EDITORS LETTER

Bitcoin remained relatively stable above $78,400 during Asian trading hours on Tuesday, even as broader risk assets came under pressure. BTC traded in a narrow range between roughly $77,200 and $79,200, showing that buyers are still defending the $78,000 area after the strong rally seen through August. Bitcoin closed August with a gain of around 24%, its strongest monthly performance since November 2024, giving the bulls a strong foundation heading into September. The return of institutional buying is also supporting the market, with Strategy stepping back into the market last week with a $370 million Bitcoin purchase after staying on the sidelines for almost two months. However, BTC is still facing resistance around the $80,000 area, and traders will want to see a clean breakout above this level before expecting another strong move higher.

The broader altcoin market was more mixed, with HYPE standing out as one of the strongest large-cap performers, gaining around 4% to trade near $84.

Bitcoin is entering September after a strong August rally, but the latest pullback shows that sellers are still active near the highs. BTC is holding around the $78,000 area after briefly moving above $80,000, keeping the broader recovery structure intact. The $78,000 level is important short-term support, while $80,000 remains the first major resistance. A sustained move above $80,000 could bring $81,000 into focus, followed by $84,000. If buyers clear $84,000 with strong volume, Bitcoin could accelerate toward $88,000–$90,000. On the downside, a break below $77,000 could send BTC toward $74,000 and $72,000. Traders should also watch for profit-taking after Bitcoin's strong August gains. For now, BTC remains bullish, but buyers need to defend the $77,000–$78,000 zone.

Ether is holding near $2,465 after a strong recovery and is approaching an important resistance zone. The first major hurdle is around $2,500, followed by the $2,550–$2,600 area. A clean daily close above $2,600 could strengthen the bullish setup and open the path toward $2,800 and $3,000. However, some profit-taking around current levels would not be surprising. If ETH slips below $2,400, traders may look for a pullback toward $2,300 and $2,200. As long as ETH holds above $2,400, the short-term structure remains constructive. Ethereum remains a key altcoin to watch, especially if Bitcoin holds above $78,000.

BNB continues to show relative strength and is trading close to $690 after consolidating near its recent highs. The token recently pushed above $690 but struggled near the $718–$725 resistance zone. If BNB breaks above $718–$725, the next major resistance comes near $745, followed by $790–$800. On the downside, $685–$690 has become an important short-term support zone. If BNB falls below $685, the price could retreat toward $660 and $640. For now, BNB remains one of the stronger large-cap setups, but traders should watch for a clean breakout above $725 before chasing the next move higher.

Solana is consolidating around the $100–$105 area after pulling back from its recent high above $110. Buyers continue to defend the psychological $100 level, keeping the broader recovery structure intact. A move back above $105 could signal that bulls are ready to challenge the recent high again. If SOL breaks and closes above $110–$111, the next upside target could be $117–$120, with $130 possible if momentum accelerates. The downside levels to watch are $100 and $95. A decisive break below $95 could send SOL toward $90. Strong Solana ETF inflows and declining exchange balances provide a positive backdrop, but price still needs to confirm the next breakout.

XRP has pulled back toward the $1.35–$1.40 region after a powerful rally from the $1 area. The recent rejection from higher levels shows that traders are also booking profits. XRP is now near an important support zone around $1.34–$1.37, which needs to hold. If buyers reclaim $1.45, the next major resistance comes around $1.50–$1.51. A breakout above $1.51 could open the path toward $1.60 and $1.66. On the downside, losing $1.34 could trigger a correction toward $1.27–$1.30. For now, XRP remains bullish above support, but the $1.50–$1.66 region will be a major test.

Trader's Outlook

Bitcoin remains the market leader, and its ability to hold $78,000 will be important for the entire crypto market. A clean break above $80,000 could push BTC toward $84,000 and $88,000–$90,000, while losing $77,000 could bring $74,000–$72,000 into focus. Ethereum needs to clear $2,500–$2,600 to target $2,800 and $3,000. BNB remains strong, but $718–$725 is the key breakout zone. Solana is consolidating around $100, with $110–$111 as the next major breakout level. XRP needs to break $1.50–$1.51 before targeting $1.60 and $1.66. Overall, the market remains bullish, but September is showing some signs of exhaustion and macro uncertainty. ETF flows and interest-rate expectations remain important, while traders should focus on major support and resistance levels rather than chasing extended moves.

CRYPTONAIRE WEEKLY

Cryptonaire Weekly is one of the industry's longest-running and most trusted sources for cryptocurrency news, market insights, and blockchain analysis. Created to support our Platinum Crypto Academy clients and global subscribers, the magazine delivers clear research, actionable technical analysis, and strong thought leadership across the digital asset space.

Each week, we provide readers with in-depth articles, project updates, and market commentary that cover the rapidly evolving world of blockchain and Web3. For traders, investors, developers, and entrepreneurs, navigating this fast-changing environment can be challenging. Our mission is to simplify that journey and help readers make informed, confident decisions.

Since our launch in 2017, we've covered every major cycle in crypto from Bitcoin's early rally past **$20,000 in 2017** to its sharp correction near **$3,200 in 2018**, marking one of the strongest bear markets in the sector's history. We followed Bitcoin's surge to **$69,000 in 2021** and its deep pullback to around **$16,000 in 2022** during a period of global uncertainty and high-profile exchange failures. Most recently, we've tracked Bitcoin's powerful 2025 resurgence as it broke into six-figure territory, hitting levels above **$123,000** and reaffirming long-term market confidence.

Our **Platinum Crypto Academy** community includes thousands of students and traders worldwide. Over time, **Cryptonaire Weekly** has grown to more than **250,000 active subscribers** and a **social reach of over 1.2 million followers across multiple platforms and community groups**. Through our research-driven insights and strategic relationships, we've also helped **350+ blockchain and crypto projects gain** meaningful traction and visibility in the global market.

For anyone looking to stay informed, identify opportunities, and understand the technologies shaping the future of finance, Cryptonaire Weekly remains a trusted and valuable resource.

WEEKLY CRYPTOCURRENCY MARKET ANALYSIS

Hello, welcome to this week's 435th edition of Cryptonaire Weekly Magazine. The global crypto market cap is $2.64 trillion, up $45 billion since the last edition. Total crypto market trading volume over the last 24 hours is $75.90 billion, up 4.25%. The Fear & Greed Index is at 75%, indicating Greed, while the Altcoin Season Index is 26%, up 14% over the last 15 days.

Bitcoin's price has increased by 22.74%, from $64,150 since the last edition to around $78,740. Ether's price has increased by 30.61%, from $1,895 over the last 15 days to $2,475.

Bitcoin's market cap is $1.58 trillion, while the altcoin market cap is $1.06 trillion. Bitcoin remained stable above $78,400 during Asian trading hours on Tuesday despite pressure on broader risk assets. BTC traded between roughly $77,200 and $79,200, with buyers defending the $78,000 area. Bitcoin closed August with a gain of around 24%, its strongest monthly performance since November 2024. Institutional buying is also supporting the market, with Strategy purchasing $370 million worth of Bitcoin last week. However, BTC continues to face resistance around $80,000, and traders will look for a clean breakout above this level before expecting another strong move higher.

Percentage of Total Market Capitalization (Domnance)

BTC	57.60%
ETH	10.86%
STABLECOINS	10.51%
Others	21.03%

The broader altcoin market was mixed, with HYPE standing out as one of the strongest large-cap performers, gaining around 4% to trade near $84. Ether and Solana slipped around 1%, trading near $2,440 and $104, while XRP remained just below $1.40 and BNB near $693. Tron and Dogecoin fell around 2%. While Bitcoin remains relatively strong, traders are still selective with altcoin exposure. A sustained BTC breakout could determine whether capital rotates more aggressively into altcoins.

Macro conditions remain an important risk for crypto traders. Asian equities were mostly weaker, while Brent crude climbed toward $91 a barrel following US military action near the Strait of Hormuz. Higher oil prices could increase inflation concerns and delay interest-rate cuts, creating a less supportive environment for risk assets. Traders should therefore continue watching BTC, equities, oil and US bond yields for signs of renewed inflation pressure.

Thailand is moving toward giving retail investors greater access to overseas crypto derivatives. The Thai SEC has proposed allowing regulated intermediaries to offer certain overseas digital-asset derivatives to retail traders, subject to requirements covering the underlying asset, maturity, leverage and settlement. The products would also need to trade on regulated exchanges using central clearing. Higher-risk products that do not meet these requirements would remain restricted to institutional investors. The consultation remains open until September 30, with traders watching for the final framework and its potential impact on crypto derivatives activity.

Corporate Bitcoin accumulation is also picking up. Strive purchased 1,800 BTC for around $143 million at an average price of approximately $79,431, taking its total holdings to 23,156 BTC and making it the fifth-largest publicly traded corporate Bitcoin holder. Strategy also purchased 4,603 BTC for approximately $370 million at an average price of $80,318, bringing its total holdings to 845,050 BTC. These purchases highlight continued corporate demand despite Bitcoin trading below its recent highs.

Bitcoin ETF flows are also supporting the bulls. US spot Bitcoin ETFs recorded around $216.7 million in net inflows on Monday, reversing $201.8 million of outflows on Friday. BlackRock's IBIT led activity with around $205.9 million, or roughly 95% of the total inflows. Ethereum ETFs recorded their 11th consecutive session of inflows, with around $87.7 million entering the funds. XRP and Solana ETFs also continued their positive streaks, recording their 10th consecutive sessions of inflows. Continued ETF demand suggests institutional and traditional-market investors remain interested in crypto exposure.

Overall, the market is showing a clear battle between strong institutional demand and short-term macro pressure. Bitcoin's 24% August rally has improved the broader trend, but BTC still needs to reclaim and hold $80,000 to confirm another leg higher. Until then, traders should expect volatility around the $78,000–$80,000 zone, with a break in either direction likely to bring stronger momentum.

Market Outlook

Bitcoin remains the key chart to watch, with $78,000 as important support and $80,000 as the first major resistance. A clean break above $80,000 could open the way toward $84,000 and potentially higher if ETF inflows and corporate buying continue. On the downside, losing $77,000 could bring $75,000 into focus. Ethereum is holding above $2,400, but a move back toward $2,500 would provide stronger confirmation of recovery. BNB remains relatively strong near $693, with $700 as the next psychological hurdle. Solana is trading near $104, making the $100 area important for maintaining its recovery structure. XRP remains close to $1.40, while HYPE continues to show relative strength among large-cap altcoins. Overall, ETF inflows and corporate buying remain encouraging. The broader setup is cautiously bullish, but traders should wait for confirmation rather than chase prices within the current range. The key signal remains whether Bitcoin can break and hold above $80,000 while maintaining strong spot and ETF demand.

introducing
FAIRCARATS

FAIRCARATS TOKEN INTRODUCTION

Bridging Lab-Grown Gemstones and Decentralized Finance
In the evolving landscape of digital assets, LabGemTraders OÜ is proud to introduce the restructured FairCarats (FCAR) token. More than just a digital asset, FCAR is a utility-driven bridge between the timeless elegance of premium lab-grown gemstones and the efficiency of the Polygon blockchain.

labgemtraders.info

FAIRCARATS (FCAR) — PUBLIC SALE

FairCarats (FCAR) is a digital utility voucher that can be redeemed for FairStones™ certified lab-grown gemstones and services.

FCAR gives early participants access and enhanced purchasing power inside the FairStones ecosystem.

Asset: FCAR (FairCarats) on Polygon Chain
Price: 14.85 USDC
Min/Max: No Minimum / 50,000 USDC
Vesting: Quarterly releases starting June 2026

official whitepaper

Public Sale Offering

Fairstones®

The LabGemTraders company is the sole supplier of gemstones to FairStones:
https://fairstones.eu/

UK Financial Ltd has announced that COQUIZILLA Coin (COQZ) is now trading on CATEX Exchange through the COQZ/USDT pair. The ERC-20 meme token operates under the UK Financial World Division's Managing Partner Program. The program supports emerging Web3 projects while keeping ownership with their original creators.

COQUIZILLA brings a distinct identity to the meme coin space, taking its name and character from a small but vocal frog native to Puerto Rico. That cultural angle, paired with a community-first approach, has helped generate early trading interest on CATEX. COQZ launched through the MayaPro Wallet at $0.25 and has since climbed to approximately $6.05 per token. That marks a gain of roughly 24 times its original offering price. Meme coin prices remain volatile, but the early momentum points to growing market attention for COQZ.

UK Financial Ltd is now preparing a separate and larger decision involving the UK Financial Moonshot Token (UKFLMS). The company's Board of Directors will meet Friday to review a potential burn of up to 60 percent of UKFLMS tokens currently outstanding. The tokens under review were purchased on the open market by UK Financial Ltd and by James Dahlke, President and CEO of UK Financial Ltd, rather than issued to them upon creation. Any approved burn would therefore involve assets the company and its CEO already bought, not tokens belonging to MoonShot or another party.

According to company records, UK Financial Ltd holds 416,556,564.07 UKFLMS. Dahlke personally holds an additional 129,850,426.34 UKFLMS. Combined, the two positions total 546,406,990.41 UKFLMS, all of which could be affected if the Board approves the measure. About 200 million UKFLMS remain outstanding beyond these combined holdings, according to the same company data.

UK Financial Ltd has already been purchasing UKFLMS in the open market ahead of Friday's meeting. The Board will decide whether the company expands beyond its existing buyback activity and adopts a formal burn to permanently reduce token supply.

"When you have a company with substantial assets, on-chain proof and verification, yet see its token trading at a market capitalization of approximately $115,000, we believe the situation deserves serious consideration," said James Dahlke, President and CEO of UK Financial Ltd. "We have always put our coin holders first. If approved, we will absorb the financial impact ourselves rather than pass it on to coin holders."

Friday's meeting will also address existing buybacks, future UKFLMS purchases and the long-term supply structure of the token.

ADVANCEMENTS IN THE CRYPTOCURRENCY WORLD

BITCOIN BARELY BLINKS AS U.S. HITS IRAN, SENDING OIL HIGHER AND STOCKS LOWER

Geopolitical stress is back in the market, lifting oil higher. Still, bitcoin BTC $78,597.55 is trading steadily during Asian hours, showing resilience and outperforming gold and stocks, a recurring theme through August.

Oil prices rose on both sides of the Atlantic after the U.S. attacked an Iranian island in the Strait of Hormuz, a major oil tanker route that has been disrupted since the conflict began six months ago. The attack drew retaliatory action from Iran.

WTI crude futures jumped nearly 2% to $85.10, with Brent rising 1.9% to $92.39, according to TradingView. Gold fell 0.8% to $4,418 per ounce, and futures tied to the Nasdaq slipped 0.5% alongside losses in Asian equity markets.

Bitcoin, however, traded near $77,580, largely unchanged since midnight UTC, according to CoinDesk. BTC's price has surged 23% this month versus gold's 9% gain and the Nasdaq's 4% rise. Other major tokens, however, traded slightly lower. Payments-focused XRP (XRP) fell by 0.8% with solana (SOL) down 0.6%.

Bitcoin's continued outperformance could be linked to strong inflows into spot ETFs and hopes for aggressive intervention by the Fed in the wake of the Treasury's bond buyback program.

However, on Friday, Fed chief Kevin Warsh delivered a hawkish speech at the Jackson Hole Symposium, raising hopes of an interest rate hike in September. Warsh noted that inflation remains insufficiently contained and argued that current financial conditions are not restrictive. He added that recent improvements in inflation are not yet enough to signal a meaningful improvement in underlying price pressures.

"The speech prompted a repricing of U.S. rates. Markets now assign a 58% probability of a September hike and price roughly 1.5 hikes by year-end," Lloyd Chan, FX strategist, at MUFG noted.

Some crypto observers continue to call for caution.

Real Trump Coins denies launching GOLD token, blames 'bad actors'

Trump-linked Real Trump Coins said it never authorized GOLD or any digital token as questions persisted over its X account, associated domains and the concentrated token supply.

Real Trump Coins has denied launching, promoting or authorizing the Trump Digital GOLD token that briefly appeared across its online presence before collapsing, blaming the promotion on "third-party bad actors."

The denial came after the Real Trump Coins X account promoted the Solana-based token on Saturday and directed users to RealTrumpCoins.com, where GOLD was also advertised. The X posts were later deleted, while the account now links to a separate domain, TrumpCoins.com.

"Trump Coins has not authorized and will not launch, promote, or authorize any digital token," Real Trump Coins said in an X post on Saturday, adding that it was working with authorities to investigate the matter.

The statement follows a highly concentrated GOLD launch, with Lookonchain reporting that the developer and newly created wallets controlled 82.45% of its supply.

Cronos halts blockchain after $75 million lending exploit hits lending app Tectonic

An attacker allegedly pushed Tectonic's thinly traded TONIC token up 100-fold, used it as collateral to borrow real assets and left most funds stranded when Cronos validators paused the network. Cronos stopped its entire blockchain on Sunday after an attacker exploited Tectonic, its biggest lending platform, in an attack estimated at roughly $75 million.

Cronos is a blockchain launched by Crypto.com in 2021 and closely tied to the exchange, which uses it to run cheaper transactions for its own products. Its CRO token is the one Crypto.com holds up as the centre of its ecosystem, and the chain hosts a small set of lending and trading apps, of which Tectonic is the largest.

Tectonic lets users deposit crypto and borrow other assets against it, much like putting up a house as collateral for a loan.

One of the assets it accepted as collateral was TONIC, its own token, which had about $1.34 million of liquidity and roughly $11,000 of daily trading volume. Tectonic's own documentation warns that low-liquidity assets can be particularly susceptible to price manipulation.

That appears to have provided the opening, blockchain data shows, as an attacker pushed TONIC's price up roughly 100-fold in about 20 minutes.

Stellar tokenized RWA market more than quadruples to nearly $4B

Stellar's real-world asset market has expanded rapidly this year as institutional adoption and tokenization activity grow across the network.

The value of tokenized real-world assets (RWA) on Stellar has climbed roughly 360% in 2026 to nearly $4 billion, up from $868.8 million at the end of last year, according to a Dune Analytics dashboard maintained by Stellar.

The network's RWA market cap stood at $3.996 billion as of Aug. 29, spread across US Treasurys, private and public credit, non-US government debt and other tokenized asset classes.

The market is concentrated among a handful of issuers. Spiko accounted for $1.55 billion of Stellar's RWA value as of Aug. 27, followed by Realiz at $559 million, Tradable at $548 million, Franklin Templeton at $546 million and Ondo at $535 million.

Stellar has gained ground in non-US government debt. Citing RWA.xyz data, the Stellar Development Foundation said the network held about $490 million in the asset class as of Aug. 20, including tokenized Mexican CETES and Brazilian government bonds issued through Etherfuse.

Despite the growth in RWAs, the blockchain's native XLM token is down about 11% year to date, trading near $0.18, according to CoinGecko data.

Charles Schwab Expands Crypto Platform Adding Solana Avalanche and Chainlink

A leading financial services firm is expanding its cryptocurrency trading service to include three additional digital assets that have gained significant investor interest.

Charles Schwab says it will add Solana (SOL), Avalanche (AVAX), and Chainlink (LINK) to Schwab Crypto accounts in the coming months.

The platform, which began rolling out to clients in May 2026, already offers direct access to Bitcoin (BTC) and Ethereum (ETH) trading.

Schwab plans to add more cryptocurrencies and digital assets over time, focusing on established ones that align with client demand.

Says Joe Vietri, Head of Digital Assets at Charles Schwab,

"With this expansion, clients will have more choices to build a digital asset allocation alongside the investing and banking experience they know and trust at Schwab. These additions are consistent with our approach to provide clients with access to familiar cryptocurrencies backed by an ecosystem of education, tools, resources, and support to make informed decisions about how crypto might fit into their broader investing goals."

Schwab Crypto features in-depth education resources and the ability to view and trade crypto alongside traditional investments on platforms like Schwab.com and thinkorswim, with 24/7 support and trading fees of 75 basis points.

The crypto world is full of ambitious projects, yet many struggle to stand out. Visibility, credibility, and long-term support often decide which projects succeed and which fade away. For years, promising ideas have launched with excitement, only to lose momentum once daily challenges set in.

UK Financial Ltd, the company behind the well known Maya project, has now introduced a new division. Called UK Financial World, it aims to tackle these common issues within the crypto space. The goal is simple, to give projects a stronger and more reliable path forward.

What is the UK Financial World?

UK Financial Ltd has officially launched UK Financial World, a brand new strategic division. The division focuses on managing, developing, promoting, and growing digital asset projects. It operates through the official platform, UKFinancial.World, built for close collaboration.

Through this platform, UK Financial Ltd and its partners can jointly manage many blockchain ventures. The division acts as a partner manager across several project categories. These include meme coins, community driven tokens, and traditional cryptocurrency projects. It also covers blockchain applications and tokenized real world assets.

Some projects keep their original ownership while UK Financial World supports their growth. In these cases, the division steps in as a management and operating partner. This setup gives founders extra support without losing control of their vision. It also gives the wider crypto community a more transparent structure to work with.

The Challenges New Crypto Projects Face in Today's Market

Weak project management – Many new crypto projects struggle with basic day to day management tasks. Founders often understand the technology well but lack real business experience. This gap leads to missed deadlines, weak communication, and stalled growth over time.

Unclear regulatory rules – Rules around crypto still differ widely from one country to another. New projects often struggle to understand which laws actually apply to them. Without clear guidance, many teams accidentally break rules or delay their launch.

Low visibility in a crowded market – The crypto space is crowded, with thousands of projects launching every month. Standing out from this crowd is hard, even for genuinely good ideas. Without visibility, investors and users often overlook projects that actually deserve attention.

No reliable launchpad – Many small projects lack access to a trusted launch platform. Without proper support, they struggle to build early momentum and community trust. A weak or unreliable launch often decides whether a project survives or fails.

Limited market reach and funding – New projects often find it hard to reach real users and buyers. Limited funding makes marketing and community building even more difficult. Without steady support, many good projects quietly fade before gaining real traction.

Why UK Financial Ltd Created the UK Financial World?

To fix common flaws across the crypto space

UK Financial Ltd created UK Financial World to directly address these common industry flaws. The company noticed that many new projects fail due to weak management and low visibility. Regulatory confusion and poor launch support also stop good ideas from growing properly. By building a dedicated division, UK Financial Ltd wanted to offer real solutions. This includes structured management, better market access, and clearer regulatory guidance for partner projects. The division was designed as a response to gaps that founders face every day. Instead of leaving new projects to struggle alone, UK Financial World steps in as a support system.

To offer partnership, not full ownership

UK Financial World was also built to offer a clear partnership model for projects. Many people assume that once a project joins a big company, ownership fully changes hands. UK Financial Ltd wanted to avoid giving that wrong impression to its community. Certain projects keep their original ownership, staying with their founders or outside partners. UK Financial World instead steps in as a strategic management and operating partner. This means founders keep creative control while gaining real operational support behind the scenes. Furthermore, it creates a more honest and transparent relationship between the company and its partners.

To give new projects recognition and credibility

One major reason behind this division is helping new projects gain real recognition. Joining forces with an established name like UK Financial Ltd builds instant credibility. New projects often struggle to earn trust when they launch completely on their own. Being linked to a known and respected company changes that perception quickly. Investors and community members feel more confident supporting a project backed by a partner. This recognition can also open doors to better exposure and stronger media coverage. Over time, this association helps smaller projects compete with more established names in the space. It gives new teams a real chance to be noticed and taken seriously.

To help projects navigate regulatory requirements

Regulatory uncertainty remains one of the biggest hurdles facing new crypto projects today. Many founders simply do not have the resources to handle complex legal requirements. UK Financial World was created partly to guide partner projects through this process. With proper support, projects can launch while staying more aligned with regulatory expectations. This reduces the risk of legal trouble that could damage a project later on. It also gives investors more confidence, knowing a project has some structured oversight. Instead of navigating rules alone, founders gain access to guidance built from real experience. This support can make the difference between a smooth launch and a risky one.

To open market access for smaller projects

Small and independent projects often struggle to reach a wider crypto market alone. Without strong connections, even good ideas can stay unnoticed for a long time. UK Financial World gives these projects a path into an existing, active community. This includes access to a wider audience already engaged with UK Financial Ltd. Smaller teams gain visibility they would find difficult to achieve completely on their own. This kind of market access can speed up growth in the early stages significantly. It also helps balance the playing field between large and small crypto projects. In the end, this support gives promising ideas a genuine chance to succeed.

What UK Financial World Brings Together Under One Platform?

UK Financial World manages a broad mix of projects across the digital asset space. Meme coins sit at one end, driven by humor and viral online culture.

Community driven tokens sit close by, since both rely on active user participation to grow.

Traditional cryptocurrency projects and blockchain applications fall under the same umbrella. Some need little beyond marketing and community support. Others require deeper technical guidance to actually function. UK Financial World handles both sides, whatever the project actually needs.

Tokenized real world assets complete the lineup, bringing physical or financial assets onto the blockchain. These projects demand careful structuring to stay compliant and earn investor trust. Covering this much ground is what makes UK Financial World a genuinely flexible partner for different kinds of builders.

The First Projects Under UK Financial World

Coquizilla (COQZ)

Coquizilla, known by its ticker COQZ, is set to go live this week. Built on the Solana network, it draws inspiration from Puerto Rican culture. The project centers around the coquí, a small frog famous for its loud call. This concept gives Coquizilla a distinct identity within a crowded meme coin market.

Coquizilla leans heavily into community and viral culture to build early momentum. UK Financial World will manage this partnership as part of its growing project lineup. This means marketing, structure, and community support come from an experienced backing team. For a meme coin, that kind of support can make a real difference early on.

KIM JONG JELLY ($JELLY)

KIM JONG JELLY, traded as JELLY, takes a bold parody approach to meme coins. The concept follows a character who once hated America until discovering jelly. This playful premise, built on Ethereum, taps directly into internet humor and culture. It already carries a fast growing social media following behind it.

More than 50,000 members currently support the project across various social platforms. That existing community gives KIM JONG JELLY a real head start before launch. UK Financial World will manage this partnership, offering structure and consistent operational support. The project is expected to go live soon, joining the division’s growing lineup.

Legend Coin (LGND)

Legend Coin, known as LGND, takes a more serious approach than typical meme coins. Built as an ERC-20 utility token, it runs on the Ethereum ecosystem. The project focuses on mergers, acquisitions, and broader global business opportunities. This gives Legend Coin a clear use case beyond pure community hype.

Legend Coin remains independently owned by its original founders and creators. UK Financial World will manage and develop the project through its Partner Program. An existing Instagram and social media community of over 25,000 members supports it already. This partnership shows how UK Financial World works with teams that keep full ownership.

Takeaway

The numbers behind new crypto launches in 2026 paint a difficult picture. More than 540,000 tokens launched on Ethereum, Solana, and Base in the first two months of the year alone, and project failure rates have climbed nearly 4,500 percent since 2021. Separate research backs this trend, showing over half of all cryptocurrencies launched since 2021 have already failed, with most of that collapse happening in 2025 alone. These figures reflect a market where hype alone is no longer enough to survive.

This is exactly the kind of environment UK Financial World was built to address. By offering structure, credibility, and hands on management, it removes many early risks for new projects. Instead of launching alone into an oversaturated market, partner projects gain real operational backing. In a market where most new tokens quietly disappear, this kind of support becomes genuinely valuable.

Polygon Quietly Patched Security Flaws in Two Hard Forks Before Disclosing Them

The Austin and Kyoto hard forks, deployed quietly on the Bor and Heimdall clients before public disclosure, closed denial-of-service and consensus-hardening flaws that Polygon says were never exploited.

Polygon Labs disclosed it patched a batch of security vulnerabilities through two hard forks—Austin on its Bor client and Kyoto on Heimdall—rolled out privately and validated on testnet before mainnet activation.
The fixes closed denial-of-service paths in block processing and a more severe flaw that could have forced costly, coordinated work across the entire validator set via a single crafted transaction.
Polygon's native token POL was trading around $0.09983 Sunday, down 2.3% on the day and 6.8% on the week.
Polygon Labs has revealed that it fixed a batch of security vulnerabilities in its proof-of-stake network through two hard forks that were rolled out privately before being disclosed publicly.

In a forum post published Wednesday, the team detailed the fixes bundled into the Austin hard fork on its Bor client and the Kyoto hard fork on its Heimdall client. Both were deployed following what Polygon described as standard practice for consensus-affecting fixes: rolling them out quietly and validating them on the Amoy testnet before mainnet activation, then going public once the network was safe.

Bitcoin ETFs Snap Nine-Day Inflow Streak as Ethereum Funds Extend Their Run

Spot Bitcoin ETFs shed $201.9 million on Aug. 28, ending a nine-day inflow run, even as Ethereum funds extended a 10-day streak with fresh cash.

U.S. spot Bitcoin ETFs recorded $201.9 million in net outflows on Aug. 28, snapping a nine-day inflow streak and trimming cumulative net inflows to about $55.1 billion.

The reversal caps an otherwise strong run—$2.8 billion over an eight-day streak as BTC tested $80,000, plus the biggest single day since May—with daily inflows repeatedly topping $300 million and peaking above $600 million on Aug. 20.

Ethereum ETFs showed no such fatigue, taking in $102.1 million to extend a 10-day streak and lift cumulative inflows to about $12.9 billion.

Spot Bitcoin exchange-traded funds broke a nine-day winning streak on Friday, shedding money just as their Ethereum counterparts kept pulling in fresh cash.

U.S. spot Bitcoin ETFs recorded $201.9 million in net outflows on Aug. 28, according to data from SoSoValue, ending a stretch of consecutive inflows that had run since mid-August. The reversal trimmed cumulative net inflows to about $55.1 billion, with the funds now holding roughly $93.9 billion in total net assets. Decrypt's ETF flow tracker flipped its Bitcoin sentiment reading to "bearish" on the day.

An ETF, or exchange-traded fund, is an investment vehicle that holds an underlying asset and trades on a traditional stock exchange, letting investors buy and sell shares through an ordinary brokerage account. A spot Bitcoin ETF holds actual Bitcoin, and each share represents a claim on a slice of that stash.

Bitcoin remained relatively stable above $78,400 during Asian trading hours on Tuesday, even as broader risk assets came under pressure. BTC traded in a narrow range between roughly $77,200 and $79,200, showing that buyers are still defending the $78,000 area after the strong rally seen through August. Bitcoin closed August with a gain of around 24%, its strongest monthly performance since November 2024, giving the bulls a strong foundation heading into September. The return of institutional buying is also supporting the market, with Strategy stepping back into the market last week with a $370 million Bitcoin purchase after staying on the sidelines for almost two months. However, BTC is still facing resistance around the $80,000 area, and traders will want to see a clean breakout above this level before expecting another strong move higher.

The broader altcoin market was more mixed, with HYPE standing out as one of the strongest large-cap performers, gaining around 4% to trade near $84. Ether and Solana both slipped around 1%, trading near $2,440 and $104 respectively, while XRP held just below $1.40 and BNB remained near $693. Tron and Dogecoin were among the weaker performers, both falling around 2%. This shows that while Bitcoin is holding up relatively well, traders are still being selective with altcoin exposure. For now, BTC remains the main market leader, and a sustained breakout from its current range could determine whether capital starts rotating more aggressively into altcoins.

Macro conditions remain an important risk for crypto traders. Asian equities were mostly weaker, while Brent crude climbed toward $91 a barrel following US military action near the Strait of Hormuz. Higher oil prices can increase inflation concerns and potentially delay interest-rate cuts, creating a less supportive environment for risk assets such as Bitcoin. This means traders should continue watching the relationship between BTC, equities, oil and US bond yields, as a renewed rise in inflation expectations could trigger short-term selling across crypto.

Thailand is also moving toward giving retail investors greater access to overseas crypto derivatives. The Thai SEC has proposed allowing regulated intermediaries to offer certain overseas digital-asset derivatives to retail traders, provided the products meet specific requirements around the underlying asset, maturity, leverage and settlement. The products would also need to trade on regulated exchanges using central clearing. The proposal shows that regulators are increasingly looking at ways to bring crypto derivatives into the traditional financial system rather than keeping them outside the regulated market. However, higher-risk products that do not meet the proposed requirements would remain restricted to institutional investors. The consultation remains open until September 30, so traders will be watching closely for the final framework and its potential impact on crypto derivatives activity in Thailand.

Corporate Bitcoin accumulation is also picking up again. Strive purchased 1,800 BTC for around $143 million last week at an average price of approximately $79,431, taking its total holdings to 23,156 BTC and making it the fifth-largest publicly traded corporate Bitcoin holder. The purchase followed another 1,110 BTC acquisition the previous week, showing that the company is aggressively increasing its Bitcoin exposure while the market remains volatile. Strategy also returned as a major buyer, purchasing 4,603 BTC for approximately $370 million at an average price of $80,318. Its total holdings have now reached 845,050 BTC, acquired at an average price of around $75,413. These purchases are important from a market perspective because they show that corporate demand remains active even with Bitcoin trading below its recent highs.

Bitcoin ETF flows are also giving the bulls some support. US spot Bitcoin ETFs recorded around $216.7 million in net inflows on Monday, reversing the $201.8 million of outflows seen on Friday. The inflows came after a nine-session streak that had brought more than $3 billion into the funds. BlackRock's IBIT dominated Monday's activity, attracting around $205.9 million, or roughly 95% of the day's total Bitcoin ETF inflows. Ethereum ETFs were even more consistent, recording their 11th consecutive session of inflows with around $87.7 million entering the funds. XRP and Solana ETFs also continued their positive streaks, with both recording their 10th consecutive session of inflows. The continued ETF demand is a positive signal because it suggests institutional and traditional-market investors are still looking for crypto exposure despite the recent price weakness.

Overall, the market is showing a clear battle between strong institutional demand and short-term macro pressure. Bitcoin's 24% August rally has improved the broader trend, but BTC still needs to reclaim and hold the $80,000 level to confirm that buyers are ready to push the next leg higher. Until that happens, traders should expect volatility around the $78,000-$80,000 zone, with a break in either direction likely to bring stronger momentum.

Bitcoin remains the key chart to watch, with $78,000 acting as an important near-term support zone and $80,000 as the first major resistance. A clean break above $80,000 could open the way toward $84,000 and potentially higher if ETF inflows and corporate buying continue. On the downside, losing $77,000 would weaken the short-term structure and could bring $75,000 back into focus. Ethereum is holding above $2,400, but traders need to see stronger buying and a move back toward $2,500 to confirm that the recent pullback is ending. BNB remains relatively strong near $693, with $700 acting as the next psychological hurdle and a sustained move above it likely to attract fresh buyers. Solana is trading near $104, and holding the $100 area will be important if bulls want to maintain the current recovery structure. XRP remains close to $1.40, but the token needs to regain higher resistance levels before traders can expect a stronger breakout. HYPE continues to show relative strength and remains one of the better-performing large-cap altcoins, although traders should be careful chasing sharp moves after a strong rally. ETF inflows across Bitcoin, Ethereum, XRP and Solana are encouraging and suggest that institutional demand has not disappeared. For now, the broader setup remains cautiously bullish, but traders should wait for confirmation rather than chase price inside the current range. The key signal for the market will be whether Bitcoin can break and hold above $80,000 while maintaining strong spot and ETF demand.

Bitcoin is entering September after a strong August rally, but the latest pullback shows that sellers are still active near the highs. BTC is holding around the $78,000 area after briefly moving above $80,000, keeping the broader recovery structure intact. The $78,000 level is now an important short-term support, while $80,000 remains the first major resistance that bulls need to reclaim decisively. A sustained move above $80,000 could bring the recent high near $81,000 back into focus, followed by the $84,000 resistance zone. If buyers clear

$84,000 with strong volume, Bitcoin could accelerate toward $88,000-$90,000. On the downside, a break below $77,000 would weaken the short-term setup and could send BTC toward $74,000 and then $72,000. The recent rally has been strong, but traders should also watch for profit-taking after Bitcoin gained about 24% during August. Exchange reserves, ETF flows and spot demand will remain important signals for determining whether the rally has enough fuel to continue. For now, BTC remains in a bullish structure, but the market needs to see buyers defend the $77,000-$78,000 zone to keep momentum alive.

Ether is holding near the $2,465 level after a strong recovery, but the price is now approaching an important resistance zone. ETH has recovered sharply from the lower levels seen earlier in the summer, and the recent price action suggests that buyers are still willing to buy dips. The first major hurdle is around $2,500, followed by the $2,550-$2,600 area. A clean daily close above $2,600 would strengthen the bullish setup and could open the path toward $2,800 and then $3,000. However, the recent rally has also pushed momentum indicators higher, so some profit-taking around current levels would not be surprising. If ETH slips below $2,400, traders may look for a deeper pullback toward $2,300 and then $2,200. The $2,200 area is likely to be an important demand zone if the market enters another correction. As long as ETH holds above $2,400, the short-term structure remains constructive. Ethereum therefore remains one of the key altcoins to watch for a breakout, especially if Bitcoin continues to hold above $78,000.

BNB continues to show relative strength and is trading close to $690 after spending much of the past few sessions consolidating near its recent highs. The token recently pushed above the $690 area but struggled to maintain momentum near the $718-$725 resistance zone. That makes $700 the first psychological level bulls need to reclaim with strength. If BNB breaks above $718-$725, the next major resistance comes near $745, followed by the $790-$800 zone. Such a breakout would confirm that buyers are still firmly in control after the strong August advance. On the downside, $685-$690 has become an important short-term support zone, and holding this area would keep the bullish structure intact. If BNB falls below $685, the price could retreat toward $660 and potentially $640. A deeper correction toward $612 would become possible if broader market sentiment turns risk-off. For now, BNB remains one of the stronger large-cap setups, but traders should watch for a clean breakout above $725 before chasing the next move higher.

Solana is consolidating around the $100-$105 area after pulling back from its recent high above $110. The recent correction has not yet damaged the broader recovery structure, with buyers continuing to defend the psychological $100 level. A move back above $105 would be the first sign that bulls are ready to challenge the recent high again. If SOL breaks and closes above $110-$111, the next upside target could come around $117-$120, with $130 becoming possible if momentum accelerates. The downside level to watch is $100, followed by the $96-$95 zone. A decisive break below $95 would weaken the current setup and could send SOL toward $90. The positive side of the current structure is that US spot Solana ETFs have recorded seven consecutive weeks of inflows, while exchange balances have also declined, suggesting that some investors are moving SOL away from exchanges. This gives the bulls a stronger fundamental backdrop, although price still needs to confirm the next breakout. For now, SOL remains in consolidation mode, with $100 support and $110 resistance likely to decide the next major move.

XRP has pulled back toward the $1.35-$1.40 region after a powerful rally that pushed the token sharply higher from the $1 area. The recent move shows that buyers remain interested, but the rejection from higher levels indicates that traders are also booking profits. XRP is now sitting close to an important support zone around $1.34-$1.37, which needs to hold to keep the short-term recovery structure intact. If buyers reclaim $1.45, the next major resistance comes around $1.50-$1.51. A breakout above $1.51 would improve momentum and could open the path toward $1.60 and eventually the recent high near $1.66. On the downside, losing $1.34 could trigger a deeper correction toward $1.27-$1.30. A break below $1.27 would weaken the bullish setup and could bring the $1.20 area back into focus. The strong inflows into XRP ETFs provide a positive backdrop, but traders still need confirmation from price action. For now, XRP remains bullish above its recent support, but the $1.50-$1.66 region is likely to be a major test for the bulls.

Bitcoin remains the market leader and its ability to hold $78,000 will be important for the entire crypto market. A clean break above $80,000 would strengthen the bullish setup and could push BTC toward $84,000 and then $88,000-$90,000. If Bitcoin loses $77,000, traders should prepare for a deeper pullback toward $74,000-$72,000. Ethereum is also showing strength, but bulls need to clear the $2,500-$2,600 resistance zone before expecting another major leg higher. A breakout above $2,600 could put $2,800 and $3,000 back on the radar. BNB remains one of the stronger charts and is holding close to its recent highs, but $718-$725 is the key breakout zone. A sustained move above $725 could send BNB toward $745 and then $790-$800. Solana is consolidating around $100, and traders will be watching the $110-$111 zone for the next breakout signal. If SOL clears $111, momentum could quickly target $117-$120, while a break below $100 would weaken the setup. XRP remains constructive after its sharp recovery, but the $1.50-$1.51 area needs to break before bulls can target $1.60 and $1.66. A loss of $1.34 would warn that profit-taking is becoming stronger and could push XRP back toward $1.27-$1.30. Overall, the market remains bullish after Bitcoin's strong August performance, but September is beginning with some signs of exhaustion and macro uncertainty. ETF flows remain an important source of support, particularly for Bitcoin, Ethereum, XRP and Solana, while traders are also watching interest-rate expectations closely. The key theme for the week is therefore simple: bulls still have control, but they need fresh breakouts to keep the rally moving. Until those breakouts arrive, traders should avoid chasing extended candles and instead watch how price reacts around the major support and resistance levels.

CEO Jeremy Allaire says Circle built “the platform for the internet financial system”, but cirBTC has only 40 BTC

How a trillion-dollar infrastructure machine launched a new Bitcoin token, and it only attracted 40 coins.

circle's wrapped Bitcoin product entered the market with unusually strong institutional credentials and almost no visible scale.

The company paired cirBTC with segregated reserves, a federally supervised custodian, direct minting and redemption for eligible businesses, and the distribution infrastructure behind USDC. Circle's Aug. 27 reserve panel nevertheless showed just 40.02450077 cirBTC outstanding about 11 weeks after its Ethereum launch.

The same panel showed 42.5114162 BTC in reserve, equal to about 106.2% coverage and a 2.48691543 BTC cushion across 14 disclosed Bitcoin addresses. The reserve cushion settled the backing question at that snapshot. The 40-token float exposed the harder problem: Circle had built a credible institutional wrapper but had barely begun to build a market around it.

That gap turns cirBTC into a test of a broader Circle thesis. Jeremy Allaire said in the company's second-quarter results that Circle had built “the platform for the internet financial system.”

Russia's Largest Bank Sber Eyes BTC, ETH, USDT for Crypto-Backed Loans

Russia’s largest bank plans to expand crypto-backed lending by accepting bitcoin, ether, and tether as collateral after new regulations take full effect. Sberbank says the initiative will build on its digital asset loan pilot.

Sberbank Plans to Expand Crypto-Backed Lending
Sber, Russia’s largest bank, majority-owned by the government, plans to accept bitcoin, ether, and tether as collateral for loans, according to Anatoly Popov, deputy chairman of its management board. Popov disclosed the lending plans in an Aug. 28 interview with TASS ahead of the Eastern Economic Forum.

This proposed expansion will follow the implementation of Russia’s new cryptocurrency regulations and the central bank’s admission of the assets to public trading. Popov said Sberbank intends to adapt its existing products to the new requirements before gradually expanding its digital asset offerings.

Practical experience with cryptocurrency has already prepared the bank for the regulatory transition, according to the executive. Crypto-backed lending is among the products Sber intends to develop further once every relevant provision has taken effect, with bitcoin, ether, and tether included in its planned collateral list.

Sberbank issued its first crypto-backed loan in December 2025 to Intelion, a Russian industrial cryptocurrency mining company, as part of a pilot.

Eric Trump Says American Bitcoin Mines Up to 13 BTC Daily at 49% Margins

Eric Trump says American Bitcoin (ABTC) mines between 11 and 13 BTC daily at close to 49% gross margins, running nearly 90,000 miners. The company's own quarterly filings largely support those figures.

Speaking on the Wolf Financial podcast, the co-founder and president's son framed the output as proof of one of the sector's most efficient mining operations, months after a public dispute over the firm's true production costs.

Numbers Track With Recent Filings
American Bitcoin was founded in 2025 by Eric Trump and Donald Trump Jr. The venture merged with Gryphon Digital Mining to list on the Nasdaq under the ticker ABTC in September 2025. Hut 8 Corp, which backed the venture, remains the majority owner.

The company's treasury has grown to about 8,300 BTC as of late August, according to Trump. That is up from roughly 5,401 BTC at the end of 2025, continuing an accumulation strategy that has drawn comparisons to Strategy.

It mined a record 932 BTC in the second quarter of 2026, its highest output yet. Gross margins that quarter landed near 49%, matching the figure Trump cited. Bitcoin (BTC) traded near $77,696 as of writing, up 0.49% over 24 hours. That gives the reserve a paper value above $600 million.

A Disputed Cost Basis
The margin claim follows a spring dispute over the firm's true production costs. Forbes alleged American Bitcoin's all-in cost ran closer to $90,000 per coin, above the roughly $57,000 figure Trump has repeated. Trump rejected the report as politically motivated.

The U.K. Gives Bank of England New Payments Mandate

The UK government plans to give the Bank of England a new secondary objective to support innovation in payment systems and emerging forms of digital money. This will include stablecoins as London looks to keep its financial sector aligned with rapid technological change.

HM Treasury announced the proposal on August 27, saying the new mandate would remain subordinate to the central bank's primary responsibility for financial stability. The government expects to introduce the change through amendments to the Financial Services and Markets Bill, which is due to return to the House of Lords on September 7 and 9.

The move gives the Bank a clearer statutory role in supporting payment technologies such as tokenization and distributed ledger technology while requiring it to report to Parliament annually on its progress.

The bank is being asked to innovate without chasing innovation The proposal extends an approach already used by the Bank when regulating central counterparties and central securities depositories. Under the new framework, the same innovation objective would apply to systemic payment systems, including those using digital settlement assets such as stablecoins.

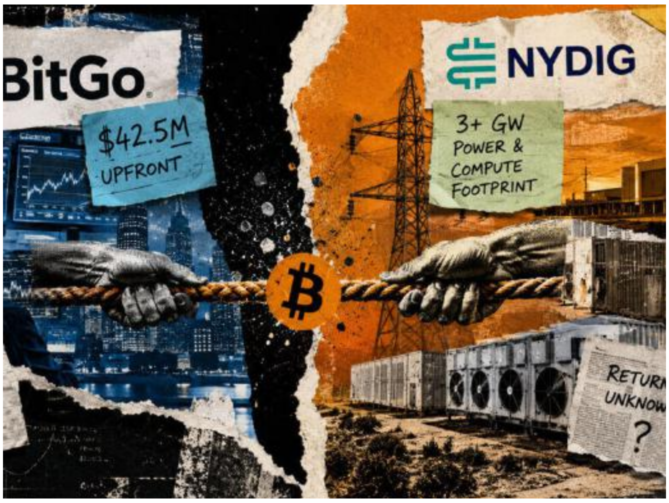
Wall Street's favorite Bitcoin broker just walked away from institutional trading to chase gigawatts of power



Grayscale has voluntarily withdrawn registration statements for its Cardano, Hedera, and Polkadot Trust products, pausing another set of altcoin ETF ambitions before they reached market.

The BitGo NYDIG deal puts roughly $42.5 million upfront against NYDIG's claimed 3+ GW power-and-compute footprint, with profitability unproven on both sides.

BitGo's NYDIG deal transfers its institutional trading business to the digital-asset custody and trading infrastructure provider, while NYDIG says it is concentrating resources on power, Bitcoin mining and high-performance-computing data centers.

The closing terms disclosed by BitGo put roughly $42.5 million of consideration upfront. BitGo is adding an institutional team, client relationships and financial products around its custody and settlement platform. NYDIG is directing attention toward a company-described power-and-compute footprint exceeding 3 GW.

The deal makes each company's resource allocation clear while leaving the margin comparison unresolved. BitGo's filings show that very large digital-asset sales can carry a thin gross spread.

'We're Back': Michael Saylor Hints Strategy May Buy Bitcoin Again

Michael Saylor has revived speculation about Strategy's next bitcoin move with a cryptic "We're Back" message and holdings chart. The post followed a buying pause while the company accumulated $6.69 billion in dollar liquidity.

Saylor Revives Strategy's Bitcoin Purchase Mystery Speculation over a renewed bitcoin purchase emerged Sunday after Strategy Inc. (Nasdaq: MSTR) Executive Chairman Michael Saylor posted the company's holdings chart without describing its next treasury action. Saylor shared the cryptic message Aug. 30 on X as investors awaited Strategy's next disclosure following two consecutive weeks without a bitcoin transaction.

The attached chart showed Strategy holding 840,447 BTC, with the reserve valued at $65.72 billion. It also plotted the company's transactions against bitcoin's market price and average acquisition cost. The message itself contained two words, with Saylor substituting the bitcoin symbol inside the final word as he stated:

"We're back."

The post functions as a potential signal rather than a transaction disclosure, leaving the company's regulatory filings to establish whether its holdings changed. Strategy's Aug. 24 filing with the U.S. Securities and Exchange Commission reported 840,447 BTC acquired for $63.36 billion at an average price of $75,385 per bitcoin, including fees and expenses.

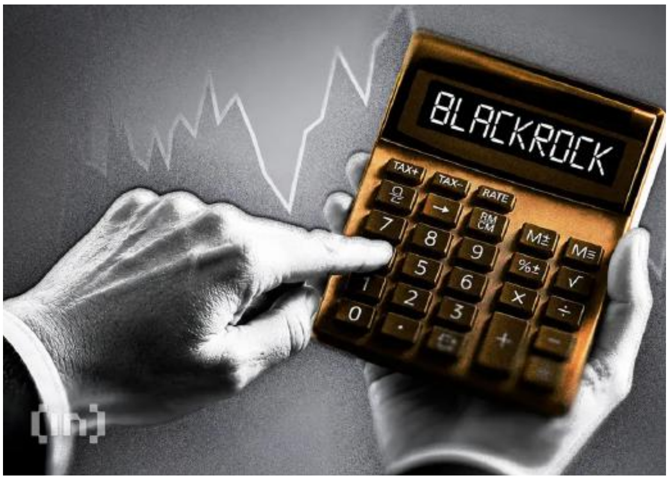
BlackRock's BUIDL Reclaims Top Spot for Tokenized Treasuries, Bolstering RWA Market



BlackRock's tokenized US Treasury fund, BUIDL, has reclaimed the top spot among products of its kind, with a market capitalization of roughly $2.8 billion.

Token Terminal data shows BUIDL now holds about 18.5% of the $15.1 billion tokenized Treasury market, narrowly ahead of Circle's USYC.

A Fast-Changing Leaderboard

Tokenized Treasury funds let institutions hold short-term US government debt on a blockchain. Settlement happens around the clock, instead of the multi-day cycles typical of traditional bond markets.

That structure has made them a popular option for institutions parking idle cash or posting yield-bearing collateral.

USYC only briefly held the top spot. The fund grew from about $600 million to nearly $3 billion over the past year.

It reached roughly $2.9 billion by late August, edging past BUIDL's $2.7 billion, according to Token Terminal data. It then lost the lead again this week.

BUIDL is BlackRock's USD Institutional Digital Liquidity Fund, administered by Securitize. USYC, meanwhile, represents a share in Circle's Hashnote-based fund, which Circle folded into its stablecoin business after acquiring Hashnote in 2025.

Coinbase's US500 Perp Hits $100M Volume in a Week

Coinbase's new US500 index perpetual contract has surpassed $100 million in 24-hour trading volume just one week after launch, according to CEO Brian Armstrong The product gives US traders exposure to an index representing the country's 500 largest companies through a single perpetual contract, allowing traders to take positions on the US stock market rather than individual shares.

The launch is notable because perpetual contracts have traditionally been associated with crypto markets. Coinbase is now applying the format to equities, giving traders a way to maintain long or short exposure to US large-cap stocks without holding the underlying shares. Armstrong said the company is already asking traders which other index perpetuals they would like to see next.

Why are traders turning to stock index perps? The early volume suggests there is demand for a simpler way to trade broad market movements. Instead of buying hundreds of companies individually, traders can take one position linked to a large-cap US index. Traditional S&P 500 products such as SPY already provide broad exposure. Still, a perpetual contract brings a trading structure familiar to crypto traders, including the ability to go long or short without a fixed expiry.

The competition is also developing quickly. Coinbase launched its US500 contract on August 17, while Kalshi filed with the CFTC just days later for its own US500 perpetual product. That suggests exchanges see an opportunity to bring more traditional financial assets into the perpetual market rather than keeping the product category focused on cryptocurrencies.
