Bitcoin came under renewed selling pressure this week, briefly dropping below the psychologically important \$80,000 level as traders reduced their exposure ahead of the US Federal Reserve's policy meeting. On October 26, BTC traded near \$79,800, while Ethereum slipped towards \$2,300 and XRP moved closer to \$1.28. Solana also weakened, trading around \$100 as selling pressure spread across the wider crypto market. The pullback has put key support levels back in focus, with traders watching closely to see whether buyers will step in or sellers will push prices lower.

The weakness reflects a combination of macroeconomic uncertainty, pressure on technology stocks and rising geopolitical tensions in the Middle East. Higher oil prices could keep inflation elevated, making it harder for the Federal Reserve to ease monetary policy.

LETTER

Bitcoin is trading around \$80,000 after failing to sustain its recovery toward \$85,000. The \$80,000–\$82,000 zone remains critical, with the 20-day and 50-day moving averages near \$81,000–\$82,000. The RSI near 41 signals weak momentum, keeping sellers in control in the short term. Immediate resistance lies at \$80,700–\$81,700, followed by \$82,500–\$83,400. A sustained move above \$83,400 could open the way toward \$85,000. On the downside, support sits at \$79,400 and \$78,100, while a daily close below \$79,000 could expose \$75,000–\$73,000.

Ethereum is trading around \$2,310–\$2,330, facing selling pressure after slipping below key moving averages. The RSI near 33 indicates weak momentum and near-oversold conditions, but does not confirm a reversal. The 20-day moving average is around \$2,440, while the 50-day average is near \$2,540, keeping the short-term trend bearish. Support lies at \$2,307 and \$2,262, with a break below \$2,260 potentially exposing \$2,200 and \$2,100. On the upside, ETH needs to reclaim \$2,370–\$2,440 to improve its recovery prospects, with a breakout above \$2,440 potentially targeting \$2,500–\$2,550. Traders should monitor volume and RSI for signs of strengthening momentum. Until ETH establishes a higher low and clears resistance, further downside remains possible.

BNB is trading around \$742, showing relative strength compared with several major altcoins. The RSI near 50 indicates neutral momentum, while the price remains above the 50-day and 200-day moving averages. The 20-day moving average near \$742 is an important short-term level. Resistance sits at \$744–\$746, followed by \$753. A breakout above \$753 could open the way toward \$760–\$767. On the downside, support lies at \$732 and \$722, with a daily close below \$722 potentially exposing \$710–\$700. Bulls need to defend \$732 and break through resistance with strong volume to strengthen the recovery outlook.

Solana is trading around \$100 after declining during the latest market correction. The RSI near 34 signals weak momentum and near-oversold conditions. SOL remains below its 20-day moving average near \$106 and its 50-day moving average around \$106–\$110, keeping the short-term trend bearish. Support lies at \$100–\$98.50, with a breakdown potentially exposing \$95 and \$90. On the upside, SOL needs to reclaim \$102.50–\$106, followed by \$110, to improve its recovery prospects.

XRP is trading around \$1.29, with its technical structure remaining bearish. The RSI near 38 signals weak momentum, while the price remains below key short-term moving averages. Support lies at \$1.275 and \$1.246, with a daily close below \$1.24 potentially exposing \$1.20 and \$1.10.

Resistance stands at \$1.31–\$1.34, followed by \$1.38–\$1.43. A breakout above \$1.34 would indicate improving buying interest, while reclaiming \$1.43 would provide stronger recovery confirmation. Bulls need to defend \$1.275 and establish higher lows to prevent further declines. For now, traders should wait for a confirmed support hold or resistance breakout before increasing exposure.

Trader's Outlook

Bitcoin remains the market's key indicator, with \$79,000–\$82,000 likely to determine whether the correction stabilises or deepens. Reclaiming \$83,400 would improve sentiment, while a daily close below \$79,000 could expose \$75,000–\$73,000. Ethereum needs to recover above \$2,370, Solana must defend \$98.50–\$100, and XRP needs to hold \$1.275 and break above \$1.34. BNB remains comparatively resilient, but a sustained move above \$753 is needed to strengthen its bullish outlook.

The Federal Reserve meeting on October 27–28 is a key event this week, with policy guidance potentially triggering volatility across digital assets. Traders should also monitor inflation expectations, bond yields and ETF flows. If Bitcoin holds support, the broader market could attempt a relief rally; a break below \$79,000 could intensify selling across altcoins. Avoid chasing sharp price moves, use appropriate position sizes, and set stop-loss levels before entering trades.

Lastly please check out the advancement's happening in the cryptocurrency world.

Enjoy the issue!

CRYPTONAIRE WEEKLY

Cryptonaire Weekly is one of the industry's longest-running and most trusted sources for cryptocurrency news, market insights, and blockchain analysis. Created to support our Platinum Crypto Academy clients and global subscribers, the magazine delivers clear research, actionable technical analysis, and strong thought leadership across the digital asset space.

Each week, we provide readers with in-depth articles, project updates, and market commentary that cover the rapidly evolving world of blockchain and Web3. For traders, investors, developers, and entrepreneurs, navigating this fast-changing environment can be challenging. Our mission is to simplify that journey and help readers make informed, confident decisions.

Since our launch in 2017, we've covered every major cycle in crypto from Bitcoin's early rally past **\$20,000 in 2017** to its sharp correction near **\$3,200 in 2018**, marking one of the strongest bear markets in the sector's history. We followed Bitcoin's surge to **\$69,000 in 2021** and its deep pullback to around **\$16,000 in 2022** during a period of global uncertainty and high-profile exchange failures. Most recently, we've tracked Bitcoin's powerful 2025 resurgence as it broke into six-figure territory, hitting levels above **\$123,000** and reaffirming long-term market confidence.

Our **Platinum Crypto Academy** community includes thousands of students and traders worldwide. Over time, **Cryptonaire Weekly** has grown to more than **250,000 active subscribers** and a **social reach of over 1.2 million followers across multiple platforms and community groups**. Through our research-driven insights and strategic relationships, we've also helped **350+ blockchain and crypto projects gain** meaningful traction and visibility in the global market.

For anyone looking to stay informed, identify opportunities, and understand the technologies shaping the future of finance, Cryptonaire Weekly remains a trusted and valuable resource.

WEEKLY CRYPTOCURRENCY MARKET ANALYSIS

Hello, welcome to this week's 439th edition of Cryptonaire Weekly Magazine. The global crypto market cap is \$2.80 Down, \$14 billion since the last Edition. The total crypto market trading volume over the last 24 hours is \$90.44 billion, which makes a 64.11% increase in the last 24 hours. The Fear & Greed index is 56% indicating Neutral and the Altcoin season index is 59% which makes a 2% decrease since last 15days.

Bitcoin's price has increased by 0.15% from 83,400 since the last edition to around \$83,525 and Ether's price has decreased by 5.46% from \$2,676 since the last 15 days to \$2,530 Bitcoin's market cap is \$1.67 Trillion and the altcoin market cap is \$1.13 Trillion. Bitcoin fell below \$80,000 as traders reduced exposure ahead of the US Federal Reserve's policy meeting. On October 26, BTC traded near \$79,800, Ethereum approached \$2,300, XRP slipped towards \$1.28 and Solana traded around \$100. Traders are watching key support levels for signs of stabilisation.

Macroeconomic uncertainty, pressure on technology stocks and Middle East tensions continue to weigh on sentiment. Higher oil prices could sustain inflation and limit the Fed's ability to cut rates, while a stronger US dollar may pressure cryptocurrencies.

Bitcoin needs to reclaim \$82,500 to improve recovery prospects. Support lies at \$79,000-\$80,000, with a breakdown potentially exposing \$77,000-\$77,765. ETF flows, trading volume and Fed guidance remain key market indicators.

Ripple Wins Final US Approval for National Trust Bank

Ripple has received final approval from the US Office of the Comptroller of the Currency to establish Ripple National Trust Bank, following conditional approval in December 2025. The move strengthens its position in regulated financial services and the stablecoin market. The bank can manage RLUSD reserves, act as collateral trustee and provide digital asset custody. However, RLUSD will continue to be issued by Standard Custody & Trust Company, regulated by New York's Department of Financial Services.

Ripple CEO Brad Garlinghouse welcomed the approval, highlighting the importance of combining innovation with regulatory oversight. The development could encourage institutional confidence and RLUSD adoption, although XRP's price impact will depend on whether it generates sustained token demand.

Robinhood's Prediction Markets Could Outperform Crypto Revenue by 2028

Bernstein analysts expect Robinhood's prediction markets to generate approximately \$1.7 billion in annual revenue by 2028, potentially exceeding the \$1.6 billion projected from crypto trading. Revenue from prediction markets could rise from \$650 million in 2026 to \$1.7 billion in 2028, representing around 18% of Robinhood's projected total revenue. The growth reflects increasing interest in event-based contracts. Bernstein also forecasts third-quarter 2026 revenue of approximately \$1.5 billion, supported by equity, options and event-contract trading. For investors, prediction markets could diversify revenue during crypto downturns, but actual performance will depend on trading activity and market conditions.

Musk Warns AI Cloud Providers Face Consolidation

Elon Musk has warned that more than 200 specialist AI cloud providers could face financial pressure as lenders become cautious about funding AI infrastructure. He argued that companies heavily dependent on AI data centres without diversified revenue may struggle to secure financing. The warning follows Gartner's forecast that more than 80% of neocloud providers could cease operating independently by 2030. Meanwhile, Bitcoin miners such as IREN and Core Scientific are expanding into AI computing and data-centre services to diversify revenue.

Although AI offers new growth opportunities, heavy capital spending, debt and uncertain demand pose risks. Investors should monitor financing, contracted AI revenue and capital expenditure rather than assuming diversification guarantees profitability.

Strategy Pauses Bitcoin Purchases and Spends \$204.9 Million on STRC Buybacks

Strategy made no Bitcoin purchases or sales last week, instead spending approximately \$204.9 million repurchasing 2.07 million STRC preferred shares, according to its latest SEC filing. Its holdings remain at 848,517 BTC, acquired for approximately \$64.02 billion at an average price of \$75,446 per coin. Strategy's US dollar reserve stood at \$4.83 billion, while its separate cash balance fell 46% to \$242.4 million following the buybacks. Since early October, the company has spent roughly \$664 million repurchasing STRC shares, compared with \$72.3 million on Bitcoin purchases. Meanwhile, MSTR fell around 2.2% to \$142.80 in Monday's premarket trading. The pause highlights Strategy's focus on capital management rather than necessarily signalling a change in its long-term Bitcoin strategy. Investors should watch future filings for changes in BTC accumulation and preferred-share repurchases, as both can influence market sentiment.

Market Outlook

Bitcoin's ability to hold \$79,000-\$80,000 remains crucial ahead of the Fed decision. Reclaiming \$82,500 could support a recovery, while a breakdown may expose \$77,000-\$77,765. Ethereum, XRP and Solana remain vulnerable if BTC weakens further. Ripple's banking approval could support stablecoin adoption, while Robinhood's prediction markets highlight revenue diversification. Musk's warning underscores AI financing risks, and Strategy's buybacks offer insight into corporate capital allocation. Traders should monitor Fed guidance, oil prices, ETF flows and bond yields. Focus on key support and resistance levels, confirm breakouts with volume, manage leverage carefully and avoid chasing rebounds without clear buying signals.

Percentage of Total Market Capitalization (Domnance)

BTC	57.53%
ETH	10.45%
STABLECOINS	10.24%
Others	21.78%

CryptoGames has extended its No Speed Limit on Dice promotion to cover Saturday, Sunday and Monday. The offer started on Saturday, 26 September, and is still live. Until then, the offer applied on Mondays only, so the window is now three times longer.

Bets placed in that window are processed at lightning speed, whatever the stake. Both Dice and Dicev2 qualify, and players can switch between the two on any of the three days. No end date has been scheduled, but nobody can say how long the promotion will last. Players who want to take advantage of it have good reason to start now.

A spokesperson for Platinum Crypto Academy, said new players should pay attention to how a platform handles bets. "Speed is the first thing many new players notice in a crypto casino," the spokesperson said. "A bet that confirms quickly at any stake size makes it easier to test a platform properly. With three days open each week, newcomers can try Dice and judge the experience themselves."

The weekend promotion is only one part of what CryptoGames offers players. Daily social promotions are open to any player who wants to join in. That gives regular visitors something new to check each day. Wagering contests and rankings let players see how their results compare with others.

Automation and trading tools are covered too. Advanced autobot betting handles automated play for those who prefer to set a strategy and let it run. A built-in exchange is also available directly on the website, so players do not need to leave the site to swap coins.

About CryptoGames

CryptoGames is an online gambling site where anyone can play using various cryptocurrencies. Players pick a game, choose their coin and chat with friends in a simple, social setting. The site offers Dice, Blackjack, Slots, Roulette, Video Poker, Plinko, Minesweeper, Keno and Lottery.

CryptoGames is owned and operated by MuchGaming B.V., which is based at Korporaalweg 10, Willemstad, Curaçao. The company is licensed and regulated by the Curaçao Gaming Control Board under License Number OGL/2024/1336/1047.

BITCOIN IS GOING TO FALL,

SMPRA

MAYA PREFERRED WILL BE #1

THE ERA OF CHANGE HAS ALREADY BEGUN.

IT'S NOT IF, IT'S WHEN.

BITCOIN:

OUTDATED TECHNOLOGY.
REAL PROBLEMS.

- ✗ High fees
- ✗ Slow transactions
- ✗ Network congestion
- ✗ No real innovation
- ✗ Inflation of supply
- ✗ Regulatory risk
- ✗ Institutions losing interest

SMPRA:

INNOVATION.
SECURITY. FUTURE.

- ✓ Next generation blockchain technology
- ✓ Ultra fast transactions
- ✓ Institutional grade security
- ✓ Regulated security token (ERC-3643)
- ✓ Limited supply and deflationary
- ✓ Global compliance
- ✓ Real utility and mass adoption
- ✓ Backed by real world assets

THE FUTURE IS

SMPRA

IT'S NOT JUST A COIN.
IT'S A GLOBAL MOVEMENT.

THE TRUTH NO ONE TELLS YOU:

WHY BITCOIN WILL FALL

- ✗ Outdated technology
- ✗ Not scalable
- ✗ No real world use cases
- ✗ Too much speculation
- ✗ Increasing regulations
- ✗ Whales are cashing out

VS

WHY SMPRA WILL BE #1

- ✓ Advanced blockchain technology
- ✓ Regulated security token
- ✓ Mass institutional adoption
- ✓ Real utility in global markets
- ✓ Transparency and compliance
- ✓ Built to lead the next era

ADVANCEMENTS IN THE CRYPTOCURRENCY WORLD

BITCOIN SLIPS UNDER \$80,000 AS TRADERS DE-RISK AHEAD OF FED MEETING

Ether and XRP led losses among the majors as the AI trade took another hit in Asia, where Goldman Sachs cut its Kospi target by 25%.

Bitcoin fell nearly 2% to about \$79,800 as of Monday Asian morning hours as traders cut risk ahead of this week's Federal Reserve meeting and another leg down in the AI trade weighed on tech stocks across the region.

Selling hit almost every major token. Ether dropped nearly 3% to just above \$2,300, and XRP lost about 3% to \$1.28. SOL slid 2% and is barely holding \$100. DOGE, ZEC, HYPE and BNB each fell 1% to 2%, while TRX was the only major in the green, up less than 1%, according to CoinDesk data.

"This week, all eyes are on the Fed meeting and it already seems like investors are de-risking as Bitcoin falls below the \$80k mark. While the Fed probably won't change rates this week, we're watching how strongly the chair hints at a December hike — that's what matters for crypto," Jeff Mei, chief operating officer at crypto exchange BTSE, said in an email to CoinDesk.

"Given record high oil prices, the escalating US-Iran conflict, and inflation, the Fed could very well adopt an aggressive tone, which means higher rates and less liquidity for crypto and stocks," he added.

The Fed announces its decision on Wednesday, and traders will be listening to Chair Kevin Warsh's press conference for any hint that a hike is coming in December. Higher rates make borrowing more expensive and tend to pull money out of riskier assets like crypto.

In Asia, the AI selloff kept going. South Korea's Kospi, which traders watch for AI sentiment because of how much weight chipmakers like Samsung Electronics carry in it, fell 1% after Goldman Sachs strategists cut their 12-month target for the index by 25%. Chip stocks were the biggest losers on Japan's Nikkei, and Chinese AI model developers slumped. Nasdaq 100 futures slipped 0.1% as investors braced for earnings from the biggest U.S. tech companies this week.

Bitcoin ETFs bleed \$635M as October slides back into the red

Thursday's withdrawals ended a three-day inflow streak and left US spot Bitcoin ETFs with \$175 million in net outflows for October.

US spot Bitcoin exchange-traded funds (ETFs) recorded \$635 million in net outflows on Thursday, pushing October's flows back into the red.

The withdrawals more than erased Wednesday's \$528 million in inflows and brought October's net outflows to \$175 million, according to SoSoValue data.

It was the largest single-day net outflow since June 25, when Bitcoin ETFs lost \$696 million. The withdraw-

als snapped a three-day inflow streak that attracted \$1.08 billion.

Bitcoin ETFs still had weekly net inflows of \$443 million. The funds had recorded two consecutive weeks of outflows before the rebound.

Bitcoin traded between \$80,996 and \$82,551 on Thursday, down from Wednesday's intra-day high of \$84,777. BTC was trading at approximately \$81,783 at the time of publication, down around 1% over the past 24 hours, according to CoinGecko.

Altcoin ETFs also saw mostly negative flows on Thursday. Ether ETFs recorded around \$111 million in net outflows.

Netanyahu Considering Crypto Plan to Dodge Banking Sanctions on Israel

Days before Israel's election, Netanyahu said he has asked for a blockchain plan in case banks are hit with sanctions, and told Israelis to prepare for a rainy day after Trump.

Netanyahu said on Israeli television that he has asked for a plan to use blockchain to get around possible banking sanctions.

He told Israelis U.S. defense aid will end

and said Israel must "prepare for a rainy day" beyond Trump; the current \$3.8 billion-a-year deal expires in September 2028.

Elliptic says Russia's ruble stablecoin A7A5 moved about \$102 billion in its first year before sanctions and other pressure cut its daily volume by 96%.

Israeli Prime Minister Benjamin Netanyahu said he has asked for a plan to use cryptocurrency and blockchain networks to help Israel get around possible banking sanctions. He

made the comments in an interview on Israel's Channel 10, four days before the country votes in a national election.

Apparently, Netanyahu is somewhat confident that the United States will stop providing Israel with military funding. "It is only a question of time," he said, telling Israelis to get used to the idea of not continuing to "receive tens of billions of dollars in American assistance" for the country's defense budget.

Chinese Prosecutors Seek Confiscation of 61,896 BTC Seized in UK From Massive Fraud: Report

Chinese prosecutors are seeking to confiscate over 61,000 Bitcoin and related assets seized by UK authorities from a massive international fraud scheme.

The Tianjin No.2 Intermediate People's Court accepted the application by the Tianjin Municipal People's Procuratorate No.2 Branch on Sept. 28 to confiscate illegal proceeds including 61,896.41552945 BTC plus other virtual currencies, cash, jewelry, and financial assets.

The assets stem from a 2014-2017 Ponzi-style fraud run by the controller of a Tianjin company that raised over RMB 403.78 billion through false investment schemes, causing over RMB 199.77 billion in losses

to more than 102,000 victims.

The perpetrator fled to the UK in 2017, where authorities seized the Bitcoin and related holdings valued at several billion pounds.

Prosecutors are applying to confiscate the property as illegal proceeds and fruits of the crime.

In the UK proceedings, the High Court ruled that Chinese law governs the existence and content of proprietary rights asserted by victims under POCA s.281.

A victim cannot necessarily recover cryptocurrency simply by proving that Bitcoin was bought with money taken from them.

Ripple's Swell Kicks Off This Week With 100+ Speakers, XRP Community

Ripple's expanded Swell conference opens Oct. 27 in New York, connecting financial institutions with XRP Ledger developers and researchers. Discussions will span digital asset markets, stablecoins, and blockchain

infrastructure as the company combines three events into one program.

Swell Combines Finance, Development, and Research Swell opens Oct. 27 at The Shed in Manhattan, where more than 80

sessions will span digital finance and blockchain development through Oct. 29. Ripple, the blockchain payments company hosting Swell, has now released the event's full agenda.

For the first time, Swell will combine with Apex and UBRI Connect. Apex is a summit for developers, institutions, and investors building on the XRP Ledger. UBRI Connect is an academic conference for participants in Ripple's University Blockchain Research Initiative.

Programming follows three tracks: Institutional, Ecosystem, and Innovation, as outlined in Ripple's confer-

ence lineup announcement. The company stated:

"Swell has historically been where Ripple makes its most significant product and partnership announcements."

Executives including Ripple CEO Brad Garlinghouse, CME Group CEO Terrence Duffy, and Bullish CEO Tom Farley appear on the published Swell agenda with discussions spanning digital asset markets and financial infrastructure. Matt Damon and Gary White, co-founders of Water.org, will also speak.

Thousands of crypto projects launch every year, yet only a few earn lasting trust. Many fade fast because they offer hype without anything solid behind it. Smart investors now look for clear backing, honest teams, and a track record they can check.

UK Financial Ltd fits that search in an interesting way. The company was established in 2018 and launched the UK Financial Moonshot Token. Known as UKFLMS, it is the first release in the Launchpad Series. At launch, the market price sat below one cent, a gap worth noticing.

How the Asset Backed Treasury Protects Investors?

Multi-chain crypto assets now reach users across several networks at once. That growth brings fresh problems for newly launched projects trying to win trust. Institutions want proof, audits, and clear reserves before they commit serious money. A new token with no history often hits a wall at the first due diligence check. Without visible backing, trust is hard to build and easy to lose.

UK Financial Ltd addresses this gap with physical asset backing. In mid-October 2026, it completed a cryptographic signature verification through its treasury asset wallet. The result gave visible, on-chain proof of a \$200 million asset allocation behind the token. James Dahlke, President and CEO

of UK Financial Ltd, confirmed how the backing is structured.

“We have already transferred gold-backed Maya Preferred MPRD tokens into the company’s Irrevocable Treasury Vault, providing approximately \$0.15 in gold backing per UK Financial Moonshot Token based on our valuation.”

That transfer solidifies the policy of designating \$0.15 worth of physical gold backing per token. The use of MPRD, the company’s common-class token, came down to visibility. Etherscan lists Maya Preferred PRA under Real World Assets, described as gold and silver backed. Even so, pricing for the current preferred-class token would not display. Dahlke explained the thinking behind the choice.

“We used MPRD, our common-class token, because Etherscan displayed its value while our repeated requests to display the current preferred-class MPRA token’s price remained unresolved. We had also raised concerns about pricing appearing against the retired MAYP token while current MPRA holdings showed zero. That left holders seeing a zero beside an asset we were explaining as gold-backed, creating confusion we were determined to resolve. Eight years of work will not be defined by a zero on somebody else’s screen.”

The next step is full public reporting. Dahlke outlined what the company will publish and how it plans to grow the backing.

“We are moving our assets onto MAYA CHAIN and publishing token balances, pricing references and supporting asset records that the public can review. We intend to strengthen the backing of our ecosystem tokens, including UK Financial Moonshot Token, through additional asset allocations and clear documentation. Our holders deserve to see what the company owns, what backs their tokens and how those figures are calculated.”

Compared with purely speculative meme assets, this creates a psychological floor for early investors. A typical meme coin rests on attention and community hype alone. Here, buyers can point to a gold value that sits well above the current price. Many believe a clear reference point helps calm panic selling among new holders. That anchor gives early buyers a tangible reason to hold through volatile weeks.

UK Financial Moonshot Token’s Two-Class, Multi-Chain Structure

Dual-token design means one project issues two classes of tokens on different blockchains. Each class runs independently, so it carries its own contract address, liquidity pool, and market. Supply rules and token economics are also kept apart for each class. UKFLMS follows this model with a Common Class and a Preferred Class. The split lets each version match the strengths of its network. It also keeps trading activity on one chain from disrupting the other.

Robinhood Common Class

The Common Class lives on Robinhood Chain, an Ethereum-compatible layer-2 network. It launched on mainnet on July 1, 2026, and uses ETH for gas fees. Layer-2 networks process trades separately and send data back to Ethereum for settlement. That setup keeps fees lower than trading directly on Ethereum mainnet. Total value locked on the network passed \$750 million by September 1, 2026.

This version is fully live and trading now on the Tokpie centralized exchange. Traders can find it there under the UKFLMS/USDT trading pair. The Common Class contract address on Robinhood Chain is

0xA57012Cf8F7d7eAb15B681D8B188b8e5893c0809

That address belongs only to this class, so buyers should never confuse it with the Solana mint.

Solana Preferred Class

The Preferred Class runs natively on the Solana blockchain instead of an Ethereum-based network. Solana is known for fast speeds and low trading fees. Those traits suit a token built for high-volume trading and quick settlement. Users can move funds quickly without worrying about heavy network costs.

The token is active on-chain, though management is holding it in a phase of strategic preparation. The Preferred Class is identified by the mint address

EuwTQRtAQqe3FjvVMXepm8vrw3CLpRoQSo
Epv6Fomoon

Solana tokens use mint addresses instead of contract addresses, which keeps this version separate from the other. Liquidity and tokenomics also stay fully independent on this side of the structure.

The Next Solana Milestone

UK Financial Ltd is turning to the Solana blockchain to drive high-velocity global expansion. The company is preparing the Preferred Class for a major launch on a top 30 CoinMarketCap exchange. Solana’s speed and low fees help attract both retail and institutional traders. Solana also supports quick transfers, which keeps entry and exit simple for newcomers. Retail users get cheap, quick trades, while institutions value fast settlement for larger orders.

Token Supply, Circulating Float and BuyBack

Token supply decides how much of a project the market can actually trade.

The Solana Preferred Class has a total supply of 1 billion UKFLMS tokens. Major tracking platforms such as Coinbase and Phantom show a circulating supply of 1 billion tokens. All of them were minted directly into an automated decentralized liquidity pool.

The Robinhood Chain Common Class is much smaller in size. Direct blockchain contract reads show a localized total supply of 400 million tokens.

A third layer comes from Maya Coin. UKFLMS acquired Maya Coin in September 2026, carrying forward its 2018 blockchain history. It took over an Ethereum-based contract ledger with a fixed total supply of 250 million tokens. The original contract still reflects about 6,289 holders, adding an established community to the project.

According to the company, UK Financial Ltd received zero free tokens from the Solana pool minting. If the company wants Moonshot tokens, it has to acquire them through the market like everyone else. Everything the company and its insiders hold was bought on the open market.

Reported holdings of UKFLMS on Solana now total 633,759,770.516500 tokens, or 63.38% of the original supply. These tokens were purchased with real money, not handed over as creator allocations.

The disclosed ownership breakdown is listed below for easy comparison.

UK Financial Ltd: 500,612,698.833856 tokens, or 50.06%

Insiders: 133,147,071.682644 tokens, or 13.31%

Combined holdings: 633,759,770.516500 tokens, or 63.38%

Tokens outside those holdings: 366,240,229.483500 tokens, or 36.62%

Buybacks form the next layer of the token's supply story. The company has bought more than 350 million tokens through buyback-style transactions on the Moonshot App. It plans to keep buying from the remaining available float, with the option to burn tokens it acquires.

The Road Ahead for UK Financial Moonshot Token
The plan is to link decentralized markets with traditional finance through two independent token classes. The Common Class runs on Robinhood Chain, while the Preferred Class runs on Solana. Separate liquidity on each network lets the project reach different types of traders. Both classes remain tied to the same gold-backed corporate treasury.

Robinhood Chain gives the Common Class a young but fast-growing home. It launched on mainnet in July 2026 and passed \$750 million in value locked by September. The Solana Preferred Class is preparing for a listing on a top 30 CoinMarketCap exchange. A CoinMarketCap update request is also in progress to carry the Maya Coin history forward.

Cardano Foundation Pushes Back On Expanding MiCA Rules To Protocol-Level DeFi

In a newly published explanation of its European consultation response, the Cardano Foundation argues for regulating activities and intermediaries rather than creating blanket rules for decentralised technology.

The Cardano Foundation has spelled out why it believes Europe's next round of crypto policymaking should avoid treating every blockchain interaction as a regulated financial service. In an October 21 article, its legal team explained the positions it submitted to the European Commission's MiCA review.

The response itself was filed on September 30, an important date distinction. The Foundation is not announcing that new laws were passed

this week. It is describing the changes it wants policymakers to make as they assess decentralised finance, staking, lending, stablecoins and the practical limits of the existing regulation.

Its argument rests on function and control. An intermediary taking custody or exercising discretion over customer assets is doing something different from a person delegating ADA stake without surrendering custody, or software that simply provides access to a public network.

The Foundation also wants clearer treatment of hybrid tokens, overlaps with other European financial rules and cross-border legal issues. These are lobbying positions, not binding exemptions.

India's largest crypto exchange absorbs \$16 million loss from internal process failure tied to retired wallet

The Mumbai-based exchange initially dismissed reports of suspicious outflows as a false alarm. It now says it lost \$16 million and will absorb the loss.

CoinDCX, India's largest crypto exchange by trading volumes, says it has absorbed a \$16 million loss after an internal process failed to move customer deposits out of a retired wallet.

It all started last week, when blockchain sleuths flagged about \$16 million in suspicious outflows from wallets linked to the Mumbai-based exchange. CoinDCX was quick to dismiss the reports, with CEO Sumit Gupta calling it a false alarm on X.

A spokesperson told CoinDesk that the addresses cited by the sleuths were old ones,

created in January 2025 and compromised in the July 2025 hack, which cost the exchange about \$44 million, and that CoinDCX had not used them since. In essence, the exchange said the activity did not have any connection with CoinDCX.

But ZachXBT, a well-known on-chain investigator, said at least one of those addresses, labeled TQKJQ, was in use by a liquidity provider and swept user deposits to CoinDCX's current public hot wallet as recently as April and May 2026.

On Sunday, CoinDCX published a blog post on the activity tied to TQKJQ, saying the wallet belongs to its old operational wallet infrastructure and that the loss was tied to it.

Cryptocurrency has opened new payment options for online casino players. Still, accepting digital coins does not make a casino reliable. Players also need clear payment terms, secure accounts, fair games, and helpful support.

The SOFTSWISS 2027 iGaming Trends report says regulatory readiness, secure payments, and risk management will set operators apart. A big game library alone no longer tells players the full story. A good crypto casino should pair a smooth experience with clear rules, verifiable fairness, and responsible gambling safeguards.

So what should players look for before choosing a crypto casino? Licensing, coin support, withdrawal policies, and game transparency all help separate credible platforms from risky ones.

What Separates a Good Crypto Casino From the Rest?

Coin Support

A good crypto casino accepts more than just Bitcoin and Ethereum. Support for Litecoin, Dogecoin, and stablecoins such as USDT gives players real choice. People can use the coins they already hold instead of swapping them first. Each extra coin adds convenience, but quality matters more than quantity.

Stablecoins matter because their value is designed to track a fixed price. That helps players avoid

sudden swings between a deposit and a withdrawal. Low network fees and fast confirmations also keep small bets worthwhile. Players should also check minimum deposits and withdrawal limits before they sign up. A clear payment page shows that a casino respects its users.

Game Variety

Variety keeps a casino interesting long after the first visit. A strong lobby offers slots, table games, and fast formats such as crash, dice, and Plinko. Some players want a quick round, while others enjoy longer sessions. Reputable studios and in-house originals both add value to a lobby.

Choice matters, but polish matters just as much when judging a game lobby. A smaller library of well-built games often beats hundreds of rushed titles. Look for games that load fast, run smoothly on phones, and show clear rules and payout information. Free demo modes also help, since players can test a game before risking real money.

Licensing and Security

A valid license shows that a regulator oversees how the casino operates. Players should check which authority issued it and confirm the details on the casino's own site. A vague or missing license is a clear warning sign.

Good security protects both the player's account and the funds inside it. Strong platforms use encrypted connections and offer two-factor authentication for every account. Clear terms on withdrawals, identity checks, and account rules show a casino takes itself seriously. Licenses vary in strength, so players should read the terms and check the casino's track record. Years of steady operation often say more than any badge.

Provable Fairness

Provably fair games let players check results instead of trusting the casino. Before each bet, the platform usually shares a hashed server seed. The player can also set a client seed that feeds into the result. Casinos that skip this feature ask players to rely on trust alone.

After the round, the casino reveals the original server seed. Players can run it through a free verifier and confirm that the outcome matches the earlier hash. The system works best when the casino explains each step in plain language. A good platform also links to a simple guide or a built-in checker for every game.

Clear Bonuses

Bonuses can add real value, but only when the terms are easy to understand. A good casino states the wagering requirement, the time limit, and the eligible games upfront. Players should never have to hunt through fine print to find these details.

Watch for maximum bet rules and withdrawal caps linked to a bonus. A large offer with a very high wagering requirement is rarely a bargain. For instance, a smaller bonus with lower requirements can be easier to clear. Some casinos offer cashback with low or no wagering, which is usually simpler to follow. Always read the full terms before claiming any offer, even a small one.

Smooth Experience

A smooth experience starts with fast sign-up and a clean layout. Players should find games, balances, and settings within a tap or two. Pages that load quickly and work in any browser keep sessions enjoyable. A site that feels clumsy often hides deeper problems, so first impressions count.

Mobile performance matters most, since many

players use their phones. Buttons should be easy to tap and menus easy to read on small screens. Deposits and withdrawals should take only a few clear steps. Helpful details such as live balances, bet history, and confirmation messages build confidence. Testing a few rounds with small bets shows how the platform really feels.

Reliable Support

Good support matters most at the moment something goes wrong. Players should find help through live chat, email, or a clear contact form. Replies should arrive quickly and solve the problem, not just repeat a script. Clear answers save time and reduce frustration for players and staff alike.

A detailed help center is a strong sign of quality. It should answer common questions about deposits, withdrawals, bonuses, and account checks. Before joining, players can test a casino by sending a simple question and noting the response time. Support in several languages helps global players feel welcome and understood. Look for honest communication, especially when a withdrawal is delayed.

Safer Play

A good casino puts player wellbeing ahead of short-term profit. Responsible gambling tools should be easy to find and simple to use. Deposit limits, loss limits, session reminders, and cool-off periods help players stay in control.

Self-exclusion is just as important for players who want a full break. It lets a player step away for a set time or permanently. The best platforms also link to independent support services and explain the warning signs of problem gambling. Players should treat gambling as entertainment, set a budget, and stop when it stops being fun. Anyone who feels overwhelmed should seek help from a trusted support organization.

Why Crypto.Games Deserves a Place on Your Shortlist?

Longevity is hard to fake in crypto gambling, and Crypto.Games has plenty of it. The brand launched in 2014, so its journey now spans twelve years. It began as a single Dogecoin slot site and grew alongside the industry. In crypto, where some sites vanish within a year, twelve years of operation stands out. As of July 2026, one review still lists

it among the longest-running provably fair crypto casinos. That record gives new players something concrete to verify instead of a marketing claim.

Trust at Crypto.Games rests on numbers that players can check themselves. Its games are provably fair, and built-in tools let players verify each bet. House edges are also published, so players can compare game math before choosing. Reviews put Crypto.Games' Dice house edge near 1%, though figures may vary. During special events or promotions, the edge can sometimes drop to 0.5%.

Crypto.Games supports popular coins, including Bitcoin, Ethereum, USDT, and Dogecoin. Holders of major coins and fans of smaller ones can both find a fit. Players who prefer steadier value can choose USDT over volatile assets. The platform also adds a social layer through chat and player rewards. Chat lets people share wins and ask questions in real time. Rewards give regular players a reason to stay active and feel recognized. Together, these features make the site feel like a community, not just a lobby.

Responsible gaming rounds out the picture, with published policies and player controls. Users can set boundaries and step away whenever they need a break. Those safeguards matter in fast games where rounds end in seconds and bets add up quickly. Players should still read the policy pages and use the tools early. For a shortlist, that mix of history, fairness, coin choice, and community earns a place. Start small, test the platform, and judge it for yourself. Always confirm that online gambling is legal where you live before joining.

What Is Driving the Growing Popularity of Crypto.Games?

Daily events give players a reason to log in more than once a week. Fresh contests, challenges, and

tournaments keep the lobby active from one day to the next. Players who enjoy friendly competition can chase a goal while they play their favorite games.

Fast payouts are the second big draw for many crypto players. Reviews describe lightning fast withdrawals with no casino fees, so winnings reach a wallet without long waits. Blockchain confirmations and network fees still apply, so timing can vary by coin. Quick access to funds also builds confidence after a big win.

Responsible gambling support also shapes how players talk about a platform. Players who feel respected are more likely to stay and recommend the site. One reviewer also notes active staff on forums, where many crypto players discuss platforms. Clear boundaries keep sessions enjoyable and help players return with a clear head.

Takeaway

Crypto casinos are still growing in 2026, though the pace is settling. An October 2026 tracker counted \$48.8 billion in on-chain deposits across 41 casinos over twelve months. Another tracker found quarterly volume roughly flat between the first two quarters of 2026. More casinos mean more choice, so players should pick with care.

For new users, Crypto.Games is a sensible place to start. It has run since 2014, supports major coins, and shares the details players need to judge fairness. Beginners can start with small bets, check each result, and learn at their own pace. Experienced players get a focused platform with clear odds and fast payouts. If you try it, keep sessions short and play within your limits.

Hong Kong names Nasdaq-listed Solana Company a strategic enterprise

The Nasdaq-listed firm said it plans to establish Solana validator operations in Hong Kong.

Hong Kong has named Nasdaq-listed Solana Company (HSDT) a strategic enterprise under a government program aimed at attracting businesses that support the city's economic development.

Solana Company said Thursday that it was among the seventh batch of businesses selected by Hong Kong's Office for Attracting Strategic Enterprises (OASES) and the only blockchain infrastructure company onboarded by the office in 2026.

Hong Kong's government confirmed the addition of 18 enterprises to the program last week, bringing its total to 142.

A Solana Company spokesperson told Cointelegraph that the designation gives it a single point of contact across government agencies and regulators, expedited pathways for recruiting overseas talent and introductions to local institutional partners.

Solana Company operates staking and validator infrastructure and advises financial institutions on blockchain adoption. It also holds Solana (SOL) as part of its digital asset treasury strategy.

The company said it plans to establish validator operations in Hong Kong under Pacific Backbone, an initiative to build a low-latency blockchain infrastructure network across the Asia-Pacific region.

Wells Fargo, Cisco, Intuit Among 6 More Companies Objecting to Tokenized Stocks

Twenty-two companies have now objected to having their shares traded on the planned OKX-ICE tokenized stock venue, after Wells Fargo, Cisco, Marvell, Arm, Moderna, and Intuit joined the list.

Six more companies, including Wells Fargo, Cisco, and Marvell, have objected to trading of their shares on OKXICE TSV, according to its Oct. 23 notice. That brings the total to 22, up from nine on Oct. 15, though the notices don't explain the companies' reasons or what the objections do.

The notice also discloses risks, including no circuit breakers beyond halts, no protections against transaction reordering, and smart contract upgrades without advance notice.

The list of companies that don't want their

shares traded on OKX and ICE's planned tokenized stock venue keeps growing.

Wells Fargo, Cisco Systems, and Marvell Technology are among six new issuers named in an updated public notice from OKXICE TSV dated Friday. Arm Holdings, Moderna and Intuit round out the new additions. That brings the total to 22 objecting companies, up from 16 on Oct. 19 and nine on Oct. 15.

Earlier objectors include Microsoft, Alphabet, Goldman Sachs, Verizon, Broadcom, and UnitedHealth Group. None of the notices explain the companies' reasons, or what effect an objection has on whether a stock can trade on the platform.

Wells Fargo joins Goldman Sachs as the second major U.S. bank on the list.

Bitcoin came under renewed selling pressure this week, briefly dropping below the psychologically important \$80,000 level as traders reduced their exposure ahead of the US Federal Reserve's policy meeting. On October 26, BTC traded near \$79,800, while Ethereum slipped towards \$2,300 and XRP moved closer to \$1.28. Solana also weakened, trading around \$100 as selling pressure spread across the wider crypto market. The pullback has put key support levels back in focus, with traders watching closely to see whether buyers will step in or sellers will push prices lower.

The weakness reflects a combination of macroeconomic uncertainty, pressure on technology stocks and rising geopolitical tensions in the Middle East. Higher oil prices could keep inflation elevated, making it harder for the Federal Reserve to ease monetary policy. Even if interest rates remain unchanged, traders will closely examine the Fed's comments for clues about its next move and the possibility of another rate increase in December. Higher interest rates and a stronger US dollar can reduce liquidity and weigh on risk assets such as cryptocurrencies.

From a trading perspective, Bitcoin needs to reclaim the \$82,500 region to improve short-term sentiment and open the door to a stronger recovery. On the downside, the \$79,000–\$80,000 zone is an important support area. A decisive break below this

range could expose the \$77,000–\$77,765 region, where buyers may attempt to defend the market. Traders should monitor trading volume, Bitcoin spot ETF flows and broader market sentiment to determine whether the latest decline is a temporary correction or the start of a deeper pullback.

Ripple Wins Final US Approval for National Trust Bank

Ripple has secured final approval from the US Office of the Comptroller of the Currency (OCC) to establish Ripple National Trust Bank (RNTB). The decision completes the chartering process after the regulator granted conditional approval in December 2025. The development is an important step for Ripple as it looks to expand its presence in the regulated financial system and strengthen its position in the growing stablecoin market.

The federally supervised trust bank is authorised to manage reserves backing Ripple USD (RLUSD), act as collateral trustee for the benefit of RLUSD holders and provide digital asset custody services. However, RLUSD will continue to be issued by Standard Custody & Trust Company, Ripple's limited-purpose trust company regulated by the New York Department of Financial Services. This structure allows Ripple to expand its regulated banking operations while maintaining the existing arrangements for issuing its stablecoin.

Ripple CEO Brad Garlinghouse welcomed the decision, saying that crypto and traditional banks work better together when innovation is supported by accountability and federal oversight. For the crypto industry, the approval highlights the growing importance of regulatory compliance as digital asset companies seek to work more closely with traditional financial institutions. A stronger regulatory framework could help attract institutional capital and increase confidence in stablecoins. Traders will be watching whether the development leads to wider RLUSD adoption, higher transaction activity and stronger demand for Ripple's services. While the news is positive for Ripple's business outlook, its effect on XRP's market price will depend on whether adoption and network activity translate into sustained demand for the token.

Robinhood's Prediction Markets Could Outperform Crypto Revenue by 2028

Prediction markets are emerging as a major potential growth area for Robinhood Markets, with Bernstein analysts forecasting that the business could generate more revenue than the company's crypto operations by 2028. According to the analysts, prediction markets could produce approximately \$1.7 billion in annual revenue by 2028, compared with an estimated \$1.6 billion from crypto trading.

Bernstein expects prediction market revenue to rise from around \$650 million in 2026 to \$1.7 billion in 2028, accounting for roughly 18% of Robinhood's projected \$9.4 billion in total revenue that year. The forecast reflects growing interest in event-based contracts, which allow users to trade on the outcome of real-world events. Robinhood is expanding its offering beyond traditional shares, options and cryptocurrencies as it looks for additional sources of growth.

The forecast comes as investors assess how sustainable Robinhood's revenue growth will be across different market conditions. Bernstein also expected the company's third-quarter 2026 revenue to increase by around 13% quarter-over-quarter to approximately \$1.5 billion, supported by equity, options and event-contract trading, alongside a recovery in crypto volumes.

For crypto investors, Robinhood's outlook highlights a broader trend: trading platforms are competing

for user activity across multiple asset classes. Prediction markets could become an important source of income when cryptocurrency volumes are weak, potentially reducing the impact of crypto market cycles on the company's overall performance. Traders following HOOD shares should watch actual earnings, trading volumes and management guidance to see whether prediction markets are delivering the growth analysts expect. The forecast remains an estimate rather than a guaranteed outcome, and Robinhood's performance will continue to depend on customer activity and market conditions.

Musk Warns AI Cloud Providers Face a Wave of Consolidation

Elon Musk has warned that more than 200 specialist AI cloud providers, often called neoclouds, could face severe financial pressure as lenders become more cautious about funding companies heavily exposed to artificial intelligence infrastructure. In a post on X, Musk argued that businesses without substantial revenue streams outside AI data centres may struggle to secure financing. He contrasted these companies with SpaceX, which he said had secured \$40 billion in debt financing for GPUs, supported by its investment-grade status and revenue from Starlink and rocket launches.

Musk expects many of these specialist providers to fail or consolidate, although some may survive. His warning follows an October forecast from research firm Gartner that more than 80% of neocloud providers could cease operating independently by 2030 as the industry struggles to generate sufficient returns from massive AI infrastructure investments.

The issue is also relevant to Bitcoin miners that have expanded into AI computing and data-centre services. Companies such as IREN have moved into AI cloud services, while Core Scientific provides data-centre hosting for customers including CoreWeave. These businesses are attempting to diversify their revenue beyond Bitcoin mining by using their power capacity, land and computing infrastructure to serve AI customers.

The shift offers miners an opportunity to reduce their dependence on Bitcoin prices and mining profitability. However, AI infrastructure requires substantial capital spending, and the business

can become vulnerable if demand fails to justify the cost of equipment, financing and electricity. If funding tightens or AI customers reduce spending, companies with heavy debt or limited cash flow could face increased pressure. Investors should monitor miners' balance sheets, debt levels, contracted AI revenue and capital expenditure plans rather than assuming that a move into AI automatically improves their long-term outlook.

Strategy Pauses Bitcoin Purchases and Spends \$204.9 Million on STRC Buybacks

Strategy, the largest publicly listed corporate holder of Bitcoin, did not buy or sell any BTC last week, instead spending approximately \$204.9 million to repurchase its STRC preferred shares. According to its latest filing with the US Securities and Exchange Commission, the company repurchased around 2.07 million shares between Monday and Friday. It also reported no Bitcoin transactions and no stock sales through its at-the-market offering programme during the period.

Strategy's Bitcoin holdings remained unchanged at 848,517 BTC, acquired for approximately \$64.02 billion at an average cost of \$75,446 per coin. With Bitcoin trading near \$79,992 around Monday's US market open, the company's holdings were still above their reported average acquisition price, although their market value remains exposed to Bitcoin's volatility.

Strategy's US dollar reserve remained at approximately \$4.83 billion, while its separate USD cash balance fell around 46% to \$242.4 million from \$447.3 million following the preferred-share repurchases. Since the beginning of October, the company has spent roughly \$664 million buying back STRC preferred shares, compared with approximately \$72.3 million used to purchase 851 BTC.

The decision comes as Bitcoin has retreated from a recent high of \$84,777 towards the \$80,000 region. Strategy's common stock, MSTR, also came under pressure, falling around 2.2% to \$142.80 in Monday's premarket trading, while STRC edged down to approximately \$99.35.

Strategy's decision to pause Bitcoin accumulation does not necessarily signal a change in its long-term strategy, but it shows that management is

also managing its capital structure and preferred-share market. Buybacks can support a company's securities, but they also compete with other uses of cash, including additional Bitcoin purchases. For traders, Strategy remains closely linked to Bitcoin's price movements, investor confidence and the company's financing decisions. A sustained Bitcoin recovery could improve sentiment towards MSTR, while a deeper BTC correction could increase volatility in the stock. Investors should watch future SEC filings to see whether Strategy resumes accumulation and how it balances Bitcoin purchases with preferred-share repurchases.

The crypto market remains under pressure as Bitcoin struggles to hold the \$80,000 level and traders wait for clearer signals from the Federal Reserve. BTC needs to reclaim \$82,500 to improve short-term momentum and strengthen the case for a relief rally. If the \$79,000–\$80,000 support zone fails, the \$77,000–\$77,765 region could become the next important downside target. Ethereum, XRP and Solana may remain vulnerable if Bitcoin continues to weaken and investors reduce exposure to riskier assets. Traders should monitor the Fed's policy statement, oil prices, the US dollar and bond yields for clues about the next market move. Ripple's national trust bank approval is a positive development for regulated crypto services and could support broader stablecoin adoption over time. Robinhood's prediction market forecast highlights how trading platforms are diversifying their revenue beyond cryptocurrency, although actual earnings will need to confirm the growth outlook. Musk's warning about AI cloud providers is a reminder that Bitcoin miners expanding into AI infrastructure face financing, debt and profitability risks. Strategy's decision to prioritise STRC buybacks over fresh Bitcoin purchases is another development for investors tracking institutional BTC demand and crypto-linked equities. In the near term, traders should focus on key support and resistance levels, confirm breakouts with volume, manage leverage carefully and avoid chasing rebounds until the market shows stronger buying pressure.

Bitcoin is trading around \$80,000, under pressure after failing to hold its recent recovery toward \$85,000. The market has now entered an important support zone, and traders are watching whether buyers can defend the \$80,000–\$82,000 area.

The 20-day moving average is near \$82,000, while the 50-day moving average is around \$81,000–\$82,000, leaving BTC below or close to these key trend indicators. The RSI is near 41, showing weak momentum and suggesting that sellers currently have the advantage in the short term. Immediate resistance sits around \$80,700–\$81,700, followed by the stronger \$82,500–\$83,400 zone. A sustained move above \$83,400 would improve the technical structure and could open the way toward \$85,000. On the downside, the first support is around \$79,400, followed by \$78,100. A daily close below \$79,000 would increase the risk of a deeper correction toward \$75,000–\$73,000, where the 200-day moving average and longer-term support area become important. Institutional ETF demand has provided some support, but uncertainty around interest rates and recent volatility in risk assets continues to weigh on sentiment. Bulls need to reclaim the short-term moving averages, while bears will look for a decisive break below \$79,000. Until BTC recovers above \$83,400, traders should treat rallies cautiously and watch for possible rejection near resistance.

Ethereum is trading around \$2,310–\$2,330, with sellers maintaining pressure after the price slipped below several important moving averages. The RSI is near 33, indicating weak momentum and placing ETH close to oversold territory, although this alone does not confirm a reversal. The 20-day moving average is around \$2,440, while the 50-day moving average is near \$2,540 on the simple moving-average measure. This leaves Ethereum needing a meaningful recovery before its short-term structure can turn bullish. Immediate support is around \$2,307, followed by \$2,262. A daily close below \$2,260 could expose the \$2,200 area and potentially lead to a deeper retest of the \$2,100 zone. On the upside, ETH needs to reclaim \$2,370–\$2,440 to show that buyers are returning. A sustained breakout above \$2,440 would improve the recovery setup and could open the way toward \$2,500–\$2,550. However, repeated rejection below the 20-day moving average would indicate that sellers remain in control. Traders should watch the RSI and trading volume for signs of improving momentum, rather than buying simply because the market appears oversold. For now, ETH remains vulnerable until it can establish a higher low and reclaim its nearest resistance levels.

BNB is trading around \$742, showing relative strength compared with several other major altcoins. Technical indicators remain mixed but lean constructive, with the RSI near 50 and price trading above the 50-day and 200-day moving averages. The 20-day moving average is around \$742, making this an important short-term decision level. Immediate resistance sits near \$744–\$746, followed by \$753. A sustained breakout above \$753 could open the way toward \$760–\$767, while a stronger move above that zone would improve the bullish structure further. On the downside, the first support lies around \$732, followed by \$722. If BNB loses \$722 on a daily closing basis, the recovery structure would weaken and sellers could push price toward \$710–\$700. The RSI suggests that momentum is close to neutral, so a breakout still needs volume confirmation. Bulls need to hold above \$732 and push through \$746–\$753 to establish stronger control. If price continues to struggle below resistance, BNB could remain range-bound despite its comparatively resilient structure. Traders should avoid assuming that relative strength guarantees an immediate rally, particularly while the broader crypto market remains under pressure.

Solana is trading around \$100, after losing ground during the latest market correction. The RSI is near 34, reflecting weak momentum and suggesting that SOL is approaching oversold conditions. However, the price remains below its 20-day moving average near \$106 and its 50-day moving average around \$106–\$110, keeping the short-term trend under pressure. Immediate support is positioned around \$100–\$98.50, with the lower end of the recent trading range acting as an important line for buyers. A sustained break below \$98.50 could expose \$95 and \$90, particularly if Bitcoin also loses its key support. On the upside, SOL needs to reclaim \$102.50–\$106 to show that buyers are returning. A breakout above \$106, followed by a move through \$110, would strengthen the recovery setup and could open the way toward \$113–\$117. The RSI and stochastic indicators suggest that a relief bounce is possible, but oversold conditions can persist during a strong downtrend. Bulls need to defend the \$98.50–\$100 area and build higher lows before a sustained recovery can be considered. Until SOL reclaims its moving averages, rallies may attract selling from traders looking to reduce exposure.

XRP is trading around \$1.29, with the broader technical structure remaining bearish. The RSI is near 38, showing weak momentum, while the price is trading below its key short-term moving averages. Immediate support sits around \$1.275, followed by \$1.246. A daily close below \$1.24 would increase the risk of a move toward \$1.20 and potentially the \$1.10 area if selling pressure intensifies. On the upside, the first resistance lies around \$1.31–\$1.34, followed by the stronger \$1.38–\$1.43 zone. A sustained breakout above \$1.34 would be the first sign that buyers are regaining some control, while reclaiming \$1.43 would provide stronger confirmation of a recovery. The current RSI suggests that selling momentum is already significant, but traders should not assume that the price has reached a bottom. Bulls need to defend \$1.275 and establish higher lows before attempting a larger move higher. If XRP breaks below support, sellers could extend the decline toward the next psychological levels. For now, XRP remains a cautious setup, and traders should wait for a confirmed support hold or resistance breakout before increasing directional exposure.

Bitcoin remains the main market indicator, and the \$79,000–\$82,000 zone will be critical in determining whether the current correction stabilises or extends further. A confirmed reclaim of \$83,400 would improve the short-term outlook, while a daily close below \$79,000 could expose the \$75,000–

\$73,000 support area. Ethereum is showing weaker momentum, and buyers need to reclaim \$2,370 before a more meaningful recovery can develop. Solana is approaching an important support zone near \$98.50–\$100, but traders should wait for a reversal signal rather than relying on oversold indicators alone. XRP remains under pressure, with \$1.275 acting as the first key support and \$1.34 as an important recovery hurdle. BNB is showing comparatively better resilience, although a sustained break above \$753 is needed to strengthen its bullish case. The Federal Reserve meeting on October 27–28 is the major event this week, and its policy statement and guidance could trigger sharp moves across digital assets. US inflation expectations, bond yields and ETF flows should also remain on traders' watchlists. If Bitcoin holds support and reclaims its short-term moving averages, the wider market could attempt a relief rally. However, if BTC breaks below \$79,000, altcoins could face further downside as traders reduce risk. Avoid chasing sharp intraday candles, and look for confirmation through daily closes, trading volume and market structure. Keep position sizes appropriate for the current volatility and define stop-loss levels before entering a trade. The priority this week is protecting capital, respecting support and resistance, and waiting for confirmation before committing to the next major move.

Grayscale Tracks 580% Crypto Winner Targeting AI Computing Revenue

GrayScale is highlighting three crypto projects addressing artificial intelligence (AI) training data, hardware financing, and computing revenue. PEARL's reported 580% three-month gain accompanies the firm's assessment of blockchain applications across the industry's supply chain.

PEARL's 580% Gain Puts AI Computing Rewards in Focus Blockchain projects

are developing ways to earn revenue from AI infrastructure, with PEARL among three examples highlighted by Grayscale on Oct. 23. Zach Pandl, head of research at the digital asset manager, examined PEARL, DATA Network, and USD.AI as examples of blockchain applications in AI infrastructure.

Pearl, a blockchain project focused on AI computing, aims to let graphics processing units (GPUs) perform AI tasks while simultane-

ously securing a proof-of-work blockchain. These chips perform many calculations in parallel. Operators could earn blockchain rewards alongside payments for AI services.

The analysis reported PEARL's 580% gain over three months, citing CoinGecko data through Oct. 22. Pandl qualified the projects' prospects:

"Their long-term relevance will depend on adoption and competitive economics."

DATA Targets Paid Contributions to AI Training Human-contributed photographs, videos, and voice recordings form the basis of DATA Network's approach to supplying material for AI development.

Canada proposes direct stablecoin cash-outs for small holders with a 1% fee cap

Covered holders could redeem without a minimum amount, while reserve-market illiquidity could limit daily exits and banking access would still matter.

Canada's proposed stablecoin rules would give covered retail holders a way to ask an issuer for their money back without meeting a minimum redemption amount, potentially opening another exit alongside selling tokens through an exchange.

The proposal published Oct. 24 would normally require redemption within three business days and cap an issuer's redemption fee at 1%. It would also let issuers limit daily redemptions when a

liquidity shortfall in reserve-asset markets prevents them from meeting all requests.

Coverage would depend on Canadian purchaser-location criteria, the issuing entity and any applicable exclusions or exemptions. Circle's treatment under the future framework remains a separate question from its current terms, which do not let every USDC holder redeem directly.

These are proposed operating terms. The Stablecoin Act, which received royal assent March 26, has core provisions marked not in force, and the government's impact statement identifies fall 2027 as the intended implementation window.

New York AG Pursues \$1,300,000,000 From Crypto Pyramid Scheme Targeting Prayer Groups

New York Attorney General Letitia James is pursuing over a billion dollars from the operators of a fraudulent cryptocurrency scheme that infiltrated prayer groups and immigrant communities with false promises of easy riches.

Attorney General James filed a motion seeking \$1.3 billion in damages and disgorgement from the founders of NovaTech, Cynthia and Eddie Petions, following a default judgment in August after they fled the US.

In June 2024, New York Attorney General Letitia James sued cryptocurrency trading firm NovaTechFX and cryptocurrency mining company AWS Mining Pty Ltd., accus-

ing them of targeting immigrant communities, particularly Haitian New Yorkers, with fraudulent promises of high investment returns. According to the lawsuit, the companies promoted their schemes through prayer groups, social media and WhatsApp group chats while operating illegal pyramid schemes.

AWS Mining, its promoters and the Petions promised investors 15% to 20% monthly gains, 200% returns on investments within 15 months and bonuses for signing up new investors. However, the company generated insufficient returns, if any, to fund its promised monthly profits and recruitment bonuses.

Archax Turns To Chainlink Data Streams For Tokenised Treasury Collateral

Archax has adopted Chainlink Data Streams to supply pricing information for GOVY, its tokenised US Treasury product, as it develops collateral use cases.

Putting Treasury bills on a blockchain is only the beginning. If an institution wants to borrow against them or use them as margin in an automated market, the software also needs reliable, timely information about their value.

That is the gap Archax is addressing with Chainlink. The regulated digital asset platform said it has adopted Chainlink Data Streams for GOVY, its continuously rolling tokenised US Treasury product. The aim is to supply pricing data to support lending, treasury management and other

on-chain collateral applications.

GOVY is designed to provide exposure to short-dated US government bills, with the underlying securities held in regulated custody. Archax describes features including transfers between approved wallets and subscriptions or redemptions using supported stablecoins.

Those details matter because a tokenised security still needs rules around custody, eligibility and price discovery. A faster oracle feed cannot remove credit, liquidity or operational risk, and a proposed DeFi integration still has to be approved by individual markets. What it can do is make the underlying asset's price usable by programmable financial systems.

Pump.fun's biggest winners may be impossible to copy as \$752 million study exposes hidden trading gap

Bitquery found that just 26% of large memecoin wallet gains passed its trading checks, raising doubts about whether followers can replicate the profits shown on leaderboards.

ump.fun copy traders risk following wallets whose multimillion-dollar gains come from transactions they cannot replicate, new blockchain research shows.

An Oct. 22 investigation by Bitquery found that only 26% of \$752.5 million in large memecoin wallet gains passed its checks for conventional market trading, raising questions about the profitability rankings investors use to identify successful traders.

The study examined 3,170 wallet-token positions with reported gains of at least \$100,000 between October 2025

and August 2026. It found that 51% of the gains involved wallets selling tokens received from other addresses, while another 13% exhibited patterns of potentially coordinated trading. The remaining 10% could not be conclusively classified.

The findings expose a weakness in crypto copy trading, where investors use automated platforms to mirror transactions made by wallets with strong historical returns.

These systems typically rely on observable purchases to establish positions. However, wallets receiving tokens through transfers can record substantial profits without executing a market purchase that followers could replicate.

Phantom rolls out Kalshi prediction markets to US users, says it's 'confident and comfortable' amid state lawsuits

Phantom users will fund trades with CASH stablecoins, with market restrictions applied in Michigan, Nevada and Washington.

Users will fund trades with CASH stablecoin balances, with cash-outs and winnings returned to their Phantom Cash accounts.

Phantom will apply restrictions by market category in Michigan, Nevada and Washington. Crypto wallet provider Phantom is rolling out Kalshi prediction markets to U.S. users, letting them trade event contracts directly on its app.

The rollout begins Friday, Oct. 23, with access expanding over the coming weeks. Phantom users will need to complete KYC on Kalshi.

The launch comes as states challenge Kalshi's claim that federal oversight protects its event contract offerings from state gambling laws. Asked whether those disputes raised concerns for Phantom, General Counsel Kevin Jacobs said the company was comfortable moving forward.

"Our perspective is that the CFTC's jurisdiction here is clear," Jacobs told The Block. "So long as our interaction with these products is consistent with our no-action position, we are confident and comfortable engaging in this activity," he said.

In March, the Commodity Futures Trading Commission issued Phantom a conditional "no action" letter, relieving it from registering as a broker.
