# SEPTEMBER

## A New Perspective

NEW IDEAS. NEW PERSPECTIVES.  
NEW POSSIBILITIES.

September marks a moment of transition—a time to pause, look back at how far we have come, and look ahead to what is possible. In dentistry, progress has always begun with a new perspective: seeing a challenge differently, embracing better ways of working, and continuously evolving to improve patient care.

This month, we celebrate the mindset that turns experience into insight, curiosity into innovation, and possibilities into progress.

# The Evolution of Dentistry From Experience to Innovation

Dentistry has always evolved with the times—from traditional methods and conventional imaging to advanced digital technologies that are transforming the way clinicians diagnose, plan and care for their patients. While technology continues to open new possibilities, the foundation remains unchanged: **clinical knowledge, experience and a commitment to better patient care.** Today, innovation is not about replacing experience, but empowering it with smarter tools, clearer insights and greater confidence. As dentistry moves forward, the most powerful practices will be those where experience meets innovation.

EXPERIENCE GIVES DENTISTRY ITS FOUNDATION.  
INNOVATION GIVES IT A FUTURE.

# Welcome

We're delighted to welcome our newest customers to the Vatech family

# vatech CBCT Clinical Insight

Bhojia Dental College & Hospital,  
Baddi-Himachal Pradesh

The Indian Academy of Maxillofacial Surgery, in association with Bhojia Dental College & Hospital, Baddi, Himachal Pradesh, organised a two-day Surgical Workshop on 21st and 22nd August 2026. The workshop brought together dental and maxillofacial surgery professionals, academicians and students for an engaging academic and clinical learning experience.

In association with the AOMSI Himachal Pradesh, Haryana and Punjab State Branches, the workshop offered a platform for knowledge sharing, clinical discussions and hands-on learning, bringing together experienced professionals and delegates from the field of maxillofacial surgery.

21st & 22nd August 2026

Bhojia Dental College & Hospital, Baddi, H.P.

The event reflected the growing importance of continuous professional education in dentistry and maxillofacial surgery. Through workshops of this nature, clinicians and students gain opportunities to stay updated with evolving surgical techniques, strengthen their practical knowledge and learn from the experiences of experts in the field.

The workshop also served as a valuable platform for professional networking and collaboration among dental and maxillofacial surgery communities. The successful gathering highlighted the importance of collaborative initiatives in advancing clinical education and promoting excellence in patient care.

## APICAL PERI-IMPLANTITIS:

The Importance of Early Detection  
& Three-Dimensional Diagnosis

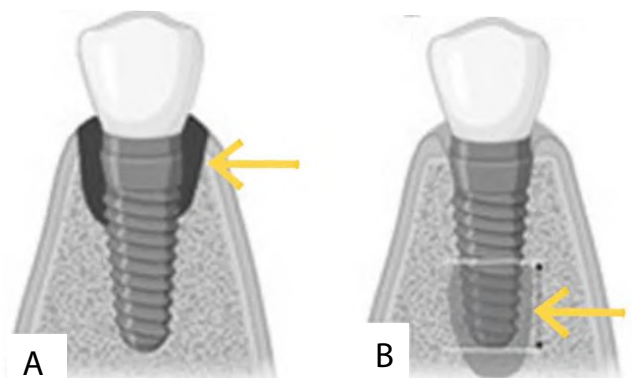

# UNDERSTANDING APICAL PERI-IMPLANTITIS

Dental implants have become a predictable solution for replacing missing teeth. However, biological complications can occasionally affect the tissues surrounding an implant. One such complication is **Apical Peri-Implantitis (API)**, also known as **retrograde peri-implantitis**.

While conventional peri-implantitis (A) progresses from the crestal bone toward the apex, apical peri-implantitis (B) originates at the implant apex, with the marginal bone often remaining unaffected initially.

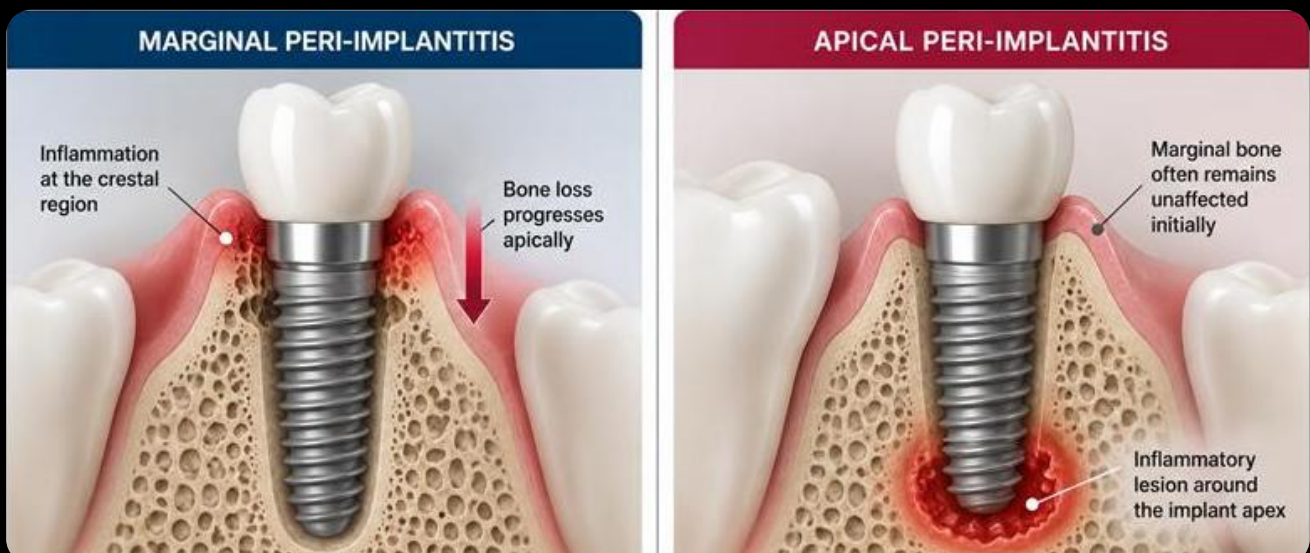

The condition may present with **pain, swelling or fistula** formation, although some patients may remain asymptomatic. This makes radiographic evaluation particularly important for early identification.

## A DIFFERENT PATTERN OF BONE LOSS

The location and pattern of bone loss provide important clues when evaluating implant-related complications.

While marginal peri-implantitis progresses from the crestal bone towards the apex, apical peri-implantitis originates around the implant apex and may develop independently of the marginal bone. Recognizing this distinction is essential for accurate diagnosis and treatment planning

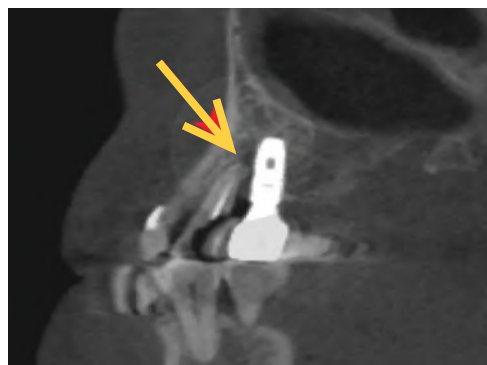

# UNDERSTANDING THE CAUSE & EXTENT

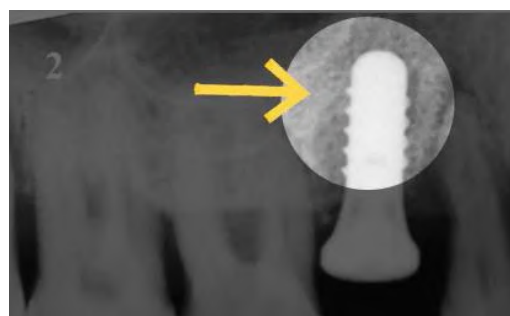

## WHY DOES APICAL PERI-IMPLANTITIS OCCUR?

The development of apical peri-implantitis is considered multifactorial, with infection being an important contributing factor. Potential causes include:

*Infection from adjacent teeth* – Persistent periapical or endodontic infection associated with neighbouring teeth may affect the implant region.

*Residual infection at the implant site* – Previous pathology or residual infected tissue following extraction may persist and contribute to the development of an apical lesion.

***Surgical factors*** – Contamination, excessive trauma or implant placement in a previously infected site may also contribute.

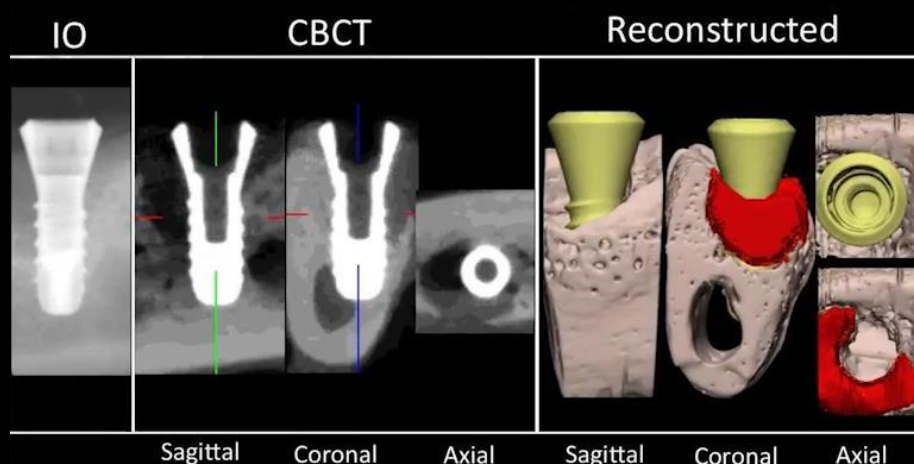

## WHY THREE DIMENSIONS MATTER?

Conventional radiographs provide valuable information but may not reveal the full extent of an apical lesion, particularly when buccal or lingual bone involvement is hidden in a 2D image.

CBCT provides a three-dimensional view in sagittal, coronal and axial planes, helping clinicians assess:

- Exact lesion location
- Three-dimensional extent
- Surrounding bone involvement
- Relationship with adjacent structures

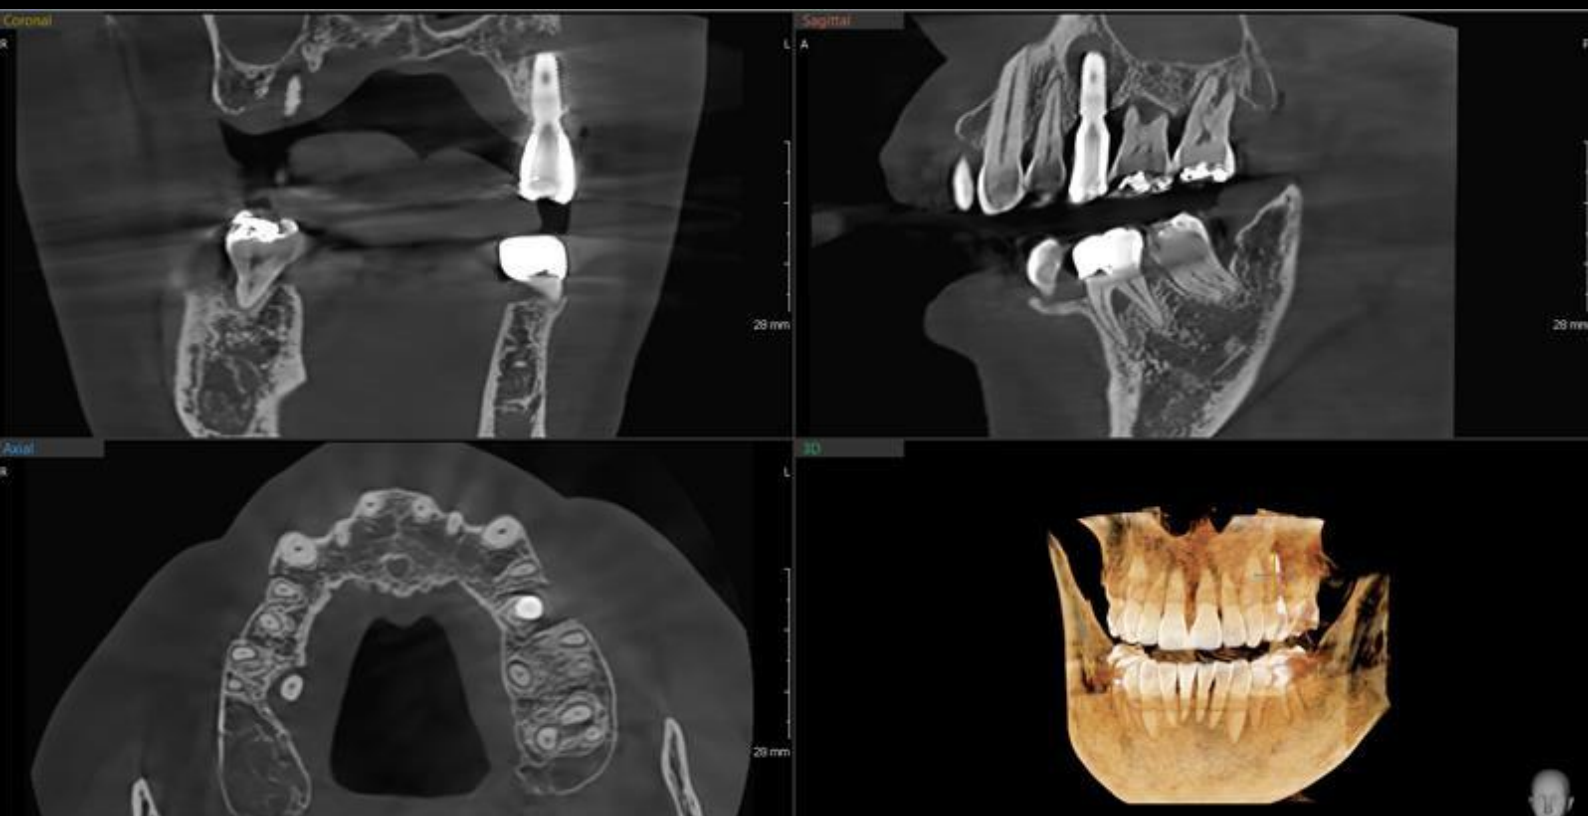

# CASE ANALYSIS

## FROM DETECTION TO THREE-DIMENSIONAL UNDERSTANDING

The importance of three-dimensional evaluation becomes clearer when applied to an actual clinical case.

The initial assessment may identify an abnormal area around an implant. However, identifying a radiolucency is only the first step. The next challenge is understanding *where the lesion begins, how it extends and which surrounding structures are involved*.

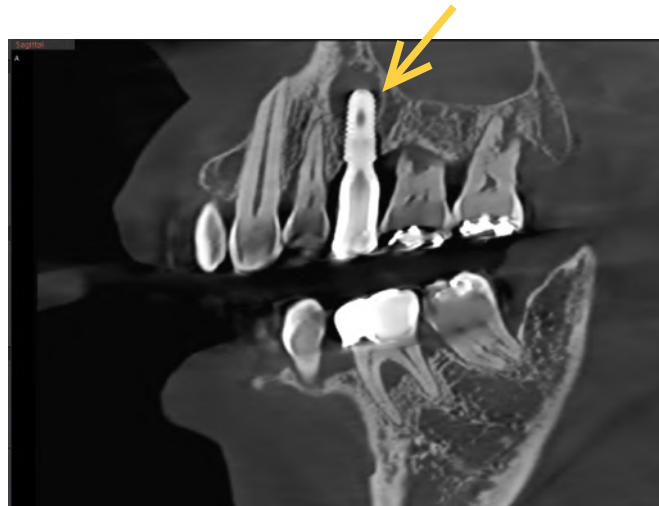

## LOOKING AT THE CASE FROM EVERY ANGLE

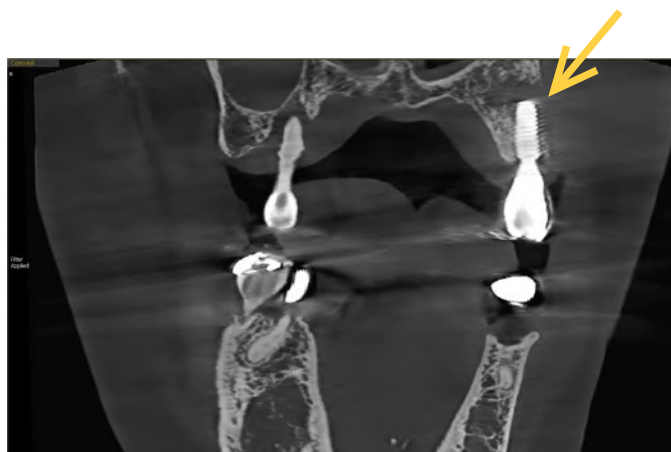

The CBCT dataset allows the region of interest to be evaluated through multiple views.

The *Sagittal* view provides information regarding the relationship of the lesion to the implant's long axis. The *Coronal* view reveals additional details about the surrounding bone, while the *Axial* view helps evaluate the distribution of the defect around the implant.

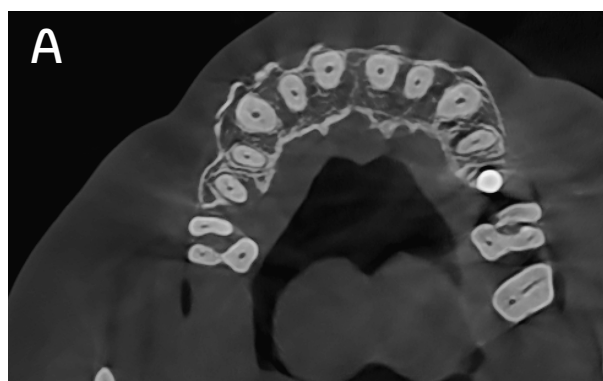

Together, these views transform a single radiographic finding into a more complete three-dimensional clinical picture.

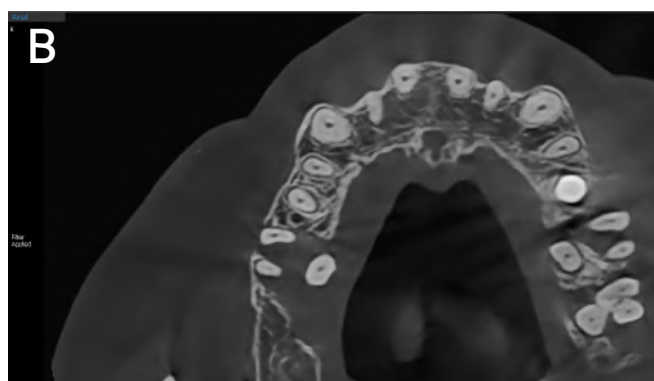

Sagittal Plane- Clearly visible bone loss beneath in the Maxillary second premolar, inflammatory lesion below implant appears radiolucent area, similar to an endodontic lesion

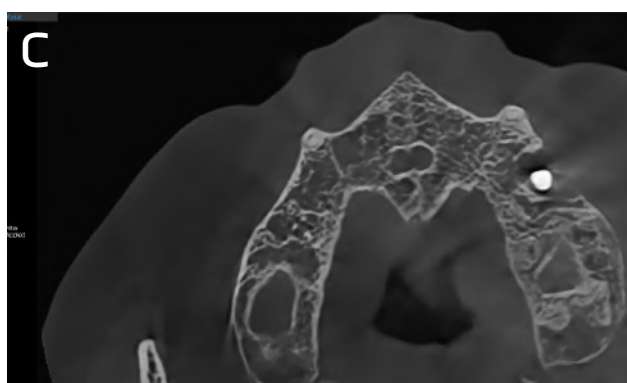

Coronal Plane- Bone loss is evident beneath the implant & also extends to Buccal bone

Axial Plane- Bone loss pattern without marginal bone involvement

Only reason the implant is in place as there is some bone in palatal, mesial, distal region

Overall in the apical region the bone loss is evident & implant long-term prognosis remain uncertain

# FROM ANALYSIS TO UNDERSTANDING

## MORE THAN A RADIOLUCENCY

When the multiplanar views are assessed together, the lesion can be evaluated in relation to the implant and surrounding anatomy.

The analysis helps clinicians move through four essential stages:

*Detect → Localize → Analyse → Understand*

Instead of viewing the lesion as a single shadow on a two-dimensional image, three-dimensional assessment helps determine its anatomical position, pattern and extent.

## THE CLINICAL PERSPECTIVE

In the case presented, three-dimensional analysis provides a clearer understanding of the pattern of bone loss and its relationship with the implant.

The ability to examine the region from different perspectives supports a more comprehensive evaluation of the clinical situation and helps guide further treatment planning.

## WHEN EVERY DETAIL MATTERS, YOU NEED TO SEE MORE

Apical peri-implantitis demonstrates why clinical diagnosis cannot always depend on a single image or a single perspective.

Understanding the true extent of a clinical problem requires the ability to look deeper, analyse anatomy in three dimensions and see details that may otherwise remain hidden.

*And when seeing more becomes essential,  
the next step begins with Vatech A9.*
