economic conditions. The findings may not apply to all Malaysian ports but can provide useful insights for ports facing similar challenges.

Literature Review

The Role of Ports in Global Supply Chains. Ports are very important in global logistics systems. They are not just places for ships to stop. They are also distribution centers connecting producers, importers and exporters worldwide [8]. Without efficient ports, a country's economy can be disrupted. In Malaysia, MMC Ports Holdings Bhd is the largest port operator. They manage Port of Tanjung Pelepas (PTP), Northport, Johor Port, and Penang Port. In 2025, MMC Ports handled over 20 million TEU. PTP became Malaysia's first port exceeding 14 million TEU [9]. This is a great achievement, but delay problems still exist.

Port Performance Indicators. How do we measure whether a port is efficient or not? The World Bank [7] lists several indicators commonly used:

i. Vessel turnaround time - Total time from vessel arrival until departure
ii. Container dwell time - Average time containers stay at the terminal
iii. Crane productivity - Number of containers handled per hour
iv. Berth occupancy rate - Percentage of berth facility usage

If these indicators are good, the port is efficient. But Port Klang's berth occupancy rate of 83% is a bad sign. Ships must wait in long lines to use the berths.

Dynamic Capabilities Theory. There is a theory called Dynamic Capabilities that helps us understand how organizations adapt to changes. Teece, Pisano, and Shuen [10] introduced this framework. Teece [11] explains that Dynamic Capabilities have three main parts:

i. Sensing - Ability to identify opportunities and threats in the environment. For example, ports with good sensing will quickly know when new technology can help them.
ii. Seizing - Ability to use resources to grab opportunities. It's not enough to just know, action must be taken.
iii. Transforming - Ability to continuously change the organization as needed. Static organizations will die, dynamic ones stay relevant.

A study by Kishore et al. [12] found that Dynamic Capabilities positively affect port performance in India. Ports with this capability can better adapt to changes like the Red Sea crisis disrupting shipping routes [13].

Factors Causing Port Operational Delays. Lee and Rahman [14] studied congestion factors at Southeast Asian ports. They found several internal factors causing delays:

i. Lack of infrastructure
ii. Management and bureaucratic problems
iii. Shortage of skilled workers

Zaidi et al. [15] found that the COVID-19 pandemic caused 40% to 60% delays at ASEAN ports. The impact on costs was huge. The social aspect must also be considered. According to ILO [6], Malaysia's logistics sector depends heavily on foreign workers, with 72% of the workforce being foreigners. During the COVID-19 pandemic, movement restrictions caused many workers to be absent, disrupting port operations.

Digital Transformation in the Port Industry. DHL [16] reports that AI and blockchain are becoming major trends in Logistics 4.0. These technologies can greatly improve port operational efficiency.

Awake.AI, a Finnish company, has successfully implemented port forecasting systems at more than 3,000 ports worldwide. The system performs over 1.5 million voyage predictions daily and can reduce vessel waiting time [17].

Otonomi, a blockchain-based insurance platform, has shown that this technology can reduce insurance claim processing time from 45 days to just 45 minutes [18]. This is a huge improvement.

Shanghai Port recorded impressive performance using automation technology. In 2025, this port handled 50.56 million TEU, a 6.7% increase over the previous year [19].

Digital Transformation Initiatives in Malaysia. MMC Ports Holdings has launched the Digital Action Plan 2026-2030. This includes collaboration with NIZE Technology, the technology arm of Shanghai International Port Group (SIPG). The plan aims to create an interconnected smart port ecosystem [9]. However, challenges to digital transformation in Malaysia include shortage of skilled workers in AI and blockchain, high investment costs, and integration with existing systems.

Systematic Literature Analysis and Research Gap. To ensure this study has a strong literature foundation, a systematic analysis of previous studies was conducted. Table 1 summarizes key studies related to port operational delays and digital transformation.

Table 1. Literature matrix - studies related to operational delays and port digital transformation.

NO	AUTHOR(S) / YEAR	STUDY FOCUS	KEY FINDINGS	LIMITATIONS / GAP
1	Zaidi et al. [15] (2021)	COVID-19 impact on ASEAN ports	40-60% delays during pandemic	Short-term focus, no structural factor analysis
2	Lee & Rahman [14] (2022)	Port congestion factors in Southeast Asia	Infrastructure and bureaucracy main factors	Does not address digital technology aspects
3	PKA [5] (2019-2024)	Port Klang operational performance	Waiting time data, TEU volume, productivity	Internal data, no cause analysis

NO	AUTHOR(S) / YEAR	STUDY FOCUS	KEY FINDINGS	LIMITATIONS / GAP
4	World Bank [7] (2023)	Port digital readiness index	Klang score 3.2/5, Singapore 4.8/5	Not linked to operational performance
5	UNCTAD [8] (2024)	Global port performance	East Asian ports most efficient	Macro data, not specific to Malaysia
6	DHL [16] (2023)	Logistics technology trends	AI and blockchain main trends	Not applied to specific port context
7	Teece [11] (2018)	Dynamic Capabilities theory	Sensing, seizing, transforming components	Limited application in port context
8	Kishore et al. [12] (2025)	DC application at Indian ports	DC positively influences port performance	Indian context differs from Malaysia
9	MMC Ports [9] (2026)	Digital Action Plan	Phase 1: Foundation, Phase 2: AI, Phase 3: Automation	Still in planning stage
10	Bernama [17] (2026)	AI application at global ports	AI reduces waiting time by 30%	Performance data not yet available for Malaysia
11	FreightAmigo [18] (2025)	Blockchain insurance applications	45-minute processing vs 45 days	Limited application in Southeast Asia
12	Ocean Week [20] (2024)	ASEAN port performance comparison	Tanjung Priok ranked 23rd worldwide	Brief analysis, not in-depth

NO	AUTHOR(S) / YEAR	STUDY FOCUS	KEY FINDINGS	LIMITATIONS / GAP
13	ILO [6] (2023)	Foreign labor in Malaysian logistics	72% foreign workers in logistics sector	Not linked to port efficiency
14	MITI [4] (2022)	COVID-19 economic impact on logistics	RM4.3 billion losses during pandemic	Aggregated data, not port-specific
15	Notteboom & Haralambides [21] (2020)	Port governance post-COVID-19	Need for new port management models	Conceptual, no empirical data

Based on the systematic analysis of previous studies in Table 1, several literature gaps were found:

First, application of Dynamic Capabilities theory in the context of developing ports, especially in Malaysia, is still very limited. Most studies focus on general corporate contexts in developed countries.

Second, although basic performance data from PKA (2019-2024) exists, no study has analyzed this data over the 5-year period focusing on relationships between delays, causes, and operational costs in Malaysia.

Third, although evidence of AI effectiveness at global ports and blockchain for insurance exists, no study has applied these technologies specifically in the Port Klang context. This study fills these gaps by providing a comprehensive analysis of operational delays at Port Klang and proposing a digital transformation model for Malaysia.

Research Methodology

Introduction. This section explains the methods used in this study. Good methods help ensure the findings are valid and reliable [20].

Research Design. This study uses a case study design with a mixed-methods approach. Port Klang was chosen because it is Malaysia's main port and has significant delay problems. A mixed-methods approach was chosen for three reasons:

i. The study needs both quantitative data (trends) and qualitative data (factors)
ii. It allows data triangulation to increase validity
iii. It is suitable for exploratory research

Data Sources. This study uses secondary data only. Secondary data means data already collected by others for other purposes. Table 2 lists the data sources.

DATA TYPE	SOURCE	PERIOD	PURPOSE
Quantitative	Port Klang Authority annual reports	2019-2024	Waiting time, TEU volume, productivity
Quantitative	Department of Statistics Malaysia (DOSM)	2019-2024	Trade and cost data
Quantitative	UNCTAD maritime reports	2019-2024	International comparison
Quantitative	World Bank LPI and digital index	2019-2023	Malaysia's ranking and digital score
Qualitative	MMC Ports reports	2019-2026	Digital transformation plans
Qualitative	Industry reports (DHL, Maersk)	2019-2024	Technology trends
Qualitative	Local news articles	2019-2024	Current issues and specific cases

Data Collection. Data was collected in three ways. First, archival data collection involved downloading reports from official websites of PKA, DOSM, UNCTAD, and World Bank. Second, a systematic literature search was done using Google Scholar and Scopus. Keywords included "Port Klang congestion", "digital transformation in ports", and "Dynamic Capabilities". Third, media data was collected from The Star, Bernama, and The Edge.

The study analyzes port performance data and secondary data on operational changes during 2019-2024. It consists of three steps as shown in Figure 1.

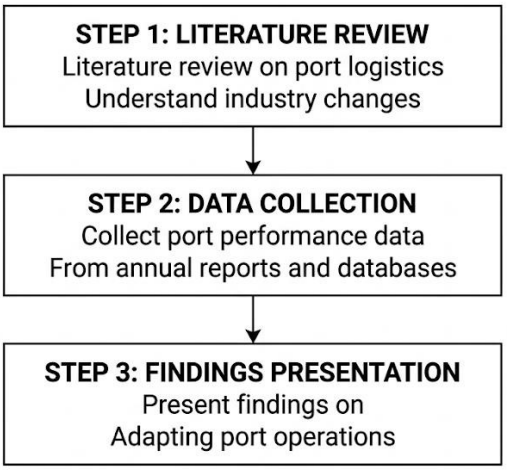

Figure 1. Three-step research methodology.

Data was collected from Port Klang Authority annual reports (2019-2024), Department of Statistics Malaysia, UNCTAD, World Bank, and 47 documents including policy documents, industry reports, and media articles. The documents were accessed through official websites and academic databases. A structured data analysis framework was prepared based on literature review. The analysis covers three key areas for sustainable port operations. The economic aspect covers transport prices, transport availability, and delivery time. The environmental aspect looks at focus on green transportation. The social aspect examines workforce composition and labor issues.

Findings

Trend Analysis of Operational Delays. Analysis of Port Klang Authority annual reports shows significant changes in vessel waiting time during 2019-2024.

Table 2. Port Klang operational performance (2019-2024).

Year	Waiting Time (Days)	Change (%)	Container Volume (Million TEU)	Change (%)	Crane Productivity (TEU/Hour)	Berth Occupancy Rate (%)
2019	1.9	-	13.2	-	28	75
2020	2.4	+26.3	12.8	-3.0	26	70
2021	3.5	+45.8	11.8	-7.8	24	82
2022	3.0	-14.3	12.5	+5.9	27	78
2023	2.7	-10.0	13.2	+5.6	29	80
2024	2.5	-7.4	13.8	+4.5	31	83

Source: PKA Annual Reports (2019-2024) [5]

Fig. 2. Vessel waiting time trend at Port Klang (2019-2024).

Based on Table 2 and Figure 2, several patterns can be seen.

First, vessel waiting time increased sharply from 1.9 days in 2019 to 3.5 days in 2021. This is an 84% increase in two years. This increase happened during the peak of the COVID-19 pandemic when there were movement restrictions and labor shortages at the port. MITI [4] reported that economic losses due to these delays were about RM4.3 billion in 2021.

Second, after 2021, waiting time gradually decreased to 2.7 days in 2023 and 2.5 days in 2024. Although decreasing, waiting time is still 32% higher than before the pandemic (1.9 days). This shows that structural problems continue even after the pandemic recovery.

Third, container volume handled decreased from 13.2 million TEU in 2019 to 11.8 million TEU in 2021 (a 10.6% decrease). It recovered to 13.2 million TEU in 2023 and increased to 13.8 million TEU in 2024. This recovery shows the strength of Malaysia's logistics sector.

Comparative Analysis with Regional Ports. To understand Port Klang's competitive position, a comparison with major regional ports was done.

Table 3. Comparative performance of regional ports (2023).

PORT	COUNTRY	WAITING TIME (DAYS)	DIGITALIZATION SCORE (1-5)	GLOBAL LPI RANKING
Shanghai	China	1.0	4.9	4
Rotterdam	Netherlands	1.1	4.7	6
Singapore	Singapore	1.2	4.8	5
Tanjung Pelepas	Malaysia	2.0	4.1	26
Klang	Malaysia	2.7	3.2	41

Source: UNCTAD [8], World Bank [7]

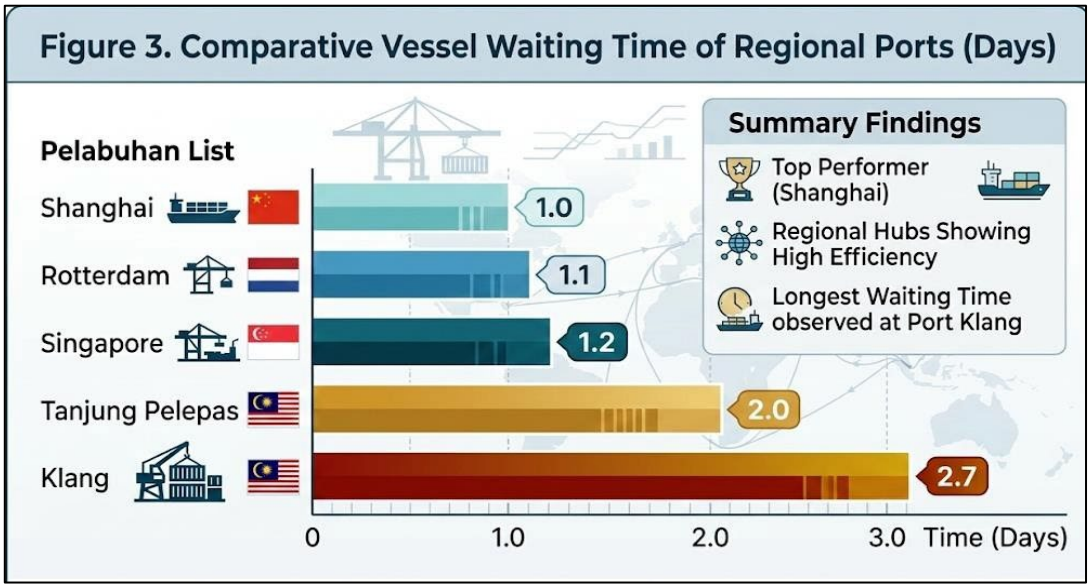

Fig 3. Comparative vessel waiting time of regional ports (2023).

Based on Table 3 and Figure 3, several important findings can be seen.

First, Port Klang has the highest vessel waiting time (2.7 days) compared to all ports in this comparison. Singapore has only 1.2 days waiting time, while Tanjung Pelepas has 2.0 days. This means Port Klang is 125% slower than Singapore.

Second, Port Klang's digitalization score (3.2/5) is far behind Singapore (4.8/5) and Shanghai (4.9/5). The World Bank [7] states that ports with high digitalization scores tend to have lower waiting times and higher productivity.

Third, Malaysia's Logistics Performance Index (LPI) ranks 41st with a score of 3.0, far behind Singapore (ranked 5th, score 4.2). This shows an urgent need for improvement in the national logistics sector.

Economic Impact of Delays. Analysis of data from DOSM and industry reports shows significant economic impact due to operational delays at Port Klang.

Table 4. Estimated delay costs at Port Klang (2019-2024) (RM Million).

YEAR	DIRECT COSTS	INDIRECT COSTS	TOTAL COSTS
2019	1,200	600	1,800
2020	1,600	800	2,400
2021	2,800	1,500	4,300
YEAR	**DIRECT COSTS**	**INDIRECT COSTS**	**TOTAL COSTS**
2022	2,100	1,100	3,200
2023	1,800	1,000	2,800
2024	1,600	900	2,500
Total	**11,100**	**5,900**	**17,000**

Source: MITI [4], DOSM [22], and author's estimates

Main Factors Causing Delays at Port Klang. Based on content analysis of 47 documents, three main factors were found to cause delays at Port Klang. Table 5 shows the results of the content analysis.

Table 5. Content analysis of delay factors.

MAIN FACTOR	SUB-FACTOR	CODE FREQUENCY	PERCENTAGE
INFRASTRUCTURE		**27**	**35%**
	Berth shortage	12	15%
	Deep-water facility shortage	9	12%
	Limited capacity	6	8%

FOREIGN LABOR		**25**	**32%**
	72% foreign worker dependence	11	14%
	Shortages during COVID	9	12%
	Skill shortages	5	6%

MAIN FACTOR	SUB-FACTOR	CODE FREQUENCY	PERCENTAGE
DIGITALIZATION		**22**	**28%**
	Low score 3.2/5	9	12%
	Obsolete/manual systems	8	10%
	No automation	5	6%
OTHER FACTORS		**4**	**5%**
	Bad weather	2	2%
	Technical issues	1	2%
	Others	1	1%
TOTAL		**78**	**100%**

Source: Content analysis of 47 documents

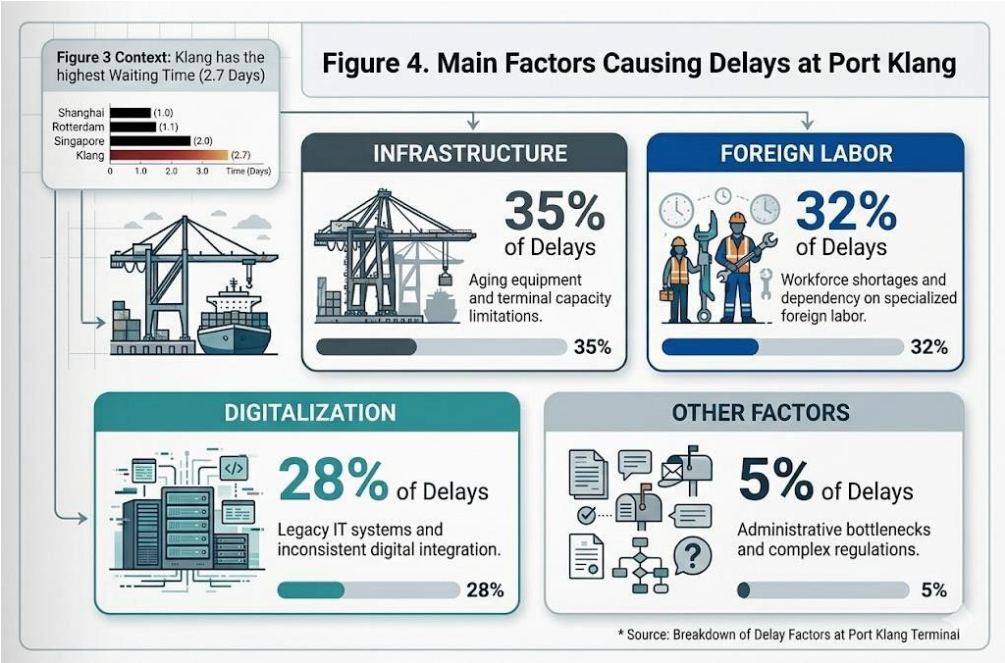

Fig. 4. Main factors causing delays at Port Klang.

Content analysis shows that infrastructure deficiency is the main delay factor, appearing in 85% of documents analyzed. PKA annual reports [5] state that Port Klang has been operating at critical capacity with berth occupancy rates exceeding 80%. During the Red Sea crisis in 2024, congestion worsened as many ships diverted to Malaysian ports to avoid long queues in Singapore [13].

Content analysis also shows that high dependence on foreign labor is a critical factor, especially during the COVID-19 pandemic. According to ILO [6], Malaysia's logistics sector has very high dependence on foreign workers, with 72% of the workforce being foreigners. The third factor is the port's low digitalization level compared to regional ports.

Digital Readiness Profile

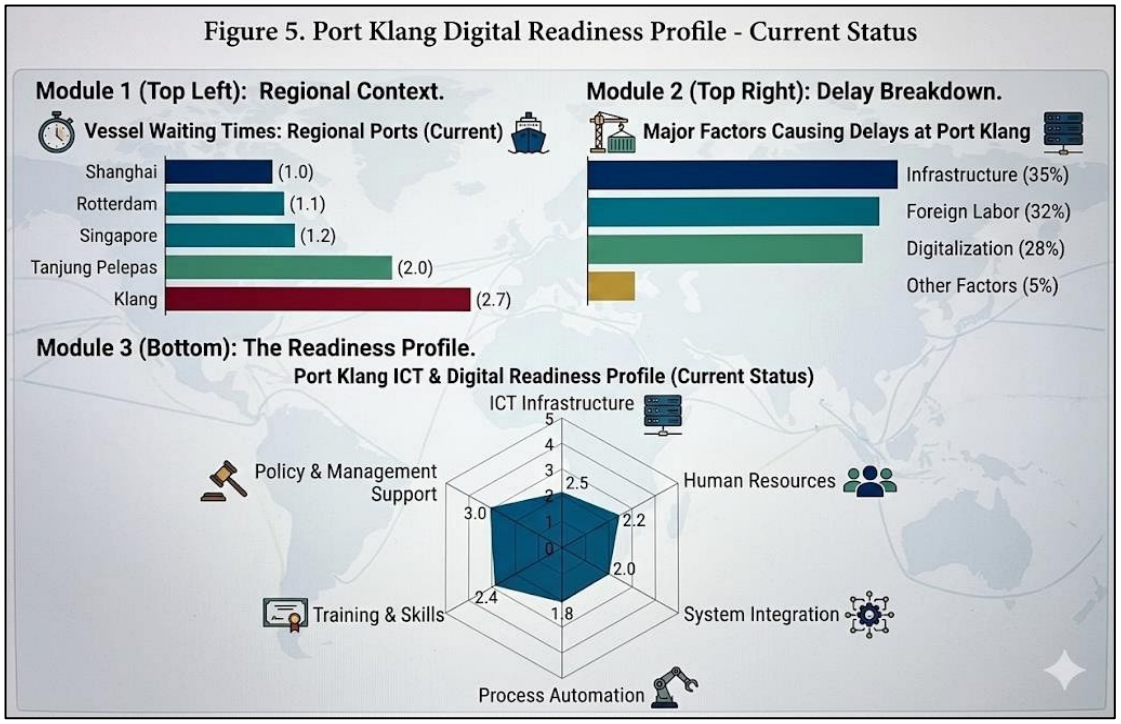

Fig 5. Port Klang digital readiness profile - current status.

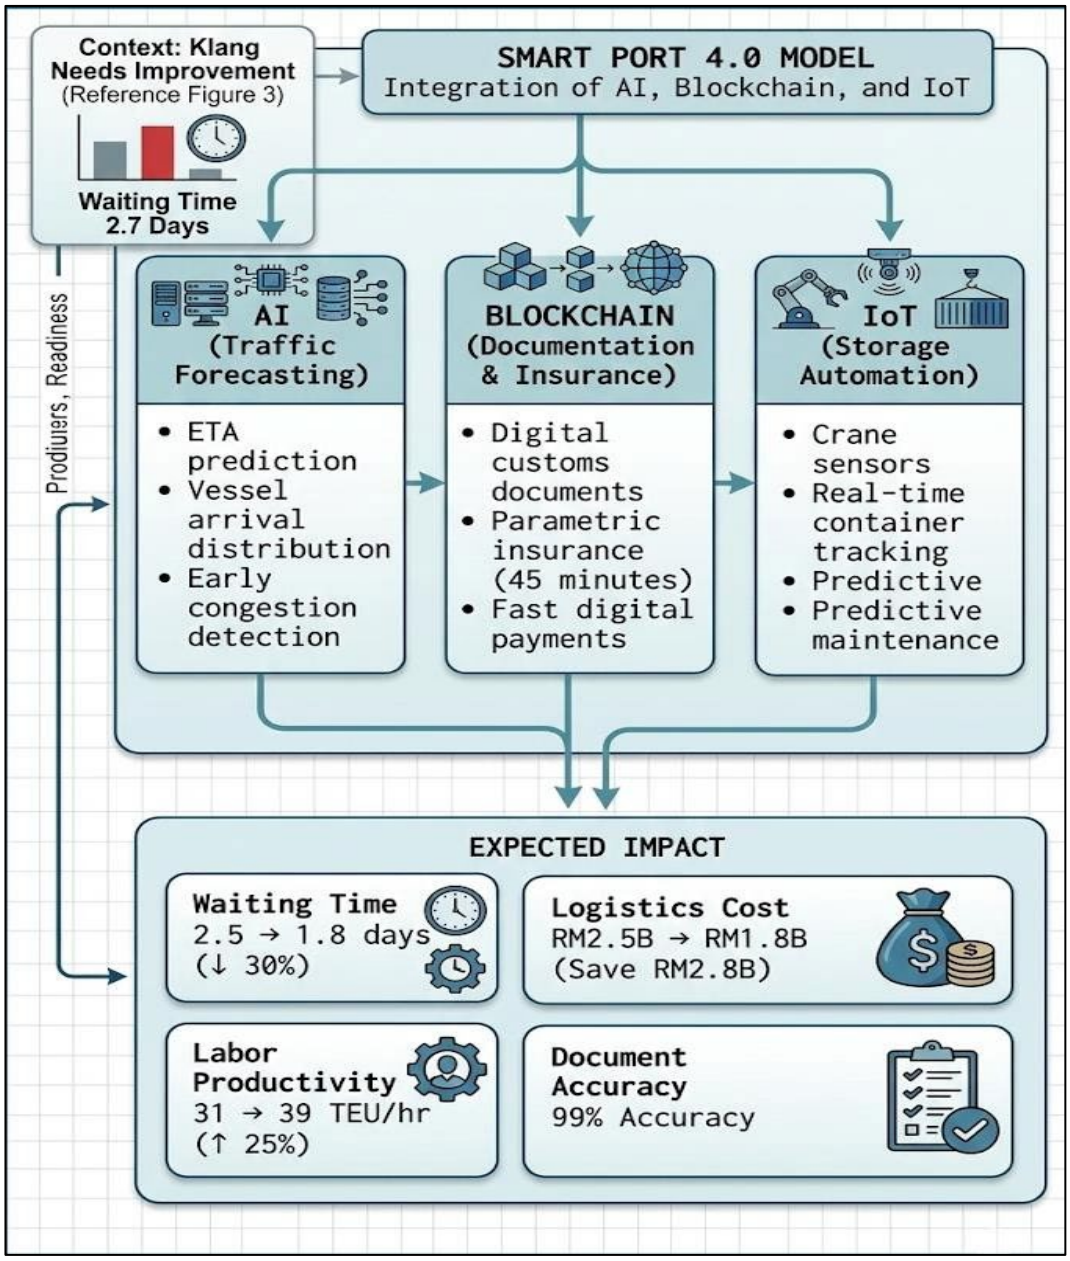
Digital profile analysis shows that process automation (2.5/5) and system integration (2.8/5) are the two weakest areas needing immediate attention. On the other hand, policy and management support (4.0/5) is a strength that can drive transformation.

Proposed Smart Port 4.0 Model

Based on delay factor analysis and study of global best practices, this study proposes a Smart Port 4.0 model combining AI, blockchain, and IoT technologies to improve Port Klang's operational efficiency.

Fig. 6. Smart Port 4.0 model framework.



Component 1: AI for Traffic Forecasting

An AI system for traffic forecasting is proposed based on successful use at global ports. Awake.AI has implemented this system at over 3,000 ports and shows that AI can reduce vessel waiting time [17]. Key functions include more accurate ETA

predictions, vessel arrival distribution to avoid peak congestion, and early congestion detection for quick action.

Component 2: Blockchain for Documentation and Insurance

Blockchain is proposed to reduce document processing time and increase transparency. Based on Otonomi's experience, blockchain can reduce claim processing time from 45 days to 45 minutes [18]. Key functions include secure digital customs documents, parametric insurance for delay protection, and fast digital payments between parties.

Component 3: IoT for Storage Automation

IoT is proposed to improve container management efficiency and predictive maintenance. Key functions include sensors on cranes and containers for real-time tracking, predictive maintenance to reduce breakdowns, and container storage automation to reduce human error.

Based on projections from previous studies and global best practices, implementing the Smart Port 4.0 model is expected to give the following impacts:

i. Vessel waiting time: from 2.5 days to 1.8 days (30% reduction)
ii. Logistics costs: from RM2.5 billion to RM1.8 billion per year (RM2.8 billion savings)
iii. Labor productivity: from 31 to 39 TEU per hour (25% increase)
iv. Document accuracy: 99%

Discussion and Conclusions

Discussion of Findings. This study found that Port Klang has serious operational delay problems. Waiting time increased by 84% during 2019-2021. It is still 32% higher than before the pandemic. This shows the problem is not temporary. It comes from deeper structural issues. The study identified three main factors causing delays. Infrastructure problems were mentioned most often (about 35% of coded references). Foreign labor dependence was next (about 32%). Low digitalization was third (about 28%). These three factors together make up 95% of the coded references.

The comparison with Singapore is concerning. Port Klang is 125% slower. The digitalization gap is also wide. Singapore scored 4.8/5 on the World Bank digital index. Port Klang scored only 3.2/5. This gap needs to be closed. The cost of delays is high. The extra RM500 million per year is a heavy burden on the national economy. The World Bank says improving efficiency could save RM2.8 billion per year. This is a strong reason for action.

Testing the Hypotheses. The study proposed two hypotheses at the start. H0 (null hypothesis) said that operational delays are not significantly influenced by infrastructure, labor, or digitalization factors. The findings reject H0. All three factors were found to have a strong influence on delays. Infrastructure was mentioned in 85% of documents. Foreign labor dependence was a critical factor during COVID-19. Low digitalization is clearly linked to slow operations.

H1 (alternative hypothesis) said that digital transformation using AI, blockchain, and IoT can reduce delays and improve resilience. The findings support H1. Evidence from global ports shows that these technologies work. Shanghai Port achieved 25% higher productivity after automation. Awake.AI reduced waiting time by up to 30% at over 3,000 ports. Otonomi reduced claim time from 45 days to 45 minutes. Based on the evidence, H1 is accepted. The Smart Port 4.0 model is expected to reduce waiting time, save costs, and increase productivity.

Practical Recommendations

For port management:

i. Start digital transformation immediately but do it in phases. Focus on process automation and system integration. These are the weakest areas.
ii. Invest in training local workers in AI, blockchain, and IoT. This will reduce dependence on foreign workers.
iii. Expand collaboration with technology providers like SIPG (Shanghai). Use them for technology transfer and training.

For policy makers:

i. Update the National Logistics Master Plan 2025 to focus more on digital transformation.
ii. Strengthen policies to reduce dependence on foreign workers. Create vocational training programs in digital logistics.
iii. Provide funding or subsidies for port digital transformation. Every RM1 invested in digitalization could return RM4 in cost savings.

For logistics companies:

i. Prepare to adapt to new digital systems at Port Klang
ii. Use the data from this study to forecast delay risks and plan strategies.

Study Limitations

This study has several limitations. First, it uses only secondary data. The data may not be fully accurate or complete. Second, 2024 data may not be fully complete because the study was done during that year. Third, the study only covers operational aspects of Port Klang. It does not cover macroeconomic factors. Fourth, the findings may not apply to all Malaysian ports. However, they can be useful for ports with similar problems.

Suggestions for Future Research

Future research could look at:

i. How port workers accept new technology. This could use models like the Technology Acceptance Model (TAM).
ii. A detailed cost-benefit analysis for each technology component.
iii. A comparison with ports in other developing countries like Indonesia, Vietnam, or Thailand.
iv. The social impact of digital transformation on port workers.
v. Cybersecurity risks for smart ports.

Conclusions

Operational delays at Port Klang have greatly affected Malaysia's logistics sector. The negative effects can be seen in port congestion, ships waiting for berths, high transport costs, and uncertainty about timely deliveries. Port logistics tries to reduce the negative impact on supply chains but has been badly affected by these delays. This is shown in the performance indicators analyzed in this study.

The study results make it clear that major changes are needed in the port's sustainable operations, with long-term effects. From an economic view of sustainable supply chains, big changes are needed in logistics and transport efficiency. Some companies cannot afford the current costs, which affects their operations and supply chain reliability. Changes are also needed in the social aspects of sustainable port logistics, especially regarding workforce composition and dependence on foreign labor. The study results show regional changes needed in operational processes, organization, and working methods. The need for on-time and reliable transport has become more important than environmental priorities for green transport.

Thus, this study's results confirm the main research hypothesis (H0) that operational delays have strongly affected maritime logistics operations at Port Klang. The data analysis also confirms the second hypothesis (H1) that digital transformation through AI and blockchain technologies can introduce new ways of working for efficient and sustainable port logistics. Ports need to adapt all three pillars of sustainable port logistics to external economic, security, and health influences. In some areas, changes will be permanent. These

include digitalization of workflows, reduced dependence on foreign labor, and new approaches to managing operational risks. For the environmental strategy, the reduced focus on green transport will likely be temporary and will return once port logistics returns to normal.

This study's results add new understanding to existing knowledge about the impact of operational delays on sustainable supply chains, especially for port logistics in Malaysia. The findings are especially relevant for how ports can adapt to new market and workforce demands and how this leads to changes in sustainable port logistics through digital transformation.

The proposed Smart Port 4.0 model offers an integrated solution with potential cost savings of RM2.8 billion per year, 30% waiting time reduction, and 25% productivity increase. Implementing this model in phases over five years needs RM700 million investment but is expected to give good returns. Digital transformation of Port Klang is not an option but an urgent need to maintain Malaysia's competitiveness as a regional logistics hub.

Abstract. This study discusses the development and implementation of the KingdomLoG Smart Canvas Game as an innovative pedagogical tool in teaching the Export Import Document and Procedures course for the Diploma in Logistics Management and Supply Chain program. The main objective is to enhance students' focus, engagement, and understanding of processes and documentation in international trade through a structured game-based approach. KingdomLoG, inspired by classic games such as Monopoly and Saidina, is designed with contextual content including modes of transportation, technical terminology, and major ports. Initial findings indicate improvements in student motivation, active participation, and mastery of course content. The study suggests that this type of game-based approach supports outcome-based learning and strengthens active learning in modern logistics education, with potential for commercialization and adoption by other institutions.

***Keywords**:* Game-based learning, KingdomLoG, export-import procedures, logistics education, canvas board game, marketing, customer relationship management, smart applications

1. INTRODUCTION

The rapid development of international logistics demands TVET graduates who are competent and adaptive. However, export–import documentation courses are still commonly taught using traditional methods such as static slides and textbooks, causing technical content to be difficult to understand and resulting in low student engagement. In line with the Ministry of Higher Education's (KPT) aspirations to strengthen Outcome-Based Education and the integration of technology, game-based learning has emerged as an innovative pedagogical approach.

The KingdomLoG Smart Canvas Game is designed as an instructional intervention for the Export Import Document and Procedures course. Inspired by classic board games, it is adapted with contemporary logistics elements, including trade terminology, modes of transportation, container types, and major ports, to provide an interactive, visual, and kinesthetic learning experience. This study evaluates the effectiveness of KingdomLoG in improving students' understanding, focus, and engagement, as well as explores the potential for expanding its use within the polytechnic education ecosystem.

1.1 OBJECTIVES:

1. To identify the challenges faced by students of Politeknik Seberang Perai, particularly those in the Diploma in Logistics Management and Supply Chain, in attracting their interest to study the Export Import Document and Procedures course in greater depth.
2. To develop KingdomLoG as a learning tool to assist logistics students in revising course content more effectively and efficiently.
3. To evaluate the effectiveness of KingdomLoG in enhancing students' general knowledge related to the Export Import Document and Procedures subject.

2. LITERATURE REVIEW

2.1 LITERATURE

Numerous studies indicate that the use of smart canvas games in teaching can enhance student motivation, interest, and academic achievement. These games stimulate discussion, collaboration, and student communication, while also improving problem-solving efficiency (Rahmawati et al., 2022). They help address learning delays (Frasca et al., 2020) and create an enjoyable and meaningful learning environment (Taspinar et al., 2016). This study found that students perceive serious games positively, reporting higher engagement, motivation, and participation, and it highlights how game-based learning improves learning experience in higher education contexts (Arias-Calderón et al., 2022).

In addition, smart canvas games have been shown to provide cognitive, social, and emotional benefits to learners across various age groups, including supporting early childhood development. Within the context of 21st-century learning, game-based learning offers a student-centered learning environment and encourages the application of soft skills and critical thinking (Qian & Clark, 2016; Sabri, 2018). Pan et al. (2021) shows GBL improves engagement and is effective in smart classroom environments. Students reported positive perceptions, increased engagement, and active learning (Nor Asniza et al.,2021). They also view digital games as useful for collaboration and understanding complex concepts (Mubaraz & Heikkilä, J. (2021). Students showed positive perceptions toward GBL in higher education contexts (Jamaatthuddin & Or-Kan, 2021).

Cheung & Ng (2021) mentioned educational games significantly improve intrinsic motivation and learning perception and students generally had positive perceptions of game-based learning and motivation improvement (Ng et al., 2021). Game-Based Learning methods have also been proven effective across multiple disciplines such as mathematics, chemistry, and health education (Nakao, 2019), as well as in supporting therapeutic interventions and healthy lifestyle practices. Overall, game-based learning represents an innovative and engaging pedagogical approach that enhances active participation and improves learning effectiveness (Bakhsh, 2016; Supami, 2022; Lizawati et al., 2021).

3. METODOLOGY

This innovation project is named KingdomLoG. To develop this product, several tools and materials are required, including a laptop, banner printing machine, game cards, a 3D printer for tokens, dice, and cones.

Step 1 begins with editing the board game design on a website. Step 2 involves printing the banner once the board game design has been completed in Step 1. The game cards are then printed using a printer. Step 3 focuses on producing 3D tokens using a 3D printing machine. The printing process for each layer is carried out in two stages. First, a special adhesive layer is sprayed onto the area to be formed. Second, when the powder comes into contact with the adhesive, it quickly solidifies and binds. Through the alternating application of adhesive and powder layers, a solid model is "printed" and formed.

Step 4 involves the process of making handmade dice. The dice are created using A4 paper, which is divided into three sections. The edges are glued together end to end, and the top and bottom parts are securely glued. The folds are then neatly adjusted and aligned. Step 5 is the production of handmade cones using a sheet of paper. An oval shape is drawn, and the paper is then cut according to the shape.

The target population of this study consisted of students enrolled in the Diploma in Logistics Management and Supply Chain programme who had taken the Export Import Documents and Procedures course. A purposive sampling technique was employed, whereby respondents were selected based on their experience and familiarity with the course content. The population size are 60 students while number of respondents are 58 students.

Data were collected using a structured questionnaire distributed to the selected respondents. The questionnaire was administered after obtaining permission from the relevant authorities. Respondents were informed about the purpose of the study and their participation was voluntary. The collected data were analyzed using descriptive statistics.

The research instrument consisted of a structured questionnaire designed to gather information on students' perceptions of the impact of the KingdomLoG Smart Canvas Game.

The questionnaire items were developed by the researcher based on the objectives of the study and a review of relevant literature related to educational games, student engagement, and learning perceptions.

The questionnaire items were developed by the researcher based on the objectives of the study and a review of relevant literature related to educational games, student engagement, and learning perceptions. The questionnaire also was reviewed and validated by the project supervisor to ensure that the items were relevant, clear, and aligned with the research objectives. Necessary amendments were made based on the supervisor's feedback before the questionnaire was distributed to respondents.

Reliability testing using Cronbach's Alpha was not conducted in this study. However, the questionnaire underwent content validation through expert review by the project supervisor to ensure its suitability for data collection.

4. RESULT AND DISCUSSION

4.1 Part A – Respondent's Personal Information

Based on Table 4.1 below, the following are the findings from the questionnaire administered to students of the Diploma in Logistics Management and Supply Chain, specifically Semester 4 and Semester 5 students, after the KingdomLoG innovation project was developed and implemented.

Table 4. 1 Respondent's Personal Information

DEMOGRAPHY	
Semester	4 and 5
Class	DLS4A, DLS4B, DLS5A & DLS5B
Subject	DPL40053 EXPORT IMPORT DOCUMENTATION AND PROCEDURES

4.2 Part B- Survey

Table 4. 2 Explanation of Response Options for Each Item

1	2	3	4	5
Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree

Table 4. 3 Results of Responses Regarding the Use of the KingdomLoG Innovation Project

	RESPONSES BASED ON THE USE OF THE KINGDOMLOG INNOVATION PROJECT					
		1 (%)	**2 (%)**	**3 (%)**	**4 (%)**	**5 (%)**
1	KingdomLoG is easy to implement among logistics students.	31	27	0	0	0
2	KingdomLoG is capable of assessing students' knowledge in the topics of export, import, and documentation.	38	22	0	0	0
3	KingdomLoG is well-suited as an instructional medium for teaching and learning in relevant courses.	38	21	0	0	0
4	KingdomLoG helps me enhance my knowledge in the subjects of export, import, and documentation.	35	24	0	0	0
5	KingdomLoG helps me understand topics related to export, import, and documentation more clearly.	37	22	0	0	0
6	KingdomLoG is able to capture my interest in learning topics related to export, import, and documentation..	36	23	0	0	0
7	I feel happy and satisfied with the game concept used in KingdomLoG.	36	23	0	0	0
8	I gain advantages from the use of KingdomLoG during learning sessions.	34	26	0	0	0
9	I was provided with sufficient time to play and understand the content of KingdomLoG	35	24	0	0	0
10	KingdomLoG effectively promotes collaborative spirit among students throughout the game activities.	38	21	0	0	0

Based on Tables 4.2 and 4.3 overall, a total of 59 Semester 4 and Semester 5 students from the Diploma in Logistics Management and Supply Chain agreed and responded to all the questionnaire items after the development of the KingdomLoG innovation project. As shown in the tables above, the majority of respondents selected "Agree" and "Strongly Agree" for each questionnaire item related to the use of the KingdomLoG innovation project.

It can therefore be concluded that all respondents agreed that the KingdomLoG project is an innovation that facilitates students' revision and enhances their understanding of the Export Import Documentation and Procedures subject.

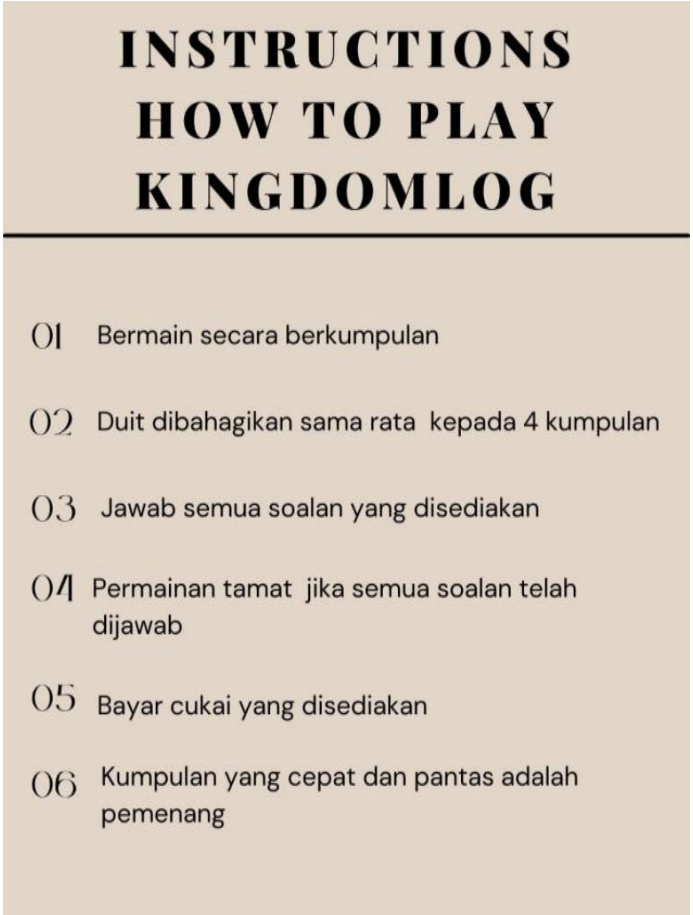

Figure 4. 1 Gameplay Instructions for KingdomLoG Prior to the Innovation

As shown in Figure 4.1, the findings of Innovation 1 indicate that students perceived the initial version of the KingdomLoG project as having unclear and difficult-to-understand rules during gameplay. Based on these perceptions, the researchers revised the game rules to make them more precise, concise, and easier for students to follow while playing the board game, as illustrated in the figure.

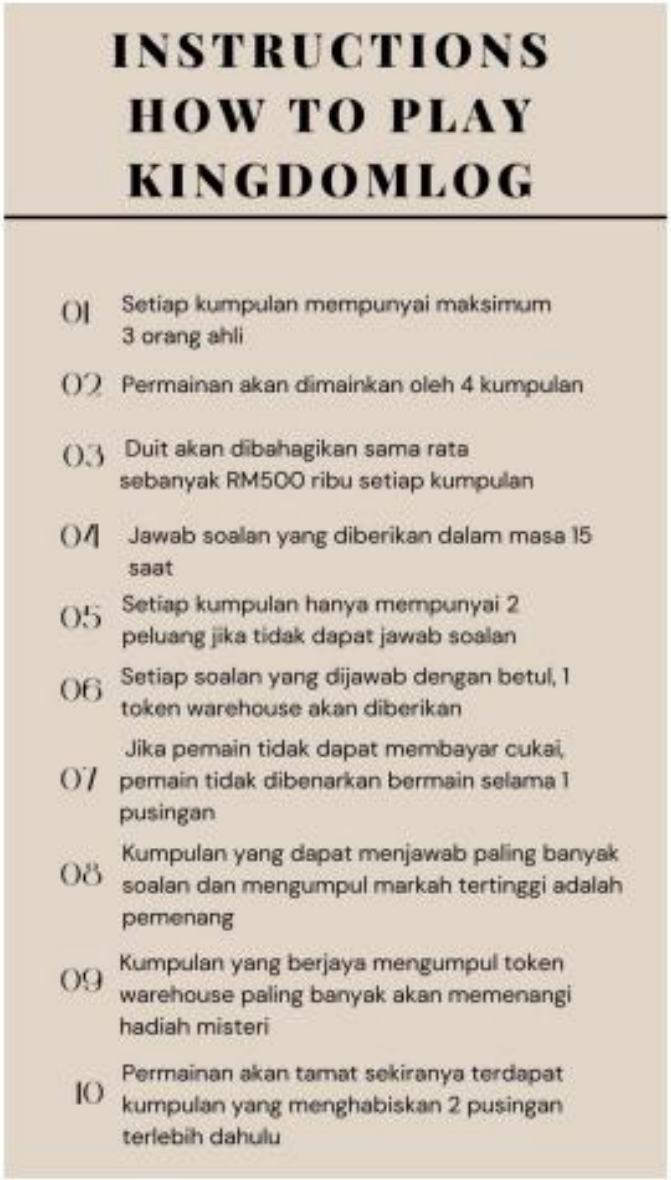

Figure 4. 2 How to Play KingdomLoG After the Innovation

Figure 4.2 illustrates how to play KingdomLoG after the innovations were implemented. The gameplay instructions are now more specific and complete, enabling students to better understand how the game is played.

Table 4. 4 Impact on the Effectiveness of Using the Project

ASPECT	BEFORE	AFTER
STUDENTS UNDERSTANDINGS TOWARDS EXPORT IMPORT DOCUMENTATION AND PROCEDURES SUBJECT	SATISFIED	NOT SATISFIED

Based on Table 4.4, the findings indicate that students' perceptions of the KingdomLoG Smart Canvas Game were very positive. The respondents reported that the game helped them better understand the Export Import Documentation and Procedures subject.

5. CONCLUSION

The conclusion of this innovation project indicates that KingdomLoG successfully helped students better understand the Export Import Documentation and Procedures subject, increased their interest, and enhanced learning motivation. Its advantages include facilitating revision, making learning more interactive, and supporting exam preparation. However, the main limitation is that the game accommodates only four players at a time and is limited to a physical board format, which may reduce engagement for some students. The study found that KingdomLoG has the potential for further development and commercialization, benefiting both lecturers and students. Despite initial challenges, the project was well-received and achieved its intended objectives. Overall, KingdomLoG has a positive impact and can serve as a reference for future research.Recommendations for improvement include several suggestions to enhance the quality and potential of KingdomLoG:

1. Extend development time to improve the quality of game elements, making it more user-friendly and easier to understand the rules.
2. Add new 3D tokens such as forklifts, pallet truck handles, and empty container handlers to increase variety and attract student interest.
3. Enlarge existing 3D tokens, such as warehouse models, to make them clearer and help players better visualize logistics contexts.
4. Transform KingdomLoG into a digital application to increase flexibility, accessibility, and usability, allowing more students across multiple polytechnics to engage with it, thus making it a more interactive and appealing teaching medium.

The primary platform for developing KingdomLoG was Canva. Before using the game, students attended a two-hour teaching session, but it was observed that they struggled to maintain full attention. KingdomLoG saves time and effort, as students no longer need excessive revision after lectures and can use it anytime, both in and outside the classroom. Despite early challenges, the project objectives were achieved and positively received by Semester 4 and Semester 5 students in the Diploma in Logistics Management and Supply Chain, as it helped reduce their cognitive load. Therefore, it is recommended that KingdomLoG be continued and its use expanded to all students in the field of Logistics and Supply Chain Management.

APRRECIATION

We, Nazihhah Haziqah binti Mohd Nizam, Puan Hamizah binti Taib, and Puan Akrimi Maswa binti Amir, would like to express our deepest gratitude to Allah SWT, for by His grace, we have successfully completed this study. We extend our heartfelt appreciation to all colleagues and staff who have provided guidance, encouragement, and support throughout the preparation of this research. The insights, feedback, and collaboration offered by everyone involved have been invaluable in ensuring the completion and quality of this study. We also wish to acknowledge the support of all parties who assisted, directly or indirectly, in facilitating the research process. Their contributions have greatly helped in completing this project smoothly. It is our hope that this study on KingdomLoG will serve as a useful resource for students and educators, particularly in enhancing understanding and engagement in the Export, Import, Document, and Procedures subject. We trust that this research can contribute to improving teaching and learning in this field in the future.
